**Lan. syst. Monandria, Decandria.** Calyx tubular, bilabiate (f. 49 b.), lower lip with 3 small acute teeth, upper lip with 2 large rounded lobes. Corolla with a large vexillum (f. 49 d.), bearing 2 parallel callosities at the base; wings stipitate, oblong, auricled. Keel of 2 petals (f. 49 c.). Stamens monodelphous (f. 49 a.), or the tenth one adhering but slightly to the others. Legume compressed (f. 49 e.), with 3 prominent nerves, especially with a prominent nereon on each side of the seminiferous suture, and terminating in an inflexed mucron (f. 49 c.); the seeds separated by cellular membranes. Seeds oval-oblong (f. 49 e.), with the hyllum linear.—Herbs or subshrubs, with twining branches, pinnately-trifoliate leaves, axillary many-flowered racemes, terminal pedicels, and large purple flowers.

3 C. minaxa (D. C. prod. 2. p. 404.) leaflets ovately-orbicular, rounded at both ends, reticulately veined, coriaceous, and are smooth, as well as the petioles; peduncles very long, and many-flowered; legumes generally 3-seeded, on short stipes.

Var. b. macheroides (D. C. prod. 2. p. 404.) racemes length of the leaves; legumes 5 times longer than broad, ascending,
and incurved at the apex; flowers erect.  β. C. S. Native of the East Indies. Lobiis nacleraloides, Rumph. Amyth. 5. p. 135. f. 1.—Rheed. mal. 8. t. 45. Perhaps a proper species.

*Lourèr²’1t’s Canavalia.* Shrub tw. 7. C. retílanas (D. C. L. c.) leaflets oval-oblong, obtuse; legumes straight, 4 times longer than broad.  β. C. S. Native of Mexico. Mucuna rútilanas, Moc. et Sesse, fl. mex. ined. Flowers and seed of a reddish scarlet colour.

11. C. bonarièn’sis (Lindl. bot. reg. 1199.) leaflets ovate, obtuse, coriaceous, glabrous, acuminate; racemes drooping, longer than the leaves; lower lip of calyx furnished with one tooth-like process; ovary falcate, pubescent, 6-ovulate, on a long villous stipe.  β. C. G. Native of Buenos Ayres. Flowers purple, large.

*Cult.* Elegant twining or climbing plants, well adapted for training up the rafters in a stove or greenhouse; their culture and propagation are the same as those for *Dióclea*, p. 362.

CC. *AMPHODUS* (from *œuf, odous*, a tooth; in reference to the vexillum being furnished with a tooth on each side at the base). Lindl. bot. reg. 1101.

Linn. *syst. Diadelphia, Decândria.* Calyx bracteates, thrust in at the base, bilabiata; upper lip bidentate, lower one trifid, with subulate segments. Corolla with a reflexed vexillum, which is furnished with an inflexed tooth on each side at the base; wings and keel linear. Stamens diadelphous. Style filiform, glabrous, crowned by a capitellate stigma. Legume linear-oblong, compressed, wingless, torulose, many-seeded. Seeds oblong, compressed, greenish brown, with a small linear hyrum, and girded by a thick white arillus. Cotyledons oblong. Radicle obtuse, inflexed.—A twining shrub, with pinnately-trifoliate leaves, stipulate ovate leaflets, ending in a spine-like mucron, and short axillary racemes of large purple flowers.

*Cult.* See *Mucuna* for culture and propagation, p. 364.

Linn. *syst. Diadelphia, Decândria.* Calyx campanulate, bilabiata; lower lip trifid, with acute segments, the middle segment drawn out most, upper lip broad, entire, and oburete. Corolla with an assurgent vexillum, shorter than the wings and keel; wings oblong, length of the keel, which is oblong, straight, and acute. Stamens diadelphous, with 5 of the anthers oblong-linear, and the other 5 ovate and hairy. Legume oblong, torose, 2-valved; the seeds separated by cellular dissements. Seeds round, with a linear hyrum girdled by a circular mark.—Clipping herbs or shrubs, with pinnately-trifoliate leaves, and axillary racemes, which are usually pendulous when bearing the fruit. Legumes hispid from innumerable brittle, stiff, stinging caducous bristles, which easily penetrate the cuticle.

Sect. I. *Zoophítháium* (from *ζωος*, zoön, an animal, and *φθις*, *φθαλος*, *φθαλός*, an eye; in reference to the form of the seeds, which resemble the eye of an animal). P. Browne, Jam. 1. D. C. prod. 2. p. 405. Legumes with the furrows transversely lamellate.

1. M. urens (D. C. prod. 2. p. 405.) flowers racemose; legumes covered with stinging bristles; leaflets clothed with shining tomentum beneath.  β. C. S. Native of the West Indies and South America. Mucuna, Maregr. bras. 19. Plun. amer. t. 107. Pluk. phyt. t. 213. f. 2. Dólólchis ures, Lindl. spec. 1020. Jacq. amer. 202. t. 182. f. 84. Stizolóbia urens, Pers. ench. 2. p. 299. Flowers large, white or yellow, with the lower edge of the wings red. The seeds from their resemblance to an eye are called by the French *Yeux-bourrique*, or ass’s eye, and for the same reason they have the name *œ–eye–bean* in our colonies in the West Indies.

*Soft Cow-itch.* Shrub cl.
Sect. II. Stizolobium (from στίς, stizo, to sting, and λοβος, a pod; in allusion to the stinging hairs with which the pods are clothed). P. Browne, jam. D. C. prod. 2. p. 405. Legumes destitute of the thorny-spike lamellae.

3 M. ALTISSIMA (D. C. prod. 2. p. 405.) flowers racemose; legumes beset with stinging hairs; leaflets glabrous on both surfaces. \( \gamma \). C., S. Native of Martinique, in mountain woods. Döölsich altissimus, Jacq. amer. 203. t. 182. f. 85. exclusive of the synonyme of Rhed. Flowers with a bluish violet vexillum, and a rather yellowish carina.

4 M. FRUÆNS (D. C. prod. 2. p. 405.) flowers racemose; legumes stinging, with the valves somewhat keeled; leaflets hairy beneath, acuminate, middle one rhomboid, lateral ones dilated on the outside. \( \gamma \). C., S. Native of Malabar, Rhed. mal. 8. t. 55.; of the Moluccas, Rumph. amb. 5. p. 142.; of the West Indies, P. Browne, jam. 290. t. 51. f. 4.; and of Guinea. Döölsich pruriens, Lin. spec. 1020. Lam. dict. 2. p. 290. Stizolobium pruriens, Pers. Carpópogen pruriens, Roxb. Flowers violaceous, becoming black when dried. Perhaps the American, Asinian, and African plants are the same. A decoction of the roots is said to be a powerful diuretic. The pods are about 4 inches long, thickly beset on the outside with stiff brown hairs, which, when applied to the skin, occasion a most intolerable itching. In the choice of Cow-itch, all those pods which are brown or shrivelled, rusty, or of a bad colour or dimissive nature, ought to be rejected. In medicine, the ripe pods are dipped in syrup, which is again scraped off with a knife. When the syrup is rendered as thick as honey by the hairs, it is fit for use. It acts mechanically as an antihistaminic, occasions no unseasiness, and may be safely taken from a tea-spoonful to a table-spoonful in the morning, fasting. The worms are said to appear with the second or third dose. A vinous infusion of the pods (12 to a quart) is said to be a certain remedy for the dropy. A strong infusion of the roots sweetened with honey is used in India by the native practitioners in cases of cholera morbus.

Common or Stinging Cow-itch. Fl. summer. Clt. 1681. Sh. cl.

5 M. gigantea (D. C. prod. 2. p. 405.) flowers umbellate; legumes covered with stinging hairs, 3-4-seeded; leaflets glabrous, acuminate, lateral ones dilated on the outside, middle one ovate. \( \gamma \). C., S. Native of Malabar and of Chittagong. —Rheed. mal. 8. t. 30. Carpópogen giganteum, Roxb. hort. beng. p. 54. Döölsich giganteum, Willdl. spec. 3. p. 1041. Flowers of a pale greenish colour.

Var. \( \beta \), nigricans (D. C. prod. 2. p. 405.) corolla black marked with a white spot. \( \gamma \). C., G. Native of Cochinchina, in hedges. Citta nigricans, Lour. coch. 456. —Rumph. amb. 5. t. 6. ex Lour. but Rumphius's plant has greenish white flowers, and is therefore referrible to the species.

6 M. macrocarpa (Wall. pl. asiat. rar. 1. p. 41. t. 47.) leaves sparingly pilose; flowers large, racemose; keel longer than the wings, of a different colour; legumes very long, ensiform, torulose, tomentose, many-seeded. \( \gamma \). C., G. Native of Nipaul, on the mountains. Flowers party-coloured; vexillum green; wings purple and keel brown.

Long-footed Mucuna. Shrub tw.

7 M. inflexa (D. C. l. c.) flowers umbellate; pedicels in- flexed; legumes covered with stinging hairs; seeds globose; lateral leaflets cordate. \( \gamma \). C., S. Native of the Andes, in woods. Negréia inflexa, Ruiz, et Pav. syst. 176. Pedunae pendulous, 2 or 4 in a series. Flowers dark purple, becoming black when dry. Inflexed-pedicellate Cow-itch. Shrub cl.

8 M. elliptica (D. C. l. c.) flowers umbellate; legumes covered with very stinging hairs, 2-seeded; seeds convex on both ends; lateral leaflets ovate. \( \gamma \). C., S. Native of Peru, on mountains. Negréia elliptica, Ruiz. et Pav. syst. 176. Flowers dark purple, drying black. Elliptic-pedicellate Cow-itch. Shrub cl.

10 M. cumosa (D. C. l. c.) racemes erect, dense-flowered; legumes oblong, unarmed; seeds compressed, with the hyrnum girded; leaflets elliptic, mucronate, glabrous. \( \gamma \). C., S. Native of Guiana, near Essequibo, in groves. Döölsich cumosus, Mey. prim. eseq. 241. Corolla white, tipped with purple. Tufted Cow-itch. Shrub cl.

13 M. mutisia (D. C. l. c.) racemes pedunculate, somewhat capitate; bracteas ovate, rounded at the apex, clothed with rusty tomentum; leaflets smoothish, membranous, elliptic-oblong, acuminate, lateral ones with very unequal sides. \( \gamma \). C., S. Native of South America, near Santa Fe de Bogota. Negréia mutisia, H. B. et Kunth, nov. gen. amér. 6. p. 442. Legume unknown. Mutia's Cow-itch. Shrub cl.

† Species indicated in Roxburgh's Hortus Bengalesicus, but not described.

19 M. angulata (Roxb. hort. beng., under Carpópogen). \( \gamma \). C., S. Native of the East Indies. Snake Cow-itch. Shrub tw.

Cult. A rich soil suits the species of Cow-itch, and they are easily increased from cuttings. None of them are worth growing, unless in botanical gardens.

CCII. CALYPOGONUM (from calyx, kalois, beauty, and pagon, a beard; in reference to hairs on the calyx segments). Desv. obs. legum. in Schlecht. Linnaea. 2. p. 513. Lin. syst.迪德尔菲亚, 德克杜利亚. Calyx bracteatis, deeply 5-cleft, closed, smooth; segments elongated, awl-shaped, nearly
equal, pinnately bearded, longer than the corolla. Legumes straight, depressed, or rather hooked, pilose, 8-seeded.—An herbaceous twining plant, with trifoliate leaves.

1 C. mucronoides (Desv. l. c.). 2. 6. 1. Native of Guinea. 

Mucuna-like Calopogonum. Pl. tw.

Cult. See Mucuna for culture and propagation, p. 364.

Lin. syst. Diadelphea, Decandria. Calyx campanulate, 5-cleft; segments subulate, incurved at the apex, 2 superior ones joined together higher up than the rest. Corolla with ample vexillum, which is bicalous at the base, and an obtuse straight keel. Stamens diadephous. Legume oblong, compressed, oblique, torulose, 2-valved. Seeds numerous, nearly spherical, separated by membranous partitions. Erect shrubs, clothed with velvety pubescence, with pinnately trifoliate leaves, stipitate leaflets, and axillary racemes of yellow flowers, with 2 pedicels rising from each bracteate. Cotyledons confluent in germination.

1 C. bi'color (D. C. l. c.) vexillum discoloured on the outside; legumes 4-5-seeded; stipitate of the lateral leaflets about equal in length to the petiololes. 6. S. Native of the East Indies. Cyttus Cajun, var. b. Lam. dict. 2. p. 249. Cyttus pseudo-cajun, Jacq. hort. vind. 2. 2. 119.—Reed. mal. 6. t. 13. Flowers yellow, except the outside of the vexillum, which is purplish. The seeds are estatable, and very delicate when young.

2 C. FLAVEUS (D. C. l. c.) vexillum the same colour on both sides; legumes 4-5-seeded, and are as yellow as the calyces spotless; stipite of lateral leaflets one half shorter than the petiololes.

6. S. Native of the East Indies, but now cultivated in South America and Africa. Cyttus Cajun, Lin. spec. 1041. Jacq. obs. 1. t. 1. Plun. ed. Burm. 114. t. 2. Burm. bezv. p. 86. t. 37. Hughes, barb. 199. t. 19. This shrub is cultivated in both Indies, South America, and Africa. In the West Indies it is chiefly planted in rows, as a fence to the sugar plantations. The seed is much eaten by the poorer inhabitants and negroes, and is esteemed a wholesome pulse; in Martinico even the better sort of people hold the seeds in high estimation, and prefer them to common peas. The chief use they are put to in Jamaica is for feeding pigeons, whence the English name. The branches, with the ripe seeds and leaves, are given to feed hogs, horses and other cattle, which grow very fat on them.

Cult. A light rich soil will suit the species of Cajanus; and young cuttings will root in sand, with a hand-glass placed over them, in heat, but the plants are annually raised from seeds brought or sent from the West and East Indies.

CIV. LUPINUS (of Pliny and other Latin writers, said to be from lupus, a wolf, on account of its being supposed to destroy the fertility of the soil; or rather aor tse the lep, aor tse lepes, whence Virgil calls lupines tristes lupini, the bitterness of this pulse contracting the muscles and giving a sorrowful appearance to the countenance, fossus). Tourn. inst. 392. t. 213. Lin. gen. 1716. Gaertn. fruct. 2. p. 150. D. C. prod. 2. p. 406.

Lin. syst. Madalaphia, Decandria. Calyx profoundly bilabiate. Corolla papilionaceous, the vexillum with reflexed sides, and the keel acuminate. Stamens monadelphous, with the tube or sheath entire, 5 of the anthers are smaller, rounder, and earlier, and the other 5 oblong and later. Style filiform. Stigma terminal, roundish, bearded. Legume coriaceous, oblong, compressed, obliquely torulose. Cotyledons thick, but converted into leaves at the time of germination. —Herbs or subshrubs, with digitate leaves, constantly composed of 5-15 leaflets, very rarely simple. Leaflets complicated before expansion, and while asleep or through the night. Stipulas adnate to the petioles. Peduncles opposite the leaves or terminal. Flowers alternate or verticillate, sessile, or pedicellate, disposed in racemes, and spikes, with one bracteate under each pedicel, and with 2 bracteoles adhering laterally to the calyx, which are caducous, or wanting.

§ 1. Leaves digitate.

* Annual herbs.

1 L. a'bus (Lin. spec. 1015.) flowers alternate, pedicellate, destitute of bracteoles; upper lip of calyx entire, lower one somewhat tridentate; leaflets obovate-oblong, usually 7 or 8, villous beneath. 6. H. Native of the Levant, and now cultivated in the south of Europe. Luth. t. 191. Blackw. icon. t. 282. L. sativus, Gater. montaub. 126.—Clus. hist. 2. p. 228. f. 1. Flowers white, almost sessile. This plant is cultivated in some parts of Italy and other parts of the south of Europe, as other pulse, for food; also in the south of France, on poor, dry, extensive plains, as an ameliorating crop, to be ploughed in where no manure is to be had, and the ground is too bad for clover or other better plants. In Tuscany, it is not only cultivated for food, but also for improving the land by ploughing it in, a practice continued from the time of the ancient Romans, as may be seen by consulting Pliny and Columella. With us it is used also among other annuals in the flower-border.

Var. b; keel of flower tipped with violet. L. albus, *Egyptius, Munch, math. 152.

2 L. * Ter'mis (Forsk. descript. 131.) flowers alternate, pedicellate, bracteolate; upper lip of calyx entire, lower one somewhat tridentate; leaflets 5-6, obovate-oblong, villous beneath. 6. H. Native of Egypt. L. protrifer, Desrous. in Lam. dict. 3. p. 622. Flowers white but with the vexillum tipped with blue. *Like L. albus and L. varius. *Ter'mis is the Arabic name of the plant. The peduncles, after being peeled, are eaten raw, and the seeds are boiled as other pulse by the Arabs. *Ter'mis or Egyptian white Lupine. Fl. Ju. Aug. Cht. 1502. Pl. 1 to 2 feet.

3 L. varius (Lin. spec. 1015.) flowers somewhat verticillate or alternate, pedicellate, bracteolate; upper lip of calyx bidentate, lower one slightly tridentate; leaflets oblong-lanceolate, villous beneath, usually 5-6 in number. 6. H. Native of Spain, South of France, Corsica, Egypt, and in the islands of the Archipelago of Europe, &c. L. semi-verticillata, Desrous. in Lam. dict. 3. p. 623. L. sylvestris a, Lam. fl. fr. Flowers large, blue or purplish.

4 L. ins'rus (Lin. spec. 1015.) flowers alternate, bracteolate; upper lip of calyx bipartite, lower one trifid; leaflets 5, oblong-spatulate, hairy on both surfaces; legumes very hairy. 6. H. Native of Spain, South of France, Egypt, Corsica, and the islands of the Archipelago of Europe. *L. digitatus, Forsk. descript. 151.—J. Banh. hist. 289. with a figure.—Park. parad. 335. t. 387. f. 1.—Gerard, emac. 1217. f. 4. Flowers smaller than those of L. varius, blue, lower ones sometimes axillary. Plant clothed with ferruginous hairs.

5 L. pil'osus (Lin. spec. 1015.) flowers verticillate, pedicellate, bracteolate; upper lip of calyx bipartite, lower one entire; leaflets 9-11, oblong-lanceolate, villous on both surfaces, as well
as the stems and calyces. O. H. Native of the south of Europe. Flowers rose-coloured, with the middle of the vexillum red.

Var. β, corollae; flowers bluish-purple. The Great Blue Lupine.

*Lupinus roseus* Fr. July, Aug. Cl. 1710. Pl. 2 to 4 ft.

6. *L. bracteolatus* (Desrous, in Lam. dict. 3. p. 622.) flowers alternate, pedicellate, bracteolate; upper lip of calyx bifid, lower one entire; leaflets 5-6, obovate-oblong, villous on both surfaces. O. H. Native of Monte Video. Said to be allied to *L. hirsutus*, according to Desrousseaux. Perhaps the same as *L. rupestris* of Kunth. Flowers probably purplish.

8. *L. linifolius* (Roth, abband. 14. t. 5.) flowers alternate; upper lip of calyx bifid; lower one rather tridif; leaflets linear, very narrow, channelled. O. H. Native country unknown. Willd. spec. 3. p. 1023. Flowers blue, smaller than those of the preceding species.

9. *L. linearis* (Desrous, in Lam. dict. 3. p. 625.) flowers alternate, on short pedicels, bracteolate; upper lip of calyx bifid, lower one tridentate; leaflets 8-11, linear, very narrow. O. H. Native of Monte Video. Flowers small blue, but with the outside of the vexillum yellowish. The stems are said to be herbaceous, but perhaps the root is perennial.

*Linear-leafletted* Lupine. Pl. 1 to 2 feet.

*Yellow* Lupine. Fl. June, Aug. Cl. 1596. Pl. 1 to 1½ feet.

11. *L. humphus* (Sesse et Moc. in herb. Lamb.) plant clothed with hairs in every part, except the leaves; leaflets 7-9, linear-lanceolate, pubescent, mucronate; flowers alternate; calyx villous, with the upper lip entire and shorter than the lower one, which is tridentate. O. H. Native of Mexico. Flowers purplish blue.

*Trailing* Lupine. Pl. 3 foot.

12. *L. microcarpus* (Sims, bot. mag. t. 2413.) flowers verticillate, sessile, bracteolate; upper lip of calyx very short, emarginate, superior one tridentate; bracteas reflexed; leaflets oblong-linear; legumes rhomboid, 2-seeded, hairy. O. H. Native of Chili. Flowers blue, with a purplish apex. Keel ciliated on the inside at the base.

*Small-podded* Lupine. Fl. May, June. Cl. 1821. Pl. 3 ft.

13. *L. pusillus* (Pursh. fl. amer. sept. 2. p. 468.) flowers alternate, without bracteoles; upper lip of calyx bifid, lower one entire; leaflets 5-7, linear-elliptic, glabrous above, but hairy beneath, as well as the stems and pedicels; legumes very hairy, 2-seeded. O. H. Native of North America, on the plains between the Missouan and the White River. Nutt. gen. amer. 2. p. 93. Flowers small, blue mixed with red.

14. *L. bicolor* (Lindl. bot. reg. 1109.) stems branched, corymbous, and are as well as the leaves clothed with silky pili; leaflets 5-7, linear spatulate; flowers few, verticillate; calyx clothed with silky wool, inapandicate, having the upper lip bifid, and the lower one elongated and entire; wings longer than the vexillum; legumes many-seeded. O. H. Native of North America, in the interior of the country, about the Columbia River, from Fort Vancouver to the branches of Lewis and Clarke’s river. Flowers with a white vexillum, which becomes reddish purple, and the keel and wings bluish purple.

*Two-coloured* flowered Lupine. Cl. 1826. Pl. 1 foot.

15. *L. microanthus* (Doug. in bot. reg. 1251.) flowers somewhat verticillate, bracteolate, sessile; upper lip of calyx bifid, lower one entire; leaflets 5-7, linear, spatulate, ciliated; legumes 6-seeded, furrowed transversely; stem branched; roots granular. O. H. Native of North America, upon the gravelly banks of the southern tributaries of the Columbia, and of the interior of California, in barren ground. Flowers pale bluish purple, the vexillum white in the centre, with 2 or 4 parallel black dots.

*Small-flowered* Lupine. Fl. May, Jul. Cl. 1826. Pl. ½ to 1 ft.

**Perennial herbs.**

16. *L. Mexicanus* (Cev. in Lag. nov. spec. 22. no. 285.) herbaceous; flowers alternate, pedicellate, bracteolate; upper lip of calyx emarginate, lower one obscurely tridentate; leaflets oblong-linear, pilose beneath. ？G. Native of Mexico. Ker. bot. reg. 457. Flowers blue, about the size of those of *L. perennis*.

17. *L. perennis* (Lin. spec. 1015.) herbaceous; flowers alternate, pedicellate, bracteolate; upper lip of calyx somewhat emarginate, lower one entire; leaflets 8-9, lanceolate, mucronate, rather villous beneath; root creeping. ？V. H. Native of North America, in sandy places, and on sandy hills from Canada to Florida. This is a very common plant in the State of New York, in Long Island, and about Philadelphia, where we have seen it growing in great plenty on sandy banks and in woods. Mill. fig. t. 176. f. 1. Lam. ill. 616. f. 1. Curt. bot. mag. 292. Flowers of a pale bluish purple colour.

18. *L. Nootkatensis* (Sims, bot. mag. t. 1311. and 2137.) herbaceous; flowers rather verticillate, pedicellate, without bracteoles; both lips of calyx entire; leaflets 7-8, obovate-lanceolate, hairy as well as the stems. ？V. H. Native of North America, on the western coast at Nootka Sound, and of the Island of Unalaska. Pursh. fl. amer. sept. 2. p. 462. Flowers elegant, blue, mixed with purple, white, or yellow, and streaked with more intense veins.

*Nootka* Sound Lupine. Fl. May, Jul. Cl. 1794. Pl. 1 to 1½ ft.

19. *L. Polyphyllus* (Doug. in bot. reg. 1096.) herbaceous; flowers rather verticillate, without bracteoles, pedicellate; leaflets 11-15, lanceolate, hairy beneath; both lips of calyx quite entire; stems pilose. ？V. H. Native of North America, on the north-west coast. Corolla purple; the vexillum of a deep bluish purple, and with the keel paler.

*Var. β, albidiflorus* (Lindl. bot. reg. 1377.) flowers white.

*White-stemmed* Lupine. Pl. 1 to 1½ feet.

21. *L. laxiflorus* (Doug. in bot. reg. 1140.) plant herbaceous, pilose; flowers alternate, without bracteoles; upper lip of calyx entire, saccate at the base, lower one longer, ovate, and acu-
SULPHUR-COLOURED-FLOWERED Lupine. Pl. 1 to 1 ½ foot.
29. L. pluriflorus (Dougl. in bot. reg. 1317.) plant herbaceous, very villous; flowers alternate, on short pedicles, bracteolate; upper lip of calyx bifid, lower one entire; leaves 5-7, lanceolate, silvery; legumes glabrous, 5-5-seeded; bracteas longer than the flowers, villous, deciduous. Ζ. Η. Native of Northern California, growing in gravelly soils; it is also found at the sources of the Walla-Wallah river, near the Blue Mountains, on the north-western coast of America. Flowers blue, with the keel and wings pallid.

\section*{Feathery Lupine. Fl. June, July. Clt. 1826. Pl. 2 to 3 ft.}
30. L. decumbens (Torrey, in ann. lyc. 2, p. 181.) plant sulphur-rose, rather decumbent; flowers pedicellate, somewhat verticillate, bracteolate; calyx clothed with silky hairs, having both lips entire; leaflets oblong-lanceolate, acute, and obtuse, silky beneath. Ζ. Η. Native of North America, on the western coast. Flowers apparently bluish purple.

\section*{Flowers, deciduous.}
29. L. pluriflorus (Dougl. in bot. reg. 1317.) plant herbaceous, very villous; flowers alternate, on short pedicles, bracteolate; upper lip of calyx bifid, lower one entire; leaves 5-7, lanceolate, silvery; legumes glabrous, 5-5-seeded; bracteas longer than the flowers, villous, deciduous. Ζ. Η. Native of Northern California, growing in gravelly soils; it is also found at the sources of the Walla-Wallah river, near the Blue Mountains, on the north-western coast of America. Flowers blue, with the keel and wings pallid.

\section*{Feathery Lupine. Fl. June, July. Clt. 1826. Pl. 2 to 3 ft.}
30. L. decumbens (Torrey, in ann. lyc. 2, p. 181.) plant sulphur-rose, rather decumbent; flowers pedicellate, somewhat verticillate, bracteolate; calyx clothed with silky hairs, having both lips entire; leaflets oblong-lanceolate, acute, and obtuse, silky beneath. Ζ. Η. Native of North America, on the southern branches of the Arkansas. Flowers small, purple, about half the size of those of L. pertennis.

\section*{White-leafed Lupine. Fl. June, Nov. Clt. 1826. Pl. 2 to 3 ft.}
31. L. sabineanus (Dougl. bot. reg. 1435.) herbaceous; flowers somewhat verticillate, without bracteoles; racemes many-flowered; calyx villous, with the upper lip ovate and acute, lower one boat-shaped, revolute; wings roundish, size of vexillum; keel acute; leaflets 7-12, lanceolate, acuminate, silky. Ζ. Η. Native of North America. Flowers disposed in long racemes, and are either white or tinged with light pink.

\section*{Sabine's Lupine. Fl. May, June. Clt. 1827. Pl. 2 to 3 ft.}
32. L. chamissonis (Eschscholtz, in mem. acad. imp. sc. petrob. vol. 10, p. 281. ex Schlecht. Linnaen. vol. 3, p. 147.) stems herbaceous, clothed with cincerea tomentum; leaves on long petioles; leaflets ovate-lanceolate, bluish, clothed with grey tomentum, but when young with rusty, silky tomentum; flowers verticillate, 3-4 in a whorl; pedicels quadrangular; stipules linear, villous; upper lip of calyx trident, lower one lanceolate, entire. Ζ. Η. Native of California, in sandy places. Flowers purple. Legumes 3-4-seeded, clothed with rusty villi. Bracteas longer than the pedicels.

\section*{Chamisso's Lupine. Pl. 3 ft.}
33. L. sericeus (Pursh, fl. amer. sept. 2, p. 468.) herbaceous; flowers rather verticillate, without bracteoles; upper lip of calyx cut, lower one entire; leaflets 7-8, lanceolate, acute, silky on both surfaces; stems clothed with silky tomentum. Ζ. Η. Native of North America, on the banks of the Kooshkookey river, and off Northern California, in the sea sand at Port St. Francisco. Flowers pale purple or rose-coloured, according to Pursh, but Chamisso says they are yellow, and quite a purplish colour in drying.

\section*{Silky Lupine. Fl. May, June. Clt. 1826. Pl. 2 to 3 ft.}
32. L. argenteus (Pursh, fl. amer. sept. 2, p. 468.) herbaceous; flowers alternate, without bracteoles; upper lip of calyx obtuse, lower one entire; leaflets 5-7, lanceolate-acuminate, acute, glabrous above, but clothed with silky-silvery down beneath. Ζ. Η. Native of North America, on the banks of the Kooshkookey river. Flowers cream-coloured.

\section*{Silver Lupine. Fl. May, June. Clt. 1826. Pl. 1 to 2 ft.}
30. L. argyrophyllum (D. C. prod. 2, p. 408.) herbaceous; flowers verticillate, pedicellate, bracteolate; upper lip of calyx nearly entire, lower one somewhat tridentate; leaflets oblong, clothed with silky hairs on both surfaces; legumes very hairy, 2-3-seeded. Ζ. Η. Native country unknown, but cultivated in
gardens in Teneriffe, where it was gathered by Courant. Flowers blue. It is not known whether this plant is an annual or a perennial.

**Silvery Lupine.** Pl. 2 to 3 feet?

37. *L. elegans* (H. B. et Kunth, nov. gen. amer. 6. p. 477.) plant herbaceous, erect, covered with soft pili; racemes elongated, pedunculate; flowers somewhat verticillate; calyx clothed with silky villi, having the lower lip acute and entire; leaflets lanceolate, acute, clothed with adpressed pili beneath; stipulas setaceous. 2. G. Native of Mexico, between Real del Moron and Totolico-el-Grande. Flowers violaceous? Legume hairy, 3-6-seeded.

**Elegant Lupine.** Pl. 1 to 2 feet?

38. *L. montana* (H. B. et Kunth, nov. gen. amer. l. c.) herbaceous; racemes elongated, pedunculate; flowers somewhat verticillate; calyx clothed with soft pili, having the upper lip acuminate and entire; leaflets 12-13, linear-lanceolate, acute, clothed with adpressed pili beneath. 2. G. Native of New Spain, at Nevada de Tollocu. Flowers violaceous? Legume hairy, usually 8-seeded.

**Mountain Lupine.** Pl. ½ foot?

39. *L. neoticus* (Kunth, mim. p. 174. t. 50.) plant herbaceous, dwarf; flowers without bracteoles, on very short pedicels, disposed in very dense spikes; upper lip of calyx bipartite, lower one entire; bracteae longer than the corolla; leaflets oblong, acute, hairy on both surfaces. 2. G. Native of the Andes, about Quito. Flowers blue.

**Cloud-born Lupine.** Pl. ½ foot.

40. *L. alopecuroides* (Desrous, in Lam. dict. 3. p. 626.) plant herbaceous, candelent, clothed with rusty woolly down; racemes sessile; flowers disposed in very dense spikes, bracteolate; upper lip of calyx bipartite, lower one entire; bracteae longer than the corolla; leaflets obovate-lanceolate. 2. G. Native of the Andes, about Quito. Flowers violaceous.

**Fox-tail-like-spiked Lupine.** Pl. 2 to 3 feet?

41. *L. vaginatus* (Schlegel et Cham. in Linnaea. 5. p. 590.) herbaceous, and clothed with silky villi; stipulas large, adnate to the petioles almost their whole length, 5-nerved, pubescent, drawn out on each side into a tooth, sheathing the axillary branches; the free part of the petiole shorter than the sheath; leaflets 11-13, lanceolate-linear, clothed with silky pili beneath, but glabrous above; stem obtuse-angled, pubescent, fimbriate; flowers somewhat verticillate; upper lip of calyx deeply bipartite, lower one longer, acuminate, and entire. 2. G. Native of Mexico, on mount Orizaba. Bracteae oblong, long-acuminated, membranous, deciduous. Corolla blue. Legume in a young state very hairy, 5-6-seeded.

**Sheathing-stipuled Lupine.** Pl. 1 foot?

42. *L. arbusitus* (Dougl. in bot. reg. 1230.) suffrutescence; flowers alternate, pedicellate, bracteolate; upper lip of calyx bifid, lower one entire, acute; leaflets 7-8, obovate-oblong, silky or both surfaces; legumes 3-4-seeded; seeds small, white. 2. F. Native of Northern California; it is also common near Fort Vancouver. Flowers with a blue vixillum, purple in the centre; wings and carina rose-coloured.

**Shrub Lupine.** Pl. May, June. Clt. 1826. Shrub 1 to 2 ft.

***Shrubby species.***

43. *L. arboreus* (Sims, bot. mag. 628.) shrubby; flowers somewhat verticillate, pedicellate, without bracteoles; both lips of calyx entire; keel ciliate on the inside; leaflets lanceolate-linear, acute, pubescent beneath. 2. F. Native country unknown. Flowers yellowish.

44. *L. multiflorus* (Desrous, in Lam. dict. 3. p. 624.) shrubby; flowers alternate, almost sessile, bracteolate; upper lip of calyx bifid, lower one tridentate; leaflets lanceolate, covered with silky villi. 2. F. Native of Monte Video. Flowers azure blue, but the vexillum and carina are yellowish on the outside. Spikes very long.

45. *L. mutabilis* (Sweet, fl. gard. 2. t. 130.) shrubby, erect, branched; branches spreading, glaucous, glabrous; leaflets 7-9, lanceolate and rather pubescent beneath, lanceolate, bluish; flowers somewhat verticillate; calyx without bracteoles, upper lip bifid, lower one keeled, acute, entire. 2. F. Native of South America. Flowers large, the vexillum white mixed with blue, changing to blue, with a large yellow mark in the centre; wings white, faintly striated; keel white. L. Cruciata- shanksii, Hook. bot. mag. t. 3056., is a native of Peru, is nothing but a slight variety of *L. mutabilis*, differing a little in the colour of the flowers.

**Changeable-flowered Lupine.** Fl. June, Aug. Clt. 1810. Shrub 3 to 6 feet.

46. *L. calyciculatus* (Sweet, fl. gard. 3. p. 368.) shrubby, clothed in every part with silkyomentum; flowers alternate, pedicellate, bracteolate; calyx appendiculate, with the upper lip bifid, and lower one entire and acuminate; leaflets 8-9, linear, calyciculatus, obtuse, clothed with silky pubescence beneath; ovary very hairy. 2. F. Native of Buenos Ayres. Flowers bright blue.

**Channelled-leafletted Lupine.** Fl. June, Aug. Clt. 1828. Sh. 3 to 6 feet.

47. *L. versicolor* (Sweet, fl. gard. 2d series, t. 12.) shrubby, erect, branched; branches and leaves pubescent; leaflets 7-9, lanceolate-spatulate, bluish, and somewhat mucronate, smoothish above, and pubescent beneath; stipulas linear-subulate; racemes elongated, on short peduncles; flowers somewhat verticillate; bracteae caducous, spreading, silky, ciliated, longer than the calyx, which is also silky; upper lip of calyx bifid, lower one entire. 2. F. Native of Mexico. Flowers small, with the vexillum of a purplish lilac colour above about half-way down, then becoming blue on each side; wings of a fine dark blue, tinged with purple; keel ash-coloured, dark purple towards the point. Flowers purple-coloured-flowered Lupine. Fl. July, Sept. Clt. 1825. Shrub 2 to 4 feet.

48. *L. fulciferus* (Sweet, fl. gard. 2d ser. t. 67.) shrubby, erect, branched; branches erect, clothed with silky pubescence; leaflets 5-7, obovate-lanceolate, acute, mucronate, tapering to the base, pubescent beneath, and with adpressed pili; stipulas setaceous; racemes middle-sized, pedunculate; flowers verticillate; bracteae caducous and setaceous, longer than the pedicels; both lips of calyx entire. 2. F. Native of Mexico. Flowers dispersed in a longish raceme, the vexillum with various shades of purple and blue mixed; wings pale blue, slightly edged with purple. Keel white, tipped with bluish purple.

49. *L. campstans* (Schlegel et Cham. in Linnaea. 5. p. 589.) shrubby, densely clothed with canescent pubescence; branches angular; leaflets 7, oblong-lanceolate, acute, mucronate, green above; stipulas subulate, short; racemes panicked; flowers somewhat verticillate; calyx bifracteolate, with both lips entire, the lowest one longest; legumes hairy. 2. F. Native of Mexico, between Perote and Plachichua. Bracteae linear, acuminated, caduceous. Flowers violaceous, about the size of those of *L. angustifolius*.

**Field Lupine.** Shrub 2 to 4 feet.

50. *L. leptophyllus* (Schlegel. et Cham. in Linnaea. 5. p. 389.) shrubby; branches angular, clothed with adpressed pubescence; leaflets 9, linear, acute, with a few silky hairs on both surfaces; stipulas foliaceous, linear; flowers disposed in loose pedunculate racemes, somewhat verticillate; calyx pubes-
cent, with both lips entire, and about equal in length, the upper one broadest; legumes hairy in a young state. F. Native of Mexico, between Táchira and Tepetitla. Flowers violaceous, about the size of those of *L. latifolius*.

**Slender-leaved Lupine.** Shrub 1 to 3 feet.

51. **L. rupestris** (H. B. et Kunth, nov. gen. am. 6. p. 47.) plant shrubby, branched, procumbent or ascending; flowers somewhat verticillate; calyx clothed with silky pili, with the upper lip bifid, and the lower one tridentate; leaflets lanceolate, acute, clothed with silky pili beneath. F. Native of South America, on the burning mount Rucu-Pichincha near Quito. Corolla violaceous. Racemes of flowers pedunculate. Legumes clothed with adpressed pili.

**Rock Lupine.** Shrub proc.

52. **L. microphyllus** (Desrous. in Lam. dict. 3. p. 624.) shrubby, procumbent, much branched; flowers without bracteoles, disposed in a kind of spiral head; upper lip of calyx bipartite, lower one entire; leaflets 5-9, linear, clothed with silky villi beneath. F. Native of Peru, on mount Antisana. H. B. et Kunth, nov. gen. am. 6. p. 473. Flowers blue. Legume oval, acuminate, 6-8 lines long.

**Small-leaved Lupine.** Shrub proc.

53. **L. smithianus** (Kunth, mém. p. 177. t. 51.) plant suffruticoso, branched, clothed with silky hairs; flowers somewhat verticillate, on very short pedicels, bracteolate; upper lip of calyx bifid, lower one entire; leaflets lanceolate-linear, obtuse, rather villous. F. Native of South America, on the burning mount Rucu-Pichincha, and in frigid places near Popayan. Stem much branched. Leaflets 3 lines long. Legume oblong, 3-4-seeded, nearly an inch long, clothed with silky hairs. Flowers blue.

**Smith's Lupine.** Shrub 2 to 3 feet.

54. **L. paniculatus** (Desrous. in Lam. dict. 3. p. 625.) plant suffruticoso erect; flowers somewhat alternate, pedicellate, bracteolate; calyx clothed with silky hairs, having the upper lip bifid, and the lower one entire; leaflets 6-7, lanceolate, glabrous above, but rather villous beneath. F. Native of Peru, and near Santa-Fe-de-Bogota. H. B. et Kunth, nov. gen. am. 6. p. 476. Flowers blue according to Desrousseux, but according to Kunth they are violaceous, and disposed in loose spikes. Stipules subulate. Racemes pedunculate.

**Panicled-flowered Lupine.** Shrub erect.

55. **L. sarmentosus** (Desrous, in Lam. dict. 3. p. 626.) plant shrubby, climbing; flowers verticillate, on short pedicels, without bracteoles; upper lip of calyx bifid, lower one entire; leaflets lanceolate, glabrous above, but rather villous beneath. F. Native of Peru, on mount Antisana. L. grácilis, Kunth, mém. 182. t. 52, ex H. B. et Kunth, nov. gen. am. 6. p. 472. Flowers blue. Spikes short, oval, on long peduncles. Legume 8-10 lines long.

**Sarmentose Lupine.** Shrub 3 feet.

56. **L. dimorphus** (Lam. dict. 3. p. 626.) plant shrubby, sarmentose, and hoary; flowers somewhat verticillate, tern, pedicellate, bracteolate; vexillum bicollum at the base. F. Native of Peru. Flowers a little smaller than those of *L. viarius*, bluish violet; the vexillum with 2 yellow marks at the base.

**Two-spotted-flowered Lupine.** Shrub sarmentose.

57. **L. tomentosa** (D. C. prod. 2. p. 409.) shrub clothed in every part with silky tomentum; flowers verticillate, pedicellate, bracteolate; both lips of calyx entire; leaflets 8-10, oblong, bluntish, mucronulate, tapering to the base; ovary very hairy.

F. Native of Peru. Sweet. 3. 1861. Flowers large, with the veins channeled above, and spotted on each side of the channel with several small blue specks, and a large blue spot on each side near the base; wings about equal in length to the vexillum, striped more or less with blue branched lines; keel with a dark purple point, fringed longitudinally with long white hairs. The vexillum at length changes to a purple, and the wings to pale red, striped with blue at the base.

**Afican Lupine.** Shrub 3 feet.

§ 2. Leaves simple, entire.

60. **L. diffuseus** (Nutt. gen. am. 2. p. 93.) plant herbaceous, diffusely procumbent, densely clothed with silky villi; leaves simple, oblong-obovate, lower ones alternate; stipules and petioles short and naked. 52. Native about Wilmington, and elsewhere in both Carolinas, in oak woods.

**Diffuse Lupine.** Pl. proc.

61. **L. integrifolius** (Lin. amer. 6. afr. p. 43.) plant herbaceous, villous; leaves simple, oblong, petiolate, acute; flowers alternately pedicellate, bracteolate; upper lip of calyx bifid; lower one entire. O. G. Native of the Cape of Good Hope. Flowers yellow.

**Entire-leaved Lupine.** Pl. 1 foot.

62. **L. cochinichinensis** (Lour. coch. 429.) plant herbaceous, erect; leaves simple, emarginate, glabrous; flowers bracteolate, disposed in a spike; upper lip of calyx bifid, lower one tridentate; legume glabrous, many-seeded. O. H. Native of Cochinchina and Bengal. Flowers yellow.

**Cochin-china Lupine.** Pl. 1 to 2 feet.

**Cult.** Every species of *Lupine* are worth cultivating for the purpose of decorating flower-borders, as they are very ornamental when in flower; they thrive best in light soil, and are most easily increased by seeds. The shrubby kinds require to be protected in severe winter by a glass covering, or by matting. If they are grown against a wall, they can be easily sheltered in winter. Cuttings of them root readily.

CCV, **CYLISTA** (from κύλις, κυλίς, a calyx; in reference to the calyx being very large). Art. hort. kew. 3. p. 512. D. C. prod. 2. p. 410.

**Lin. Syst.** *Diadelphe*, *Decándria*. Calyx larger than the corolla, 4-cleft; upper segment emarginate or bifid, lower one the largest, and sometimes very large. Corolla papilionaceous, permanent. Keel 2-edged. Stamens diadelphous. Legume usually 2-seeded. Seeds in *C. pychostachys* ovate-globose, shining, with a small oval hymen. Embryo with thick cotyledons, and a small curved radicle. — Twining shrubs, with pinnately-trifoliate leaves, rhomboid or ovate, acute, stipulate leaflets, and axillary simple racemes of yellow flowers. Bracteas large, caducous.

1. **C. scaritosa** (Art. l. c. Roxb. cor. 1. t. 92.) calyx very large, scarious, with the upper segment emarginate, lower one very large; legumes 1-celled, 1-2-seeded; bracteas lanceolate, acuminate. O. G. S. Native of the East Indies, among the Circars. Flowers pale yellow, mixed with red. Style inflexed at the base, slender, but at length becoming thick and dilated.

**Scaritosa-calysed Clyista.** Pl. tw.

2. **C. tomentosa** (Roxb. cor. t. 221.) calyx villous; the segmen
ments cuneated, upper one bifid, lower and lateral ones equal; legume divided transversely into 2-3 seeded cells, somewhat constricted in the middle; bracteas broad, ovate, mucronately acuminate. *L. *S. Native of Mysore. Flowers yellow. Seeds spherical, bluish violet, polished, lower one usually abortive.

3 C. *albiloba* (Sims, bot. mag. 1859.) calyx half-5-cleft, with nearly equal segments, shorter than the corolla; bracteas ovate, acuminate. *L. *S. Native of the Mauritius. The plant is clothed in every part with ferruginous pubesces. Perhaps a species of *Rynchostoa*. Flowers white.

*White-flowered Cylista*. Fl. April, May. Shrub tw.

5 C. *puchochachya* (D. C. prod. 2. p. 410.) calyx with one of the lips bipartite, and with the other bluntly tridentate. *L. *S. Native of Sierra Leone. Leaves unknown. Pedicels twin, densely racemose. Calyx and legume permanent, clothed with velvety down. Petals and stamens permanent. Corolla probably resupinate. The trigonous lip is usually underlying the vexillum. Perhaps a proper genus.

*Slender-spiked Cylista*. Shrub tw.

Cult. See *Erioche", for culture and propagation, p. 348.

**CCVI. ERYTHRINA** (from erythros, erythros, red; in reference to the colour of the flowers). Lin. gen. 855. Lam. ill. t. 608. D. C. prod. 2. p. 410.—Corallodendron, Tourn. inst. t. 446.—Moricou, Adams.

**Lin. syst. Diadephia, Decandria.** Calyx tubular (f. 50. a.), with a truncate, somewhat dentate border (f. 50. a.), or spathaceous. Corolla with a very long oblong vexillum (f. 50. b.) wings as well as the dipetalous keep much shorter than the vexillum. Stamens diadelphous (f. 50. c.), straight, the tenth one adorning more or less to the rest, but sometimes free, much shorter than the wings, rarely deficient. Legume long (f. 50. d.), tortulose, many-seeded, 2-valved. Seeds ovate, having a lateral hyuron.—Trees or shrubs, rarely herbs, with small stipules, which are distinct from the petiole, pinnately-trifoliate leaves, having the leaflets furnished with glands at the base instead of stipules. Stems and petioles usually furnished with prickles. Racemes of flowers elongated, with the pedicels usually approximating by threes. Flowers red, scarlet, or crimson. Seeds shining, usually black and red mixed, or pure black or red.

§ 1. *Acaciodes* (from a, without, and caulis, a stem; in reference to the species contained in this division having nothing but annual stems, rising from a subterraneous trunk). Both the floriferous and leaf bearing branches dying yearly, and rising again from an underground stump or trunk.

1 E. *herbacea* (Lin. spec. 992.) branches herbaceous, annual, and are, as well as the leaves, unarmored and glabrous; leaflets rhomboid; racemes elongated; flowers distant, torn; calyx truncate; vexillum lanceolate. *L. *F. Native of Carolina, Florida, and about the Mississippi, in sandy fields and woods. Trew. ehr. t. 58. Sims, bot. mag. 877. Lodg. bot. cab. 851. Floriferous branches sometimes furnished with one or two leaves. Corolla deep scarlet. The tenth or less than four free and short. *Herbaceous Coral-tree*. Fl. June, Sept. Cilt. 1724. Pl. 2 to 3 feet.

2 E. *hederaefolia* (Spreng. syst. 3. p. 244.) leaflets somewhat 5-lobed, acuminate; pedicels rising in the racemes by threes; calyx 5-toothed; stem prickly; root tuberous. *L. *F. Native of Louisiana. Xyphanthus hederaefolius, Rafn. Flowers scarlet.

*Ivy-leaved Coral-tree*. Pl. 1 to 2 feet.

3 E. *resupinata* (Roxb. cor. 3. t. 220.) branches herbaceous, annual, and are, as well as the petals, rather prickly; leaflets roundish; racemes crowded with flowers, short; calyx bilabiate; vexillum oval-oblong. *L. *S. Native of the East Indies. Vexillum of a purplish scarlet colour. Racemes 2 or 3 inches long, rising before the leaves.

§ 2. *Species the stems of which are only herbaceous in the gardens, or when not protected in winter by a stove, but in their native countries become small trees.*

4 E. *horrida* (Moc. et Sesse, fl. mex. icon. ind. D. C. prod. 2. p. 413.) stems almost herbaceous, angular, and are, as well as the petioles and ribs of leaves, very prickly; leaflets ovate, cordate, acute; calyx 5-toothed; legume stipitate, pedunculose, prickle. *L. *F. Native of Mexico, on Mount Aya-hual-tempo. Flowers unknown, but probably crimson.

*Horrid Coral-tree*. Cilt. 1824. Pl. 2 to 3 feet.

5 E. *toxipipes* (Moc. et Sesse, fl. mex. icon. ind. D. C. prod. 2. p. 413.) stems nearly herbaceous, prickly; petals unarmored; leaflets ovate; racemes lateral, on long peduncles; calyx obliquely truncate, somewhat bilabiate; vexillum oblong; stamens 9 connected, the tenth free. *L. *F. Native of Mexico. Flowers of a coppery scarlet colour. Root fibrous.

*Long-peduncled Coral-tree*. Pl. 2 to 3 feet.

6 E. *leptocarpa* (Moc. et Sesse, fl. mex. icon. ind. D. C. prod. 2. p. 413.) stems herbaceous, and are, as well as the petioles, unarmored; leaflets ovate, rather cordate; calyx spathaceous; vexillum oblong, bidentate at the apex; legume rather villous. *L. *F. Native of Mexico. Racemes terminal. Flowers of a pale scarlet colour. Stamens 9 connected, and one free. Legume stipitate, cupulidade at the apex.

*Slender-rooted Coral-tree*. Pl. 2 to 3 feet.

7 E. *criista-galli* (Lin. mant. 99.) stems woody; petals prickly, glabrous; leaflets oval or ovate, glabrous, conciseous, bluntish; calyx truncate, somewhat bidentate; stamens 9 connected, but with the tenth free; keel 3 times longer than the calyx. *L. *F. Native of Brazil. Smith, exot. bot. 2. p. 95. Sweet, fl. gar. 214. A stout shrub. Flowers of a bright deep scarlet colour.

*Cock's-comb Coral-tree*. Fl. May, July. Cilt. 1771. Shrub 6 to 8 feet, or tree 20 feet.

8 E. *laevigata* (Jacq. obs. 3. p. 1. s. 51.) stems strinus, branched; branches glabrous, rather prickly; leaflets petiolar, oblong, acuminate; petals rather prickly, glabrous; calyx truncate, undidentate; keel monopetalous; stamens monadelphous. *L. *F. Native of South America. Sweet, fl. gard. 2. t. 142. E. cris-ta-galli, Ker. bot. rep. 315. exclusive of the synonyms. Flowers of a rich dull crimson.

§ 3. *Arboreous or shrubby species, with the branches bearing the racemes as well as the leaves.*

LEGUMINOSÆ.

10 E. coralloide'ndron (Lin. spec. 392, exclusive of var. a.) stem arborescent, prickly; petioles unarmed; leaflets broad, rhomboid-ovate, acute, glabrous; calyx truncate, 6-toothed; vexillum oblong; the tenth stamen free, and about equal in length to the rest. ã. S. Native of the West Indies. Comm. hort. amst. t. 108. E. spinosa, Mill. dict. no. 1. Flowers deep scarlet, about 2 inches long. The flowers do not appear until the leaves have fallen.

11 E. ennea'ndra (D. C. cat. hort. moup. 100.) stem arborescent, and, as well as the petioles, prickly; leaflets rhomboid, pubescent beneath; calyx truncate; vexillum linear-oblong; stamens 9 joined together, the tenth absent. ã. S. Native of South America. E. velutina, Jacq, hort. schenbr. t. 4. t. 466. Flowers of a deep scarlet colour. The leaves push forth when the flowers begin to decay, and fall before they rise. In Jacquin's E. velutina the calyx is somewhat bluntly toothed, while in this plant it is truncate.

12 E. macrophy'lla (D. C. prod. 2. p. 411.) stem shrubby; petioles rather prickly; leaflets broadly ovate, acuminate, glabrous above, pubescent beneath; calyx tubular, bluntly somewhat bilabiate at the apex; vexillum linear-oblong, straight; wings and keel shorter than the calyx; stamens 10, monadelphous. ã. G. Native country unknown, but is cultivated in the gardens of Teneriffe. Leaflets 9-12 inches long, and 7-9 inches broad. Racemes clothed with velvety villi. Flowers scarlet. This species comes very near E. coralloide'ndron, but differs from it in the tenth stamen being connected to the rest; it is also nearly allied to E. nöbilis.

13 E. ni'tis (Jacq. hort. schenbr. t. 216.) stem arborescent, and is, as well as the petioles, unarmed; leaflets rhomboid-ovate, acute, glabrous; calyx tubular, bilabiate at the apex; vexillum elongated, linear-lanceolate; stamens 9 connected, the tenth one almost free, and about equal in length to the others. ã. S. Native of Caracas, E. incinris, Mill. dict. no. 6. 7. Flowers either pale or dark scarlet. The leaves rising when the flowers begin to fade.

14 E. su'berósas (Roxb. hort. beng. p. 58.) stem prickly; petioles unarmed; leaflets roundish-ovate, tomentose beneath; calyx spathaceous, bilabiate; stamens diadelphous, length of the vexillum. ã. S. Native of the East Indies. Flowers scarlet.

Corky Coral-tree. Tree.

15 E. poa'xanthus (Brot. in Lin. trans. 14. p. 342. t. 11.) stem arborescent, prickly; petioles also prickly; lateral leaflets ovate, middle one rhomboid-ovate, all pubescent beneath; calyx obliquely truncate, with the upper side cleft or entire; stamens diadelphous, hardly shorter than the vexillum. ã. S. Native of South America. Lindl. bot. reg. 1246. Flowers scarlet.

16 E. secunda'flora (Brot. in Lin. trans. 14. p. 340. t. 12.) stem arborescent, prickly; petioles unarmed; leaflets ovate, somewhat acuminate, glabrous on both surfaces; calyx unopen, obsolescently dentilicate, toothless, truncate, and variously cut behind; stamens diadelphous, length of the vexillum; keel equal in length to the wings, but longer than the calyx, and almost 3 times shorter than the vexillum. ã. S. Native of Brazil. Flowers deep scarlet, second (f. 50.)

Secund-flowered Coral-tree. Clt. 1826. Tree 10 to 14 feet.

17 E. specio'sa (Andr. bot. rep. t. 443.) stems shrubby, prickly; petioles and ribs of leaves prickly; leaflets broad, slightly 3-lobed, acuminate, glabrous; calyx tubular, somewhat bifid; vexillum linear-lanceolate, elongated. ã. S. Native of the West Indies. Ker. bot. reg. 750. A. and B. where the petioles are said to be unarmed in the description, but the plant is figured with them. Flowers deep crimson. Stamens undescribed. Racemes and calyces velvety.

18 E. guinées'sis; stem much branched, prickly; petioles and ribs of leaves prickly; leaflets oval-lanceolate, entire; calyx spathaceous; legume torulose. ã. S. Native of Sierra Leone, in the low lands. An elegant species, with long spike-formed racemes of scarlet flowers. The leaves pushing forth when the flowers begin to fade, or as the wet season advances (v. s. herb. Lamb.)

19 E. rubrine'via (H. B. et Kunth, nov. gen. am. 6. p. 454.) stem arborescent, prickly; leaflets roundish-ovate, acuminate, rather cuneated and rounded at the base, 3-nerved, glau- cous beneath; calyx tubular, spathaceous, glabrous; vexillum linear, straight; stamens nearly monadelphous. ã. S. Native of South America, on the western declivities of mountains about Santa-Fe-de-Bogota, where it is called Chocho. Flowers flesh-coloured.

20 E. umbrósa (H. B. et Kunth, l. c.) stem arborescent, prickly; leaflets somewhat acuminate, 3-nerved, glabrous, rounded and truncate at the base, the middle one rather deltoid; calyx campanulate, spathaceous; vexillum linear-cuneated, straight, very long; stamens diadelphous. ã. S. Native of South America, between La Guayra and Caracas, where it is called Buacre, and where it is planted in rows to shade the plantations of Theobroma Cacao or chocolate-nut. It is also used in Trinidad for the same purpose. Flowers scarlet.

Shady Coral-tree. Clt. 1817. Tree 40 to 60 feet.

21 E. ca'ffra (Thumb. prod. 121. fl. cap. 559.) stem arborescent, and is, as well as the petioles and primary ribs of leaves, prickly; leaflets broad-ovate, glabrous, bluntly acuminate; calyx 5-toothed; vexillum ovate-oblong, obtuse; stamens 9 connected together, the tenth free. ã. S. Native of Caffre Land. Ker. bot. reg. 736. A. and B. Sims, bot. mag. 2431. Flowers of a dirty scarlet-colour.

22 E. hume'na (Spreng. syst. 3. p. 243.) stem arborescent, prickly; leaflets acute, smooth; petioles prickly, and nerves of leaves beneath; racemes aggregate, straight, terminal; calyx truncate, toothed; stamens diadelphous, shorter than the vexillum. ã. S. Native country unknown. E. Câfrâ, Brot. vag. Flowers scarlet.

Hume's Coral-tree. Tree.

23 E. arbo'rescens (Roxb. cor. 3. t. 216.) stem arborescent, prickly; petioles unarmed; leaflets broadly ovate, acutish, pubescent beneath; calyx campanulate, entire; vexillum oval, concave; stamens 10, monadelphous at the base. ã. S. Native of Nipaul. Flowers of a carmine colour, about an inch and a 3 b 2.
372  LEGUMINOSÆ.

half long. Legumes pendulous, pedicellate, villous, cupulitate at the apex.

*Arborescent* Coral-tree. CIt. 1818. Tree 12 to 15 feet.

21. *E. indica* (Lam. dict. 2. p. 391. var. a.) stem arborescent, prickly; petioles unarmed; leaves broad-ovate, acute, glabrous; calyx spathaceous; vexillum spreading, ovate, concave; stamina monadelphous at the base. P. S. Native of the East Indies. E. coralloidendron ß, Lin. spec. 992. E. orientalis, Murr. comm. goett. 8. p. 35. t. 1. —Rheed, mal. 6. t. 7. —Rumph. amb. 2. t. 76. Flowers of a splendid scarlet-colour. In Rhedee's figure the calyx is acute and much elongated, but in the figure of Rumphius it is short and obtuse; they are therefore probably distinct species.

*Indian* Coral-tree. CIt. 1814. Tree 20 to 30 feet.

25. *E. lourei*; stem arborescent, prickly; petioles armed; leaves rather coriace, deltidoid, acute, glaucous; calyx spathaceous; vexillum very long, acute; stamina monadelphous at the base, equal in length to the vexillum. P. G. Native of China and Cochinchina. E. coralloidendron, Lour. coch. 427. Flowers scarlet. A decoction of the bark is used against intermittent fevers, and the leaves are used to cleanse ulcers.

Loureiro's Coral-tree. CIt. 20 to 30 feet.

Painted-leaved Coral-tree. CIt. 1696. Shrub 6 to 10 feet.

27. *E. spatheacea* (D. C. prod. 2. p. 412.) stem arborescent, and is as well as the petioles unarmed; leaves broad-ovate, acute, glaucous; calyx velvety, spathaceous, acutely 5-toothed at the apex. P. S. Native of St. Domingo. Wings and keel scarlet; vexillum not seen.

Spatheaceous-calyxed Coral-tree. CIt. 1824. Sh. 6 to 10 ft.

28. *E. velutina* (Willd. nov. act. scrut. berol. 3. p. 426. spec. 3. p. 914.) stem arborescent, prickly; leaves rounded at both ends, 3-nerved, rather pilose above, but clothed with soft canescent tomentum beneath, unarmed, terminal one transversely elliptic; calyx spathaceous, slightly 5-toothed, tomentose; vexillum elliptic, reflexed. P. S. Native of South America, near Caracas. H.B. et Kunt. nov. gen. amer. p. 435. Flowers with a reddish-yellow vexillum, and with the wings and keel greenish yellow.

Velvety Coral-tree. CIt. 1810. Tree 60 feet.

29. *E. fuscæa* (Lour. coch. 427.) stem shrubby, prickly; petioles unarmed; leaves lanceolate, glabrous; calyx bilabiata; vexillum elongated, convolute; stamina monadelphous at the base. P. G. Native of Cochinchina, on the banks of rivers. Gelala aquatica, Rumph. amb. 2. t. 78. ex Lour. But neither the figure nor description agrees with the present plant. Flowers of a brownish-red colour.

Brownish-flowered Coral-tree. Shrub 8 feet.

30. *E. servosa* (D. C. prod. 2. p. 413.) stem arborescent, and is as well as the petioles unarmed; leaves oval, acuminate, glabrous above, feather-nerved beneath and clothed with velvety down as well as the petioles; racemes axillary, short; calyx ample, irregularly 5-toothed. P. S. Native of Brazil. Flowers 2 inches long. Leaflets 4-6 inches long, with the nerves elevated beneath. Legumes unknown.

Nerved-leaved Coral-tree. Tree.

31. *E. clauca* (Willd. nov. act. nat. scrut. berol. 3. p. 428. spec. 4. p. 915.) stem arborescent, prickly; petioles unarmed; leaves ovate, glaucous beneath; calyx bilabiata; vexillum cuneiform, spreading; keel longer than the wings; stamina 10, monadelphous at the base. P. S. Native of South Ame-

Glaucescent-leaved Coral-tree. CIt. 1819. Tree 20 feet?

32. *E. Họpe'tala* (Lam. dict. 2. p. 392.) stems sermate, and are as well as the petioles unarmed; leaves ovate-lanceolate, glabrous; calyx campanulate, 5-lobe; petals unguiculate, about equal in length; stamina 10, monadelphous at the base. P. S. Native of Brazil, at Rio Janeiro. Flowers an inch and a half long. Legume unknown.

Equal-petalled Coral-tree. Shrub cl.

33. *E. senegalensis* (D. C. prod. 2. p. 413.) stem shrubby, and is as well as the petioles and ribs of leaves prickly; leaves ovate-oblong, obtuse, coriaceous, glabrous; calyx obliquely truncate, somewhat bilabiate; vexillum oblong-cuneiform, straight, obtuse. P. S. Native of Senegal. Flowers an inch long, deep crimson. Leaflets 3 inches long and 12 or 15 lines broad. The leaves push forth when the flowers begin to fade.

34. *E. abyssinica* (Lam. dict. 2. p. 392.) stem arborescent, prickly; petioles unarmed; leaves glaucous, obtuse, lateral ones broadly and obliquely ovate, terminal one roundish. P. S. Native of Abyssinia (Bruce). Flowers and fruit unknown. According to Bruce, the seeds of this species of *Coral-tree* are called *Carats* in Abyssinia, and are used in weighing gold and precious stones.

Abyssinian Coral-tree. Tree.

35. *E. breviflora* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stem arborescent; flowers, and is as well as the petioles prickly; leaves ovate, acute; racemes axillary, shorter than the leaves; calyx bilabiata; vexillum oval; legumes pendulous, few-seeded, glabrous, unarmed, mucronate. P. G. Native of Mexico, at the river Ayacapixtla. Flowers scarlet.

Short-flowered Coral-tree. Tree.

36. *E. coralloïdes* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 413.) stem arborescent, bearing a solitary prickle under each leaf; petioles unarmed; leaves ovate; calyx truncate; vexillum linear-oblong; legumes glabrous, few-seeded, stipitate at the base, cupulitate at the apex. P. G. Native of Mexico. Flowers scarlet. Seeds red; the hyllum girded by a white line; they are commonly called Colorines.

Coral-like-seeded Coral-tree. Tree.

37. *E. Pat'axtas* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 414.) stem shrubby, and is as well as the petioles unarmed; leaves ovate, obtuse; racemes terminal, rather velvety; mouth of calyx dilated and obliquely truncate; vexillum spreading, stipitate, roundish; legume villous. P. S. Native of Mexico. Flowers scarlet.

Spreading Coral-tree. Tree.

38. *E. divaric'ata* (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 414.) stem shrubby, prickly; petioles unarmed; leaves coriace, acute; calyx velvety, spathaceous, 5-toothed at the apex; vexillum spreading, oval; stamina diadelphous. P. S. Native of Mexico. Flowers scarlet, large, and very beautiful. Racemes lateral, many-flowered. Perhaps the same as *E. spatheacea*, but differs in the trunk being prickly.

Divaricate Coral-tree. Tree.

39. *E. monos'perma* (Gaertn. in Freycinet, voy. bot. p. 486. t. 114.) arborescent, unarmed; leaves broadly ovate, retiniform, obtuse, clothed with brownish tomentum beneath; legume 1-seeded. P. S. Native of the Sandwich Islands. Flowers scarlet.

One-seeded Coral-tree. Tree.

4 Species, the names of which are given in garden catalogues, but without any description.

1 *E. aculeatissima*, Desf. 2 *E. triacanthâ*, Willd. 3 *E. incâna*, Willd. 4 *E. piscioïdes*, Hortul. 5 *E. filûgens*, Hortul. 6 *E. striata*, Roxb. 7 *E. ovalifolius*, Roxb. 8 *E. sublobâta*, Roxb.
Cult. The species of Coral-tree have fine large leaves and splendid flowers, and are therefore worth cultivating in every collection of stove plants; they all thrive well in light loamy soil. In order to bring them into flower they should be placed on shelves in the stove, when they have lost their leaves giving them hardly any water, and when they begin to shew flowers they may be watered more freely. Cuttings of all, if taken off at a joint without depriving them of their leaves, strike root readily in sand, under a hand-glass, in moist heat. E. laurifolia and E. cristata-galli will thrive and flower freely if planted in the open ground, in a warm sheltered situation; in such a situation, however, they are always killed to the stump in winter.

Lin. syst. Diadelphía, Decándria. Calyxt tubular, bilabiata, 4-cleft; upper lobe largest and obtuse, lower one acute, 2 lateral ones very short. Corolla with an oblong-linear, straight, very long vexillum. Wings very narrow, shorter than the calyx, as well as parts of the carina. Stamens diadelphous. Legumes decomposed, flat, sessile, many-seeded, mucronate by the style. Seeds flat.—Climbing shrubs with small leaves, which are furnished with 2 stipels each at the top of the pedicel.

1 R. volúbilis (Willd. 1. c. Vahl. ecl. 3. p. 41. t. 30.) branches dotted from tubercles; leaves glabrous, cordate, ovate, acuminate; racemes bearing flowers from the base. ☠ S. Native of Porto-Rico, on the highest mountains, and of Mexico. Flowers scarlet, an inch and a half long.

Twinig Rudolphia. Shrub twb.

2 R. rosea (Tussac, fl. ant. t. 22.) branches smooth, glabrous; leaves ovate-oblong, glabrous, acuminate; racemes pedunculate. ☠ S. Native of St. Domingo. Flowers scarlet, hardly an inch long. Legume pubescent. Perhaps the figure in Plum. icon. t. 102. f. 1. is referrible to this species, and all the synonyms of the following, but the leaves in our plant are not peltate as in it, the flowers are smaller and the legume is not glabrous nor torose at the seeds, as represented in the figure of Plumier.

Peltate-leaved Rudolphia. Shrub twb.

4 R. dúnia (H. B. et Kunth, nov. gen. amer. 6. p. 432. t. 591.) branches angular, sulcated, glabrous; petiolar; leaves somewhat deltoid-ovate, and somewhat hastately cordate at the base, and acuminate at the apex, glabrous; peduncles axillary; legume beaked by the style. ☠ S. Native of New Granada, in shady places near Turbaco, ex Kunth, and in Cuba, about the Hawaiian, Willd. Glycine sagittata, Humb. in Willd. enum. 757. Flowers scarlet or rose-coloured.

Cult. The species are elegant climbers, bearing large scarlet flowers, and are well adapted for covering the rafters in stoves or stove conservatories. Their culture and propagation are the same as for the species Erythrina, which see.

Lin. syst. Diadelphía, Decándria. Calyx campanulate, 5-toothed, the 2 superior teeth approximate and almost connected. Corolla with a lanceolate spreading vexillum; keel incurved, about equal in length to the wings and vexillum. Stamens diadelphous. Legume stipitate, compressed, flat, membranous, indescent, 1-seeded at the apex. Seed large, compressed.—Asiatic, unarmed trees, with pinnately trifoliate leaves, and large ovate, roundish, stipellate leaflets. Racemes many-flowered. Flowers 3 together, on short pedicels, and furnished with 2 bracteoles each, under the calyx. Corolla of a deep scarlet colour. Down on the calyces usually black and velvety. This genus probably agrees better with the tribe Dalbergiée than with the present.

1 B. Frondósa (Roxb. cor. 1. p. 22. t. 21. asiát. res. 3. p. 469.) branches pubescent; leaflets roundish, obtuse, or emarginate, rather velvety beneath; corolla 4-times the length of the calyx; calyceal teeth acute. ☠ S. Native of the East Indies, on the mountains.—Rheed. mal. 6. t. 16 and 17. B. Frondósa. Kern. Icon. Tree t. 1. 4. Erythrina monosperma, Lam. dict. 1. p. 391. Stipes and suture of the legumes clothed with white tomentum, but the valves are hardly pubescent. Flowers 2 inches long. The red juice which flows from the tree evaporates to the consistence of gum, which is astringent, and is called gum-lac or East India kino, but is not so good as the African. The expressed juice of the fresh flowers, and infusions of the dried flowers yield a water colour brighter than gamboge; they also yield a fine durable yellow lake in a large proportion. The lac insects are frequently found upon the smaller branches and petioles of the tree; but whether the natural juices of its bark contribute to improve their red colouring matter has not been determined.

Frondosae Butea. Clt. 1796. Tree 40 feet.

2 B. Superba (Roxb. cor. 1. t. 22.) branches glabrous; leaflets roundish, obtuse, velvety beneath; corolla 4-times the length of the calyx; calyceal teeth acute. ☠ S. Native of Porto-Rico, on the highest mountains. This is a very showy tree, approaching the preceding species, but is larger in all its parts. It yields similar juice.

3 B. Parviflóra (Roxb. hort. beng. 1. 53.) branches pubescent; leaflets roundish, obtuse, clothed with silky tomentum beneath; racemes panicled; corolla hardly twice the length of the calyx; calyceal teeth acute. ☠ S. Native of Coromandel, on the mountains. This is a very showy tree, bearing small flowers, similar to the preceding species, but is larger in all its parts. It yields similar juice.

Small-flowered Butea. Shrub twb.

4 B. Braamia (D. C. prod. 2. p. 415.) ☠ G. Native of China. Braam. chin. t. 23. This tree comes very near to B. frondósa, but differs in the leaves being edged with white, probably with white tomentum, in the calyx being greenish, in the flowers being fewer on the racemes, in the gineals being more exalted, and in the petals diverging more.

Braamia's Butea. Cult. The species of this genus bear large fine leaves, and large showy scarlet flowers. Their culture and propagation are the same as for the species of Erythrina, which see.

Tribe VI.

Dalbergiæ (plants agreeing in some important characters with Dalbergia.) Bronn. diss. p. 134. exclusive of some genera. D. C. mem. legum. x. Corolla papilionaceum (f. 51. b.), perigynous. Stamens variously connected. Embryo with the radicle bent back upon the edge of the cotyledons (f. 21. e. f.), which are thick (f. 21. c.). Legumes 1-2-seeded, indehiscent.

—Usually climbing shrubs, with impari-pinnate leaves, rarely, but sometimes pinnately trifoliate or simple. This tribe is pro-
bably very distinct from *Phascolus*, but the germination of the seeds is not sufficiently known.

**Lin. syst.** Monadelphia, Decandria. Calyx tubular, with 5 blunt teeth. Corolla papilionaceous. Keel lunate, of 2 concreta petals. Stamens 10, monadelphous. Legume oblong, obtuse, much compressed, 1-seeded, membranous. Seed oblong, flat.—Unarmed, climbing, glabrous shrubs, with impari-pinnate leaves, having from 1 to many pairs of eustipellate leaflets. Racemes axillary and lateral. Flowers white. Roots fleshy. 1 D. trifoliata (Lour. l. c.) leaves pinnately trifoliate; leaflets ovate-lanceolate; racemes axillary, length of leaves. 2. D. pinnata (Lour. l. c.) leaves impari-pinnate, with many pairs of alternate, ovate-oblong leaflets; peduncles lateral, many-flowered. 3. D. trifoliata (Lour. l. c.) leaves pinnately trifoliate; leaflets ovate-lanceolate; racemes axillary, length of leaves. 4. D. pinnata (Lour. l. c.) leaves impari-pinnate, with many pairs of alternate, ovate-oblong leaflets; peduncles lateral, many-flowered.

**CCX. ENDESPERUM** (from *eucalyptus*, indigent, and *espera*, a seed; in reference to the want of seeds, there being only one in each legume). Blum. ex flora, 1825. p. 132. D. C. prod. 2. p. 415.

**Lin. syst.** Monadelphia, Endeardia. Calyx bilabiata, bibracteate at the base; upper lip bluntly 2-lobed, lower one tridentate. Wings and carina on long claws. Stamens 9, monadelphous, the second one absent, or deficient. Legume on a very long pedicel, membranous and foliaceous, lanceolate, 1-seeded, indehiscent. Seed linear, compressed. This genus is said to be allied to *Dalbergia*.

1 E. scandens (Blum. l. c.)  S. Native of Java. Leaves abruptly pinnate; leaflets alternate, oblong, elongated, obtuse at the base, ending in a very short acumen at the apex, villous on both surfaces, but more so beneath. Racemes when bearing the flowers shorter than the leaves, but becoming longer as the pods advance. Flowers small, probably white.

**Cult.** See *Dalbergia* for culture and propagation, p. 375.

**CCXI. PONGAMIA** (Pongam) is the Malabar name of the first species). Lam. ill. t. 603. Vent. malm. no. 28. D. C. prod. 2. p. 416.—Galeëlé, Lam. dic. 2. p. 594. exclusive of the synonyms of Rumphius, and therefore the name.

**Lin. syst.** Monadelphia, Decandria. Calyx cup-shaped, 5-toothed, obliquely truncate. Petals 5, all unguiculate and disposed into a papilionaceous corolla. Stamens 10, monadelphous, having the sheath or tube eleft above, or the tenth stamen bosomed from the rest. Legume somewhat compressed, flat, indehiscent, beaked, 1-celled, 1-2-seeded.—East Indian trees, with impari-pinnate leaves, opposite leaflets, axillary racemes of usually white or yellow flowers.

2 P. chine*sis* (D. C. prod. 2. p. 416.) leaves with 2 or 3 pairs of ovate-lanceolate, glabrous leaflets; stem shurbby.  S. Native of China. Robinia mitis, Lour. coch. 455. Flowers yellow, tern in the raceme.

5 P. sericea (Vent. l. c.) leaves with 3-4 pairs, or only with 1 pair from abortion, of oblong leaflets, which are silky beneath; racemes elongated, approximating into a panicle.  S. Native of Java. Flowers probably white. *Silky-leaved* Pongamia. Shrub.

6 P. atropurpurea (Wall. pl. rar. asiat. 1. p. 70. t. 78.) leaves with 3-4 pairs of oblong, attenuated, coriaceous, smooth leaflets; flowers disposed in dense racemes, numerous, forming a terminal panicle; legumes broad, ovate-lanceolate, 1-seeded, smooth.  S. Native of the Burman empire, in woods on the shores of Martaban, at Amherat, and Moalmyne, and elsewhere. Flowers deep purple. The wood is much esteemed by the Burmese and Talyene people, who employ it for beams and rafters in their houses. Dr. Wallich was told that they eat the tender leaves. *Dark-purple-flowered* Pongamia. Tree 70 feet.

**Cult.** See *Dalbergia* for culture and propagation, p. 375.

**Lin. syst.** Monadelphia, Octandria, or Diaadelphia, Decandria. Calyx campanulate, 5-toothed (f. 51. a.). Corolla papilionaceous (f. 51. c.); petals of keel connected to the apex (f. 51. b.). Stamens 8-10, sometimes all monadelphous, with the tube or sheath eleft in front, sometimes divided into 2 equal opposite bundles. Legume stipitate, membranous, compressed, flat, oblong, tapering to both ends, 1-seeded (f. 51. d.). Seeds compressed, remote. Radical inflexed.—Sometimes trees, but usually climbing shrubs, with impari-pinnate leaves.

1 D. ouginei*sis* (Roxb. hort. beng. p. 53.) leaves pinnately trifoliate; leaflets ovate-roundish, rather villous, with undulated curly margins; pedicels 1-flowered, rising in fascicles, and are as well as the calyces villous.  S. Native of the East Indies. Flowers small. Terminal leaflets obovate.

*Ougeina* Dalbergia. Chlt. 1820. Tree 30 feet.

2 D. sasoo (Roxb. hort. beng. p. 52.) leaflets 5, alternate, petiolulate, obovate, abruptly acuminate, glabrous above, but pubescent beneath; panicles axillary, puberulous, shorter than the leaves.  S. Native of Bengal. Stamens 8, monadelphous, with a dorsal fissure. Legume linear-lanceolate, tapering to the base, stipitate, glabrous, 1-seeded. Flowers white. *Sasoo* Dalbergia. Chlt. 1820. Tree 30 feet.

3 D. latifolia (Roxb. cor. 2. p. 7. t. 113.) leaflets 3-5, alternate, roundish, emarginate, glabrous above and pubescent beneath; panicles axillary, few-flowered, much shorter than the leaves.  S. Native of Coromandel, on the mountains. Stamens monadelphous, with a dorsal fissure. Flowers white. Legume oblong-lanceolate. The wood is used in making household furniture in India. *Broad-leaved* Dalbergia. Chlt. 1811. Tree 40 feet.

4 D. rhamnoides (Roxb. cor. 2. p. 9. t. 115.) leaflets 7, nearly opposite, oblong, obtuse, glabrous; branches and petioles tomentose; panicles axillary, much shorter than the leaves.  S.
Native of Coromandel, on the mountains. Flowers white. Stamens monadelphous, with a dorsal fissure. Legumes unknown. 

D. panicles. Subcl. 

5 D. robu'sta (Roxb. hort. beng. p. 53.) leaves 7-9, oval, or obovate, obtuse, somewhat mucronate, minutely pubescent; racemes spike-formed, twice the length of the leaves; pedicels aggregate. \(^b\). S. Native of the East Indies, in Stille. Flowers small, white, numerous. Stamens monadelphous, with a dorsal fissure. Legumes unknown. 

Robust Dalbergia. Cl. 1811. Shrub cl. 

6 D. sca'ndens (Roxb. cor. 2. t. 192.) leaves 9-11, elliptico-oblong, acute, glabrous; racemes axillary, spike-formed, longer than the leaves; pedicels in fascicles. \(^b\). S. Native of Coromandel. Flowers rose-coloured. Legumes linear-lanceolate, 2-3-seeded, glabrous, tapering to both ends. 

Climbing Dalbergia. Cl. 1812. Shrub cl. 

7 D. vol'ti'ilis (Roxb. cor. 2. t. 191.) leaves 11, alternate, oval, mucronate, glabrous; pedicels terminal and axillary, divaricate. \(^b\). S. Native of Coromandel. Flowers blue. Stamens divided into 2 equal bundles. Legumes linear-oblong, obtuse, 1-2-seeded, glabrous. 

Twining Dalbergia. Cl. 1818. Shrub tw. 

8 D. froun'osis (Roxb. hort. beng. 53.) leaves 9-11, alternate, obovate, obtuse, emarginate, glabrous; panicles axillary, usually nearly terminal, length of leaves; pedicels and calyces hardly pubescent. \(^b\). S. Native of Coromandel. Flowers white. Stamens divided into two equal bundles. Legume broad, linear, tapering to both ends, 1-3-seeded, glabrous, wingless on both sutures. 

Frondeae Dalbergia. Tree 30 feet. 

9 D. panicu'la'ta (Roxb. cor. 2. p. 8. t. 114.) leaves 9-11, alternate, elliptico-obovate, obtuse or emarginate, glabrous; pedicels terminal; peduncles, pedicels, and calyces villosus. \(^b\). S. Native of Coromandel, on the mountains. Flowers white. Stamens divided into 2 equal bundles. Legume oval-lanceolate, 1-2-seeded. 

Panicled Dalbergia. Cl. 1811. Tree 30 feet. 

10 D. timor'ensis (D. C. prod. p. 417.) leaves 9-11, alternate, glabrous on both surfaces; racemes axillary, length of leaves. \(^b\). S. Native of the Island of Timor. Flowers unknown. 

D. lanceolatia \(\beta\), Lam. dict. 3. p. 256. ex herb. mus. Paris. Legume linear-lanceolate, attenuated at both ends, glabrous, 1-2-seeded; the seminiferous suture bearing a narrow wing. The figure in Rheed. mal. 6. t. 22. is referable to this species. 

Timor Dalbergia. Cl. 1826. Tree 15 feet. 

11 D. lanceolatia (Linn. fil. suppl. 516.) leaves 11-15, alternate, oblong, obtuse, pilose and veinless beneath; racemes axillary, elongated, and are as well as the calyces pilose. \(^b\). S. Native of the East Indies. Flowers rusty. Stamens divided into 2 equal bundles. Legume linear-lanceolate, 1-2-seeded, on a long stipe. 

Speared-shaped-podded Dalbergia. Tree 30 feet. 

12 D. arr'okia (Roth. nov. spec. 330.) leaves 17-25, alternate, oval, obtuse, somewhat emarginate, pubescent on both surfaces, when young they are clothed with tomentum; racemes panicled, sub-second. \(^b\). S. Native of the East Indies. Stamens equally diadelphous. Legume unknown. 

Tree Dalbergia. Tree 30 to 40 feet. 

13 D. Bar'ley'h (Telfair. mas. Hook, exot. bot. 188.) leaves opposite, linear-lanceolate, with revolute margins, silky beneath; racemes terminal, elongated; calyx with subulate teeth; vexillum silky on the back. \(^b\). S. Native of the Mauritius. Stamens 10, monadelphous. Flowers purple; the pedicels rising 2-3 together from the raceme. 

Barley's Dalbergia. Cl. 1823. Shrub cl. 

14 D. ru'fa; leaves alternate, elliptic, rather oblique at the base, emarginate at the apex, clothed with rubous pubescence beneath as well as the petioles and branches; racemes or panicles of flowers axillary, short. \(^b\). S. Native of Sierra Leone. Habit of Tamarindus (v. s. herb. Lamb.) 

Rufous Dalbergia. Tree 20 feet. 

15 D. aze'lia'na; glabrous, smooth; branches warty; leaves small, alternate, obtuse at both ends, deeply emarginate at the apex; panicles axillary, shorter than the leaves; legumes flat, stipitate, membranous. \(^b\). S. Native of Sierra Leone. Flowers unknown (v. s. herb. Lamb.). 

Azelia's Dalbergia. Shrub 8 to 10 feet. 

16 D. corongong'o'lia; branches, panicles, and under side of leaves clothed with pubescent pubescence; leaves alternate, elliptico-oblong, glabrous above, obtuse at both ends, and slightly mucronate at the apex; panicles twin, axillary, \(^b\). S. Native of Sierra Leone. Flowers unknown. (v. s. herb. Lamb.) 

Oblong-leaved Dalbergia. Tree. 

17 D. sen'icea; branches and panicles clothed with rufescent pubescence; leaves alternate, when young clothed with silky pubescence, elliptic, tapering to the base, obtuse and mucronate at the apex; pedicles sub-corymbose, axillary, much shorter than the leaves. \(^b\). G. Native of Nipaul. Flowers small. (v. s. herb. Lamb.) 

Silky Dalbergia. Shrub. 

18 D. margina'ta (Roxb. hort. beng. 53.) glabrous; leaves alternate, broad, obovate, coriaceous, margined, rather glaucous beneath; panicles 2-3 together, diffuse, shorter than the leaves. \(^b\). S. Native of the East Indies. 

Marginated-leafletted Dalbergia. Shrub cl. 

19 D. caud'a'ta; leaves numerous, alternate, oblong-lanceolate, emarginate, mucronate, pale beneath; racemes axillary, panicled, pubescent, shorter than the leaves; legumes pubescent, 1-seeded at the base, and hooked, ending in a long coriaceous, obtuse wing. \(^b\). S. Native of Guiana. (v. s. herb. Lamb.) 

Tailed-podded Dalbergia. Tree. 

20 D. jara'nica; leaves opposite, elliptic, tapering to both ends, acuminate, mucronate, glaucous beneath; racemes axillary; flowers secund. \(^b\). G. Native of Japan. (v. s. herb. Lamb.) 

Japan Dalbergia. Tree. 

21 D. lat'sis'iqua (Desf. cat. hort. par. 108.) leaves ovate, abruptly acuminate, pubescent beneath; pedicels pubescent; legumes broad. \(^b\). S. Native of South America. The rest of the plant unknown. 

Broad-siliqued Dalbergia. Tree. 

22 D. be'troph'yll'a (Wild. spec. 3. p. 901.) leaves 3-5, oval, glabrous, obtuse; racemes axillary, longer than the leaves. \(^b\). S. Native of the East Indies. Stamens 10, monadelphous. Legume reniform-oval, reticulately veined. 

Variable-leaved Dalbergia. Tree. 

† Species, the names of which are only known from Roxburgh's Hortus Bengalensis, p. 53. and p. 98. without any description. 

1 D. emarginata. 2 D. Ze'ylanica. 3 D. tamari'ndiflota. 

4 D. stipula'ce'a. 5 D. rimosa. 6 D. reniformis. 7 D. alata. 

8 D. parvi'flora. 9 D. Gr'ove. 10 D. spinosa. 

Cult. The species will all grow freely in a mixture of sand,
toam, and peat, and young cuttings of them will strike root freely if planted in a pot of sand, with a hand-glass placed over them, in a little bottom heat. The climbing kinds are well adapted for covering the rafters in stores or stove conservatories.

**CCXIII. PTEROCARPUS.** (from *pterop* and *pteran*, a wing, and *carpos*, fruit; in reference to the pods being girded by a broad wing). Lin. gen. no. 854. Lam. ill. t. 602. exclusive of some species. D. C. prod. 2. p. 418.

_Lin. syst._ Monadelphia Decadria, or Diadelphia Decadria. Calyx 5-toothed. Petals 5, disposed into a papilionaceous corolla. Stamens 10, monadelphous or diadelphous. Legume indiscisive, irregular, nearly orbicular, usually varicose, 1-seeded, girded by a wing. Cotyledons thick, incurred. Radicle somewhat inflexed at the base.—Unarmed trees or shrubs, with impari-pinnate leaves, and axillary racemes of flowers. This is a very polymorphous genus, and ought to be divided into several genera, but at present the flowers and fruit of the species are too little known to render this practicable.

**SECT. I. MOUTOUCHIA** (Moutouchia is the Caribbean name of _P. suberosa_). Aubl. guian. 2. p. 718. t. 299. D. C. prod. 2. p. 418.—Griselina, Neck. elem. no. 1338. but not of Forst. Stamens monadelphous, with the sheath or tube entire, not cleft above. Legume roundish, suberose, 1-seeded, having the superiorterature straight, but not winged.

1 P. Dalco (Lin. spec. 438.) leaves 5-7, alternate, ovate, acuminate, glabrous, shining; fruit smoothish. _S_. N. Native of Guadaloupe and others of the West India islands. P. officinalis, Jacq. amer. 283. t. 183. f. 2. P. Draco, Willd. exclusive of the synonymes of Aublet and Commerson. P. hemipetala, Gayrn. fruct. 2. p. 321. t. 156. f. 2. The wood of this tree is white and heavy, the bark thick, of a rusty grey colour, being cut transversely it betrays no marks of redness at first, but in a short time it is variegated with many blood red dots, that collect into little globules or tears. The tree itself when cut in different parts in a short time is full of blood-coloured drops, shining and very clear, in the space of 10 minutes they harden, especially if the sun shines hot, and then are collected under the name of _sanguis draconis_ or dragon's-blood. The bark, wood, and leaves have an astringent taste. The resin of _P. Draco_ was formerly sent in abundance from Carthagena to Spain; it no longer occurs in commerce on account of the decreased demand for dragon's-blood, and all the dragon's-blood in commerce is obtained chiefly from the fruit of _Cálanus Draco_ var. _vérus_, and _rudéntum_, the uses of which we shall give under that head.

_Trottis_—blood Pterocarpus. C. 1820. Tree 30 to 40 ft.

_Corky_-fructed Pterocarpus. Tree 40 feet.

3 P. crispates (Moc. et Ses. fl. mex. icon. inéd.) leaves 5-9, alternate, ovate, acutis; fruit smoothish; petals curled. _S_. N. Native of Mexico. Racemes panicled. Flowers of a dirty yellow peach colour.

_Curl-ed-petalled_ Pterocarpus. Tree 40 feet.

**SECT. II. AMPHYMIUM** (from _amphi_, around, and _hyper_, a membrane; in reference to the pods being girded round by a membrane). Stamens monadelphous, with the sheath or tube cleft longitudinally on the upper side, sometimes the whole length. Fruit almost orbicular, containing 1 or 2 seeds inside, girded all round by a broad membrane.

4 P. Roehri (Vahl. symb. 2. p. 79.) leaves 7-9, alternate, ovate-oblong, abruptly acuminate, and are, as well as the branches and fruit, glabrous. _S_. Native of French Guiana, in woods. P. Apalatut, Rich. in act. soc. nat. par. 1. p. 111. P. Röhrri, Willd. spec. 3. p. 905. exclusive of the synonymes of Aublet, according to König in ann. bot. 1. p. 358. Aubl. guian. 2. t. 145. f. 53. fruit, exclusive of the rest of the plate.

Rohri's Pterocarpus. C. 1816. Tree 40 feet.

5 P. ornemularius (Moc. et Ses. fl. mex. icon. inéd.) D. C. prod. 2. p. 418. leaves 5, opposite, ovate, acute, glabrous; fruit orbicular, emarginate at the base, but mucronate at the apex. _S_. Native of Mexico. Flowers yellow.

Orbicular-fruit Pterocarpus. Tree 30 feet.

6 P. amphiymium (D. C. prod. 2. p. 418.) leaves 7, ovate, elliptic, acute, rounded at the base, glabrous above, and pubescent beneath; branches, petioles, calyces, and fruit clothed with soft tomentum. _S_. Native of Mexico, on the western de-cities of mountains. Amphiymenium pubescentes, H. B. et Kunth, nov. gen. amer. 6. p. 380. Flowers yellow?

_Around-membraned_ Pterocarpus. C. 1850. Tree 50 feet.

7 P. Marsu'mium (Roxb. corb. 2. p. 9. t. 110.) leaves 5-7, alternate, elliptic, somewhat emarginate, coriaceous, glabrous; branches and calyces glabrous; panicle terminal; legume rather glabrous, _S_. Native of Coromandel, on the mountains. Flowers pale yellow. Stamens disposed in 2 pentandrous bundles, which are rather concrete on the lower side.

_Pouch-carried_ Pterocarpus. C. 1811. Tree 40 feet.

8 P. Dalbergionides (Roxb. hort. beng. p. 53.) leaves 5-7, alternate, elliptic, bluish, coriaceous, and are, as well as the branches and calyces, glabrous; panicles of flowers axillary. _S_. Native of the East Indies. Stamens divided into 2 pentandrous bundles. Flowers yellow.

_Dalbergia_ of Pterocarpus. Tree 40 feet.

9 P. Brilus (Roxb. in herb. Lamb.) leaves broad, glabrous, alternate, ovate-roundish, deeply 2-lobed at the apex; racemes short, axillary; fruit 1-seeded. _S_. Native of the East Indies.

_Two-lobed_ Pterocarpus. Tree 20 feet.

**SECT. III. ECHINA'SEUS** (from _echynus_ and _cheinos_ a hedgehog, and _diskos_ a disk; in allusion to the legumes being beset with stiff bristles in the centre). Fruit almost orbicular, and somewhat falcate, mucronate from the base of the style, which is either lateral or oblique, girded all round by a membrane, and beset with long stiff bristles in the centre. Flowers unknown.

The species of this section are not well known, or it would have probably constituted a distinct genus.

10 P. Adansoni (D. C. prod. 2. p. 419.) leaves 13-15 alternate, petiolulate, oval or rather oblong, acutis or mucronate, adult ones glabrous above, but clothed with adpressed, silky velvety, canescent down beneath, as well as the branches, petioles, peduncles, and legumes; point of legume lateral, somewhat falcate, not reflexed. _S_. Native of Senegal. _P_. Se-negalenis, Vahl. ex herb. Juss.

Adanson's Pterocarpus. Tree 20 to 30 feet.

11 P. Echinato's (Pers. ench. 2. p. 277.) leaves ovate, somewhat cordate, glabrous; legume smoothish, falcate, with the point directed towards the pedicel. _S_. Native at Capo de Solar.

_Echinato's_ Pterocarpus. Tree.

12 P. Erhna'seus (Lam. dict. 5. p. 728. ill. 602. t. 4.) leaves alternate, elliptic, obtuse, glabrous above, but clothed with rusty pubescence beneath; fruit having a short, straight, lateral point. _S_. Native of Senegal and other parts of Guinea. The true African kimbo has been discovered by Mr. Mungo Park to be the produce of this tree. It is known up the rivers Gambia and Senegal by the name of Pan du Sangue. Kino is a gum resin.
which is a powerful remedy in obstinate chronic diarrhoeas and dysenteries, and in all diseases arising from laxity of the solids. Externally it is applied as a styptic to check hemorrhages from wounds or ulcers, and to diminish the discharge of ichorous matter from ill-conditioned ulcers. *Hedge-hog-fruited* Pterocarpus. Tree 20 feet.

13 P. Angolensis (D. C. prod. 2. p. 419.) leaves 11, petiolulate, oval, ending in a short tapering point, glabrous above, but pubescent along the nerves beneath; fruit large, rather villous. h. S. Native of the western coast of Africa, in the kingdom of Angola.

**Angola Pterocarpus.** Tree 30 feet.

**Sect. IV. Santalabia** (from *santalum*, the Latin name for Saunder's-wood). D. C. prod. 2. p. 419. Stamens unequally didellous, that is, 9 connected, and 1 free. Fruit almost orbicular, containing 2 or 3 seeds inside.

14 P. Indica (Willd. spec. 3. p. 504.) leaves 5-9, alternate, ovate, acute, glabrous; racemes axillary, simple or branched; fruit acutely mucronate. h. S. Native of the East Indies.—Rumph. amph. 2. t. 70. P. Indicus, Roxb. hort. beng. p. 53. P. Dráco, Lam. ill. t. 602. f. 2.—Comm. hort. amst. 1. t. 109. Flowers white.

**Indian Pterocarpus.** Tree 30 feet.

15 P. Santalinus (Lin. fil. suppl. 318.) leaves 3-5, alternate, rondalish, retuse, glabrous; racemes axillary, simple or branched; petals crenated. h. S. Native of India, on mountains. Flowers yellow, streaked with red. This is the true Santalum rubrum of Koenig. The wood is dark red with black veins, heavy, close, capable of a good polish, and sinking in water. The wood is known in commerce by the name of *Saunders's-wood*; it yields a deep red colouring matter, which appears to be of a resinous nature, to ether and alcohol, but not to water. Its colouring matter forms beautifully coloured precipitates with many metallic solutions. It also yields one kind of dragon's blood. *Saunders's-wood.* Clt. 1800. Tree 66 feet.

16 P. Santaloides (Luer. herb. D. C. prod. 2. p. 419.) leaves 5-7, alternate, oval, acuminate, glabrous; racemes axillary, simple, shorter than the leaves; peduncles clothed with velvety pubescence; bracteoles 2, linear, subulate, longer than the calyx. h. S. Native of Sierra Leone. Flowers dirty yellow.

**African Saunders's-wood or Santalum-like Pterocarpus.** Clt. 1793. Tree 60 feet.

17 P. Flavus (Lour. 5. p. 431.) leaves 5-7, opposite, ovate, acute; racemes lateral, spicate; vexillum toothed. h. G. Native of China and the Moluccas. P. luteus, Poir. suppl. 4. p. 610.—Rumph. amph. 3. t. 117. Bark yellow, bitter, and is used for dyeing yellow. Flowers yellow.

**Yellow-harked Saunders's-wood.** Tree 40 feet.

19 P. Uliginosus (Roxb. hort. beng. p. 533.) leaves opposite, ovate, acuminate, glabrous; racemes long, panicked. h. S. Native of the East Indies. Flowers white.

**Dog Pterocarpus.** Tree.

20 P. Sapindoides (D. C. prod. 2. p. 419.) leaves 11-13, opposite, oval, acuminate, glabrous; racemes axillary, much shorter than the leaves, rather velvety. h. S. Native of South America. Stamens diadelphous. Fruit unknown. Perhaps referrible to *Amerinum.*

**Sapindus-like Pterocarpus.** Tree 20 feet.

21 P. scandent (Poir. 5. p. 730.) leaves 7-11, opposite, oblong, acuminate, glabrous; racemes axillary, longer than the leaves; stems climbing. h. S. Native of Caracas.

**Climbing Pterocarpus.** Clt. 1817. Shrub cl.

**Sect. V. Ateleia** (from *atreia, atelles*, imperfect; in reference to *P. Ateliana, which is without the wings and keel to the flowers*). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 419. Legume membranous, samaroid, stipitate, compressed, with the upper suture straight, and furnished with a narrow wing, but the lower suture is convex. Racemes simple. Perhaps a proper genus.

22 P. Ateliana (D. C. prod. 2. p. 419.) leaves 13, alternate, ovate, lower ones smallest. h. S. Native of Mexico. *Ateliana* pterocarpus, Moc. et Sesse, fl. mex. icon. ined. Flowers white, disposed in racemose spikes. Corolla with an oblong vexillum, but the wings and keel are wanting. Stamens 10, monadelphous at the base.

**Imperfect-flowered Pterocarpus.** Tree 20 feet.

23 P. Microcarpus (Pers. ench. 2. p. 277.) leaves 7, opposite, elliptic, obtuse at both ends, but emarginate at the apex, coriaceous, glabrous; peduncles and pediades pubescent. h. S. Native of South America. Flowers unknown. Legume pale, 1-seeded, reticulately veined.

**Small-fruited Pterocarpus.** Tree.

24 P. Cummer (Bert. in herb. Boll. D. C. prod. 2. p. 419.) leaves 5-7, opposite, oblong, attenuated at both ends, bluntish, glaucous; pedicels and pediades glabrous. h. S. Native of St. Domingo. D. C. legum. mem. 10. t. 57. f. 1. Flowers unknown. Pods like those of the two preceding species.

**Gum-bearing Pterocarpus.** Tree.

25 P. Feltaria (D. C. prod. 2. p. 419.) leaves 3, oblong-linear, glabrous; legumes stipitate, oval, winged on one side, 1-seeded. h. G. Native of the Cape of Good Hope. *Clypeola* and Peltaria Capensis, Burm. herb.—D. C. legum. mem. 10. t. 57. f. 2. Racemes terminal, almost simple. Flowers pendulous. Calyx acutely 5-toothed, small, permanent. Pedals deciduous. Stamens monadelphous, with the sheath or tube permanent, and cleft above.

**Buckler-podded Pterocarpus.** Tree.

26 The species of *Pterocarpus* thrive best in a loamy soil, and young cuttings not deprived of their leaves root readily in sand under a hand-glass, in heat.

**CCXIV. DREPANOCA RPSUS** (from *derpano, drepang* a sickle, and *karpos, carpos* a fruit; in reference to the form of the pods, which are falcate). Meyer, prim. ess. 238. D. C. prod. 2. p. 420.—Nephrosis, Rich. ined.—Orucríia, Juss. ined. *Lin. syst. Monadelphia Decandria, or Diadelphia Decandria.* Calyx 5-toothed, with 2 bracteas at the base, lower tooth diverging at the apex. Petals 5, disposed into a papilionaceous corolla. Stamens 10, monadelphous, with the sheath or tube cleft in front, or equally diadelphous, that is, disposed in 2 pentandrous bundles. Legume compressed, indehiscent, wingless, falcate, 1-celled, 1-seeded. Seeds fixed to the ventral suture.—Shrubs, with impari-pinnate leaves with usually from 5-9 nearly opposite oval-oblong leaflets. Panicles of flowers terminal.

**Lunate-podded DrepanoCarpus.** Clt. 1792. Sh. 6 to 10 feet.
LEGUMINOSÆ. CCXIV. DREPANOCARPUS.

2 D. AFRI'CA'NUS; spines stipular; leaflets alternate, oblong, obtuse, white beneath; racemes terminal. ÷ S. Native of Guinea, on the sea shore. Legume flat, crescent-shaped, as well as the seed. (v. s. herb. Lamb.)

Afri'can Drep'anocarpus. Fl. Feb. Shrub 6 to 10 feet.

3 D. DE'GÉS (H. B. et Kunth, nov. gen. amer. 6. p. 390.) spines none; leaflets 5-7, pubescent beneath. ÷ S. Native of Caracas, in the plains. Leaflets elliptic, rounded at both ends, membranous. Legume reniformy semi-lunate, wrinkled reticulately. Flowers unknown.

Doubtful Drep'anocarpus. Tree 30 feet.

4 D. ? cyathifo'rmis (D. C. prod. 2. p. 420.) spines none; shrub climbing; leaflets alternate, ovate, acuminate, glabrous; panicles somewhat corymbous; fruit orbicular, rather cup-shaped. ÷ S. Native of Mexico. Pterocárpus cyathifo'rmis, Moc. et Sesse, fl. mex. ícon. ined.

Cup-shaped-podded Drep'anocarpus. Shrub cl.

5 D. microphyllus (Meyer, in act. soc. nat. cur. bonn. 12. p. 997.) spines stipular, recurved; leaves with many pairs of leaflets; stamens monodelphous. ÷ S. Native of Panama. Very like the following species.

Small-leafflet Drep'anocarpus. Shrub 6 to 10 feet.

6 D. isadé'lphus (Meyer, l. c.) spines stipular, recurved; leaflets 12-16 pairs; stamens equally diadelphous. ÷ S. Native of Surinam. Ovaly hairy, falcate. Fruit unknown.

Isadé'lfhus-stemmed Drep'anocarpus. Shrub 6 to 10 feet.

7 D. paniculátus; leaves with 4 pairs of leaflets; leaflets elliptic, coriaceous, pubescent beneath; panicles equal in length to the leaves; fruit lunate. ÷ S. Native of St. Domingo. Pterocárpus paniculátus, Spreng. syst. 3. p. 192.

Pani'cled Drep'anocarpus. Tree.

Cult. See Pterocárpus for culture and propagation, p. 377. The species require to be watered occasionally with salted water to make them thrive.

CCXV. Ecast'aphyllum. CCXVI. Amé'rimum.

LIn. SYST. Diadélphá, Octo-Deckán'dria. Calyx campanulate, somewhat bilabiata, upper lip emarginate, lower one trilobed. Corolla papilionaceus. Stamens 8-10, equally diadelphous or 9, and 8 of them equally diadelphous and 1 loose. Legume nearly orbicular, membranous, valveless, bivolute, but only 1-seeded. Seed reniform. Radicle unicnately-inflexed. —Shrubs, with simple, trifoliate, or impari-pinnate leaves, and axillary sub-corymbose panicles of flowers.

1 E. Brown'nei (Pers. ench. 2. p. 277.) petiole bearing only one leaflet; the leaflet broad, ovate, rounded and corrinate at the base, acuminate at the apex, and pubescent beneath. ÷ S. Native of the West Indies and South America, as well as of Senegal and Gambia, in swampy places. E. réuséscens, Browne, jan. p. 289. t. 52. f. 1. Pterocárpus Ecastaphyllum, Lin. spec. 1052. exclusive of the synonyme of Plumer. Berg. act. stockh. 1769. p. 116. t. 4. Amerínum Siebéri, Reichb. in Sieb. pl. exsicc. seneg. no. 36. Leaves spreading in a double row, pubescent when young, but glabrous in the adult state. Calyx ferruginous.

Var. ÷ S. glábrum; leaves glabrous beneath.

Browne's Ecastaphyllum. Chl. 1793. Shrub 6 to 8 feet.

2 E. dé'siimu (H. B. et Kunth, nov. gen. amer. 6. p. 388.) petiole with only one leaflet; leaflet elliptic-oblong, ended in a short blunt acumen, rather cordate at the base, and marked with pellucid lines, and pilose on the nerve beneath; legumes reniform, wrinkled. ÷ S. Native of the province of Caracas, near Cúica ou at the Orinoco.

Doubtful Ecastaphyllum. Shrub 6 to 8 feet.

4 E. éusé'scens (D. C. prod. 2. p. 421.) leaves impari-pinnate, with 5-7 alternate, ovate, acuminate leaflets, which are pubescent, as well as the branches and legumes. ÷ S. Native of Cayenne or French Guiana. Panicles axillary, branched, pendunculate. Stamens equally diadelphous. Legume nearly orbicular, almost an inch in diameter.

Pubescent Ecastaphyllum. Shrub.

5 E. moné'taria (D. C. prod. 2. p. 421.) leaflets 3, alternate, ovate, acuminate, glabrous; peduncles axillary, numerous, spikéd. ÷ S. Native of Surinam in humid places. Dalbérgia Moné'taria, Lin. fl. suppl. 317. Pterocárpus ternáta, Poir. dict. 5. p. 727. ex Kunth and Richard, Pers. ench. 2. p. 277. Stamens 9, 8 of which are disposed in two equal bundles, but the ninth one is loose, or hardly connected to the others at the base. Legume oval, roundish. Flowers minute, white. The root when cut yields a purple juice. The wood is red, and yields a resin resembling dragon's-blood.

Money-like-podded Ecastaphyllum. Shrub 6 to 10 feet.

6 E. Berté'rii (D. C. prod. 2. p. 421.) leaflets 3, alternate, obovate-orbicular; racemes spike-formed, simple, axillary, solitary; legume coriaceous, glabrous, nearly orbicular. ÷ S. Native of St. Domingo. Pterocárpus Bertéríi, Spreng. syst.

Bertero's Ecastaphyllum. Shrub.

† A doubt'ful species.

7 E. microphyllum (H. B. et Kunth, nov. gen. amer. 7. p. 206.) leaflets 25-45, small, oblong, acute, and somewhat mucronate, rounded at the base, clothed with adpressed pili on both surfaces; legumes falcate, oblong, rather rugulose. ÷ S. Native of Venezuela, near Santa Barbara.

Small-leafflet Ecastaphyllum. Shrub.

Cult. See Pterocárpus, p. 377, for the culture and propagation of the species.

CCXVI. AMÉRÍNUM (from a, priv. and μερίνμα, merínum, care; void of care or in a state of security; but what induced Dr. P. Browne to give this name to the present genus is unknown to us, unless it was the careless flow of the branches, or some medical virtue which the plant is supposed to possess). P. Browne, Jan. 288. Adams. fam. 2. p. 320. D. C. prod. 2. p. 421. —Amerínum species of Swartz, fl. ind. occ. 3. p. 1293. t. 25.

LIn. SYST. Monodélphá, Deckán'dria. Calyx somewhat bilabiata, 5-toothed. Petals 5, disposed into a papilionaceous corolla. Stamens 10, monadelphous, with the sheath or tube cliete in front. Legume compressed, 2-valved, 1-celled, 1-seeded; the superior suture straight, and a little winged; the lower one very convex. —Small trees or shrubs, with alternate, stalked, ovate, somewhat cordate, simple leaves.

Browne's Amerínum. Chl. 1793. Shrub 6 to 10 feet.
2 A. striaguifrus (H. B. et Kunth, nov. gen. amer. 6. p. 389.) leaves ovate, rather cordate, obtuse, clothed with adpressed pilis on both surfaces. h. S. Native on the banks of the Orinoco. Branches and petioles clothed with ferruginousomentum. Racemes axillary, solitary, 3 times longer than the petioles.

Strigulose Amerimnum. Shrub 6 to 10 feet.

Cult. See Pterocarpus, p. 377, for culture and propagation.

Lin. syst. Monadelphus, Decandria. Flowers the same as those of Amerimnum, but the stamens are all monadelphous, the tenth one concrete with the others to the middle. Legume bi-articulate; joints 1-seeded, dehiscent, compressed, with the superior suture straight, and the lower one convex, but the upper joint is sometimes wanting.—American trees, furnished with stipular spines, simple crowded leaves, or perhaps trifoliate leaves, with the leaflets sessile.

Small-flowered Brya. Shrub 12 feet.

Cult. See Pterocarpus for culture and propagation, p. 377.

CCXVIII. DEGUELIA (abridged from asa-lu pagarun-deguele, the Caribbean name of the plant). Aubl. guian. 2. p. 750. t. 300. Lam. ill. t. 603. D. C. prod. 2. p. 422.—Cyliçóma, Neck. cem. no. 1043.

Lin. syst. Didálipèia, Decandria. Calyx bilabiata, upper lip entire, lower one trilobed. Petals 5, disposed into a papillose corolla; wings and carina equal in length, but the vexillum is larger. Stamens 10, diadelphous. Corolla (ex Richard) declinate, narrow, oblong, hispid, straightish. Style stretched out, capillary, hispid on the inner side even to the apex. Stigma terminal, capitate, glandular. Legume (ex Aubl.) globose, small, 2-valved, 1-seeded. Sessile spherical, covered with farina.—A sarmentous shrub, with impari-pinnate leaves, furnished with 2 pairs of oval acute leaflets, spike-formed axillary racemes of flowers. This genus, according to its habit, is allied to Nissolia and Pterocarpus, but the legume, as it is described by Aublet, belongs probably to a different plant (according to Richard).

Climbing Deguela. Shrub cl.

Cult. See Pterocarpus for culture and propagation, p. 377.

Suborder II. or Tribe VII.

SWARTZIAE (plants agreeing with Swartzia in important characters). D. C. legum. mem. xi. prod. 2. p. 422. Seals closely joined into an ovate-globe abalasbrum before expansion (f. 52. b.), which at last bursts valvately, as the flowers expand (f. 52. g.). Petals few, irregular or wanting, and are, as well as the stamens, hypogynous (f. 52. d.). Racide incurved (f. 21. c. f). Cotyledons thick. Germination unknown. Leaves simple or simply pinnate. This is a very distinct suborder or tribe, agreeing with Detariae in the valveless calyx, with tribe Mnutjaceae in the hypogynous stamens, and in the irregular petals as well as in the habit of the plants with Dalbergiaceae.

Lin. syst. Decc-Polyandria, Monogynia. Seals closely connected into an ovate-globe abalasbrum, but bursting afterwards somewhat irregularly and almost valvately almost to the base. Petal one, hypogynous, flat, lateral or wanting. Stamens 10-15-25, variable in number, hypogynous, sometimes with 2 or 4 of them larger than the others, and sterile, and appearing like petals, the rest usually connected a little way at the base. Legume usually stipitate, 2-valved, 1-celled, few-seeded. Seeds arillate, exalbiminous. Embryo with thick cotyledons, and an uncinately, inflexed, short, exerted radicle.—Trees, with simple or impari-pinnate leaves, and with the flowers rising in racemes from the axils of the leaves.

Sec. 1. POSSIIRA (the name of S. arboréscens in the axilus). Aubl. guian. 2. p. 934.—Rittera, Schreb. gen. no. 1919.—Hochedzlia, Neck. cem. no. 1382. Flowers usually with one petal, rarely with 3; when the last is the case, one of them is much larger than the rest.

* Leaves simple; having the petiole bidentate at the apex. The teeth in place of stipels.

1 S. SIMPLIFiÓLIA (Willd. spec. 2. p. 1219.) leaves simple, ovate-oblong, obtuse, emarginate; peduncles usually 5-flowered; petal one, roundish, ovate, larger than the calyx; stamens 20-25. h. S. Native of the West Indies. Rittera simplex, Vahli. Possiira simplex, Swartz. prod. 82. Flowers pale yellow.

Simple-leaved Swartzia. Clt. 1818. Shrub 6 to 10 feet.

2 S. GRANDIFiÓLIA (Willd. l. c.) leaves simple, oblong-ovate, acuminate; peduncles 3-flowered; petal roundish-reniform, large; stamens 20-25. h. S. Native of Trinidad and St. Vincent. Rittera grandifolia, Vahl. exl. 2. p. 57. pl. amer. dec. 1. t. 9. Flowers yellow. Ovary stipitate, arched.

Great-flowered Swartzia. Clt. 1821. Shrub 6 to 8 feet.

3 S. DODECÁNDRA (Willd. l. c.) leaves simple, oval, drawn out at the apex into an emarginate acumen; peduncles usually 5-flowered; petal oblong, length of calyx; stamens 10-20. h. S. Native of South America. Rittera dodecandra, Vahl. symb. 2. p. 60. t. 34. Ovary stipitate. Flowers yellow.

Dodecandrous Swartzia. Shrub 6 feet.

4 S. PARVIÓLIA (D. C. legum. mem. xi. t. 60.) leaves simple, on very short petioles, ovate, drawn out into an emarginate 3 c 2.
acumen; peduncles usually 3-flowered; petal unguiculate, roundish, a little fringed, length of calyx; stamens 20-25. 

5 S. ochracea (D. C. legum. mem. xi. t. 58.) leaves simple, ovate-elliptic, acute; peduncles 1-flowered. 

Native of South America, about Buenos Ayres. Flowers unknown. 

Leaf standing on a stipe half an inch long, obovate, tapering to the base, apiculate by the style. Seed I, large, reniform.

7 S. splendida (D. C. legum. mem. xi. t. 242.) leaves trifoliate, petioles terete, wingless; leaflets ovate-elliptic, drawn out into a blunt, narrow, somewhat enlongate acumen; peduncles 2-5-flowered. 

Native of Guiana and Cayenne. Penny like Swartzia. 

8 S. multijolia (Smith, in Rees' cyc. no. 5.) leaves with 3-5 leaflets; leaflets marginated, leaflets lanceolate-oblong; petal orbicular, length of calyx; stamens very numerous, polyadelphous. 

Native of the Caracas. Petal yellowish.

10 S. longifolia (D. C. legum. mem. xi. t. 24.) leaves with 5 leaflets; petioles terete; leaflets elliptic, acuminate; peduncles rather velvety; racemes twin; petal unguiculate, longer than the calyx; stamens numerous. 

Pinnate-leaved Swartzia. 

11 S. brachystachya (D. C. legum. mem. xi. t. 59.) leaves with 3-7 leaflets, and are as well as the branchlets glabrous; petioles terete; leaflets elliptic, acuminate; peduncles smoothish, 5-9-flowered; petal ovate-orbicular, longer than the calyx. 

Native of Cayenne. Calyx bifurcate, with the lobes reflexed. Petals 3, particularly with a roundish vexillum and 2 wings. Oval clothed with hoary, adpressed down. Leaflets 7-8 inches long. Perhaps a true species of Swartzia.

Long-leaved Swartzia. 

12 S. tomentosa (D. C. legum. mem. xi. t. 59.) leaves with 5-7 leaflets; petioles terete, and as well as the branchlets velvety; leaflets ovate-oblong, acuminate, velvety beneath; stipulas nearly orbicular. 

Native of Cayenne, on the banks of rivers, where it is called Bois pagaie blanche. Robinia Paucococo, Aubl. guian. 2. p. 769. t. 307. Robinia tomentosa, Wildl. spec. 3. p. 1134. Racemes rising beneath the leaves along the branches. Flowers red. The wood is white, and very useful. Anaceae is the Guiana name of the tree.

Tomentosa Swartzia. 

Tree 60 feet.

13 S. Plemitig (Raddi, mem. pl. bras. add. p. 18.) leaves
nately inflexed.—Unarmed trees or shrubs, with simple stipulate leaves, and axillary or terminal, many-flowered racemes, bifructiculate pedicels and yellow flowers.

1 *Z. splendens* (Max. et Nees. L. c. p. 15. t. C.) stipulas nearly orbicular; leaves ovate-oblong, glabrous. Z. S. Native of Brazil. Flowers large, yellow.

**Splendid Zollernia.** Shrub 10 to 15 feet.

2 *Z. falcat'a* (Max. et Nees. L. c. p. 16. t. D.) stipulas falcate; leaves oblong, acute at the base, attenuated at the apex and bluntest, glabrous. Z. S. Native of Brazil, on the banks of the river Paráiba. Krameriá glabra, Spreng. native entd. 2. p. 157. Flowers yellow, smaller than those of the first species. (f. 52.)

**Falcate-stipala Zollernia.** Tree 20 feet. (Cult. See Swartzia for culture and propagation, p. 380.)

**Division II.** **Recte'mbré** (from rectus, straight, and embryo, an embryo; in reference to the radicle and cotyledons being straight). Radicle and cotyledons straight. (f. 21. i. k. l. m.)

**Suborder III. or Tribe VIII.**

**MIMÓSEAE** (plants agreeing with *Mimosa* in important characters). Embryo straight (f. 21. m.), sometimes with the radicle bending a little to the cotyledons. Flowers regular (f. 53. a.), usually polygamous (f. 53. b.), rarely all hermaphroditic (f. 54. b.). Sepals 4-5, valvate in aestivation, usually connected together at the base, the calyx is therefore 4-5-toothed (f. 54. a.). Petals 4-5, equal (f. 53. a.), also valvate in aestivation, usually hypogynous, rarely inserted in the bottom of the calyx, sometimes more or less connected together into a monopetalous corolla. Stamens inserted with the petals, free (f. 53. b. f. 54. b.), or monadelphous, equal in number to the petals or multiple that number (f. 53. b.). Embryo straight (f. 21. m.), with a hardly evident plumule. Umbilical funicle usually twisted. Leaves abruptly pinnate or abruptly bipinnate. Cotyledons in all, except *Entada*, and perhaps some species of *Inga*, foliaceous and exserted.

**Lin. syst. Polygynia, Mone'cia.** Flowers polygamous. Petals 5, distinct. Stamens 10-25. Anthers glandular at the apex. Legume compressed, evidently articulated; the valves usually separating into 2 membranes at maturity. Joints of legume 1-seeded, with the ribs permanent. Seeds thick. Cotyledons fleshy, remaining unchangeable and inclosed within the spermacord in germination.—Shrubs with climbing, unarmed stems, bipinnate or conjugately bipinnate leaves, usually with the rachis terminating in a tendril. Flowers white, innumerable, with many abortive, disposed in dense spikes. Legume glabrous, unarmed, very large.

1 *E. gigalbium* (D. C. legum. mem. xii. prod. 2. p. 424.) leaves bipinnate, ending in a tendril, with 1-2 pairs of pinnae, and 2-4 pairs of oblong, emarginate, glabrous leaflets; spikes of flowers axillary; stamens 20-25. Z. S. Native of the West Indies, climbing over trees and forming arbours. Mimósas scándens, Swartz, obs. 389. Lun. hort. jam. 1. p. 137. M. scándens Americana, Lin. and most other authors. Legume 6-8 feet long, coriaceous, with the sutures very thick. Seeds nearly orbicular, 2 inches in diameter. The shrub is called *Cucoen* in the West Indies.

**Giana-podded Entada.** Ctt. 1819. Shrub cl.

2 *E. purpur'étha* (D. C. legum. mem. xii. prod. 2. p. 425.) leaves bipinnate, ending in a tendril, with 1-2 pairs of pinnae and 2-4 pairs of ovate, emarginate, glabrous leaflets on each pinna; spikes of flowers axillary; stamens 10. Z. S. Native of the Malveaceae on the sea-shore, Malabar, and the Mauritius.—Rheed. mal. 8. t. 32. 33, 34.—Rumph. amb. 5. t. 4. Purse'atha, Lin. fl. zeyl. 644. Burm. ind. 222. Mimósas scándens, Roxb. hort. beng. p. 49. M. scándens l'inda of authors. Legume like that of *E. gigalbium*. This species is classed among the emetics in Java.

**Purse'atha Entada.** Ctt. 1780. Shrub cl.

**One-skiped Entada.** Ctt. 1800. Shrub cl.

**Many-skiped Entada.** Ctt. 1816. Shrub cl.

5 *E. chillánthia* (D. C. l. c.) leaves bipinnate, with 3-4 pairs of pinnae, and 7-8 pairs of linear, oblong leaflets on each pinna, which are pubescent beneath; spikes unis, terminal on the branches. Z. S. Native of Guiana, in humid places. Mimósas chillánthia, Meyer, prirm. essq. 168.—Plum. ed. Burm. t. 12. Flowers decandrous.

**Lip-flowered Entada.** Shrub cl.

6 *E. adæn'anthëra* (D. C. l. c.) leaves with 2 pairs of pinnae; leaflets oblate, oblique, glabrous; tendrils terminal. Z. S. Native of the Island of Malickococo. Adenanthera scándens, Forst. prod. no. 117. This plant, from its habit, is related to the present genus.

**Adenanthera-like Entada.** Shrub cl.

(Cult. See shrubby species of *Mimosa* for culture and propagation, p. 387.)

**Lin. syst. Polygynia, Mone'cia.** Flowers polygamous. Petals 4-5, connected together into a 4-5-cleft, funnel-shaped corolla. Stamens inserted in the base of the corolla, or in the stipe of the ovary, equal in number to the lobes of the corolla, or double or triple that number, particularly from 4 to 15 in number. Legume compressed, flat, 1 or many-jointed; joints 1-seeded; ribs permanent. Stipulas petiolar. Leaves bipinnate, with 1 or more pairs of pinnae, each pinna bearing 2 or many pairs of leaflets. Flowers rose-coloured or white, disposed in
heads. Leaves usually sensible to the touch, as in the common sensitive plant.

§ 1. *Senticosa*. Leaves with 1 pair of pinnae, and with 2 pairs of leaflets on each pinna, the inner pair smaller than the outer pair. Stems 4, rarely 5. Leaves in most of the species sensible to the touch.

1 M. *de Biles* (Humb. et Bonpl. in Willd. spec. 4. p. 1029.) stem herbaceous, simple, rather prickly, glabrous, unarmored at the base of the petioles, but hairy; leaflets obovate, mucronate, clothed on both surfaces with adpressed pubescence; heads of flowers elliptic, solitary. S. Native of South America, near Caripe. B. H. et Kunth, nov. gen. amer. 6. p. 248. Flowers rose-coloured. Pods unknown.

Weak Sensitive-plant. Fl. 1 to 2 feet.

2 M. *aerida* (Humb. et Bonpl. in Willd. spec. 4. p. 1030.) branches clothed with canescent pubescence, prickly; leaflets dimidately-oblong, acute, pubescent; petioles unarmored; heads of flowers twinn. S. Native of Peru, near Moche, in sand by the sea-side. A creeping shrub, very nearly allied to *M. senticia*. Legume hispid, 4-celled, hardly constricted between the seeds. Flowers rose-coloured. Kunth, min. p. 2. t. 1.

Whitish Sensitive-plant. Shrub creeping.

3 M. *sensiviva* (Lin. spec. 1501.) stem and petioles prickly; leaflets ovate, acute, clothed with adpressed pili beneath, but glabrous above. S. Native of Brazil. Flowers rose-coloured and tetradomous, as in the preceding species, however, Linnaeus's plant is said to have pentandrous flowers. Trew, chr. t. 95. Ker. bot. reg. 25. Lindl. bot. reg. Flowers purple. Leaflets broad, but not so sensible to the touch as those of *M. pudica*.

Sensitive-plant. Fl. April, Sept. Clt. 1618. Sh. 3 to 6 ft.

4 M. *ornithocephala* (Willd. enum. p. 1047.) stem and petioles prickly; leaflets dimidately cordate, ovate, obtuse, glabrous. S. Native of Brazil. Flowers red. Very like *M. sensitica*, but more prickly and glabrous.

5 M. *strigosa* (Willd. spec. 4. p. 1030.) branches and petioles beset with stiff hairs and prickles; leaflets rather dimidiate, ovate-oblong, acute, striose on both surfaces; heads of flowers usually solitary. S. Native of South America, at the Orinoco and of Mexico. B. H. et Kunth, nov. gen. amer. 6. p. 248. Flowers purple. Perhaps the same as *M. strigosae* of Pers. euch. 2. p. 263.

6 M. *adlarens* (H. B. et Kunth, nov. gen. amer. 6. p. 249.) branches hairy and prickly; petioles villous, unarmored; leaflets dimidiatly-ovate, mucronate, clothed above with adpressed pili, and with silky and somewhat striose hairs beneath; heads of flowers solitary. S. Native of South America, at the Orinoco. Flowers red. Legume unknown.

Adhersoning Sensitive-plant. Shrub 3 to 4 feet.

7 M. *floribunda* (H. B. et Kunth, nov. gen. amer. 6. p. 250.) branches and petioles pubescently-pilosae and very prickly; leaflets 2-pairs, somewhat dimidiate ovate, acute, clothed with striose hairs beneath, but glabrous above; heads of flowers twin or tern. S. Native of South America, near Cumaná, and of Mexico, near Jalapa. Flowers red.

**CCXXIII. *Mimosas***

§ 2. *Pudica* (pudicus, chaste; in reference to the sensitive qualities of the leaves). Leaves with 1 or more pairs of pinnae; when the last is the case, they are disposed in a digitate manner at the top of the common petiole, each pinna bearing many pairs of leaflets, which are about equal in size and shape. Stems 4, rarely 5. Leaves usually sensible to the touch.

8 M. *pistacularia* (Willd. spec. 4. p. 1028.) unarmored; leaves with 1 pair of pinnae, each pinna bearing 3 pairs of elliptic, obtuse leaflets, with a gland between the terminal pair. S. Native of Caracass. Flowers red. Legume linear, sinuated, 6-7 inches long. Perhaps belonging to a different division of the genus.

*Pecitone* Leaved Sensitive-plant. Shrub. 11 M. *polycera* (Kunth, mim. p. 8. t. 8. nov. gen. amer. 6. p. 25.) branches prickly, striated, pilose; leaves conjugately pinnate; petioles much longer than the prickles; leaflets many pairs, oblong-linear, acute, glabrous above, but clothed with adpressed pili beneath as well as on the margins. S. Native of Peru, in sandy places. Heads of flowers solitary. Flowers red. Legumes pilose, with very hispid margins.

Many-flowered Sensitive-plant. Shrub 1 to 2 feet.

12 M. *pudica* (Lin. spec. 1501.) stem herbaceous, prickly, with the petioles and peduncles more or less beset with stiff hairs or bristles; leaves somewhat digitately pinnate, with 4 pinnae, each pinna bearing many pairs of linear leaflets. S. Native of Brazil. Andr. bot. rep. t. 544. Flowers red. Legumes glabrous in the middle, but with the margins beset with stiff bristles. Superior leaves sometimes the same as the inferior ones. This plant is commonly grown in gardens, under the name of the sensitive plant, the leaves falling on the slightest touch. Sensitive plants were not unknown to the ancients. Theophrastus speaks of the *ασθενωμενη*, as growing about Memphis in Egypt, and Pliny of the *Eschynomene*, so called from its contracting the leaves at the approach of the hand. It is thus characterized in the flowery poetry of Darwin:

"Weak with nice sense the chaste *Mimosa* stands,
From each rude touch withdraws her timid hands;
Oft as light clouds o'erpass the summer glade,
Alarm'd she trembles at the moving shade,
And feels alive through all her tender form
The whisper'd murmurs of the gathering storm;
Shuts her sweet eye-lids to approaching night,
And holds with freshness'd charms the rising light."

The cause of the well-known motion of the leaves of the sensitive and humble plants has been the subject of many ingenious explanations; but it has not been treated by any botanist with so much ingenuity as by Dr. Dutrochet, whose theory we give as explained in the Botanical Register.

M. Dutrochet states, that having ascertained hot nitric acid to possess the power of separating and reducing to its simplest
form the whole mass of vegetable tissue, and that the same acid produced other effects equally advantageous for the examination of the most obscure parts of vegetable structure, he was induced to give his attention to that of *Mimosa pudica*, in the hope of gaining some evidence respecting the cause to which its sensibility is to be ascribed. Beginning with the pith he observed a considerable number of minute globules, of a greenish colour, intermingled among the cells, and adhering to them in an irregular manner. After attempting to show the probability of these globules having deceived Mirble in various points of his analysis of vegetation, and especially in regard to the pores, which that botanist supposes to exist in the cellular tissue of plants, Dr. Dutrochet proceeds to remark, that the application of hot nitric acid to these globules renders them perfectly opaque, whence he concludes that they are in fact minute cells, filled with a particular fluid which is subject to become concrete by the application of acids. Now it is known that such fluids as are thus altered by acids are usually dissolved and liquefied again by the application of alkalies. A few drops, therefore, of a solution of hydrate of potash were suffered to fall upon a portion of the pith on which nitric acid had been acting, and the mixture was exposed to the heat of a lamp. Being examined after a few minutes, the globules were found to have resumed their natural appearance. This curious fact indicated, in the opinion of Dutrochet, a strong and unexpected point of analogy between plants and animals. According to the microscopical researches of some modern observers, it has been ascertained that all the organs of animals are composed of a conglomeration of minute corpuscles, similar to those just described; the corpuscles which constitute the muscles are soluble in acids, but those which compose the nervous system are insoluble in the same acids, and only soluble in alkalies. Now, as the chemical properties and external appearance of the particles scattered among the cellular tissue of plants, and constituting the nervous system of animals, are the same, the author is induced to infer, that the spherical particles of plants are in fact the scattered elements of their nervous system. This hypothesis receives additional strength from the great similarity which exists between the medullary substance of the brain of *Mollusca gasteropoda* and the cellular medullary tissue of plants. In pursuit of this idea, Dr. Dutrochet made a variety of experiments upon the sensitive plant, the results of which seem to be these:—

The principal point of locomotion or of mobility exists in the little swelling which is situated at the base of the common and partial pedicles of the leaves; this swelling is composed of a very delicate cellular tissue, in which is found an immense number of nervous corpuscles; the axis of the swelling is formed of a little fascicle of tubular vessels. It was ascertained by some delicate experiments, that the power of movement, or of contraction and expansion, exists in the parenchyma and cellular tissue of the swelling, and that the central fibres have no specific action connected with the motion. It also appeared that the energy of the nervous powers of the leaf depended wholly upon an abundance of sap, and that a diminution of that fluid occasioned an extreme diminution of the sensibility of the leaves. Prosecuting his remarks still further, the author ascertained that in the motion of the sensitive plant two distinct motions take place, the one of locomotion, which is the consequence of direct violence offered to the leaves, and which occurs in the swellings already spoken of; the other is nervomotion, which depends upon some stimulus applied to the surface of the leaflets, unaccompanied by actual violence, such as the solar rays concentrated in the focus of a lens. As in all cases the bending or folding of the leaves evidently takes place from one leaf to another with perfect continuity, it may safely be inferred, that the invisible nervous action takes place in a direct line from the point of original irritation, and that the cause by which this action of nervomotion is produced must be some internal uninterrupted agency. This was, after much curious investigation, determined by the author to exist neither in the pith nor in the bark, nor even in the cellular tissue filled with nervous corpuscles, and on which he supposes the locomotion of the swelling at the base of the pedioles to depend. It is in the ligeous part of the central system in certain tubes supplied with nervous corpuscles, and serving for the transmission of sap, that Dr. Dutrochet believes he has found the true seat of nervomotion, which he attributes to the agency of the sap alone, while he considers the power of locomotion to depend upon the nervous corpuscles alone.

**Chaste or Common Humble-plant.** Fl. April, Sept. Clt. 1638. Pl. 1 foot.

13 *M. hispidula* (H. B. et Kuth, nov. gen. amer. 6. p. 252.) stems prickly, and densely beset with stiff hairs; leaves somewhat digitately pinnate, with 4 pinnae; leaflets linear, acute, ciliated, glabrous; heads of flowers usually twin; legumes very hispid. *S. S. Native of South America, near Santa Barbara. Very nearly allied to *M. pudica*. Flowers red.*

**Hispid Humble-plant.** Fl. May, Sept. Clt. 1820. Sh. 1 to 2 ft. 14 *M. pudica* (Willd. spec. 1032.) stem shrubby, prickly, glabrous; leaves somewhat digitately pinnate, with 4 pinnae, each pinna bearing many pairs of linear leaflets; heads of flowers elliptic. *S. Native of Brazil, about Bahia. Flowers red.*

15 *M. tomentosa* (Humb. et Bonpl. in Willd. spec. 4. p. 1038.) branches unarmed, clothed with silky hairs; leaves somewhat digitately pinnate, with 4 pinnae, each pinna bearing many pairs of oblong-linear leaflets, which are clothed with hoary silky villi beneath. *S. Native of South America, on the banks of the river Orinoco. Kuth, mim. p. 11. t. 4. H. B. et Kuth, nov. gen. amer. 6. p. 253. Flowers red. Legumes unknown. The specific name is fallacious.

**Tomentosa Humble-plant.** Shrub.

16 *M. pilosa* (Moc. et Sesse, in herb. Lamb.) prickles stipitate, recurved; leaves with only 1 pair of pinnae, each pinna bearing numerous linear, mucronate leaflets; stem hispid as well as the pedicels, petioles, and rachis of leaves; peduncles solitary or twin, axillary, about the length of the pedioles; calyx hispid; legumes prickly on the margins, 3-4-jointed. *O. Native of Mexico. Heads of flowers nearly globorular, red.*

**Hairy Sensitive-plant.** Pl. 1 to 2 feet.

17 *M. tricarpa* (Schlecht. et Cham. in Linnaea. 5. p. 591.) leaves with 1 pair of pinnae, each pinna bearing 12 pairs of oblique, ovate-elliptic, mucronate leaflets; which are adpressed ciliate on the margins, shining and glabrous above, but strigose beneath; petiole short; stipulas small, filiform; branches, rachis of leaves, and peduncles scabrous from stiff hairs; heads tern, on long peduncles, axillary, and forming a loose terminal raceme, which is leafy at the base. *S. Native of Mexico, between Laguna, Verde, and Actopan. Flowers pale red. Legumes unknown.*

Three-headed Mimosa. Shrub.

18 *M. polydractyla* (Humb. et Bonpl. in Willd. spec. 4. p. 1033.) stems prickly, glabrous, pilose above; leaves somewhat digitately pinnate, with 8 pinnae, each pinna bearing many pairs of linear leaflets. *S. Native of Guiana, and about Demerara, as well as in Maranham. Flowers purple. Heads of flowers twin, ovate, pedunculate.*

§ 3. Bipinnatae (from bipinnatus, bipinnate leaves). Leaves bipinnate, with the pinnae distant, not approximate at the top of the common petiole, as in the last division.

* Plants prickly.

19 M. geminata (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2, p. 427.) stems diffuse, and are as well as the petioles prickly; leaves bipinnate, with 2-3 pairs of pinnae, each pinna bearing 15-20 pairs of leaflets; heads of flowers axillary, twin. S. Native of North America, on the western coast. Heads of flowers almost like those of M. pudica. Flowers red. Legumes unknown.

Trin-headed Mimosa. Pl. diffuse.

20 M. maura (Kunth, min. p. 31, t. 10. nov. gen. amer. 6. p. 250.) branches prickly, puberulous; leaves bipinnate, with 3-4 pairs of pinnae, each pinna bearing 6-13 pairs of linear, acutish, glabrous leaflets, which are puberulous beneath as well as on the margins; prickles straight, subulate, those on the petioles opposite; heads of flowers solitary. S. Native of Peru. H. B. et Kunth, nov. gen. amer. 6. p. 254. Flowers red. Legume ovate, 2-jointed, beset with bristles.

Humble Mimosa. Shrub ½ foot.

22 M. haematia (Willd. spec. 4. p. 1033.) branches, petioles, and peduncles pubescent and prickly; leaves bipinnate, with 4 pairs of pinnae, each pinna bearing 7-8 pairs of leaflets; peduncles longer than the leaves. S. Native of the East Indies. Legume 5-jointed, sinuated, pubescent.

Hooked Mimosa. Shrub 2 to 4 feet.

23 M. somniaria (Humb. et Bonpl. in Willd. spec. 4. p. 1036.) branches prickly, rather hispid; leaves bipinnate, with 4-5 pairs of pinnae, each pinna bearing many pairs of linear, glabrous leaflets; racis rather prickly; heads of flowers solitary. S. Native of New Granada, on the Andes. H. B. et Kunth, nov. gen. amer. 6. p. 256. Kunth, min. p. 20. t. 7. Flowers red. Legume linear, many-jointed, hispid.

Sleeping Mimosa. Shrub 2 to 6 feet.

24 M. ptilitans (Humb. et Bonpl. in Willd. spec. 4. p. 1036.) branches prickly, glabrous; leaves bipinnate, with 5-6 pairs of pinnae, each pinna bearing many pairs of linear, glabrous leaflets; racis setose, and rather prickly; heads of flowers usually twin. S. Native of South America. Flowers red. Legumes linear, 8-12-jointed, rather setose. Perhaps distinct from M. somniaria.

Beating Mimosa. Shrub 2 to 4 feet.

25 M. intermedia (Kunth, min. p. 16. t. 6. H. B. et Kunth, nov. gen. amer. 6. p. 255.) branches hispid, and are as well as the racis prickly; leaves bipinnate, with 4-7 pairs of pinnae, each pinna bearing 9-15 pairs of linear, obtuse, glabrous leaflets; heads of flowers usually twin. S. Native of the plains of Caracas. Flowers red. Legume short, 2-4-jointed, oblique, hispid, with the upper joint broader than the rest.

Intermediate Mimosa. Shrub procumbent.

26 M. somnificosa (H. B. et Kunth, nov. gen. amer. 6. p. 257.) branches pilose, and are as well as the racis prickly; leaves bipinnate, with 10-12 pairs of pinnae, each pinna bearing many pairs of linear, acutish, glabrous leaflets; heads of flowers solitary. S. Native of South America, within the tropics. Flowers red.

Sleepy Mimosa. Shrub.

** Plants unarmed.

27 M. vespida (Willd. enum. p. 1048.) branches and petioles unarmed, but clothed with clammy glands; leaves bipinnate, with 4 pairs of pinnae, each pinna bearing many pairs of linear, obtuse, glabrous leaflets; heads of flowers globose, solitary. S. Native of Brazil. Flowers red. Legume unknown. Perhaps belonging to a different section.

28 M. microptera (Humb. et Bonpl. in Willd. spec. 4. p. 1039.) branches and petioles unarmed, but clothed with adpressed pilis; leaves bipinnate, with 12-14 pairs of pinnae, each pinna bearing many pairs of oblance-linear, obtuse, ciliated leaflets; heads of flowers ovate, twin or tern. S. Native of the banks of the river Orinoco. Kunth, min. p. 28. t. 8. nov. gen. amer. 6. p. 257. Flowers red. Legume linear, many-jointed, strigose.

Sect. II. Habræa (Habbas is the Egyptian name of M. polyacanthæ). D. C. legum. mem. xii. prod. 2. p. 428. Legume compressed, very hispid, with straight parallel margins, never contracted at the articulations; joints few, shorter than broad. In all the species the branches and petioles are prickly; the prickles on the petioles usually opposite. Leaves bipinnate.

Flowers white.

29 M. dorrnens (Humb. et Bonpl. in Willd. spec. 4. p. 1035.) branches prickly, and densely clothed with white hairs; leaves bipinnate, with 5-7 pairs of pinnae, each pinna bearing 9-12 pairs of linear, rather falcate, acute leaflets, which are pubescent on both surfaces; prickles opposite, subulate, straight, placed between each pinna, and at their base; heads of flowers solitary. S. Native of South America, in sand on the banks of the river Apures. Flowers white. Legume unknown, but is allied to M. asperata.

Sleeping Mimosa. Fl. June, July. Clt. 1818. Sh. procumb. 30 M. canescens (Willd. spec. 4. p. 1038.) leaves bipinnate, with 8-10 pairs of pinnae, each pinna bearing many pairs of leaflets, which are covered with hoary strigae; cauleine prickles hooked, those on the petioles remote. S. Native of Guiana. Flowers white. Branches, petioles, and peduncles beset with stiff pubescence.

31 M. hispida (Willd. spec. 4. p. 1037.) leaves bipinnate, with 10 pairs of pinnae, each pinna bearing many pairs of 3-nerved leaflets; cauleine prickles hooked, petiolar ones wanting. S. Native of Caraccas. Branches, petioles, and peduncles setose. Legume attenuated at both ends, flat, setose, of about 15 joints. Flowers white.

Hispid Mimosa. Tree 10 to 20 feet.

32 M. ciliata (Willd. enum. p. 1048.) leaves bipinnate, with 10 pairs of pinnae, each pinna bearing many pairs of ciliated leaflets; prickles straight, opposite, a pair between each pair of pinnae, but solitary at the base of the pinnae. S. Native of Brazil. Branches and petioles hirsute. Flowers white. Legumes unknown. Allied to M. asperata.

Ciliated-leafletted Mimosa. Shrub.

33 M. pellet (Humb. et Bonpl. in Willd. spec. 4. p. 1037.) leaves bipinnate, with 8-12 pairs of pinnae, each pinna bearing many pairs of leaflets, which are hispid on the margins, as well as on the under surface; cauleine prickles straight, as well as those at the base of the pinnae; peduncles twin, 4 times longer than the
heads of the flowers. ț S. Native of South America, near Cumana, and on the banks of the river Magdalena near Nares. Branches and petioles hispid. Legumes rather incurve, and hispid, composed of 21-23 joints. Stamens 10-12 in the specimens collected about Cumana, but only 8 in those collected near Nares, ex Kunth, m.m. 27. t. 9. H. R. et Kunth, nov. gen. p. 258.

Clad Mimosa. Shrub 3 to 4 feet.

34 M. POLYACANTHIA (Wildl. spec. 4. p. 1034.) leaves bipinnate, with 8-11 pairs of pinnae, and each pinna bearing many pairs of leaflets; prickles on the stem, as well as those between the pinna, hooked, those at the base of the pinna straight, and subulate; peduncles 4 times the length of the heads of flowers. ț S. Native of Guiana, Abyssinia, and Upper Egypt. Bruce, trav. 5. t. 7. M. Habbas, Delle. ill. fl. aegypt. p. 31, but not of Link. Peduncules and petioles beset with stiff adpressed villi. Perhaps sufficiently distinct from A. asperata.

Many-spined Mimosa. Shrub 2 to 3 feet.

35 M. ASPERATA (Wildl. spec. 4. p. 1035.) leaves bipinnate, with 8-12 pairs of pinnae, each pinna bearing many pairs of leaflets, which are clothed with adpressed bristles beneath, as well as on the margins; prickles on the stem, and between the pinna rather hooked, but those at the base of the pinna straight; peduncles usually twin, length of the heads of flowers. ț S. Native of Jamaica, Vera Cruz, and about Demerara. D. C. legum. mem. xii. t. 63. Calyx unequally many-toothed. Leaves falling on the slightest touch.

Var. a, hirsutior (D. C. l. c.) M. asperata, Lin. spec. 1507. Mill. fig. t. 182. f. 3. Briton. cent. t. 19.

Var. b, levior (D. C. l. c.) M. pilis, Lin. amœn. 4. p. 274.

36 M. SICARIA (Hoffm. verz. fl. 1824. p. 221.) leaves bipinnate, with usually 5 pairs of pinnae, each pinna bearing many pairs of linear, rather ciliated leaflets; prickles straight, subulate, those on the stems scattered, between the pinna opposite, and solitary between the pairs. ț S. Native of Brazil. Perhaps sufficiently distinct from M. asperata.

Sicaria Mimosa. Shrub 4 to 6 feet.

SECT. III. BATACAU'lon (from βατος, batos, a bramble, and καυλος, kaulos, a stem; stems prickly). D. C. legum. prod. 2. p. 429. Legumes compressed, flat, quite glabrous or hardly pubescent, with parallel ribs, never contracted at the articulations, unarmed or bearing a single row of spines. The leaves of all are bipinnate, and the flowers either white or pale yellow.

37 M. BEBRE'LLIS (Lam. dict. 1. p. 20.) branch and petiolar prickles scattered and hooked; leaves bipinnate, and are, as well as the branchlets, clothed with adpressed pubescence, having 4-5 pairs of pinnae, and each pinna bearing 10-12 pairs of oblong-linear leaflets; glands oblong, one situated between each pair of pinna when young. ț S. Native of the East Indies. M. octandra, Roxb. cor. 2. t. 200. M. Rottleri, Spreng. syst. 2. p. 206. Heads of flowers yellowish, 3 or 4 rising together from the axils of the upper leaves, which are abortive. Legume compressed, curved, glabrous, obscurely articulated, and furnished with hooked prickles on both sutures, very rarely unarmed.

38 M.? CERATONIA (Lin. spec. 1508.) branch and petiolar prickles scattered and hooked; leaves bipinnate, and are, as well as the branches, glabrous, with usually 5 pairs of pinnae, each pinna bearing many pairs of obovate leaflets; legume smooth, obscurely articulated, and bearing hooked prickles on the ribs on both sides. ț S. Native of St. Domingo and the South America.

Ceratonia-like Mimosa. Shrub 4 to 2 feet.

39 M. OLIGACANTHIA (D. C. legum. prod. 2. p. 429.) caules prickles hooked, one under each leaf; leaves bipinnate, unarmed, and are, as well as the branches, glabrous; pinnae 2-4 pairs, and each pinna bearing 3-4 pairs of obovate leaflets; legumes evidently articulated, and hardly aculeated on the ribs. ț S. Native of St. Martha. Prickles of legume straight, subulate, and very few.

Few-spined Mimosa. Shrub 3 to 6 feet.

40 M. CACA'IATA (Lin. spec. 1500.) branch and petiolar prickles scattered and hooked; leaves bipinnate, with only one pair of pinna, situated at the top of the petiole, each pinna bearing 4 pairs of obliquely-ovate acute leaflets, which are rough from adpressed stipe, and ciliated; legumes oval-oblong, with the disk glabrous, but with the sutures very spiny. ț S. Native of South America. Comm. Hort. 1. t. 28. The lower flowers of the spikes are barren, but the upper ones are fertile.

41 M. LEIOCA'IARA (D. C. legum. mem. xii.) prickles on the branches very few and straightish; leaves unarmed, bipinnate, and are, as well as the branches, glabrous, with 12 pairs of pinnae, each pinna bearing many pairs of linear leaflets; legumes unarmed, glabrous, evidently articulated, disposed in racemes. ț S. Native of St. Martha. Acacia nubanas, Spreng. in herb. Ball. Perhaps belonging to a different division of the genus.

Smooth-spatulate Mimosa. Shrub.

† Species uncertain to which genus they belong, or to what section of the genus; they are therefore disposed according to the form of the leaves.

* Leaves simple.

42 M. BAUHINIFOLIA (Salisb. prod. p. 324.) leaves simple, 2-lobed, pubescent.—Native country, flowers, and fruit unknown.

Perhaps a species of Bauhinia or Hymenaea.

Bauhinia-leaved Mimosa. Shrub.

• Leaves simply pinnate.

43 M. 1 FLORA (Lour. coch. 650.) unarmed; leaves pinnate, with many pairs of very pilose leaflets; leaflets ovate, obtuse; heads of flowers terminal; legume straight, slender. ț G. Native of Cochin-china, in woods. M. crinita, Pers. ench. 2. p. 201. Flowers white, disposed in large heads, polyandrous. Perhaps a species of Inga.

Pilose Mimosa. Shrub 4 feet.

44 M. TE'RA (Lour. coch. 652.) prickles scattered, branchial; leaves impari-pinnate; leaflets 5 pairs, oblong-ovate, emarginate; spikes of flowers lateral; corolla 5-lobed, deciduous; legumes curved, flat, many-seeded. ț S. Native of Cochin-china and China, where it is planted for hedges, which are impenetrable to animals. From the branchied spikes we should judge this tree to be a species of Gleditschia.

Fierce Mimosa. Tree 50 feet.

••• Leaves with one pair of pinnae.

45 M. STAMINAE (Billb. pl. bras. in flora. 1821. p. 332) unarmed; leaves with one pair of pinnae, each pinna bearing about 25 pairs of leaflets; heads of flowers globose, axillary, pedunculate; stamens very long. ț S. Native of Brazil.

Long-stemmed Mimosa. Shrub or tree.

46 M. CASCABE'TELO (Coll. hort. ripal. 91.) unarmed; leaves with one pair of pinnae, each pinna bearing 2-3 pairs of elliptic, acute, glabrous leaflets, with an adpressed gland between the outer pair of leaflets. ț S. Native country unknown, as well as the flowers and fruit. Said to be allied to M. pistaciaefolia.
Cascabelillo Mimosa. Shrub 3 to 4 feet.

47 M. nirsuta (Spreng. syst. 2. p. 204.) unarmed; stipulas linear; leaves with one pair of pinnae, each pinna bearing 12 pairs of oval, margined, ciliated leaflets; common petiole hairy. "S. Native of Monte Video.

Hairy Mimosa. Shrub or tree.

48 M. sprengelii (D. C. prod. 2. p. 430.) prickles scattered, horizontal; branches strigose, adpressed downwards; leaves with 1 pair of pinnae, each pinna bearing 6 pairs of obliquely ovate-oblong, nerves leaflets, ciliated at the base; flowers axillary, sessile, pentandrous. "S. Native of Monte Video.

M. ciliata, Spreng. syst. 2. p. 204. but not of Wild.

Sprengel's Mimosa. Shrub or tree.

** Leaves pinnate and bipinnate. **

49 M. cochlioca' spes (Gomes, obs. pb. bras. p. 50. t. 4. f. 3.) unarmed; leaves distinctly and abruptly-pinnate, with 3 pairs of pinnae, and 3 pairs of leaflets; heads of flowers solitary; legumes compressed, spiral. "G. Native of Brazil, near Rio Janeiro. Abaremotema, Pis. bras. 77. Leaflets ovate-lanceolate, 3 or 4 pairs on each pinna, and 3 pairs of pinnae. Stamens 20, monadophalous. Bark choky, and very astringent.

Twisted-fruited Mimosa. Shrub 3 to 6 feet.

**** Leaves bipinnate. ****

† Unarmed shrubs or trees.

50 M. corniculata (Lour. coch. 651.) unarmed; leaves bipinnate; leaflets usually 8 pairs; petiole prickly at the base, and propped by a recurved callous horn; panicle terminal, subcoriaceous. "G. Native of China, in the suburbs of Canton.

Flowers white, 4-cleft, polyandrous and monadophalous. Perhaps a species of *Acacia*. Louereou did not see any heraphrodite flowers.

Horned-petaled Mimosa. Tree 20 feet.

51 M. baies'ica (Mol. chill. ed. gall. 338.) unarmed; leaves bipinnate; pairs 6 pairs; leaflets somewhat denticulated; flowers celandine. "S. Native of Chili.

Balsam Mimosa. Shrub or tree.

52 M. terminalis (Salisb. prod. 325.) leaves bipinnate; petioles acutely angled above; leaflets unequal-sided, ovate-lanceolate, mucronate, coriaceous. "G. Native about Port Jackson, in New South Wales.

Terminal Mimosa. Tree.

53 M. aggregata (Pers. ench. 2. p. 263.) leaves bipinnate; leaflets distant, pilose beneath, as well as the petiole; peduncles numerous, aggregate in the axis of the leaves. "S. Native of the East Indies. Perhaps a species of *Acacia*.

Aggregato-peduncled Mimosa. Tree.

54 M. rhombipodia (Pers. ench. 2. p. 263.) leaves bipinnate; leaflets large, rhomboidal; flowers disposed in spikes. "S. Native of Trinidad. Perhaps a species of *Acacia*.

Rhombi-leaved Mimosa. Tree.

55 M. torubilis (Forsk. descript. p. 176.) leaves bipinnate, with 5 pairs of pinnae, the outer pair furnished with a scale between, each pinna bearing 7-9 pairs of oblong, very short leaflets; legumes twisted, glomerated. "G. Native of Arabia, near Haras. Flowers white, disposed in heads. Perhaps a species of *Acacia*.

Twisted-peduncled Mimosa. Tree.

56 M. ? glomerata (Forsk. descript. 177.) leaves bipinnate; legumes black, twisted, glomerated. "S. Native of Arabia.

Glomerated-peduncled Mimosa. Shrub.

57 M. ? flavata (Forsk. descript. 176.) leaves bipinnate, with 3-5 pairs of pinnae, each pinna bearing 7-10 pairs of linear oblong leaves, destitute of any glands. "G. Native of Arabia.

Yellow-flowered Mimosa. Shrub.

† Armed shrubs or trees.

58 M. ? lutea (Mill. dict. no. 17.) prickles very long; leaves bipinnate, glabrous; flowers globose, pedunculate. "S. Native of South America. Flowers yellow.

Yellow Mimosa. Shrub.

59 M. ? trienervis (Desf. cat. hort. par. 180. Pers. ench. 2. p. 266.) glabrous; rameal and petiolar prickles scattered, and rather hooked; leaves bipinnate, with 3-4 pairs of pinnae, each pinna bearing 8-10 pairs of oval-rhomboid, mucronate, veiny leaflets, which are 3-nerved at the base; there is a gland at the base of the petiole, and one between each of the two extreme pairs of pinnae. "S. Native country unknown, as well as the legumes and flowers. Acacia trienervis, Desv. journ. bot. 1814. p. 70. Perhaps the figure in Breyn. cent. 1. t. 17. appertains to this plant, and therefore it is the same as M. longisiliquum of Lam. dict. 1. p. 21. The species appears to be intermediate between the sections *Habslina* and *Batacacioides* of the present genus.

Three-nerved-leaved Mimosa. Tree?

60 M. ? angulata (Spreng. neve. entd. 2. p. 158.) prickles on the angles of the branches scattered, and bent backwards; leaves bipinnate, with 12 pairs of pinnae, each pinna bearing many pairs of linear ciliated leaflets; petioles unarmed, and are, as well as the branches, very villous, and bearing glands between the pairs of pinnae; petiole branched. "S. Native of Brazil. Legume unknown. Said to be allied to *M. rubricadulis*.

Angular-branched Mimosa. Shrub or tree.

61 M. rugata (Lam. dict. 1. p. 20.) prickles scattered, short, hooked; leaves bipinnate, with 7-8 pairs of pinnae, each pinna bearing 15-15 pairs of linear leaflets; there is a sessile gland at the base of the petiole; legumes complanate, sinuate, plicated, wrinkled, mucronate. "S. Native of the East Indies. Legumes 5 inches long, and one inch broad. Flowers unknown.

Wrinkled Mimosa. Tree.

62 M. latispinosa (Lam. dict. 1. p. 22.) spines petiolate, scattered, very broad, compressed, straight; leaves bipinnate, at length becoming glabrous, glandless, with 12-20 pairs of unarmed pinnae, each pinna bearing 10-15 pairs of elliptic-oblong leaflets. "S. Native of Madagascar. Petioles, branches, and under side of leaves pubescent. Flowers and fruit unknown.

63 M. ? sinuata (Lour. coch. 653.) shrub climbing and prickly; leaves bipinnate, with many pairs of pinnae, as well as leaflets; leaflets small, linear; heads of flowers axillary, solitary, small, on long peduncles; legumes compressed, sinuate. "G. Native of Cochin-china, in woods. Perhaps a species of *Entada*.

Corolla wanting.

Sinuated-podded Mimosa. Shrub cl.

64 M. ? semi-spinosa (Lin. spec. 1508.) prickles crowded at the tops of the internodes; leaves bipinnate. "S. Native of South America. The rest unknown.

Half-spiny Mimosa. Shrub.

65 M. ? camphechia' na (Mill. dict. no. 20.) spinose; leaves bipinnate; leaflets narrow; spines split their whole length. "S. Native about Camppeachy. The rest unknown.

Camppeachy Mimosa. Tree.

66 M. kantu'fia (Bruce, trav. ed. gall. 8vo. vol. 13. p. 88. t. 36.) rameal, stipular, and petiolar prickles hooked; leaves bipinnate, with 5-8 pairs of pinnae, each pinna bearing about 9 or 10 pairs of oblong obtuse leaflets; spikes of flowers cylindrical; stamens 10, free. "S. Native of Abyssinia. A very prickly bush, with sweet-scented flowers. Pterolobium, R. Brown, abyss.
whence the legume is probably winged. Perhaps a species of Acacia or Gagnebina.

*Kentussia* Mimosa. Shrub 6 feet.

67 M. *agrestis* (Sieb. in Spreng. Syst. 2. p. 206.) prickles on the branches horizontal and straight; branches hoary; leaves bipinnate, with 6 pairs of pinnae, each pinna bearing about 16 pairs of puberesent leaflets; racemes spike-like, exceeding the leaves. 7 G. Native of Palestine. Perhaps the same as *M. arvensis*, Sieb. ex Steud. nom. 

*Field* Mimosa. Shrub.

68 M. *a' muta* (Spreng. Syst. 2. p. 206.) prickles much crowded, straight, and rather flexuous; leaves bipinnate, with 8 pairs of pinnae, each pinna bearing about 12 pairs of roundish leaflets, which are clothed with stellate pubescence, but tomentose beneath; heads of flowers tomentose, hairy. 7 S. Native of Brazil.

*Rival* Mimosa. Shrub or tree.

69 M. *abste'gens* (Roxb. ex Spreng. Syst. 2. p. 206.) prickles on the branches crowded, and a little recurved; branches dotted; branchlets villous; leaves bipinnate, with 8 pairs of pinnae, each pinna bearing many pairs of linear salinated leaflets; petioles unarmed, puberesent, glandular at the base; heads of flowers panicled. 7 S. Native of the East Indies.

70 M. *Madagascar'nis* (Spreng. L. c.) prickles on the branches scattered, and a little reflexed; leaves bipinnate, with 10 pairs of pinnae, each pinna bearing many pairs of minute linear leaflets, which are villous, as well as the branchlets; peduncles lateral, usually twin. 7 G. Native of Madagascar.

*Madagascar* Mimosa. Shrub or tree.

71 M. *brasil'ensis* (Spreng. L. c.) prickles stipular, opposite, erect; petioles hairy, almost unarmed; leaves bipinnate, with many pairs of pinnae, as well as leaflets; leaflets linear, imbricated; heads of flowers shorter than the leaves. 7 S. Native of Brazil.

*Brazil* Mimosa. Shrub or tree.

72 M. *ferruginea* (Rottl. in Spreng. L. c.) prickles both of the branches and petioles recurved; petioles and branchlets pubescent; leaves bipinnate, with many pairs of pinnae, as well as leaflets; leaflets linear, dimidiate, imbricated, glabrous; gland oblong, situated at the base of the petiole; heads of flowers panicked, terminal. 7 S. Native of the East Indies.

73 M. *barleyana* (Hort.) There is nothing further known of this plant than that it is a native of Madagascar.

*Barclay's* Mimosa. Shrub or tree.

*Cult.* The leaves of most of the species of this genus are sensitive to the touch, and are therefore all worth cultivating for curiosity. They thrive well in a mixture of loam and peat, and young cuttings will root if planted in a pot of sand, with a bell-glass placed over them in heat. Some of the kinds ripen seeds in abundance, by which they are easily increased. The seeds of the annual kinds require to be sown in pots, and the pots placed in a hot-bed, and when the plants rise to the height of 2 or 3 inches they should be potted off separately into small pots, and shifted from size to size of pots as they grow, giving the plants plenty of heat and moisture.

**CCXCV. GAGNEBINA (meaning unknown).** Neck. elem. no. 1296. D. C. legum. mem. xii. no. 5. prod. 2. p. 431.

LIN. SYST. Decadria, Monogynia. Flowers hermaphrodite. Calyx 5-toothed. Petals 5, oblong-linear, distinct. Stamens 10. Style long, filiform, deciduous. Legume complanate, dry, indehiscent, with a marginal wing rising from both sutures, transversely many-celled inside; cells 1-seeded.—Elegant, unarmed, glabrous shrubs, natives of the Mauritius and Madagascar. Leaves bipinnate, with many pairs of linear leaflets, which are equal in size and shape, and having a gland at the base of the petiole, and one between each pair of pinnae. Spikes of flowers axillary, cylindrical, yellow. Legumes clothed with white villi when young, but glabrous in the adult state.

2 G. *axillaris* (D. C. prod. 2. p. 432.) leaves with 24 pairs of pinnae, each pinna bearing about 50 pairs of leaflets; spikes of flowers axillary, lower ones solitary, upper ones rising by twos or threes. 7 S. Native along with the preceding species. D. C. legum. mem. xii. t. 64. f. A. *M. pterocarpa*, Lam. dict. 1. p. 13. Vahl. symb. 3. p. 103.

*Cult.* See *Mimosa* for culture and propagation.

LIN. SYST. Polygynia, Mono'c'ia. Flowers polygamous. Calyx 5-toothed. Petals 5, connected together into a 5-cleft corolla. Stamens numerous, exerted, sometimes joined together a short way at the base, and sometimes a great way up. Legume broad, linear, compressed, 1-celled. Seeds sometimes imbedded in pulp, sometimes in farina, and sometimes, though rarely, enwrapped in a pelticle.—Usually unarmed trees or shrubs, with spikes or heads of red or white flowers. This genus will require to be still further divided into separate genera, when the characters of the species are better known. The legumes being in some thickened at the margins, in others flat, straight, or twisted. The seeds in some are imbedded in pulp, in others enveloped in a dry pelticle at maturity. The stamens in some are monadelphous only at the base, while in others they are connected into a long exerted column, and the pollen in the anthers in some is powdery, but in others it is in a few granular masses, as in *Aesclepiadaceae*.

§ 1. *I nga vera* (true species of *Inga*). Leaves simply pinnate. Leaflets large, from 2 to 9 pairs, the extreme ones always the largest. The species contained in this division are all natives of South America; they are unarmed trees, bearing spikes of flowers, with a few exceptions, and furnished with glends on the petioles between the pairs of leaflets.

*Periploca* (from περιπλω, pteron, a wing, and πως τως, pou podos, a foot; in reference to the footstalks of the leaves being winged). *Common periploca evidently winged*.

1 1. *Sapind* (H. B. et Kunth, nov. gen. amer. p. 286.) leaves with 2 pairs of oblong acuminate leaflets, which are membranous, quite smooth, shining above, and attenuated at the base. 7 S. Native of the banks of the river Magdalena. Legumes 5-6 inches long, and a little arched, containing pulp which is sweet and sapid. Flowers unknown.

*Sapid* Inga. Tree 50 feet.

2 1. *Quassiefozia* (Willd. spec. p. 1013.) leaves with 2 pairs of ovate-oblong acuminate leaflets, which are shining on both surfaces; spikes of flowers ovate, pedunculate; corolla villous. 7 S. Native of Para, in Brazil. Superior leaflets 3 inches long. Branches glabrous. *Legume unknown*.

*Quassia-leaved* Inga. Clt. 1820. Tree 40 feet.

3 D 2
3. I. nitida (Willd. spec. 4. p. 1013.) leaves with 2 pairs of oblong-lanceolate leaflets, which are shining on both surfaces, and pilose on the veins beneath; spikes of flowers pedunculate, oblong; corolla villous. \( \frac{7}{2} \). S. Native of Para, in Brazil. Branches hairy. Superior leaflets 4-5 inches long. Legume unknown.

**Shining-leaved Inga.** Tree 30 to 40 feet.

4. I. pilosissima (Desv. journ. bot. 1814. p. 71.) leaves with 2 pairs of oval-oblong, acuminate, shining leaflets, which are rather pilose, as well as the branches; glands large, one between each pair of leaflets; spikes of flowers oblong-capitate, pedunculate; corolla villous. \( \frac{7}{2} \). S. Native of Cayenne. Mimosa pilosissima, Rich. in act. soc. hist. nat. par. 1. p. 113. Mimosa lucida, Vahl. eel. amer. 3. p. 31. t. 24. Petioles cuneately winged beneath the upper pair of pinnae, and somewhat orbicularly winged beneath the lower pair. Branches terete. Superior leaflets 5-6 inches long. Legume unknown.

**Petiole Inga.** Tree 40 feet.

5. I. setifera (D. C. prod. 2. p. 432.) leaves with 2 pairs of oval abruptly-acuminate leaflets, which are rather cuneate at the base, paler beneath, and rather villous on both surfaces; petiole broadly winged, and drawn out at the apex into a long bristle, which is longer than the superior internode of the leaves; spikes of flowers ovate, pedunculate; corolla villous. \( \frac{7}{2} \). S. Native of French Guiana. Superior leaflets 6-8 inches long, and the lower ones 3 inches long, having the nerves clothed with appressed villi, and the intervals between the nerves rather pilose. Legume unknown.

**Bristle-bearing Inga.** Clt. 1824. Tree 20 to 30 feet.

6. I. lucida (H. B. et Kunth, nov. gen. amer. 6. p. 287.) leaves with 2 pairs of nearly elliptic, rather acuminate, coriaceous, quite smooth leaflets, which are shining above, and rounded at the base; spikes of flowers pedicellate, elliptic-oblong; corolla clothed with silky wool. \( \frac{7}{2} \). S. Native on the banks of the river Magdalena, near Badilles. Seeds black.

**Lucid-leaved Inga.** Tree 20 to 30 feet.

7. I. umbellifera (Stend. nom. p. 431.) leaves with 2 pairs of lanceolate leaflets, which are glabrous, as well as the corollas and branches, with a gland between one of the pairs of leaflets; umbels of flowers axillary, pedunculate. \( \frac{7}{2} \). S. Native of South America. Mimosa umbellifera, Vahl. eel. amer. 3. p. 30. Legumes spiral. Flowers white.

**Umbelliferous Inga.** Tree.

8. I. fulgens (Kunth, mim. p. 36. t. 11. nov. gen. amer. 6. p. 287.) leaves with 2-3 pairs of obovate-elliptic, quite smooth leaflets, which are rounded at both ends, and undulate on the margins; spikes of flowers elliptic-oblong, somewhat pedicellate; corolla clothed with silky hairs. \( \frac{7}{2} \). S. Native of New Granada, near Honda. Flowers red. Legumes unknown.

**Fulgent Inga.** Tree.

9. I. macrophylla (Humb. et Bonpl. in Wild. spec. 4. p. 1015.) leaves with 2 or 3 pairs of ovate, cordate, rather acuminate, membranous, glabrous leaflets, which are shining above; spikes of flowers pedunculate; corolla villous. \( \frac{7}{2} \). S. Native of South America, on the banks of the Orinoco near St. Fernando de Atabapo. H. B. et Kunth, nov. gen. amer. 6. p. 286. Branches tetragonal. Superior leaflets half a foot long. Legumes unknown.

**Long-leaflet Inga.** Tree.

10. I. terebrata (Willd. spec. 4. p. 1012.) leaves with 3-4 pairs of oblong, acuminate, nearly equal leaflets, which are glabrous above and scabrous beneath; spikes of flowers ovate, twin, pedunculate. \( \frac{7}{2} \). S. Native of Cayenne. Mimosa alba, Swartz. fl. ind. occ. 2. p. 976. Vahl. eel. 3. p. 31. Petioles a little margined, wingless at the base, but winged at the apex. Corolla green. Filaments white, monadpholous. Legume unknown.

**White-stemmed Inga.** Clt. 1804. Tree 10 to 20 feet.

11. I. feuillei (D. C. prod. 2. p. 433.) leaves with 3-4 pairs of oval-oblong, glabrous leaflets, which are acute at both ends; spikes of flowers usually twin, ovate, pedunculate; legumes very long, linear, flat, glabrous. \( \frac{7}{2} \). S. Native of Peru, also cultivated in the gardens about Lima. Pacáí, Feuill. obs. 3. p. 2. p. 27. t. 19. but not of Frezier. Flowers white. Legume 1-2 feet long, containing a sweet white pulp which is eaten by the natives of Peru.

**Feuille's Inga.** Clt. 1824. Tree 20 to 30 feet.

12. I. simarissis; leaves with 2 pairs of ovate, shining, glabrous leaflets, which taper to both ends; spikes axillary, solitary, shorter than the leaves, pedunculate. \( \frac{7}{2} \). S. Native of Guiana, and the island of St. Christopher. Mimosa Simariensis, Audub. guian. 2. p. 945. Swartz, fl. ind. occ. 2. p. 979. Flowers white.

**Simari Inga.** Tree 20 feet.

13. I. mocisiana; leaves with 5 pairs of elliptic, acuminate leaflets, which are pubescent above, but clothed with silky down beneath; petioles winged; peduncles, racemes, and young branches clothed with rusty down; peduncles solitary, axillary; corolla clothed with yellowish down. \( \frac{7}{2} \). S. Native of Mexico. Flowers red. (v. s. in herb. Lamb.)

**Mocino's Inga.** Tree.

14. I. setosa; clothed with bristles in every part, but more so on the petioles, branches, and peduncles; leaves with 6 pairs of sessile, broad, elliptic, acuminate leaflets; petioles broadly winged; stipulas roundish, acuminate; peduncles long, axillary, solitary, bearing spikes of loose flowers at the apex. \( \frac{7}{2} \). S. Native of Peru. Mimosa setosa. Ruiz et Pav. in herb. Lamb. Pisan Inga. Tree.

15. I. parana; clothed with rusty pubescence, especially on the under side of the leaves, peduncles, and young branches; leaves with 3-4 pairs of oblong, acuminate leaflets; petioles winged; spikes of flowers forming a terminal panicle. \( \frac{7}{2} \). S. Native of Peru. Mimosa Pisana, Ruiz et Pav. in herb. Lamb. Petioles only sometimes winged at the very apex.

**Sweet-scented Inga.** Tree.

17. I. pavosiana; clothed with rusty down; petioles winged; leaflets alternate, elliptic-oblong, broad, acuminate, and rather cordate at the base, glabrous above, except on the nerves; spikes of flowers axillary, solitary; bractæa linear, length of calyx. \( \frac{7}{2} \). S. Native of Peru. Calyx tubular, ribbed. Corolla villous. (v. s. in herb. Lamb.)

**Pavon's Inga.** Tree.

18. I. fastuosus (Wild. spec. 4. p. 1014.) leaves with 4-5 pairs of oval-oblong, acuminate leaflets, which are glabrous above, but clothed with rusty hairs beneath; glands pedicellate; spikes few-flowered; peduncles and corollas villous. \( \frac{7}{2} \). S. Native of Caracas. Mimosa fastuosæ, Jacq. fragm. t. 10. Corolla tubular, rufous, 2 inches long. Stamens red, twice the length of the corolla. Legume broad-linear, twisted in a spiral manner, with thickened margins.

**Proud Inga.** Clt. 1820. Tree 50 feet.

19. I. salvadori (Willd. spec. 4. p. 1012.) leaves with usually 4 pairs of oblong, acuminate leaflets, which are glabrous and shining above, and rather scabrous beneath; spikes of flowers oblong, solitary; corollas glabrous; branchlets hairy. \( \frac{7}{2} \). S. Native of Caracas. Flowers white. Legumes linear, glabrous, a foot long.

**Sapindus-like Inga.** Tree 50 feet.
20. *I. velutina* (Willd. spec. 4. p. 1014.) leaves with 4 pairs of ovate, acute leaflets, which are clothed with soft pubescence on both surfaces, but shining above; spikes of flowers solitary; corolla villos; branches and peduncles hairy. \( \gamma S \). Native of Pará, in Brazil. Legumes unknown. There is a solitary gland between each of the lower pairs of leaflets, and 3 between the superior pair.

**Vele Ving.** Clt. 1820. Tree.

21. *I. affinis* (D. C. prod. 2. p. 483.) leaves with 4 pairs of oval, acuminate leaflets, which are pubescent above and rather shining, but villose beneath and opaque; petioles, branches, peduncles, and flowers clothed with velvety tomentum; spikes of flowers solitary or twin; corolla villos. \( \gamma S \). Native of Brazil. This species is very nearly allied to *I. velutina*, but the leaflets are not above half the size, with a solitary gland between each pair of leaflets.

**Allied Ving.** Clt. 1800. Tree.

22. *I. insignis* (Willd. spec. 4. p. 1012.) leaves with 4 pairs of oval-oblong, acuminate leaflets, which are shining and glabrous above, but clothed with fine pubescence beneath; spikes of flowers axillary, usually twin; corollas villos; legumes sulate, pubescent. \( \gamma S \). Native of South America, in humid places near Cumana and Santa Fe de Bogota. Kunth, mirm. 39. p. 12. H. B. et Kunth, nov. gen. amer. 6. p. 298. Allied to *I. verna*, but the leaflets are pubescent beneath, and the legumes is longer and mucronate. Corolla green.

**Spurios Inga.** Clt. 1820. Tree 40 to 60 feet.

23. *I. ve ra* (Willd. spec. 4. p. 1010.) leaves with 4-5 pairs of obovate-oblong, acuminate, glabrous, membranous leaflets; spikes axillary, few-flowered, usually solitary; corolla clothed with silky wool; legume furrowed, pubescent. \( \gamma S \). Native of Brazil, Mexico, West Indies, and near Maypures, on the Orinoco, &c. Mimosa Inga, Lin. spec. 1498.—Soan. hist. t. 183. f. 1. —Plum. gen. t. 25. Flowers white. Legume sweet and edible.

25. *I. Bonplandiana* (H. B. et Kunth, nov. gen. amer. 6. p. 288.) leaves with 5 pairs of elliptic-oblong, acute, rather coriaceous, somewhat coriaceous, glabrous leaflets, which are shining above; flowers in spikes; corollas silky; legumes glabrous. \( \gamma S \). Native of South America, in the province of Jaen de Bracamoros, on the banks of the Camaya.

**Bonpland's Inga.** Tree 40 to 50 feet.

26. *I. insennis* (Kunth, mirm. p. 43. t. 12. H. B. et Kunth, nov. gen. amer. 6. p. 290.) leaves with 5 pairs of elliptic, acuminate, glabrous leaflets, which are rounded at the base, the nerves rather hairy, shining above; spikes of flowers oblong, axillary, twin; corollas clothed with silky hairs. \( \gamma S \). Native of South America, between Quito and Pueblo. Flowers white. The legume, according to Bonpland, is quadrangular, woody, tomentose, and pulpy inside.

**Seyra Inga.** Tree 40 to 50 feet.

27. *I. ornithos* (H. B. et Kunth, nov. gen. amer. 6. p. 291.) leaves with 5 pairs of oblong-lanceolate, acuminate, coriaceous, pilose leaflets, which are coriaceous at the base and shining above; spikes of flowers solitary, axillary, and terminal. \( \gamma S \). Native near Quito. Flowers unknown. Legume linear, with thickened margins, rather falcate, densely tomentose.

**Ash-leaved Inga.** Tree 20 feet.

28. *I. ornata* (Kunth, mirm. p. 43. t. 14. H. B. et Kunth, nov. gen. amer. 6. p. 292.) leaves with 5 pairs of oblong, acute leaflets, which are rounded at the base, and pubescent above; branches and peduncles clothed with hairy pubescence; spikes of flowers oblong, twin, panieded; corolla clothed with silky hairs. \( \gamma S \). Native in the province of Popayan, on the bank of the river Cauca. Corolla rufous, 10 lines long. Stamens red, 3 inches long. Legumes 3-4 feet long, farrowed, pulpy inside.

**Adorned Inga.** Tree.

29. *I. rhophia* (Willd. enum. p. 1046.) leaves with 5 pairs of oblong, acuminate leaflets which are shining and hairy above, but villous beneath; branches clothed with ferruginous tomentum. \( \gamma S \). Native of Brazil. Flowers and fruit unknown.

**Red-leaved Inga.** Tree.

30. *I. Berteroana* (D. C. legum. mem. xii. prod. 2. p. 484.) leaves with 6 pairs of oblong, acuminate leaflets, which are rather puberulous above, but clothed with soft velvety down beneath, with a gland situated between each pair; branches, peduncles, petioles, calxes, and nerves of leaves clothed with short velvety down; spikes of flowers ovate, axillary, solitary; corolla clothed with silky hairs. \( \gamma S \). Native of St. Martha. Corolla white. Stamens red.

**Bertero's Inga.** Tree.

31. *I. angustifolia* (Willd. spec. 4. p. 1012.) leaves with 4-9 pairs of lanceolate, acuminate leaflets, which are shining on both surfaces; legumes linear, flat, glabrous. \( \gamma S \). Native of Caracas. Glands small, between the pairs of leaflets. Flowers unknown.

**Narrow-leaffletted Inga.** Tree.

* * Apetropode (from a, priv. πετρον, pteron, a wing, and πως πακι, pous podos, a foot; in allusion to the footstalks of the leaves being without wings, so conspicuous in the last division. Common petiole hardly winged or altogether naked.

32. *I. Bourgoin (D. C. prod. 2. p. 484.) leaves with 2-3 pairs of ovate, shining, glabrous leaflets; petioles a little winged at the apex of the articulations, and also each furnished with a gland; spikes of flowers axillary, short, usually 4-together. \( \gamma S \). Native of Guiana, Cayenne, Caracas, and of Barbados, in humid woods. Mimosa Bourgoin, Aubl. guian. 2. t. 358. Mimosa furficula, Lin. spec. 1498. I. marginata, Willd. spec. 4. p. 1015. The legume, according to Aublet, is dry and divided internally into many cells by transverse dissepiments. The column of stamens exserted beyond the corolla, which is glabrous. Bourgoin is the French name of the tree in Guiana.

**Bourgoin Inga.** Clt. 1752. Tree 30 to 40 feet.

33. *I. marginata* (H. B. et Kunth, nov. gen. amer. 6. p. 285.) leaves with 2 pairs of oblong, much-acuminated, membranous, glabrous leaflets, which are opaque above, and shining beneath, and conuated at the base; petiole rather pilose, furnished with a narrow wing at the apex. \( \gamma S \). Native of South America, in the valleys of Araguen. Perhaps sufficiently distinct from *I. Bourgoin*. Flowers white.

**Marginate-petioled Inga.** Clt. 1820. Tree 20 to 30 feet.

34. *I. thyrsoides* (Desv. journ. bot. 1814. p. 71.) leaves with 3 pairs of ovate, glabrous leaflets, which are veiny beneath; petioles almost naked, except at the tops of the articulations, where they are a little winged; branches angular, cinereous; flowers thyrsoid. \( \gamma S \). Native of Guiana. Legume unknown. Flowers not sufficiently known.

**Thyrsoid Inga.** Tree.

35. *I. Aubignosa* (D. C. prod. 2. p. 484.) leaves with 4-5 pairs of oblong-ovate, acuminate leaflets, which are glabrous and shining above, except on the nerves, but clothed with rusty velvety down beneath, as well as the branches, petioles, peduncles, and calxes; spikes of flowers oblong, usually twin; corolla clothed with silky hairs. \( \gamma S \). Native of Cayenne.

Reusty Inga. Tree.
36 I. THIBAUDIANA (D. C. legum. mem. xii. prod. 2. p. 434.) leaves with 4-5 pairs of ovate-oblong, acuminate leaflets, which are glabrous above, except the nerves, but pubescent beneath as well as the petioles, peduncles, and calyces; spikes of flowers usually twin, oblong, but panicked at the tops of the branches; corollas clothed with silky pubescence. *S.* Native of Cayenne. Petioles winged at the apex, but naked at the base. Corolla slender, 7 lines long. Stamens red, exerted. Legume unknown.

Thibaud’s Inga. Tree.
37 I. FRAXINEA (Willd. spec. 4. p. 1019.) leaves with 5 pairs of oblong, acuminate, shining leaflets; petiole semi-terete, pubescent; spikes of flowers pedunculate, pubescent, and panicked at the tops of the branches; corollas glabrous. *S.* Native of Para, in Brazil. Legume unknown.

Ash-like Inga. Tree. 20 to 30 feet.
38 I. INEGUALIS (Humb. et Bonpl. in Willd. spec. 4. p. 1019.) leaves with 4 pairs of oblong-lanceolate, membranous leaflets, which are unequal at the base, shining above, and glabrous on both surfaces as well as the petioles, peduncles, and flowers; spikes of flowers oblong, on short peduncles. *S.* Native of the banks of the Orinoco.

Unequal-leafletted Inga. Tree.
39 I. HUMBOLDTIANA (H. B. et Kunth, nov. gen. amer. 6. p. 285.) leaves with 4 pairs of oblong, acute, membranous, glabrous leaflets, which are acutish at the base and shining above; spikes of flowers nearly globose, terminal, panicked; corolla clothed with silky hairs. *S.* Native of New Granada, on the banks of the river Magdalena. Legume unknown.

Humboldt’s Inga. Tree.
40 I. XONILIS (Willd. enum. 1047.) leaves with 3-4 pairs of oblong, acute, glabrous leaflets; spikes panicked; peduncles pubescent; corolla silky. *S.* Native of Brazil. Legume unknown.

Noble Inga. Tree.
41 I. JUGLANDIFOLIA (Willd. spec. 4. p. 1018.) leaves with 3-4 pairs of oblong, acuminate, glabrous leaflets, which are attenuated at the base; petioles glabrose, and are as well as the branches clothed with ferruginous pubescence; spikes of flowers 2-3-together, axillary, pedunculate; corolla villous. *S.* Native of Caracas. Legume linear, flat, 7 inches long. This is very distinct, from the absence of the glands on the petiole.

Walnut-leafed Inga. Tree. 20 to 30 feet.
42 I. CORUSCANS (Humb. et Bonpl. in Willd. spec. 4. p. 1017.) leaves with 3 pairs of oblong leaflets, which are attenuated at both ends, coriaceous, glabrous, and shining; petioles, branches, peduncles, and flowers glabrous; spikes of flowers 2-3-together, crowded, axillary. *S.* Native of New Granada, on the banks of the river Magdalena, near Vigo. Spikes of flowers 2 inches long. Legume unknown. Kunth, nov. gen. amer. 6. p. 285.

Glittering Inga. Tree.
43 I. STIPULARIS (D. C. legum. mem. xii. prod. 2. p. 435.) leaves with, 2-3 pairs of oval, acutish leaflets, which are shining above, but glabrous on both surfaces, as well as the branches and flowers; stipulae large, orbicular, permanent, foliaceous; spikes of flowers ovate, axillary, solitary, pedunculate. *S.* Native of Cayenne. Calyx tubular, 2-3 lines long. Corolla hardly twice the length of the calyx. Legume unknown.

Stipular Inga. Tree.
44 I. CAPITATA (Desv. journ. bot. 1814. vol. 1. p. 71.) leaves with 2 pairs of ovate, acuminate, shining leaflets, which are quite glabrous on both surfaces, as well as petioles, branches, peduncles, and flowers; spikes of flowers ovate-oblong, axillary, 2-3-together, pedunculate. *S.* Native of Cayenne. Branches warty, terete. Calyx, tubular, 2-3 lines long. Legume unknown.

Capitate-flowered Inga. Tree.
45 I. LAURIANAI (Willd. spec. 4. p. 1018.) leaves with 2 pairs of ovate-oblong, acuminate, shining leaflets, which are glabrous on both surfaces, as well as the petioles, peduncles, and flowers; spikes of flowers solitary or twin, elongated, almost sessile, axillary. *S.* Native of St. Christopher, Martinico, St. Domingo, Brazil, Guadaloupe, and Porto-Rico. Mimosa laurina, Swartz, fl. ind. occ. 2. p. 978. Mimosa fagifolia, Jacq. amer. 264. t. 164. Calyx 1 line long. Corolla white, 3 times the length of the calyx. The pulp contained in the legumes is purgative.

Laurel-like Inga. Cilt. 1818. Tree 30 feet.
46 I. PUNCTATA (Willd. spec. 4. p. 1016.) leaves with 2-3 pairs of oblong, acuminate, shining leaflets, which are glabrous as well as the branches; petioles terete, pubescent; spikes of flowers ovate, pedunculate, and panicked at the tops of the branches; corolla clothed with silky villi. *S.* Native of Caracases. Branches beset with white dots. Legume unknown.

47 I. SPLENDENS (Willd. spec. 4. p. 1017.) leaves with 2 pairs of oblong, acuminate, shining leaflets, which are glabrous on both surfaces, as well as petioles and branches; spikes of flowers axillary, twin, pedunculate; corolla clothed with silky villi. *S.* Native of Para, in Brazil. Branches warty. Legumes unknown. The species is said to be allied to I. punctata, but it is larger in all its parts.

Splendent Inga. Tree.
48 I. SPECTABILIS (Willd. spec. 4. p. 1017.) leaves with 2 pairs of ovate, acute, shining leaflets, which are unequal at the base and glabrous on both surfaces, as well as the petioles and branches; spikes terminal; corollas villous. *S.* Native of South America, and cultivated in St. Martha. Mimosa spectabilis, Vahl, act. soc. hafn. 2. p. 219. t. 10. Leaflets thickly beset with feather nerves, the superior ones 6 or 7 inches long and 4 broad, but the lower ones are one-half smaller than the superior ones.

Sherry Inga. Tree.
49 I. SERTULLIFERA (D. C. prod. 2. p. 436.) leaves with 2 pairs of ovate, shining leaflets, which are glabrous on both surfaces as well as the calyces and corollas; flowers pedunculate, umbellate; umbels simple. *S.* Native of Cayenne. Mimosa coriacea, Pers. enh. 2. p. 263. Inga coriacea, Desv. journ. bot. 1814. vol. 1. p. 71. but not of Willd. Branches warty. Leaflets large. Legumes unknown.

Little-garland-bearing Inga. Tree.
50 I. NODOSA (Willd. spec. 4. p. 1016.) leaves with 2 pairs of ovate-oblong, unequal-sided, glabrous leaflets, furnished with a small gland between the lower pair. *S.* Native of Ceylon, Mimosa nodosa, Lin. spec. 1496.—Pluk. alum. 211. f. 5.

Knotted Inga. Tree.
51 I. CORIACEA; leaves with 3-4 pairs of leaflets, lower ones the smallest; petioles wingless; leaflets lanceolate, acuminate, oblique at the base, undulated on the margins, hairy as well as the petioles and young branches; peduncles short, few-flowered, lateral, terminal, and axillary. *S.* Native of Mexico. Mimosa coriacea, Seese et Moe, in herb. Lamb. Coriaceae.-leaved Inga. Tree.
52 I. COCCINEA; petioles wingless; leaves with 3 pairs of broad-elliptic, acuminate, smooth leaflets, which are oblique at the base, sometimes with a smaller leaflet on one side at the base; spikes long. *S.* Native of Peru. Mimosa coccinea, Ruiz et Pav. in herb. Lamb. Flowers scarlet.
Scarlet-flowered Inga. Tree.

53 I. carrnosa; petals wingsless; leaves with 3 pairs of broad, elliptic, mucronate, smooth leaflets; peduncles axillary, twist, clothed with rusty down as well as the young branches; legumes lanceolate, flat. * S. Native of Peru. Mimosa carrnosa, Ruiz et Pav. in herb. Lamb.

Fleshy Inga. Tree.

54 I. Ruiziana; petals wingsless; leaves with 4 pairs of elliptic-oblong, very long, and very broad, smoothish leaflets; peduncles axillary, clothed with rusty down; spikes capitulate, many-flowered. * S. Native of Peru. (v.s. in herb. Lamb.)

Ruis’s Inga. Tree.

55 I. agresta; petals wingsless; leaves with 3-4 pairs of smooth, membranous, ovate-oblong, acuminate leaflets; spikes aggregate, axillary. * S. Native of Peru. (v.s. in herb. Lamb.)

Aggregate-spiked Inga. Tree.

56 I. stipulacea; petals hispid, wingsless; leaves with 2 pairs of broad, elliptic, acuminate, sessile leaflets, which are attenuated at the base; tube of stamens much exerted; stipules large, rounded at the apex, nerved. * S. Native of Peru. Mimosa stipulacea, Ruiz et Pav. in herb. Lamb.

Large-stipuled Inga. Tree.

57 I. Guayaquilensis; petals naked; leaves with 2 pairs of elliptic-oblong, glabrous leaflets, which are attenuated at both ends, and acuminate at the apex; spikes sessile, solitary, or twin. * S. Native of Guayaquil. (v.s. in herb. Ruiz et Pav.)

Guayaquil Inga. Tree.

58 I. Faigifolia; petals wingsless; leaves with 3 pairs of long, oblong-lanceolate, glabrous leaflets, furnished with 1 gland between each pair; peduncles terminal and axillary, twin or solitary; peduncles clothed with rusty down. * S. Native of Guayaquil. (v.s. in herb. Ruiz et Pav.)

Guayapo Inga. Tree.

59 I. umbellata; petals wingless, bearing only one pair of leaflets at the apex, which are ovate-elliptic, acuminate, and glabrous; peduncles axillary; flowers umbellate, pedicellate. * S. Native of Peru. Mimosa axillaris, Ruiz et Pav. in herb. Lamb. Flowers apparently white.

Umbellate-flowered Inga. Tree.

60 I. heterophyllya (Willd. spec. 4. p. 1030.) leaves with 1-2 pairs of oblong, acuminate leaflets, which are shining on both surfaces; petals, branches, and flowers glabrous; glands of the petiole somewhat pedicellate; peduncles terete at the base; flowers disposed in umbellate racemes. * S. Native of Para, in Brazil. Mimosa Para, Poir. suppl. 1. p. 44. Branches warty from dots. Leaflets 1½ inch long. Legumes unknown.

Various-leaved Inga. Tree.

61 I. hymenæoides (Desv. journ. bot. 1814. 1. p. 70.) leaves with 1-2 pairs of ovate, oblong, obtuse, shining leaflets; peduncles glandless; branches, peduncles, and flowers glabrous; heads of flowers axillary, pedunculate; legumes oblong, obtuse, straight, tapering at the base, with thickened margins. * S. Native of Cayenne. Leaflets rather coriaceous, 1½ inch long and 1 inch broad. Legumes 2 inches long.

Hymenæa-like Inga. Cl. 1823. Tree.

62 I. Inicuill (Schlecht et Cham. in Linnaea. 5. p. 492.) This species comes very near  I. coruscans, with the glands on the petioles usually obsolete, the legume 1 foot long and an inch broad, 6-10-seeded, glabrous, curved, or straight, with the valves thick, and containing eatable pulp. There is another tree found in Mexico, near Colima, very similar to  I. inicuill, but differs in the glands, in the petioles being always present, and in the inflorescence being in few-flowered heads, in short peduncles, which are disposed in crowded fascicles in the axils of the leaves.

8. S. Native of Mexico, where it is called inicuill. Bracteoles minute, ciliate. Flowers white.

Inicuill Inga. Tree.

§ 2. Hymenaëoideae (containing plants which have the habit of Hymenæa). Leaves with 1 pair of pinnae, and each pinna bearing 2-3 or many leaflets.

* Bigemine (from bis, twice, and geminis, a twin; in reference to the leaves, which are divided twice by twos). Leaves with one pair of pinnae, and each pinna bearing only one pair of leaflets.

63 I. microphylla (Humb. et Bonpl. in Willd. spec. 4. p. 1004.) spikes stipular, straight; leaflets dimidiatly-elliptic, obtuse, and retuse, glabrous, rather coriaceous; petiole smooth, furnished with a gland in the fork; spikes of flowers globosely-elliptic, solitary, axillary; corolla 5-cleft, glabrous. * S. Native of South America, near Cumana. H. B. et Kunth, nov. gen. amer. 6. p. 293. Spines thick. Legumes unknown.

Small-leaved Inga. Cl. 1817. Shrubs 6 feet.

64 I. pruegens (Humb. et Bonpl. in Willd. spec. 4. p. 1004.) spikes stipular, very short, straight; leaflets dimidiatly-oblong, obtuse and retuse, membranous, glabrous; petals hairy, furnished with a gland in the fork; heads of flowers globose, racemose; corolla 5-cleft, pubescent; legumes torulose, circuminate. * S. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 294. Flowers white.

Pungent Inga. Tree 50 feet.

65 I. duicis (Willd. spec. 4. p. 1005.) spikes stipular, very short, straight; leaflets somewhat dimidiatly-oblong, obtuse, and somewhat retuse and mucronate; petals hairy, shorter than the leaflets, with a gland in the fork, as well as one between the leaflets; heads of flowers globose, racemose. * S. Native of Coromandel and the Philippine islands. Mimosa dilicis, Roxb. cor. 1. t. 99. Flowers white, in terminal racemes. Legume twisted, red, and glabrous, containing a fleshy sweet pulp, which is reckoned wholesome.

Sweet Inga. Cl. 1800. Tree 30 feet.

66 I. Javaëa (D. C. prod. 2. p. 436.) spikes stipular, very short, and straight, or wanting; leaflets somewhat dimidiatly-oblong, obtuse, glabrous; petiole smooth, and longer than the leaflets, with a gland in the fork; heads of flowers globose, racemose. * S. Native of Java. Legume flat, incurved, glabrous, corollate between the seeds.

Java Inga. Tree 20 feet.

67 I. ungues-caiti (Willd. spec. 4. p. 1006.) spikes stipular, straight; leaflets roundish-elliptic, rather dimidiate, emarginate, membranous, glabrous; petiole glabrous, furnished with a gland in the fork, and between the leaflets; heads of flowers globose, disposed in terminal racemes; legume twisted. * S. Native of the Caribbee Islands, and near Cumana. Mimosa anguis-cati, Lin. spec. 499. Jacq. hort. schonbr. 3. t. 392. Descout. fl. ant. 1. t. 11. Quâmobilt, Hern. mex. 94.–Plum. ed. Bourn. t. 4. Flowers whitish. In Jamaica it is called Black-bean shrub. The seeds, according to Sloane, are eaten by goats, and sometimes by the negroes; they are frequently brought to England, and strung as beads. The bark is astringent, and is used in lotions and fomentations in America.

Cat’s-claw Inga. Cl. 1670. Tree 10 feet.

Guadaloupe Inga. Tree.

69 I. meliifera (Willd. spec. 1. p. 1006.) spines stipular, recurved; leaflets somewhat dimidiately-obovate, with a gland at the base of the petiole; legume ensiform, straight. $\S$. Native of Arabia Felix. Mimosa unguis-cati, Forsk. desc. 176. M. mellifera, Vahl. symb. 2. p. 103. Flowers white, from which bees collect a great deal of honey.

Honey-bearing Inga. Tree 10 feet.

70 I. Lanceolata (Humb. et Bonpl. in Willd. spec. 4. p. 1005.) spines stipular, straight; leaflets somewhat dimidiately-lanceolate, obtusate, rather puberulous, furnished with a gland in the fork, and between the leaflets; spikes of flowers cylindric, axillary, solitary; legumes curved. $\S$. Native of New Andalusia, near Cumana. Kunth, mim. 49. t. 15. nov. gen. amer. 6. p. 293. Flowers white; as in the rest of the present division of the genus. Legume linear, glabrous. Spikes longer than the leaves.

Lanceolate-leafletted Inga. Tree 50 to 60 feet.

71 I. Legustrina (Willd. spec. 4. p. 1007.) spines stipular, short, straight; leaflets dimidiately-oblong, obtuse at both ends; petiole pubescent, with a gland in the fork, as well as one between the leaflets; spikes of flowers cylindric, axillary, solitary; legume straight. $\S$. Native of the West Indies. Mimosa fe'cida, Jacq. hort. schonbr. 3. t. 390. Acacia fe'cida, H. B. et Kunth, nov. gen. amer. 6. p. 265. Corolla greenish. Stamens 10, white. Spikes of flowers almost extraflaceous. Legume unknown. Seeds naked, ex Bonpl.

Petid Inga. Clt. 1816. Tree 10 to 20 feet.

Hymenaea-leaved Inga. Tree 20 feet.

73 I. Sprengelii; spines stipular, twin, straight; leaves with one pair of pinnae, each pinna bearing 2 obliquely-oblong, obtuse, coriaceous, glabrous leaflets; flowers racemose; legumes glabrous, smoothish. $\S$. Native of South America. I. Ber'terii, Spreng. syst. 3. p. 127. but not of D. C. Sprengelii Inga. Tree.

74 I. Pure'scens (Bert. inedl. D. C. prod. 2. p. 437.) spines stipular, very small, straight; leaflets oblong-lanceolate, rather oblique at the base, obtuse, pubescent beneath; petiole pubescent, with a gland in the fork and between the leaflets; heads of flowers globose, racemose. $\S$. Native of South America. Corolla greenish, puberulous. Stamens red. Legume unknown. Very like I. Jor'fex.

Pubescent Inga. Tree.

75 I. ro'brex (Kunth, mim. p. 52. t. 16. nov. gen. amer. 6. p. 295.) leaflets obliquely-oblong, or lanceolate-oblong, acute, and rather mucronate; petiole glabrous, with a gland in the fork and between the leaflets; heads of flowers globose, racemose. $\S$. Native of New Granada, near Carthagena. Corolla greenish, puberulous. Stamens red. Legume unknown. Forcex Inga. Tree 20 feet.

76 I. ro'sea (Steu'd. nom. p. 431.) spines stipular, straight; leaflets lanceolate, and are, as well as the branches, glabrous; heads few-flowered, disposed in loose axillary racemes; pedicels twin. $\S$. Native of Cayenne. Mimosa ro'sea, Vahl. celt. amer. 3. p. 33. t. 25. Flowers red. Legume unknown.

Var. $\beta$, subinermis (D. C. prod. 2. p. 437.) leaflets oblong, pubescent beneath; spines very short.

Rose-coloured-flowered Inga. Shrub 6 to 10 feet.

78 I. Macrostychus (Steu'd. nom. p. 431.) spines stipular, straight; leaflets lanceolate-oblong, and are, as well as the branches, glabrous, with a gland at the top of the common petiole, as well as one at the tops of partial ones; spikes of flowers axillary, elongated, solitary; corolla clothed with fine tomentum on the outside. $\S$. Native of Cayenne. Mimosa brachystachys, Vahl. celt. amer. 3. p. 34. t. 24. Legumes unknown.

Long-spiked Inga. Tree.

Panicled Inga. Tree.

80 I. Tetraphylla; leaves with 1 pair of pinnae, and each pinna bearing 1 pair of leaflets; leaflets oblong, oblique, clothed with white pili beneath; peduncles twin, axillary; heads of flowers globose. $\S$. Native of Mexico. Mimosa tetraphylla, Sesel et Moc. in herb. Lamb.

Four-leafletted Inga. Shrub.

* * Tergeminae (from ter, thrice, and geminus, a twin; in reference to the divisions of the leaves). Leaves with 1 pair of pinnae, each pinna bearing 3 or 5 leaflets.

81 I. Ramiflora; smooth; leaves with 1 pair of pinnae, and each pinna furnished with 3 leaflets, which are elliptic and acuminate; spikes sessile, rising in clusters from the branches. $\S$. Native of Guayaquil. Mimosa ramiflora, Ruiz et Pav. in herb. Lamb. Flowers apparently white.

Branch-flowered Inga. Tree 20 feet.

82 I. Tergemina (Willd. spec. 4. p. 1008.) unarmed; pinnae trifoliate; leaflets obliquely-oblong, obtuse, glaucous beneath; petioles glandless; fascicles of flowers axillary, solitary, pedunculate; legumes straight, with thickened margins. $\S$. Native of Martinico. Mimosa tergemina, Lin. spec. 1499. Jacq. amer. t. 177. f. 81.—Plum. ed. Burm. t. 10. f. 1.—I. Caripénis, Willd. spec. 4. p. 1009. which is different, according to Kunth, nov. gen. amer. 6. p. 298. Flowers purplish.

83 I. Vahl'iana (D. C. prod. 2. p. 438.) unarmed; pinnae trifoliate; leaflets obliquely-lanceolate, attenuated, bluish-tinted, and are as well as the branches glabrous, with a gland on the top of the common petiole, as well as on the tops of the partial ones; spikes of flowers somewhat opposite, elongated, rising from the leafless branches. $\S$. Native of St. Martha. Mimosa ligustrina, Vahl. celt. amer. 3. p. 34. t. 27. but not of Jacquin. Vahl's Inga. Tree.

84 I. Emarginata (Humb. et Bonpl. in Willd. spec. 4. p. 1009.) unarmed; pinnae trifoliate; leaflets somewhat dimidiately obovate, obtuse, sometimes somewhat emarginate, and rather cordate at the base; petioles glandless; fascicles of flowers pedunculate, disposed in a somewhat panicled raceme. $\S$. Native of Mexico, near Acapulco, on the sea-shore. Kunth,

LEGUMINOS.E. CCXXV. INGA.

Caracara Inga. Shrub cl. 87. I. longifolia (Humb. et Bonpl. in Willd. spec. 4. p. 1009.) shrub climbing, unarmed; pinna trifoliate; leaflets oblong- lanceolate, acuminate, minutely serrate at the base, membranous, glabrous; peduncles axillary, small; legumes cuneate. S. Native of South America, near Cavocho, on the banks of the Channaya. H. et Kunth. Nov. gen. amer. 6. p. 298.

Long-leafflet Inga. Shrub cl. 88. I. falciformis (D. C. prod. 2. p. 438.) unarmed; pinna trifoliate; leaflets oblong-lanceolate, acuminate, more or less round-tipped, armed at the base, narrowest on the inner side, with a gland between the pinna and one between the terminal leaflets; leaf very flat, linear, falcate, obtuse. S. Native of St. Martha. Plant quite glabrous. Leaflets 4-6 inches long, and 1 inch broad. Legumes longer than the leaflets, containing about 14 seeds.

Falciform-podded Inga. Tree.

90. I. glomerata (D. C. prod. 2. p. 438.) unarmed; pinna trifoliate; leaflets minutely oblong-lanceolate, attenuated at the base, acuminate at the apex, with a gland between the pinnae and between the opposite leaflets; flowers disposed in glomerate fascicles, which are axillary, lateral, and sessile. S. Native of Cayenne. Stamens monadelphous beyond the corolla. Flowers apparently white. Leaves glabrous.

Glomerate-flowered Inga. Tree. 91. I. latifolia (Willd. spec. 4. p. 1020.) unarmed; pinnae trifoliate, but usually bearing 5 leaflets; leaflets minute at the base, obovate-oblong, acuminate, lower ones alternate, upper ones opposite, with a gland between the pinnae and between the opposite leaflets; flowers disposed in pedunculate, lateral, and axillary fascicles. S. Native of the Caribbean islands, and the warmer parts of Mexico. Mimosa latifolia, Lin. spec. 1498.—Plum. ed. Burm. t. 9. Flowers rose-coloured. Legumes unknown.

91. I. umbrosa (Wall. pl. rar. asiat. 2. p. 23. t. 124.) spines stellate, simple; leaves with 1 pair of pinnae, each pinna bearing 3 broad leaflets, the lower one the smallest; leaflets oblong, obtuse, oblique at the base, acute; petiolo wingless, bearing a small, flat gland at the apex; heads of flowers pedunculate, axillary, solitary, glabrous, globose. S. Native of Silhet. Flowers white, fragrant.

Shady Inga. Tree 40 to 60 feet.

** Conjugata-pinnata (from conjugatus and pinnatus; in reference to the disposition of the leaflets). Leaves with one pair of pinnae, each pinna bearing from 1 to many pairs of opposite leaflets.

** Vol. 11.
between each pair; flowers lateral, in umbels. *P. S.* Native of Para, in Brazil. Allied to *I. latifolia*.

**Stem-flowered Inga.** Tree 40 feet.

101 **I. bigeminia** (Willd. spec. 4. p. 1807.) unarmored; pinnae 2, each bearing 2-3 pairs of oblong-lanceolate, acuminate leaflets; petiole glabrous, with a gland in the fork and one between each pair of leaflets; racemes panicled, terminal, legume twisted. *P. S.* Native of the East Indies. Mimosa bigeminia, Lin. spec. 1409. Vahl. symb. 2. p. 103.—Rheed. mal. 6. t. 12.

**Two-paired-leafleted Inga.** Tree 40 feet.

102 **I. jiringa** (Jacq. mal. misc. 1. no. 1. p. 14. under *Mimosa* unarmored; pinnae 2, each bearing 3 pairs of quite smooth leaflets; panicles fascicled, axillary; heads few-flowered; legumes large, articulate twisted, black. *P. S.* Native of the East Indies, Pulo-Pinang, Malacca, &c. Mimosa Djiriniga, Roxb. hort. beng. p. 98. Flowers white. *Jirinnga* is the Malay name of the tree.

**Jirinnga Inga.** Tree.

103 **I. mollissima** (Humb. et Bonpl. in Willd. spec. 4. p. 1007.) unarmored; pinnae 2, each bearing 4 pairs of obliquely obovate leaflets, which are clothed on both surfaces with very soft silky villi; petioles glandless, and are as well as the branches clothed with pubescence; heads of flowers pedunculate, axillary, solitary. *P. S.* Native of South America. Kunth, min. p. 61. t. 19. H. B. et Kunth, nov. gen. amer. 6. p. 306. Legume straight, linear, obtuse, beset with hairy tomentum, with thickened margins. Stamens white.

**Very soft Inga.** Tree 20 feet.

104 **I. fasciculata** (Willd. spec. 4. p. 1022.) unarmored; pinnae 2, each bearing 8-10 pairs of culturate, 2-nerved leaflets; heads of flowers pedunculate, axillary, solitary. *P. S.* Native of Para, in Brazil. Legume linear, flat, acute, attenuated at the base, with a thickened glabrous margin.

**Fascicled-flowered Inga.** Tree 20 feet.

105 **I. Canescens** (Schlecht. et Cham. in Linnaea. 5. p. 593.) shrubby, unarmed, and clothed on every part with soft canescent hairs; leaves with 1 pair of pinnae, each pinna bearing 2 pairs of leaflets, lower pair the smallest, all obliquely elliptic, obtuse, and mucronulate; heads of flowers axillary, on long peduncles. *P. S.* Native of Mexico, between Marantal and Puente del Rey. A much-branched shrub. Terminal leaflets 9 lines long. Tube of stamens exserted beyond the corolla.

**Cane-canescent Inga.** Shrub 6 feet.

106 **I. triflora**; unarmored; pinnae 2, each bearing 3-4 pairs of obovate, roundish, nervet, coriaceous, glabrous, shining, box-like leaflets, which are rusty beneath and glabrous at the base; pinches of flowers axillary; the heads few-flowered. *P. S.* Native of Guayaquil. Mimosa triflora, Ruiz et Pav. in herb. Lamb.

**Three-flowered Inga.** Shrub 6 feet.

107 **I. Adiantifolia** (Kunth, min. p. 66. t. 21. nov. gen. amer. 6. p. 501.) unarmored; upper leaves conjugately pinnate, lower ones bipinnate, each pinna bearing from 11-13 pairs of obliquely-linear, oblong, glabrous leaflets, which are cuneate at the base; heads of flowers axillary, pedunculate, solitary, or twin. *P. S.* Native of South America, on the shady banks of the river Atahopo, in the province of Guatita. *I. discolor*, Willd. 4. p. 1023. Corolla greenish. Stamens white. Legumes unknown.

**Adiantum-leaved Inga.** Tree 20 to 30 feet.

§ 3. *Samanaceae* (*Saman* is the South American name of *A. Sáman*).

**Leaves doubly pinnate, that is, bipinnate.**

*Paucifololate* (from *pauce*, few, and *follodium*, a leaflet).

Spines none. Leaves with from 2-9 pairs of pinnae, each pinna bearing from 2-20 pairs of leaflets.

108 **I. Filipes** (Vent. choix. t. 38.) leaves with 2 pairs of pinnae, each pinna bearing from 3-4 pairs of obovate, glabrous leaflets, with a gland between each pair of pinnae; heads of flowers axillary, on very long peduncles, rather pendulous. *P. S.* Native of St. Domingo. Flowers red. Legume linear, pendulous, acute, torulose at the seeds.

**Thread-petioled Inga.** Shrub 6 feet.

109 **I. Nanoeufolia** (D. C. prod. 2. p. 440.) leaves with 2 or 3 pairs of pinnae, each bearing 2-3 pairs of oval leaflets, which are attenuated at both ends, with an obscure gland between each pair of pinnae; heads of flowers usually twin, on long peduncles. *P. S.* Native of Brazil. The leaves are black when dried. Legume linear and incurved.

**Nanoeufolia-leaved Inga.** Shrub.

110 **I. moniliformis** (D. C. prod. 2. p. 440.) leaves with 2 pairs of pinnae, each bearing 6-7 pairs of oval, obtuse, glabrous leaflets, with a depressed gland between each pair of pinnae; petioles and peduncles rather pubescent; umbels of flowers axillary, on long peduncles; flowers on long pedicels; legume moniliform. *P. S.* Native of the island of Timor. Corolla tubular, and is as well as calyx glabrous. Stamens numerous.

**Moniliform-podded Inga.** Tree or shrub.

111 **I. Saponaaria** (Willd. spec. 4. p. 1008.) leaves with 2 pairs of distant pinnae, each bearing 2 pairs of ovate, acuminate leaflets, with a large, elongated gland at the base of the common petiole; heads of flowers axillary and terminal, disposed in loose, panicled corymbs. *P. S.* Native of the Moluccas, and of Cochín-china, in woods. *Mimosa saponaaria*, Lour. coch. p. 653.—Rumph. amb. 4. t. 66. The bark yields excellent soap, which is used by the inhabitants of Cochín-china.

**Soap Inga.** Shrub.

112 **I. Brachystachya** (D. C. prod. 2. p. 440.) leaves with 3 pairs of pinnae, each bearing 3-4 pairs of oval, rather obovate, obtuse, glabrous, shining leaflets, with a gland between each of the pairs of pinnae, and also between the upper pair of the leaflets; petioles, branches, peduncles, and flowers clothed with velvety pubescence; spikes of flowers ovate. *P. S.* Native of Brazil. Peduncles rising 2-3-together from the axes of the leaves. Leaflets reticulately veined beneath.

**Short-spike Inga.** Tree or shrub.

113 **I. Sassa** (Willd. spec. 4. p. 1027.) leaves with 3-4 pairs of pinnae, each bearing 12 pairs of oblong-ovate leaflets; flowers umbrellately panicled; staminiferous tube exserted beyond the corolla. *P. S.* Native of Abyssinia. Sassa, Bruce. trav. 5. t. 4 and 5. Flowers of two forms, some with a short staminiferous column, and some with a long one, as in the next species.

**Sassa Inga.** Tree.

114 **I. Zygia** (D. C. legum. mem. xii. t. 65. prod. 2. p. 440.) leaves with 3-4 pairs of pinnae, each bearing 3-4 pairs of somewhat rhomboïd-ovate leaflets, with a gland at the base of the common petiole; flowers umbraculately panicled; stamens monadelphous, with the tube much exserted beyond the corolla. *P. S.* Native of the West Indies. Staminiferous tube twisted when the flowers are in restoration. Legumes unknown. From the structure of the stamens the present plant, along with *I. Sassa*, *I.温馨比ía*, and *I. Bourgôni*, will probably form a distinct genus or a section, which may be called *Zygia*, as in P. Browne, jam. 72. f. 8.

**Zygia Inga.** Tree.

115 **I. Meritensisoides** (Nees. et Mart. act. bonn. 12. p. 35. t. 5.) leaves with 2-3 pairs of pinnae, each bearing 12-15 pairs of sessile leaflets; common petiole hairy; spikes of flowers globose, pedunculate, disposed in terminal corymbs at the tops of the branches. *P. S.* Native of Brazil, in fields. Acacia asplenoides, Nees. in bot. zeit. 4. p. 203. bras. reis. 2. p. 192.
Corolla 4 rarely 5-cleft. Stamens red. Legume 2-3-seeded. Allied to L. adiantifolia.

Mertensia-like Inga. Shrub 2 to 4 feet. 116 I. comosa (Willd. spec. 4. p. 1029.) leaves with 3 pairs of pinnae, each bearing 2-10 pairs of ovate leaflets, which are setose at the base; flowers disposed in panicled corylums; pedi- toes, branches, and flowers glabrous. f. S. Native of Jamaica, on rocks. Mimosa comosa, Swartz. fl. ind. occ. 980. Leaves usually twin. There are holes instead of glands on the partial pedi- toes, which are edged with hairs. Ovary pubescent. Legume glabrous. Flowers white.

Tufted Inga. Cilt. 1818. Tree 20 to 30 feet. 117 I. trapenzifolia (D. C. prod. 2. p. 441.) leaves with 2-4 pairs of pinnae, each bearing 5-9 pairs of rhomboid-ovate leaflets, which are glabrous and shining above, but clothed with pubescence beneath, as well as pedi- toes, branches, peduncles, and flowers; glands between the lower pinna, and with some along the upper side of the partial pedi- toes beneath the upper pairs of leaflets; heads of flowers pedunculate, solitary, axillary. f. S. Native of Cayenne. Mimosa trapenzifolia, Valil. exl. amer. 3. p. 56. t. 28. Legume glabrous, twisted.

Trapezied-leaved Inga. Tree. 118 I. cyclocarpa (Willd. spec. 4. p. 1026.) leaves with usually 9 pairs of pinnae, each bearing 20-30 pairs of leaflets, outer ones largest, with a gland in the middle of the petiole; spikes of flowers globose, pedunculate, axillary; legumes ciliate. f. S. Native of Caraccas. Mimosa cyclocarpa, Jacq. fragm. t. 34. f. 1. Flowers white. The pulp in the legume is saponaceous.

Circle-podded Inga. Tree 60 feet. 119 I. cinerea (Hub. et Bonpl. in Willd. spec. 4. p. 1024. et H. B. et Kunth, nov. gen. amer. 6. p. 504.) leaves with 5 pairs of pinnae, each bearing 6 pairs of obliquely ovate leaflets, which are glabrous above and pubescent beneath, with a gland between each pair of pinnae and one between each pair of leaflets; heads of flowers pedunculate, globose; stamens 20-22. f. S. Native of Caraccas. Branchlets pubescent. Mimosa pubigera, Poir. suppl. 1. p. 47. Stamens red. This species, with the fol- lowing, will perhaps form a distinct genus.

Grey Inga. Tree 30 to 40 feet. 120 I. salutarius (H. B. et Kunth, nov. gen. amer. 6. p. 504.) leaves with 4 pairs of pinnae, each bearing 6-7 pairs of somewhat rhomboid-ovate leaflets, which are glabrous above but clothed with soft pubescence beneath, with a gland between each pair of pinnae, and also between each pair of leaflets; heads of flowers globose; stamens about 40; legumes rather torulose. f. S. Native of New Granada, between Turbo and Carthage. Stamens red.

Salutary Inga. Tree 20 to 30 feet. 121 I. saman (Willd. spec. 4. p. 1024.) leaves with 4-6 pairs of pinnae, outer pairs of pinnae bearing 6 pairs of leaflets, inner pair bearing 2 or 3 pairs; leaflets ovate-oblong, obtuse, glabrous above but pubescent beneath, as also the peti- toes and branchlets, with a gland between each pair of pinnae, as well as one between each pair of leaflets; heads of flowers pedunculate, axillary, lower ones solitary, the upper ones rising 3-6-together. f. S. Native of Caraccas and Jamaica. Mimosa Saman, Jacq. fragm. t. 9. Legume linear, 7-8 inches long, flat on both sides, and channelled on both sutures. Branchlets striated, when young they are clothed with velvetyomentum, as well as the leaves.

Saman Inga. Tree 60 feet. 122 I. pedicellaris (D. C. prod. 2. p. 441.) leaves with 6-7 pairs of pinnae, each bearing about 20 pairs of oblong-linear, obtuse leaflets, which are glabrous above and pubescent beneath, as well as the peduncles, peti- toes, branches, and flowers, with a thick gland between the upper pair of pinnae, and a small one between the upper pair of leaflets; heads of flowers usually twin, axillary; flowers pedicellate. f. S. Native of Cayenne. Legume oblong, straight, 2¼ inches long and an inch broad, chinky on the inside after the seeds have fallen.

Pedicellate-flowered Inga. Tree 20 to 40 feet. 123 I. pterocarpa (D. C. prod. 2. p. 441.) leaves with 8-9 pairs of pinnae, each bearing about 12 pairs of oval, very blunt, glabrous leaflets; pedi- toes velvety, glandless; legumes compressed, winged, nearly lanceolate, glabrous. f. S. Native of the island of Timor. Flowers unknown.

Winged-fruited Inga. Tree. 124 I. hirsuta; densely clothed in every part with white hairs; leaves with 3-4 pairs of pinnae, each pinna bearing many pairs of small leaflets, which are densely clothed with white hairs beneath, but glabrous above; heads of flowers solitary, axillary, on long peduncles; flowers silky. f. S. Native of New Spain. Mimosa hirsuta, Ruiz et Pav. in herb. Lamb. Stamens red, much exerted.

Hairy Inga. Tree. 125 I. l. leptophylla (Lag. gen. et spec. 16. no. 293.) spines stipular, recurved; leaves with 4-7 pairs of pinnae, each pinna bearing 10-18 pairs of leaflets; heads of flowers globose, peduncle- late; legumes lanceolate, nearly falcate. f. S. Native of South America. Mimosa leptophylla, Cav. Flowers all her- maphrodite. Perhaps a species of Actaea.

Slender-leaved Inga. Shrub 4 to 6 feet. 126 I. martilis (Spreng. in herb. Balb. syst. 3. p. 132.) spines lateral, straight, solitary; leaves with 6-8 pairs of pinnae, each pinna bearing from 15-23 pairs of linear leaflets; peti- toes pubescent, bearing a gland at the base, and one between each of the 2 ultimate pairs of pinna; heads of flowers axillary and lateral, on short peduncles, somewhat umbraculately globose. f. S. Native of St. Martha. Young branches rising from scaly stipulaceous buds. Stipulas oblong. Spines usually absent. Corolla glabrous, 5-cleft. Stamens numerous. Legume rather falcate, compressed, 4 inches long, bearing gum on the inside.

Corcondian Inga. Tree. 128 I. alternifolia; smooth; leaves bipinnate, with many pairs of pinnae, each pinna bearing many alternate, glaucous, coriaceous leaflets; spines stipular, straight; peduncles solitary, axillary; heads of flowers globular; legumes smooth, twisted in the form of a shell. f. S. Native of Mexico. Mimosa cirrhinumtus, Sesce et Moc. in herb. Lamb.

Alternate-leaflletted Inga. Shrub 2 to 3 feet. 129 I. peandula (Willd. spec. 4. p. 1025.) leaves with about 20 pairs of pinnae, each pinna bearing numerous pairs of linear ciliated leaflets; peti- toes pubescent, bearing a gland above its

3 E 2
LEGUMINOSÆ.  CCXXV.  INGA.  CCXXXVI.  PARKIA.

base; spikes of flowers globose, on long compressed peduncles, pendulous. ♂. S. Native of Para, in Brazil. Legume unknown. Perhaps a species of Parkia.

Pendulous-spiked Inga. Tree 30 feet.

130 I. filicina (Willd. spec. p. 1025.) leaves with 10 pairs of pinnae, each pinna bearing numerous pairs of linear, obtuse, mucronulate, shining leaves; pedicels and peduncles clothed with rusty pubescence; spikes of flowers oblong, on long peduncles, drooping. ♂. S. Native of Para, in Brazil. Perhaps a species of Parkia.

Fern-like-leaved Inga. Tree.

131 I. fuculifera (Hamilt. prod. fl. ind. occ. p. 61.) unarmed; leaves with usually 7 pairs of pinnae, each pinna bearing 45-50 pairs of narrow, linear, acute leaves, which are cordate at the base; racis and pedicels pubescent; heads of flowers oblong, on long peduncles; legume pedicellate, twin. ♂. S. Native of St. Domingo, where it is called Pois doux. Legume 8-10 inches long, margined, filled with sweet yellow edible pulp inside.

Fuculiform Inga. Tree 20 to 30 feet.

§ 4. Anneslega (in honour of George Annesley, Lord Mountnorris). Leaves bipinnate, with 6-50 pairs of pinnae; each pinna bearing many pairs of linear leaflets. Anters 2-celled; the pollen in 4 globular masses. This division will certainly form a distinct genus.

132 I. glandulosa (Stend. nom. p. 431.) leaves with 17 pairs of pinnae, each pinna bearing 8 pairs of linear acute leaflets, which are glabrous, as well as the corollas, with a sessile gland seated between each pair of leaflets; spikes of flowers axillary, solitary, erect, longer than the leaves. ♂. S. Native of Cayenne. Mimosa glandulosa, Vahl. clem. amer. 3. p. 38, but not of Smith nor Michx. Corella 5-cleft. Stamens numerous, monadelphous. Legumes unknown.

Glandular Inga. Shrub 6 to 10 feet.

133 I. pennatula (Schlecht. et Cham. in Linneæ. 5. p. 593.) clothed with white mealy tomentum; branches flexuous, angular, striated, pubescent; leaves with 40-50 pairs of pinnae, each pinna bearing many pairs of small, oblong, obtuse, ciliated and densely imbricated leaflets, with a large gland beneath the lower pair of pinnae on the petiole; prickles stipular, connate, straight, spreading, conically-subulate; heads of flowers axillary, on short peduncles; legume in an immature state fleshy; seeds immersed in pulp. ♂. S. Native of Mexico, near Hacienda de La Laguna, and also near Jalapa.

Feathered-leaved Inga. Shrub.

134 I. anomala (Kunth, mim. 70. t. 22. nov. gen. amer. 6. p. 203.) leaves with 15-17 pairs of rather unequal pinnae; each pinna bearing many pairs of linear leaflets, which are obtuse at both ends and glabrous, but adpressedly ciliated on the margins; petioles glandless, and are, as well as the branches, peduncles, and flowers puberulous; heads usually twin, few-flowered, disposed in a terminal raceme. ♂. S. Native of Mexico, near Pascuaro, and on mount Jorullo. Mimosa grandiflora, Lher. sort. ang. t. 30. Acacia grandiflora, Willd. spec. 4. p. 1074. Coll. hort. rip. 2. t. 9. Legume linear, acute, glabrous, attenuated at the base, having the margins thickened. Flowers of a pleasing red colour, sessile on the apex of the peduncle. Anters 2-celled; the pollen in 4 globular masses.

Anomalous Inga. Fl. May, Aug. Clt. 1729. Sh. 6 to 10 feet.

135 I. Houstonia (D. C. prod. 2. p. 442.) leaves with 5-7 pairs of pinnae, the upper ones longer than the rest, each pinna bearing many pairs of linear leaflets, which are somewhat obt-

liquely-truncate at both extremities, and pubescent beneath; pedioles glandless, and are, as well as the peduncles and flowers, clothed with rufous tomentum; heads usually twin, few-flowered, disposed in a terminal raceme. ♂. S. Native of Mexico, about Vera Cruz. Gleditschia inermis, Lin. spec. 1509. Mimosa Houstonia, Lher. sort. t. 30. Acacia Houstonia, Willd. spec. 4. p. 1062. Ker. bot. reg. 98. Mill. fig. t. 5. Mimosa hierauta, Vahl. Flowers white. Anthers like those of I. anomala. Legume linear, flat, very hairy.

Houston's Inga. Fl. May, Aug. Clt. 1729. Sh. 6 to 10 ft.

136 I. ? Timoria (D. C. prod. 2. p. 442.) leaves with usually about 50 pairs of pinnae, each pinna bearing numerous pairs of linear leaflets, which are obliquely truncate at both ends, and pubescent beneath; pedioles glandless, and are, as well as branchlets, velvety. ♂. S. Native of the island of Timor. Leaflets about 50 pairs. Flowers unknown. The legume is described by De Candolle as being on a long pedicel within the calyx, oblong, compressed, flat, obtuse, and glabrous, but as it was only on the same sheet of paper with the specimen, and separated from it, it is doubtful whether it belonged to the plant or not.

Timor Inga. Tree 60 feet.

Cult. ? Ina is a fine genus of trees and shrubs, bearing deli-

crete compound leaves, and beautiful flowers; for which some of the species are much admired. They are all increased by young cuttings, which should be taken off at a joint, and planted in a pot of sand, placing a bell-glass over them, then the pot to be plunged in heat.

CCXXXVI. PARKIA (in memory of Mungo Park, the cele-

Lin. syst. Monadelphía, Decádria. Calyx tubular, bilabiata, the mouth imbricate in estivation. Petals 5, nearly equal, the upper one a little broader than the rest, conspicuously imbricated in estivation. Stamens 10, hypogynous, monadelphous. Legume many-seeded, 2-valved, separated into 1-seeded divisions, filled with farinaceous pulp.—African and East Indian unarmed trees, with bipinnate leaves with many pairs of pinnae, and each of the pinna bearing many pairs of leaflets, with minute stipulas, axillary pedunculate spikes of vermilion flowers, which are seated on a club-shaped or orbicular receptacle, the lower ones usually wanting.

1 P. africana (R. Brown, l. c.) leaves with usually 20 pairs of pinnae, each pinna bearing about 30 pairs of obtuse pubescent leaflets, with a gland at the base of the petiole, and with a small umbilicate gland between 2 or 3 of the upper pairs of leaflets; heads of flowers biglobular. ♂. S. Native of Africa, in various places, particularly on the western coast, in the kingdoms of Benin and Warre; and also of North Africa, in Soudan, where it is called Dourou. ? Inga biglobosa, Beauv. fl. d'ouw. 2. p. 53. t. 90. D. C. prod. 2. p. 442. Mimosa biglobosa, Jauc. amer. t. 176. f. 87. Mimosa taxifolia, Pers. ench. 2. p. 266. In Soudan the seeds are roasted as we roast coffee, then bruised, and allowed to ferment in water; when they begin to become putrid they are well washed and pounded, the powder made into cakes, somewhat in the manner of our chocolate; they form an excel-

lent sauce for all kinds of food. The farinaceous matter sur-

rounding the seeds is made into a pleasant drink, and they also make it into a kind of sweetmeat.

2 P. uniglobosa (G. Don, in Loud. hort. brit. p. 277.) leaves bipinnate, pubescent, with many pairs of pinnae, each pinna bear-

ing many pairs of leaflets; heads of flowers globular, on very long peduncles. ♂. S. Native of Sierra Leone, where it is
called Locust-tree. Heads of flowers pendulous. Flowers of a vermilion colour. The pulpm within the pods is sweet and aromatic, and is eaten by the natives of Africa. This is probably the Nitta mentioned by Mr. Mango Park.

3. P. Roxb. in Bonpl. J. of Bot. (1822) 2: 63. = P. Roxb. var. indica; leaves with usually 20-24 pairs of pinnae, each pinna bearing 50-65 pairs of linear, obtuse, rather falciform leaflets, with a gland between 2 or 3 of the upper pairs of pinnae; rachis pubescent; head of flowers club-shaped. 7. S. Native of Sylhet, in the East Indies. 1. Y nga biglobosa, Roxb. Flowers vermilion.

Roxburgh's Nitta Tree. Tree 30 to 40 feet.

Cult. See Inga for culture and propagation, p. 396.

LIN. SYST. Polygynia Monocot. Flowers polygamous. Petals 5, joined in a 5-celled corolla. Stamens 8-10, free. Legume minutely echinate, tetragonal, and as if it were 4-valved in consequence of the valves being divisible into 2 parts longitudinally. Seeds numerous, oblong,-Herbs, with tuberculous roots, and angular stems. Petioles and legumes beset with hooked prickles. Leaves bipinnate, sensible to the touch, as those of the sensitive plants. Flowers rose-coloured, collected into globose heads.

1. S. ACULEATA (Willd. spec. 4, p. 1041) stem tetragonal; leaves with 2-3 pairs of pinnae, each pinna bearing numerous pairs of leaflets; legumes acute, a little longer than the peduncle; heads of flowers solitary. 7. S. Native of Mexico, about Vera Cruz. Mimosa quadrivalvis, Lin. spec. 1508. Mill. fig. t. 183. f. 1. Banks, rel. Houst. t. 25. Flowers red. Roots creeping.

2. S. LEPTOCA'RA (D. C. legum. mem. xii. prod. 2. p. 443,) stem tetragonal; leaves with 2-3 pairs of pinnae, each pinna bearing many pairs of leaflets; legumes ending in a long acumen, 10 times the length of the peduncles; heads of flowers solitary or twin. 7. S. Native of St. Domingo. Prickles of the stem and petioles hooked, but those on the legume are subsulate and straight. Flowers red.

Slender-fruited Schrankia. Pl. 1 to 2 feet.

3. S. HAMATA (Humb. et Bonpl. in Willd. spec. 4, p. 1042,) stem pentagonal; leaves with 4 pairs of pinnae, each pinna bearing many pairs of leaflets, which are unequal at the base; legumes ending in a beak-like acumen; heads of flowers on very short peduncles. 7. S. Native of South America, on the banks of the river Magdalena near Mompos. H. B. et Kunth, nov. gen. amer. 6. p. 260. Flowers red.

Hooked-prickled Schrankia. Pl. 1 to 2 feet.

4. S. DISTA'CHY (Moc. et Sesse, fl. mex. const. ined. D. C. prod. 2. p. 443,) stems pentagonal; leaves with 6 pairs of pinnae, each pinna bearing many pairs of leaflets; legumes acute at both ends, 3 times the length of the peduncles; heads of flowers twin. 7. S. Native of New Spain. Flowers red.

Two-spiked Schrankia. Pl. 1 to 2 ft.

5. S. UNDONATA (Willd. spec. 2. p. 443,) stem pentagonal; leaves with 6 pairs of pinnae, each pinna bearing many pairs of leaflets; legumes ending in a beak-like acumen at the apex, twice the length of the peduncles; heads of flowers solitary or twin. 7. F. Native of North America, from Virginia to Florida. Mimosa floridana, Michx. fl. bor. amer. 2. p. 154. Vent. choix. t. 28. Mimosa lindia, Walt. car. p. 252. Flowers red.

Cult. All the species of this genus are worth cultivating on account of their leaves, which fall at the slightest touch, as those of the sensitive plants. They grow best in a mixture of loam, peat, and sand, and may be propagated by young cuttings planted in sand, with a bell-glass placed over them in heat, or they may be increased by separating the tubers of the roots.

1. D. BRACHYLOBA (D. C. legum. mem. xii. t. 66,) plant herbaceous, unarmed, glabrous; leaves with 6-9 pairs of pinnae, each pinna bearing 15-25 pairs of linear leaflets, with a gland seated between the lower pair of pinnae; heads of flowers solitary, axillary, pedunculate; legumes straightish, lanceolate. 7. F. Native of meadows in the region of Illinois and Kentucky. Acacia brachyloba, Willd. spec. 4. p. 1071. Mimosa Illinonicus, Michx. fl. bor. amer. 2. p. 254. Legume glabrous, 6-7 lines long, and 1 1/2 broad. Flowers white.

2. D. Glandulosa (D. C. l. c.) plant herbaceous, glabrous, unarmed; leaves with 12-14 pairs of pinnae, each pinna bearing 20-30 pairs of linear leaflets, with a gland situated on the petiole between each of the pairs of pinnae; heads of flowers solitary, pedunculate, axillary; legumes falcate. 7. F. Native of the plains along the banks of the rivers Tennessee and Mississippi. Mimosa glandulosa, Michx. fl. bor. amer. 2. p. 254. Vent. choix. t. 27. but not of Smith. Acacia glandulosa, Willd. spec. 4. p. 10711. Mimosa contortuplicata, Zucc. obs. cent. 1. no. 100. Flowers white.

3. D. INTERMÉDIA (Torrey in ann. lyc. 2. p. 191,) unarmed, herbaceous, and glabrous; leaves with 8-9 pairs of pinnae, each pinna bearing many pairs of oblong-linear leaflets, with a gland seated on the petiole between the lower pair of pinnae; heads of flowers solitary, axillary, pedunculate; legumes falcate. 7. F. Native of North America, on the Canadian river. Flowers white.

Intermediate Darlingtonia. Pl. 1 foot.

Cult. Peat and sand, mixed with some vegetable mould is the best soil for the species of Darlingtonia. They should be grown in pots, and placed among the Alpine plants, and they may be increased by dividing at the root, or by young cuttings planted in sand, with a bell-glass placed over them.

CCXXIX. DESMAN'THUS (from démean, desme, a bundle, and a'enos, anthos, a flower; in reference to the flowers, which are collected into bundles or spikes). Willd. spec. 4. p. 1044. Kunth, mîm. p. 115. D. C. prod. 2. p. 443.

LIN. SYST. Polygynia, Monocot. Flowers polygamous. Calyx 5-toothed. Petals 5, distinct, oblong-spatulate or joined, but usually wanting in the newer flowers. Stamens 10, rarely 5, with the filaments in the lower flowers of the spike sterile, membranous, and dilated or filiform. Legume dry, continuous, 2-valved. -Herbs or shrubs, with bipinnate leaves, and linear leaflets. Spikes of flowers axillary, pedunculate, ovate or cylindrical. Flowers white, but with the fertile filaments usually yellow. Perhaps it would have been better to have divided the present genus into three separate genera instead of sections.
LEGUMINOS.E.  

**Sect. I. Neptunia** (so called on account of the species contained in this section being inhabitants of lakes and ponds).  
Legume oblong, 4-6-seeded, broadest at the base. Sterile filaments all petaloid.—Prostrate, usually rooting, aquatic herbs, furnished with bipinnate leaves, which are sensible to the touch, as those of the sensitive plants, and axillary solitary peduncles. Leaves with 2-3 pairs of pinnae, each pinna bearing 10-12 pairs of leaflets.

1 D. lauc'iris (Willd. spec. 4. p. 1044.) stems creeping, terete; leaves with 3 pairs of pinnae, each pinna bearing many pairs of leaflets; peduncles bracteate; spikes of flowers ovate.  
2 W. S. Native of South America, near Monypox, floating in stagnant water, as well as in the river Magdalena. Mimosa lauc'iris, Humb, et Bonpl. pl. equin. 1. t. 16. Mimosa aquatica, Pers. ench. no. 58. Sterile stems white tipped with yellow. 

2 D. nat'ans (Willd. l. c.) stems terete, creeping, inflated in parts; leaves with 2-3 pairs of pinnae, each pinna bearing many pairs of leaflets; spikes of flowers ovate; peduncles naked, or only furnished with one bract.  

3 D. stol'eni'era (D. C. prod. 2. p. 444.) stems terete, creeping; leaves with 2-3 pairs of pinnae, each pinna bearing many pairs of leaflets; spikes of flowers nearly globose; peduncles long, naked, or furnished with one bracteate in the middle.  
2 W. H. Native of Senegal, floating in stagnant water. The plant throws out large branched roots. Stamens long, petaloid. Mimosa stoloni'era, Perr. in litt. Mimosa aq'uitica, Bœde in litt.

**Stolon-bearing Desmanthus.** Pl. fl.

4 D. poly-phyl'lius (D. C. prod. 2. p. 444.) stem erect? angular; leaves with 4 pairs of pinnae, each pinna bearing many pairs of leaflets; peduncles furnished with 2 bracteate each; spikes of flowers ovate.  
2 W. S. Native country unknown. Leaflets 30-60 pairs. Legume oval-oblong, tapering into a stipite at the base, 5-seeded. 

**Many-leaved Desmanthus.** Pl. fl.

5 D. triqu'er'tus (Willd. spec. 4. p. 1045.) stems prostrate, compressed, triquetrous at the base; leaves with 2-3 pairs of pinnae, each pinna bearing 12 pairs of leaflets; spikes of flowers globose; peduncles furnished with 2 deciduous bracteate.  

6 D. ple'na (Willd. spec. l. c.) stems prostrate, compressed; leaves with 2-4 pairs of pinnae, each pinna bearing 12 pairs of leaflets; peduncles bracteate.  
2 W. S. Native of Mexico, about Vera Cruz, in water. Mimosa pléna, Lin. spec. 1502. Mill. fig. t. 182. f. 2. Banks, rel. Houst. t. 23. Bracteate 2 on each peduncle, broad, ovate-lanceolate, acuminate. Flowers white and yellow. 

**Sect. II. Desma'the'a (an alteration from the generic name).**  
D. C. legum. mem. xii. prod. 2. p. 444. Legumes linear, 10-15-seeded. Sterile stamens almost filiform. Neuter flowers usually petaloid.—Shrubs or subshrubs, with leaves which are not sensible to the touch as those of the last section. Leaves bipinnate, with from 2-5 pairs of pinnae, each pinna bearing from 12-15 pairs of leaflets.

7 D. depre'ssus (Humb. et Bonpl. in Willd. spec. 4. p. 1546.) stems suffruticose, prostrate; leaves with 2 pairs of pinnae; petiole bearing one gland at the apex; spikes capitulate, few-flowered; flowers deciduous; legume narrow, linear.  
7 S. Native of Peru, near Moche, and of Guadalupe. Kuntch, mii. m. 115. t. 35. nov. gen. amer. 6. p. 262. Mimosa depré'ssus, Poir. suppl. 1. p. 58. Flowers white. 

**Depressed Desmanthus.** Shrub prostrate.

8 D. depre'ssus (Wild. l. c.) stems suffruticose, prostrate; leaves with 4-5 pairs of pinnae; spikes capitulate, few-flowered; flowers pentandrous; legumes narrow, linear.  

9 D. leptophyl'lius (H. B. et Kuntch, nov. gen. amer. 6. p. 264.) stems suffruticose; leaves with 6-7 pairs of pinnae, each pinna bearing 16-20 pairs of linear, acute, ciliated leaflets, with a gland seated on the petiole between the lower pair of pinnae; heads few-flowered; flowers deciduous; legumes linear, elongated.  
7 S. Native of Cumana, near Bondores. Flowers white. 

**Sleender-leaved Desmanthus.** Shrub ½ foot.

10 D. virgi'ata (Willd. spec. 4. p. 1047. exclusive of the synonyms of Pluck. and Rheed.) stems suffruticose, erect, angular; leaves with 3-4 pairs of pinnae, with a gland situated between the lower pair; peduncles naked; spikes few-flowered, capitulate; flowers deciduous; legume narrow, linear, 25-30-seeded.  

**Twiggly Desmanthus.** Fl. June, Aug. Ctt. 1774. Shrub 1 to 2 feet.

11 D. strict'us (Bertol. vir. bon. 1824. p. 49.) stem suffruticose, erect, angular; leaves with 4-5 pairs of pinnae, with a gland situated on the petiole beneath the lower pair; peduncles naked; spikes capitulate, few-flowered; flowers deciduous, legume narrow, linear, 15-20-seeded.  
7 S. Native of Jamaica, St. Domingo, and Guadalupe. Mimosa puncta'ta, Lin. spec. 1504.—Comm. hort. 1. t. 31. Flowers white. The legume has the form of those species contained in the section Neptunia, but it contains from 12-15 seeds as in those of the present section. 

**Straight-stemmed Desmanthus.** Fl. June, Aug. Ctt. 1800. Shrub 1 to 2 feet.

12 D. punctu'us (Willd. l. c.) stem suffruticose, erect; leaves with 4-5 pairs of pinnae, with a gland situated on the petiole beneath the lower pair; spikes of flowers ovate; peduncles furnished with deciduous bracteate at the base; flowers deciduous; legume linear-oblong, rather oblique at the base, hardy 5 times longer than broad.  
7 S. Native of the East Indies. Mimosa angustistilia, Lam. dict. 1. p. 10. Flowers white. Very like D. virga'ta according to Besse, cat. hort. crem. 1816. p. 49. of which it is perhaps only a variety. 

**Straight-stemmed Desmanthus.** Fl. June, Aug. Ctt. 1800. Shrub 1 to 2 feet.

13 D. tenex'lus (D. C. prod. 2. p. 445.) stems rather diffuse; leaves with 3-4 pairs of pinnae, having a gland situated on the petiole beneath the lower pair; peduncles naked, shorter than the petioles; legume linear, 10-12-seeded, hardly 5 times longer than the breadth.  
7 S. Native of the East Indies. Legume 3-9 lines long, and 2 lines broad. 

**Weak Desmanthus.** Shrub 1 foot.

**Sect. III. Dicho'stachys** (from ἕ in, dis, two, χορὼ, chronia, colour, and στεφάς, stachys, a spike; in reference to the two colours of the spikes of flowers, from the white and yellow stamens).
LEGUMINOSÆ. CCXXIX. Desmanthus.

D. C. legum. mem. xii. prod. 2. p. 445. Legume linear, twisted or somewhat falcate? Sterile filaments linear, and elongated; anthers of the fertile ones bearing a pedicellate gland at the apex of each. Petals 5, distinct or joined?—Shrubs, having the branches usually spinose, with bipinnate pubescent leaves, bearing from 5-10 pairs of pinnae, and each pinna bearing many pairs of leaflets, furnished with glands between the pairs of pinnae, especially between the lower ones. Flowers disposed in oblong-cylindrical 2-coloured spikes, in consequence of the sterile stamens being white or variously coloured, and the fertile ones yellow.

14 D. divergens (Wildl. spec. 4. p. 1048.) leaves with 8 pairs of pinnae, each pinna bearing 20-50 pairs of ciliated leaflets; spikes of flowers twin, pendulous, cylindrically obovate; legumes twisted. S. Native of Abyssinia. Bruce, trav. 5. t. 61. Diverging Desmanthus. Fl. June, July. Clt. 1816. Shrub 3 to 6 feet.

15 D. lepto'stachys (D.C. legum. mem. xii. prod. 2. p. 445.) leaves with 8 pairs of pinnae, each pinna bearing 20-50 pairs of ciliated leaflets, furnished with a stipitate gland between each pair of pinnae; petioles and peduncles hairy; spikes of flowers usually twin, cylindrical, shorter than the leaves. S. Native of Senegal and Sierra Leone. Sieb. pl. exsic. senec. 47. Very nearly allied to the preceding species, but differs from the plant figured by Bruce, in the leaflets being more numerous, and in the spikes of flowers being more slender, and not pendulous, and, lastly, in the sterile filaments being filiform.

16 D. callis'tachys (D.C. prod. 2. p. 445.) leaves with 5 pairs of pinnae, each pinna bearing about 20 pairs of leaflets; petioles and peduncles puberulous; glands on the petiole sessile; spikes solitary, cylindrical, erect. S. Native country unknown. Spikes of flowers rose-coloured at the bottom, but yellow at the top. Stillest filaments linear. Anthers furnished with a black gland each. The specimens of this plant were collected in the gardens of Teneriffe.

17 D. tricho'stachys (D.C. legum. mem. xii. t. 67.) leaves with 10 pairs of pinnae, each pinna bearing 20 pairs of ciliated leaflets; petioles and peduncles puberulous; glands on the pedicellate; spikes cylindrical, erect, interrupted at the base, rather longer than the leaves. S. Native of Senegal. Mimosa bicolor, Bade in litt. 1820. Mimosa varia, Perr. in litt. 1825. Branches unarmed according to the specimen. Spikes 2 inches long. Sterile filaments very long, and hair-formed.

Hair-spiked Desmanthus. Shrub 3 to 4 feet.

18 D. cine'reus (Wildl. spec. 4. p. 1048.) leaves with 8-10 pairs of pinnae, each pinna bearing about 12-15 pairs of ciliated leaflets; petioles pubescent; spikes of flowers solitary, nodding, rather shorter than the leaves; corolla gamopetalous, 5-toothed; legume linear, falcate, somewhat transversely lobulate inside. S. Native of the East Indies. Mimosa cinerea, Lin. spec. 1505. Roxb. cor. 2. t. 174.—Burm. zeyl. t. 2. Spikes rose-coloured at the bottom and yellow at the apex. Branches white, when young pubescent.

19 D. nulator (D.C. prod. 2. p. 446.) branches spiny, when young clothed with hairy tomentum; leaves with 10 pairs of pinnae, each pinna bearing 20-25 pairs of ciliated leaflets; petioles villous; spikes pedunculate, rather shorter than the leaves, nodding; flowers decandrous, the filaments in the lower ones castrate and petaloid. S. Native of Senegal. Mimosa nulator, Pers. ench. 2. p. 115. This is perhaps the same as D. lepto'stachys, but differs in the spines being straight, spreading, simple, hairy, but at length becoming glabrous.

Nodding-spiked Desmanthus. Shrub 3 to 4 feet.

Cult. A mixture ofpeats, loam, and sand suits the species of this genus, and young cuttings root readily if planted in a pot of sand, with a bell-glass placed over them. The kinds belonging to section I. *Nepitina*, being aquatic with sensitive leaves, should be grown in tubs or large pans, with 4 or 5 inches of mould in the bottom, and filled up with water. The tubs or pans should be placed in a warm situation in a stove, or in a hot-bed in summer, where the plants will thrive and produce seeds.

CCXXX. Adenanthera. CCXXXI. Prosopis.

CCXXX. Adenanthera (from *ad*er, *aden*, a gland, and *anthera*, an anther; in reference to the anthers, which are terminated by a deciduous, pedicellate gland each). Lin. gen. no. 526. Lam. ill. t. 334. D. C. prod. 2. p. 446.

Lin. syst. Decandria, Monogynia. Flowers hermaphroditic. Calyx 5-toothed. Petals 5, lanceolate, sessile. Stamens 10. Anthers terminated by a pedicellate, glandular leaf each. Legume compressed, linear, membranous, transversely many-celled inside, somewhat swollen above the seeds, destitute of pulp.—Trees or shrubs, with bipinnate leaves and racemose spikes of flowers. This genus is related to *Cassia*, according to Bronn. diss. p. 130. But differs in the petals being valvate in restoration.

1 A. *Pavonina* (Lin. spec. 555.) leaflets oval, obtuse, glabrous on both surfaces; legumes rather falcate. S. Native of the East Indies. Jacq. coll. 4. p. 212. t. 23. Rumph. amb. 3. t. 109. Flowers white and yellow mixed. Legume falcate, 10-12-seeded. Seeds highly polished, of a vivid scarlet colour, with a circular streak in the middle on each side. This is one of the largest trees in the East Indies, and its timber is much valued on account of its solidity. The natives use the powder of the leaves in their ceremonies. The seeds, besides being eaten by the common people, are of great use to jewelers and goldsmiths, on account of their equality, for weights, each of them weighing 4 grains; they also make a cement by heating them up with borax.

Falcate Adenanthera. Clt. 1812. Tree 60 feet.

† Species not sufficiently known.

Bonpland’s Adenanthera. Tree 25 feet.

Circinallis-podded Adenanthera. Tree 30 feet.

Cult. See *I nga* for culture and propagation, p. 396.

CCXXXI. Prosopis (from *pros*os, *prosopon*, a mask; a name given by Dioscorides to *Avretus lappa*). Lin. mant. 68. Kunth, min. 106. D. C. prod. 2. p. 446.

Lin. syst. Polygynia, Monoecia. Flowers polygamous. Calyx 5-toothed. Petals 5, free. Stamens 10, with the filaments hardly joined at the base. Legume continuous, filled
with pulp inside, linear, rather compressed, swollen above the seeds, and at length separable into 1-seeded divisions.—Unarmed or prickly trees or shrubs, with bipinnate leaves, having from 1-4 pairs of pinnae, each pinna bearing many pairs of oblong-linear leaflets, and pedunculate elongated axillary spikes of flowers. Flowers rather distant on the spikes, greenish, whitish, or yellow. The pulp in the pods of all the species is eaten by the natives in the various countries of their growth. The pericarp almost entirely consists of tannin.

Sect. I. ADENOPIES (from αδένος αδένος, aden adenos, a gland; in reference to the anthers, which are terminated by a deciduous gland each, as in the genus Adenanthera). D. C. prod. 2. p. 446. Anthers tipped by a deciduous gland each. Indian trees, furnished with a few scattered prickles.

1 P. spec’orea (Lin. mant. 68.) prickles scattered; leaves of oblong-linear, oblong-obtuse leaflets. g. S. Native of the coast of Coromandel. Roxb. cor. 1. t. 63.—Burn. ind. t. 26. f. 3. Flowers yellow. Legume linear, terete, attenuated at both ends, pen- dulous, filled with mealy pulp, which the natives of the coast of Coromandel eat; it has a sweetish agreeable taste, and may be compared to that of the Spanish Algaroba, or locust-tree, Cercidium siliquastrum. Torr. & F. adenanthera (D. C. prod. 2. p. 446) prickles scattered, compressed at the base; leaves with 1–2 pairs of pinnae, each pinna bearing 10–11 pairs of linear, acute leaflets. g. S. Native of the coast of Coromandel. Adenanthera acuminata, Roxb. hort. beng. 90. Both this and the species are called Teshami by the Telingas, and Vanni-marara by the Tamuls.

Spike-bearing Algaroba. Cht. 1812. Tree 40 to 50 feet.

Sect. II. ALGAROA (Algaroba is the name in South America for several of the species). D. C. prod. 2. p. 446. Anthers without glands.—American trees, which are either destitute of spines, or when present they are axillary.

2 P. hórìda (Kunth, mbr. p. 106. t. 33. nov. gen. amer. 6. p. 396.) spines stipular, vint. very long; leaves with 2-3 pairs of pinnae, each pinna bearing 10–12 pairs of oblong leaflets, which are pubescent on both surfaces; rachis of leaves bearing 2 or 3 glands. g. S. Native at the bottom of the Andes, on the eastern side, and in the sand on the sea-shore along the Pacific ocean, where it is called Algaroba by the natives, who eat the pulp contained in the pods. Flowers white. Legume torulose, 17-24-seeded.

Horrid Algaroba. Tree 20 feet.

3 P. glandulo’sa (Torrey, in ann. lyc. 2. p. 192. t. 2.) spines thick, cylindrical conical; leaves with 1 pair of pinnae, each pinna bearing 6-7 distant pairs of linear, rather falcate, obtuse, glabrous, rather ciliate leaflets, with glands between the pair of pinnae, as well as between the pairs of leaflets; legumes straight, torulose, pulpy inside; spikes of flowers cylindric. g. P. Native of North America, on the Canadian river. Glandular Algaroba. Tree.

4 P. inérmis (H. B. et Kunth, nov. gen. amer. 6. p. 307.) unarmed; leaves with 3 pairs of pinnae, each pinna bearing 6-13 pairs of linear oblong leaflets, which are finely pubescent beneath; rachis of leaves bearing 2-3 small, cup-shaped glands. g. S. Native of Peru. Flowers greenish white.

Unarmed Algaroba. Tree 60 feet.

5 P. du’licis (Kunth, mbr. p. 110. t. 34. nov. gen. amer. 6. p. 307.) spines stipular, or almost wanting or deciduous; leaves with 1-2 pairs of pinnae, each pinna bearing 18-25 pairs of glabrous leaflets, but which are a little ciliate at the apex; rachis of leaves bearing 1-2 small, convex glands. g. S. Native of New Spain. Acacia levisiâta, Willd. spec. 4. p. 1059. and A. edulis, Willd. enum. p. 1056.7 Corolla green. Filaments white. Legume torulose, containing 13-15 seeds. The pulp contained in the pods is very sweet, and is eaten by the inhabitants of the countries where the trees grow.

Sweet-podded Algaroba. Cht. 1818. Tree 40 to 50 feet.

6 P. microphy’lla (H. B. et Kunth, nov. gen. amer. 6. p. 308.) spines stipular, subulate; leaves with 2-4 pairs of pinnae, each pinna bearing from 11-18 pairs of minute, oblong, pubescent, convolute leaflets; rachis of leaves bearing 2 glands. g. S. Native of Mexico, between Valladolid and Taxco. This is perhaps a species of Tange, according to Kunth.

Small-leafletted Algaroba. Tree 20 feet.

7 P. du’ilia (H. B. et Kunth, nov. gen. amer. 6. p. 309.) unarmed; leaves with 12 pairs of pinnae, each pinna bearing 11-21 pairs of linear-oblong, acute, glabrous leaflets; rachis of leaves biglandular. g. S. Native of New Granada, near Turbo. Legume somewhat spirally convolute.

Doubtful Algaroba. Shrub 5 feet.

8 P. pal’lida (Kunth, mbr. p. 106. nov. gen. amer. 6. p. 309.) spines or unarmed; leaves with 2 pairs of pinnae, each pinna bearing 11-12 pairs of linear, obtuse, pubescent leaflets; rachis of leaves bearing 2-3 concave glands; spikes of flowers solitary, filiform, exceeding the leaves. g. S. Native of South America, on hills about Bracamora, near Passo de Mata.

Pale Algaroba. Tree.

9 P. silique’strum (D. C. prod. 2. p. 447.) spikes stipular, twin, straight; leaves with 2-3 pairs of pinnae, each pinna bearing numerous pairs of linear, obtuse leaflets; legumes compressed, filiform. g. S. Native of Chili, where it is called Algaroba de Chile, and where the inhabitants eat the pulp contained in the pods. Acacia siliquestrum, Lag. nov. gen. et spec. 16. no. 205. Flowers white?

Silique-podded or Chili Algaroba. Tree 30 to 40 feet.

10 P. flexu’ssa (D. C. prod. 2. p. 447.) spikes stipular; leaves with only 1 pair of pinnae, each pinna bearing usually about 8 pairs of glabrous, linear, obtuse leaflets, which are narrowest at the base; legume rather terete, torulose. g. S. Native of Chili. Acacia flexu’ssa, Lag. nov. gen. et spec. 16. no. 205. Very like the preceding species.

Flexuous Algaroba. Tree.

11 P. cuma’ nensis (Kunth, mbr. p. 106. nov. gen. amer. 6. p. 310.) unarmed; leaves with 1 pair of pinnae, each pinna bearing many pairs of linear leaflets, which are obtuse at both ends, and glabrous as well as the petioles, with a sessile, oblong, obtuse gland, seated on the petiole between the pair of pinnae; spikes filiform; flowers opposite. g. S. Native of Cumana. Acacia cuma’nensis, Willd. spec. 4. p. 1058. Legumes unknown. Leaflets 11 pairs on each pinna, ex Willd., but in Bolmood’s specimen there are 22 pairs on each of the pinna.

12 P. bracteol’ata (D. C. prod. 2. p. 447.) spikes stipular, straight; leaves with 2 pairs of pinnae, each pinna bearing from 16-18 pairs of linear leaflets, which are obtuse at both ends, and are as well as petioles glabrous, with a sessile gland on the petiole between the pairs of pinnae; spikes filiform, bearing subulate erect bracteoles beneath the flowers. g. S. Native of St. Martha. Habit as well as flowers like that of the preceding species, from which it is hardly distinct.

Bracteolate-flowered Algaroba. Tree.

13 P. dominguensis (D. C. prod. 2. p. 447.) spikes stipular, straight, small; leaves with 1 pair of pinnae, each pinna bearing from 16-18 pairs of linear leaflets, which are obtuse at both ends and glabrous as well as the petioles, with a sessile gland between the pair of pinnae; spikes filiform; legumes compressed, constricted between the seeds. g. S. Native of St. Domingo, where it is called Bohahunda, and therefore perhaps
the note in Coll. hort. rip. p. 2. no. 3. is referrible to this species.

14 P. juliflora (D. C. prod. 2. p. 447.) spines stipular, straight, small; leaves with 1-2 pairs of pinnae, each pinna bearing from 18-20 pairs of linear leaflets, which are acutish at both ends, and are glabrous as well as petiolar, with a sessile gland seated on the petiole between the pairs of pinnae; spikes cylindrical, sessile; legume much compressed. f. S. Native of the south of Jamaica, in dry places. Mimosa juliflora, Swartz, prod. p. 85. Mimosa piliflora, Swartz, fl. ind. occ. p. 2. p. 986. Spikes of flowers almost like the aments of Sä vex frágilis. Flowers yellowish. Legume filled with a fleshy substance between the seeds, which is eatable. Leaflets 5-8 lines long. Acacia falcata, Desf. Cat. hort. par. ed. 2. p. 207. is probably not distinct from this tree.

† Species not sufficiently known.

15 P. torquata (D. C. prod. 2. p. 448.) spines twin, stipular; leaves with 1-2 pairs of pinnae, each pinna bearing many pairs of linear leaflets, with a gland between the pairs of pinnae on the petiole; spikes of flowers cylindrical, on short peduncles; legume torquate and constricted between the seeds, and filled with necaly pulp inside. f. S. Native of South America. Acacia torquata, Lag. nov. gen. et spec. 16, no. 206. Stamens 10, free.

Collared-podded Algaroba. Tree.

16 P. affinis (Spreng. syst. 2. p. 326.) spines straight; leaves with only one pair of pinnae, each pinna bearing many pairs of remoties, quite glabrous leaflets; petiolar without glands; branches tuberized; spikes filiform, twin. f. S. Native of Monte Video.

Allied Algaroba. Tree.

Cult. See Iunga for culture and propagation, p. 396.

CCXXXII. LAGONYCHIUM (from λαγως, lagos, a hark, and ὠνυχων, onychion, a little nail; in reference to the spines on the shrub). Bieb. suppl. 288. D. C. prod. 2. p. 448.

Linn. syst. Decandria, Monogynia. Flowers hermaphroditic, many of which are abortive. Calyx 3-toothed. Petals 5, free. Stamens 10, hypogynous, free. Anthers without glands. Style twisted at the apex. Legume stipitate, indehiscent, ovate-cylindrical, somewhat didymous, rather recurved, never torulose, filled with pulp inside.—A small shrub, with scattered, prickly, bipinnate leaves, bearing 3-5 pairs of pinnae, and each pinna bearing 10 pairs of leaflets, which are pubescent beneath. This is a doubtful genus, which is perhaps not distinct from Acacia.

Cult. This shrub should be planted in a warm situation in the open border, and sheltered by a mat in severe weather in winter. It may be increased by seeds or layers, and very young cuttings will root if taken off at a joint, and planted in sand, with a hand-glass placed over them.

CCXXXIII. ACA'CA (from ac, a point, in Celtic, or from acutus, akazo, to sharpen; many of the species are furnished with spines). Neck. elem. no. 1297. Willd. spec. 4. p. 1049. Kunth, mm. p. 74. D. C. prod. 2. p. 448.

Linn. syst. Polygyna, Monoc'ca. Flowers polygamous (l. 55. c. l. 54. b.). Calyx 4-5-toothed (f. 54. a.). Petals 4-5, sometimes free (f. 53. a.), and sometimes joined together into Vol. II.

a 4-5-cleft corolla. Stamens variable in number from 10 to 200 in each flower. Legume continuous, dry, 2-valved.—Shrubs or trees, very variable in habit and leaves. Spines stipular, scattered, or wanting. Flowers yellow, white, rarely red, disposed in globular heads or spikes, decandrous, or polyandrous, eufemmercious or monadelpous. This is a very polymorphic genus, which may hereafter be divided into several genera, and the characters of the species are better known. The barks of many of the species abound to such a degree in tanning principle as to have become an object of commercial importance.

Sect. I. Phyllumo'nne (from φυλλον, phyllon, a leaf; leaves simple). Leaves of two forms, those in seedling plants being pinnate, but in the adult plants the leaflets are abortive, and there only remains the dilated petiole, which is called a phyllodium. Acacia aphylloa, Wendl. diss. 1820. Flowers in all yellow. These species are mostly natives of New Holland.

§ 1. Capitulæ (from capitatus, headed; disposition of flowers). Flowers collected into globose heads; heads solitary on the peduncles.

* Stipulas spinose.

1 A. alata (R. Br. in hort. kew. ed. 2. vol. 5. p. 464.) stipulas spinosus permanent; stem bifidously winged; phyllodium deciduous, 1-nerved, ending in a spine at the apex, and with the upper margin furnished with a glandular tooth; heads of flowers solitary or twin. f. G. Native of New Holland, on the western coast. Ker. bot. reg. 396. Wendl. diss. no. 1. t. 1. Coll. hort. rip. 1. t. 17. Reich. mag. gart. t. 88. Flowers yellow.

Winged-stemmed Acacia. Fl. April, July. Clt. 1803. Sh. 6 to 10 feet.

2 A. Dolabi'formis (Wendl. l. c. no. 38.) stipulas deciduous or wanting; branches rather angular; phyllodia linear, somewhat falcate, rather deciduous at the base, obliquely and emarginately truncate at the apex, with the lower lobe ending in a pungent mucrone. f. G. Native of New Holland. Flowers yellow.

Dolabiiform-leaved Acacia. Fl. April, July. Clt. 1818. Shrub 4 to 6 feet.

3 A. dec'ipnis (R. Br. l. c. p. 465.) stipulas spinosum, deciduous; phyllodia triangular and somewhat trapezoid, with the nerve approximating the lower side, and drawn out into a spine at the apex, the superior margin furnished with one acut gland-bearing tooth; heads many-flowered, usually solitary. f. G. Native of New Holland, on the south-west coast. Adianthum truncatum, Burm. fl. ind. t. 66. f. 4. Mimosa decipnis, Kœn. ann. bot. 1. p. 306. t. 8. Sim. bot. mag. 1745. A. dolabiiformis, Coll. hort. ripul. p. 1. but not of Wendl. Peduncles longer than the phyllodia. Branches glabrous. Flowers yellow.

Var. B, trapezo'idea (D. C. prod. 2. p. 449.) stipulas decumbent; phyllodia irregularly trapezoid, with the nerve approximating the lower margin, and drawn out into a spine at the apex, but the upper margin is furnished with 2 obustae, gland-bearing teeth; young heads of flowers axillary, sessile, and usually solitary. f. S. Native of New Holland, on the eastern coast. Branches angular, glabrous. Perhaps a proper species.

4 A. del'tou'dea (Cunningh. L. s.) stipulas acicular, spinosum, twin; phyllodia dolabiiform, smooth, ending in a spine-like mucrone, many-nerved, convex on the upper side, and nearly straight on the lower; branches slightly angular, pubescent; heads of flowers solitary, on peduncles, which are longer than the phyllodia. f. S. Native of New Holland, within the tropic.

Deltoid-leaved Acacia. Clt. 1824. Shrub 3 to 6 feet.

cent, permanent; phyllodia triangular, with 1 nerve, which approximates the lower side, and is drawn out into a spine at the apex, the superior margin furnished with 1 gland-bearing tooth; heads solitary, on short peduncles, 2-flowered. h. G. Native of New Holland, on the western coast. Wendl. diss. no. 3. t. 2. Branches pubescent. Corolla 4-lobed.

6 A. hastulata (Smith, in Rees’ cycl. suppl.) stipulas spineous, permanent; phyllodia glabrous, rhomboid, ending in a spinose acumen, with 1 nerve in the centre, and the superior margin furnished with 1 gland-bearing, obtuse tooth; branches hispid; heads solitary, 3-4-flowered. h. G. Native of New Holland, at King George’s Sound. Stipulas bristle-formed, erect.

Hastulate-leaved Acacia. Fl. April, June. Clt. 1824. Sh. 3 to 6 feet.

7 A. Nervosa (D. C. legum. mem. xii. prod. 2. p. 419.) stipulas spineous, permanent; phyllodia oval-oblong, acuminate at both ends, ending in a spine, with 1 nerve in the middle, and with nerve-formed, entire margins; heads pedunculate, usually twin, 5-8-flowered. h. G. Native of New Holland.

Nerved-leaved Acacia. Fl. April, Jun. Clt. 1824. Sh. 3 to 6 ft.

8 A. ornithophora (Sweet, fl. austral. 24.) stipulas spineous, permanent, a little shorter than the phyllodia; phyllodia obliquely oblong-lanceolate, 1-nerved, rather plicate, ending in a hooked apex at the apex, and furnished on the upper margin with a gland-bearing tooth; branches hairy; heads of flowers pedunculate, solitary, or twin, numerous. h. G. Native of New Holland. The outline of the leaves gives the form of the body and head of a bird.

9 A. paradaxa (D. C. cat. hort. nonsp. p. 74.) stipulas spineous, permanent; phyllodia obliquely oblong-lanceolate, quite entire, undulated, 1-nerved; branches clamy, glabrous; heads of flowers solitary. h. G. Native of New Holland, on the eastern coast. A. undulata, Willd. ennum. suppl. p. 68. Wendl. diss. no. 4. t. 3.

10 A. armata (R. Br. in hort. kew. 5. p. 483.) stipulas spineous, permanent; phyllodia obliquely ovate-oblong, quite entire, 1-nerved; branches hairy; heads of flowers solitary; legumes velvety. h. G. Native of New Holland, on the southern coast. Sims, bot. mag. 1553. Bonpl. nov. t. 55.

11 A. acuminata (Link, ennum. xii. p. 448.) stipulas spineous, very minute; phyllodia linear, ending in a subulate pungent point, approximate; branches glabrous, angular; heads of flowers solitary. h. G. Native of New Holland.

Juniper-like Acacia. Fl. Mar. Ju. Clt. 1790. Sh. 4 to 8 ft. 13 A. asparagus (Cuming, in Field’s new south wales, p. 345.) stipulas permanent; phyllodia linear, sulcate, stiff, mucronate, alternate, and crowded, somewhat dilated near the base, where it bears a glandular tooth; heads of flowers axillary, solitary; branches glabrous, diffuse. h. G. Native of New South Wales, on the Blue Mountains. Intermediate between A. neocarid and A. juniperina.

14 A. broomii (Steev. nom. phan. 1. p. 2.) stipulas setaceous, spineous, small, deciduous; phyllodia linear-subulate, ending in a pungent mucrone, distant, spreading; branches terete, glabrous; heads of flowers solitary, unarmed; peduncles slightly shorter than the phyllodia. h. G. Native of New Holland, in King’s Island. A. aciculatus, R. Br. in hort. kew. 5. p. 450. but not of Willd. A. juniperina, Sieb. pl. excis. nov. holl. no. 463. The phyllodia are much more distant from each other than those of A. juniperina.

15 A. echinate (D. C. prod. 2. p. 449.) stipulas setaceous, spineous, permanent; phyllodia linear-subulate, ending in a pungent mucrone; branches terete, hairy-pubescent; heads of flowers solitary; peduncles 3-times shorter than the phyllodia. h. G. Native of New Holland. A. juniperina, Sieb. pl. excis. nov. holl. no. 447. Very like A. juniperina, but differs from it in the young heads of the flowers being ebracteate from the spinose ebracteate bracteas.

16 A. fusciflora (Wendl. diss. no. 26. t. 9. exclusive of the synonymy of R. Brown) stipulas velvety, small, and almost permanent; phyllodia linear-terete, smooth, obtuse, slightly mucronate; branches terete, glabrous; heads of flowers solitary; peduncles 3-times shorter than the phyllodia. h. G. Native of New Holland, on the eastern coast.

17 A. diffusa (Ker. bot. reg. 634.) stipulas small, caducous; phyllodia linear, 1-nerved, ending in an oblique acumen, with the spinula continuous along the lower margin; branches diffuse, globose, angular; heads of flowers usually twin. h. G. Native of New South Wales, on the Blue Mountains, Sims, bot. mag. 2417. A. prostrata, Lodd. bot. cab. 631. A. daviesioides, Cunningham. ms.

18 A. sulcata (R. Br. in hort. kew. 5. p. 460.) stipulas small, concave, deciduous; phyllodia linear-terete, sulcate, mucronate; branches nearly terete, glabrous; heads of flowers usually twin. h. G. Native of New Holland, on the western coast. Wendl. diss. no. 27. t. 10. Calyx 5-parted. Petals 5, ex Wendl. Bracteas concave, permanent. Legume flexuous.

Furrowed-leaved Acacia. Fl. May, Aug. Clt. 1808. Sh. 2 to 6 feet.

19 A. salicina (Wendl. diss. no. 16.) stipulas almost wanting; phyllodia linear, attenuated at both ends, quite entire, almost nerveless; branches angular, glabrous; heads of flowers solitary, on short peduncles; legumes contracted between the seeds, loment-formed. h. G. Native of New Holland, at Cape Van Diemen and about Port Jackson. Mimosa salicina, Labill. nov. holl. 2. p. 86. t. 295. There is a variety with broader phyllodia, and another with very narrow ones.

20 A. emarginata (Wendl. diss. no. 17.) stipulas wanting; phyllodia linear-spatulate, attenuated at the base, emarginate at the apex, and mucronate; heads of flowers twain; peduncles longer than the heads. h. G. Native of New Holland. Perhaps a variety of the following species, the calyx being simultaneously 5-toothed in both.

21 A. stricta (Willd. spec. 4. p. 1052.) stipulas wanting;
phyllodia linear, attenuated at the base, but rounded and mucronate at the apex, 1-nerved in the middle; heads of flowers twin; peduncles shorter than the heads.  giọng. native of new holland, on the eastern coast. mimosa stricta, andra bot. rep. t. 53. sima, bot. mag. 1121. mimosa snarevollna, desf.

straight acacia. fl. feb. may. clt. 1790. sh. 3 to 6 ft.

22 a. lepressea (sieb. pl. exsic. nov. holl. no. 2455.) stipulas almost wanting; phyllodia linear-lanceolate, leprosely dotted, 1-nerved, attenuated at the base, and terminating in a calous, incurved mucrone; branches angularly-furrowed; heads of flowers 2-3-together, axillary; peduncles clothed with hoary pubescence, shorter than the heads.  giọng. native of new holland. very like a. dodoneaefolia.

leptome acacia. fl. mar. june. clt. 1817. sh. 4 to 8 ft.

23 a. dodoneaefolia (wildl. emum. suppl. p. 68.) stipulas wanting; phyllodia linear-lanceolate, rather falcate, attenuated at the base, 1-nerved in the middle, and terminated by an incurved calous mucrone; branches angular, and are as well as the phyllodia clamydus; heads of flowers twin; peduncles longer than the heads.  giọng. native of new holland, on the eastern coast. mimosa thomsoniana, pers. enc. 2. p. 261. a. viscosa, wendl. diss. no. 19. t. 7. cyath. 5-toothed.

dodonea-leaved acacia. fl. mar. june. clt. 1816. sh. 4 to 8 ft.

24 a. multikealia (d. c. legum. mem. xii. prod. 2. p. 450.) stipulas wanting; phyllodia linear-lanceolate, attenuated at the base, many-nerved, furnished with a gland-like tooth on the upper margin; heads of flowers solitary or twin, on short peduncles.  giọng. native of new holland, on the eastern coast. young branches angular, adult ones terete.

many-nerved-leaved acacia. fl. mar. june. clt. 1824. shrub 5 to 6 feet.

25 a. eglandulosia (d. c. legum. mem. xii. prod. 2. p. 450.) stipulas wanting; phyllodia linear-lanceolate, attenuated at the base, entire on both sides, and glandless, many-nerved at the base; heads of flowers solitary; peduncles rather longer than the heads.  giọng. native of new holland.

glandless-leaved acacia. fl. mar. june. clt. 1824. sh. 4 to 6 feet.

26 a. laniceps (cunning. in field's new south wales, p. 345.) shrub villous; phyllodia lanceolate, acute, stiff, nervet, falcate, ending in a pungent mucrone; heads of flowers twin, axillary; upper part of branches and legume very woolly.  giọng. native of new holland, frequent on rocky barren ranges in the interior of the country. hook. bot. mag. 2922.

wool-bearing acacia. fl. mar. may. clt. 1824. sh. 6 to 8 ft.

27 a. rigens (cunningh. mss. in lodd. hort. brit. p. 406.) stipulas almost wanting or deciduous; phyllodia filiform, compressed, ending in an oblique, calous mucrone at the apex, 3-nerved at the base, and furnished with a gland-bearing tooth on the upper margin at the base; branches straight, angular, pubescent; heads axillary, solitary; peduncles clothed with pubescent scales, much shorter than the phyllodia.  giọng. native of new holland. phyllodia 3-4 inches long.

stiff acacia. fl. mar. june. clt. 1824. shrub 4 to 6 feet.

28 a. lineata (cunningh. mss.) stipulas wanting or deciduous; phyllodia linear, ending in an oblique, calous mucrone at the apex, glandless, 1-nerved, the nerve parallel with the superior margin, and contiguous to it; phyllodia as well as the branches hairy; heads of flowers usually twin; peduncles filiform, longer than the phyllodia.  giọng. native of new holland. phyllodia 4½ inch long.

lined-leaved acacia. fl. mar. may. clt. 1824. sh. 4 to 6 ft.

29 a. hispidula (wildl. spec. 4. p. 1054.) stipulas small, deciduous; phyllodia oblong, 1-nerved, with both the nerve and margins denticulately hispid; heads of flowers solitary.  giọng. native of new holland, on the eastern coast. lodd. bot. cab. 836. mimosa hispidula, smith, new holl. t. 16. cyath. 4-toothed. petala 4. legume oval-oblong, 2-seeded.

hispid acacia. fl. apr. may. clt. 1794. sh. 2 to 4 ft.

30 a. cochlearis (wendl. diss. no. 7.) stipulas almost wanting; phyllodia linear-lanceolate, many-nerved at the base, rather pilose, quite entire, mucronate; heads solitary.  giọng. native of new holland, in van lewinn's land. mimosa cochlearis, lab. nov. holl. 2. p. 85. t. 234. cyath. 5-parted. legume linear-oblong, straightish, 4-8-seeded, somewhat contractd between the seeds.

spoon-leaved acacia. fl. apr. ju. clt. 1818. sh. 4 to 6 ft.

31 a. carica (d. c. legum. mem. xii. prod. 2. p. 451.) stipulas wanting; phyllodia obovate-oblong, tapering to the base, obtuse at the apex, quite entire, and with 1 nerve in the middle; heads of flowers solitary; branches angularly 2-angled.  giọng. native of new holland, on the east coast.

two-angled-leaved acacia. fl. apr. june. clt. 1820. shrub 4 to 6 feet.

32 a. angustifolia (wildl. spec. 4. p. 1053.) stipulas almost wanting; phyllodia obliquely obovate-oblong, 7-8-nerved, emarginate at the apex, and oblique at the base; heads of flowers globose, usually solitary; branches triquetro-angular.  giọng. native of the moluccas, where it is called mangi goengung. mangium montanum, rumph. amb. 3. p. 129. t. 81.

mangium acacia. clt. 1820. tree 10 to 20 feet.

34 a. laurifolia (wildl. spec. 4. p. 1053.) stipulas almost wanting; phyllodia obliquely obovate-oblong, 7-8-nerved, emarginate at the apex, and oblique at the base; heads of flowers globose, usually solitary; branches triquetro-angular; legumes falcate.  giọng. native of the friendly islands and the hebrides, as well as of new caledonia. labill. nov. cap. 68. t. 68. mimosa simplicifolia, lin. suppl. 436. mimosa mangium, forst. prod. no. 395. legume moniliform.

laurel-leaved acacia. clt. 1775. tree 20 to 25 feet.

35 a. trinervata (sieb. l. c. no. 443.) stipulas almost wanting; phyllodia linear, mucronate, smoothish, with 3 nerves running the whole length without any gland on the side, twice the length of the peduncles; heads of flowers sometimes solitary, sometimes disposed in short racemes on long pedicels.  giọng. native of new holland. phyllodia nearly like those of the preceding species, but 4½ inch long, and ending in a long oblique mucrone. branches and phyllodia rather pilose at the top. this is an ambiguous species, apparently joining the present division of the genus to the following.

three-nerved acacia. fl. apr. ju. clt. 1820. sh. 4 to 6 ft.

36 a. elongata (sieb. pl. exsic. nov. holl. no. 443.) stipulas almost wanting; phyllodia linear-falcate, 3-nerved, ending in a calous mucrone, bearing 1 gland on the upper margin at the base; branches angular, glabrous, as well as the phyllodia; heads of flowers solitary, twin, or tern; peduncles canescent, much shorter than the phyllodia.  giọng. native of new south wales. a. hebecaphala, cunningh. mss. in lodd. hort. brit. p. 406. branches angular, drooping. phyllodia 8 inches long and 1 line broad. corolla 5-cleft.

3 & 2
Leguminosae.

Elmarged-leaved Acacia. Fl. March, May. Clt. 1817. Sh. 6 to 10 ft.
37 A. verniciflora (Cunning, in Field's new south wales, p. 344) phyllodia linear-lanceolate, 2-nerved, falcate, attenuated at the base; heads of flowers globose, axillary, twin; young branches viscid. G. Native of New Holland, on rocky hills near Cox's River, &c.

38 A. calamiifolia (Sweet, in Colv. cat. ed. 2. and bot. reg. 839) stipulas almost wanting; phyllodia filiform, compressed, spreading, ending in an incurved mucron at the apex, glabrous as well as the branches; peduncles solitary, much shorter than the phyllodia. G. Native of New Holland, in the interior of the country. A. uncinata, Lodd. bot. cab. 1800. Sieb. pl. exsic. no. 522. The legume is said to be articulated, arched, and compressed.

Red-leaved Acacia. Fl. May, June. Clt. 1823. Sh. 3 to 4 ft.
39 A. quadripartita (D. C. prod. 2. p. 451) stipulas almost wanting; phyllodia filiform, tetragonal, straight, ending in a straight mucron, without any gland on the side, glabrous as well as the branches, and with a slight nerve on both the lower and upper side; heads of flowers sometimes solitary and sometimes racemose. G. Native of New Holland. A. calamifolia, Sieb. pl. exsic. nov. holl. no. 442. A. litoralis, Cunningham, mss. This appears to be an intermediate species between the first division of the genus Calamitae, and the second division Capitato-racemose. Very like A. calamifolia.

Falcate-leaved Acacia. Fl. April, June. Clt. 1820. Sh. 3 to 4 ft.
40 A. Cunninghamii: leaves linear, falcate, mucronate, 2-3-nerved, scattered, twice the length of the peduncles; heads of flowers axillary, solitary; legume very narrow, elongated. G. Native of New Holland, at Spring-wood. A. taxifolia, Cunningham in Field's new south wales, p. 344. Lodd. bot. cab. 1225. but not of Wild.

41 A. uncifeifolia (Cunning, mss. Loud. hort. brit. p. 407,) stipulas almost wanting; phyllodia obliquely ovate, undulate, and margined, 1-nerved, glabrous, ending in a hooked or twisted point, bearing an oblong mucron on the upper margin at the base; branches terece, hairy; heads of flowers axillary, solitary; peduncles beset with adpressed pili, longer than the phyllodia. G. Native of New South Wales. Lodd. bot. cab. 1544. Phyllodia an inch long. The heads of flowers being so numerous, appear like a raceme at the tops of the branches.

42 A. cyclus (Cunning, mss. Loud. hort. brit. 407.) stipulas almost wanting; phyllodia oblong-lanceolate, obtuse, ending in an oblique callous mucron, but attenuated at the base, 3-7-nerved, having one gland in front on the upper margin; heads of flowers axillary, affixed, 2-nerved; peduncles shorter than the phyllodia. G. Native of New Holland, on the south-west coast.

Circle-eye-seeded Acacia. Fl. April, June. Clt. 1824. Sh. 4 to 6 ft.
43 A. neunatoideae (Cunning, mss.) phyllodia disposed in something like whorls, they are crowded and very short, compressed, subulate, and mucronate; branches rather hairy; heads of flowers solitary; peduncles twice the length of the phyllodia. G. Native of New South Wales. Phyllodia 2 lines long.

Bunonia-like Acacia. Shrub 2 to 4 feet.
44 A. graveolens (Cunning, mss. Loud. hort. brit. 407. Lodd. bot. cab. 1460.) stipulas almost wanting; phyllodia lanceolate, tapering at both ends, shining, 2-nerved, furnished with a gland on the upper margin at the base, and are, as well as the young branches, clammy; heads of flowers usually twin, axillary: peduncles much shorter than the phyllodia; branches erect. G. Native of New South Wales. Heads of flowers somewhat second.

Strong-scented Acacia. Fl. April, June. Clt. 1820. Shrub 6 to 10 ft.
45 A. kuncifolius (Cunning, mss.) young branches slightly pubescent; phyllodia rather clammy, linear-lanceolate, somewhat falcate, ending in a stiff hooked mucron, having one longitudinal nerve, which is parallel to the superior margin, and contiguous to it; heads of flowers axillary, usually twin, on short peduncles. G. Native of New South Wales. Phyllodia half an inch long, bearing one gland on the upper margin at the base. Very like A. ornithophora of Sweet.

Hedge-bill-formed-leaved Acacia. Shrub 5 to 6 feet.

§ 2. Capitato-racemose. Flowers collected into globose heads, the heads disposed in racemes along the axillary peduncles. Stipulas of all nearly obsolete, or when present they are unarmed.
46 A. falkata (Willd. spec. 4. p. 1053; phyllodia oblong, falcate, tapering much at the base, acute, 1-nerved, and feather-veined, glandless; the longitudinal nerve parallel to the upper margin, and contiguous to it; heads of flowers racemose, rarely solitary. G. Native of New Holland, on the eastern coast. Wendl. diss. no. 11. t. 14. A. obliqua, Desv. journ. bot. 1814. p. 67. Mimosa falkata, Pers. mss. 2. p. 261. Calyx 5-parted. There are two varieties of this species; one with very acute leaves, and the heads of flowers in racemes, and another with bluntish leaves, and the heads of flowers usually solitary.

47 A. falkiformis (D. C. prod. 2. p. 452) phyllodia oblong, falcate, much attenuated at the base, but blunting at the apex, with a longitudinal nerve in the middle, as well as being finely feather-nerved, bearing one gland in front on the upper margin. G. Native of New Holland. Sieb. pl. exsic. nov. holl. no. 616. Phyllodia 5-6 inches long, and 8-9 lines broad. Heads of flowers racemose. Legume stipitate, flat, rather glaucous, 2 inches long, and 5-10 lines broad.

48 A. spirilobus (Labill. c. p. 69. t. 69.) unarmed; phyllodia lanceolate, falcate, obtuse, 3-nerved, tapering to both ends; heads of flowers twin, in racemes; legumes coelochely-orbicular. G. Native of New Caledonia. Racemes shorter than the phyllodia.

Spirre-podded Acacia. Shrub 8 feet.
49 A. penninervis (Sieb. pl. exsic. nov. holl. no. 458) phyllodia oblong, acuminate at both ends, straight, with one longitudinal nerve in the middle, having feathered veins running from it, and furnished with one gland in front at the base. G. Native of New Holland. A. impreusa, Cunningham, mss. Lindl. bot. reg. 1115. Lodd. bot. cab. 1319. Hook. bot. mag. 2754. Phyllodia 2-3 inches long, and 5-6 lines broad, pale. The feathered veins rise from the base of the phyllodia, both in this and the preceding species, growing obliquely from the gland. Heads of flowers about the size of a pea, racemose.

Feather-nerved-leaved Acacia. Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.
50 A. pendula (Cunning, mss. Loud. hort. brit. 490.) aspect greyish; phyllodia linear-lanceolate, rather arcuate, attenuated at both ends, ending in a somewhat hooked mucron, having one gland in front at the base, and 2-3 longitudinal nerves; heads of flowers racemose; branches slender, pendulous. G.
Native of New South Wales. Phyllodia 3 inches long, and 3 lines broad. Habit of *Salix Babylónica* or *Weeping-sallow*.

**Dropping-branched Acacia.** Fl. April. Ct. 1824. Shrub 6 to 10 feet.

**Black-wooded Acacia.** Fl. April, June. Ct. 1808. Shrub 6 to 10 feet.

52. *A. heterophylla* (Wild. spee. 4. p. 1054.) phyllodia linear, attenuated at both ends, rather falcate, many nerved; there are also sometimes bipinnate leaves at the tops of the branches; heads of flowers disposed in a kind of raceme. *G.* Native of the island of Bourbon. Mimôsa heterophylla, Lam. dict. 1. p. 14. exclusive of var. *β.* Heads 2 or 3 in each raceme. *A. hirta-leaved Acacia.* Ct. 1824. Trees 6 ft. high.

53. *A. angustata* (Wendl. diss. no. 8. t. 4.) phyllodia oblong, tapering much at the base, 1-nerved, bearing 1-3 glands in front on the upper margin; heads of flowers racemose; flowers 5-cleft. *G.* Native of New Holland. Very like the following species, but differs in the racemes being one-half shorter than the phyllodia. Petals 5, distinct. Ovary tormentose. The plant under this name in Sieb. pl. exsic. nov. holl. no. 452, differs from Wendlund’s in the phyllodia being scarcely margined, and only furnished with one gland in front on the upper margin, although perhaps the same.

**Pleasing Acacia.** Fl. April, June. Ct. 1820. Shrub 4 to 6 ft.

55. *A. Oleifolia* (Cunningh. mss. Loud. hort. brit. p. 407.) stipulas small, caduceous; phyllodia ovate-oblong, oblique, marginated, falcate at the apex, mucronate, and are, as well as the branches, pubescent; heads solitary, axillary, length of the phyllodia. *G.* Native of New South Wales. A. uncinata, Lindl. bot. reg. 1532.

**Olive-leaved Acacia.** Fl. June, July. Ct. 1824. Sh. 4 to 6 ft.

**Podalyria-leaved Acacia.** Fl. March, May. Ct. 1824. Sh. 4 to 6 ft.

57. *A. Scapuliformis* (Cunningh. mss.) aspect white; phyllodia roundly triangular or obliquely obovate, mucronate at the apex, with an angle on the upper margin above the middle, wherein one gland is seated, having only one nerve, which is curved; heads of flowers disposed in axillary and terminal racemes, crowded. *G.* Native of New South Wales. A. papuliformis, Loud. hort. brit. p. 407. Phyllodia 1/2 inch long, and 4 lines broad.

**Scapula-formed-leaved Acacia.** Shrub 4 to 6 ft.

58. *A. Vestita* (Ker. bot. reg. t. 628.) phyllodia obliquely elliptic-lanceolate, 1-nerved, ending in an awn-like mucrone, and are, as well as the branches, hispid; heads of flowers loosely racemose along the peduncles, upper ones solitary. *G.* Native of New Holland, in the interior of the country. A. conspicua, Cunningham. mss. Racemes longer than the phyllodia. Petals 5.

**Clothed Acacia.** Fl. April, July. Ct. 1820. Sh. 4 to 6 ft.

59. *A. Marginata* (R. Br. in hort. kew. 5. p. 462.) phyllodia lanceolate, elongated, 1-nerved, bearing one gland on the upper margin in front; heads few-flowered, racemose; flowers 4-cleft. *G.* Native of New Holland, on the western coast. This species has much the appearance of *A. myrtilloïda*, but the ovary is tormentose. Wendl. diss. 1. t. 5. A.

**Margined-leaved Acacia.** Fl. April, June. Ct. 1803. Sh. 3 to 6 ft.

60. *A. Furfuracea*; glaucescent; leaves elliptic or ovate, glabrous, oblique, ending in an innocuous mucrone, bearing a gland on the upper margin; racemes erect, axillary; legumes covered with white furfuraceous powder. *G.* Native of New Holland, on hills on Guguee-gong river, 50 miles from Bathurst. A. dealbata, Cunningham. in Field’s new south waters. p. 345. but of Link. A slender shrub.

**Scurfy Acacia.** Fl. April, June. Ct. 1824. Sh. 2 to 4 feet.

61. *A. Umbrosa* (Cunningh. mss. Loud. hort. brit. p. 407.) phyllodia obliquely ovate-lanceolate, tapering at both ends, smooth, 3-nerved, with the nerves to one side, acute at the apex, and ending in a hooked mucrone, and bearing a gland on the upper margin not far from the base; heads of flowers racemose; racemes shorter than the phyllodia. *G.* Native of New South Wales. Phyllodia 4 inches long, and 1 inch broad.

**Shady Acacia.** Fl. March, May. Ct. 1824. Sh. 4 to 6 feet.

62. *A. Astringens* (Cunningh. mss.) phyllodia glaucescent, broad, obliquely ovate-oblong, obtuse, somewhat araucate, and margined, feather-nerved, smooth, furnished with one gland on the upper margin at the base; heads of flowers racemose; racemes shorter than the phyllodia. *G.* Native of New South Wales. Phyllodia 3-4 inches long, and 1 inch broad.

**Astringent Acacia.** Shrub 6 to 10 feet.

63. *A. Pyrifolia* (D. C. legum. mem. xii. prod. 2. p. 452.) stipulas hard, permanent; phyllodia broad, oval, ending in a pungent mucrone, furnished with a middle nerve, as well as with feathered and reticulated veins, quite entire, and are, as well as the branches, glaucous; heads numerous, racemose; flowers 3-cleft. *G.* Native of New Holland, on the eastern coast.

**Pear-leaved Acacia.** Fl. April, June. Ct. 1824. Sh. 4 to 6 feet.

64. *A. Birentata* (D. C. prod. 2. p. 453.) phyllodia oblong, acuminated at both ends, and furnished with a gland on the upper margin at the base, and with 2 nerves, which run the whole length of the phyllodia; heads of flowers racemose; racemes shorter than the phyllodia. *G.* Native of New Holland. Sieb. pl. exsic. nov. holl. 504.

**Two-nerved-leaved Acacia.** Fl. April, June. Ct. 1824. Sh. 4 to 8 feet.

65. *A. Bivenosa* (D. C. legum. mem. xii. prod. 2. p. 452.) phyllodia oblong, obtuse, rather attenuated at the base, quite entire, glaucescent, smoothish, furnished with 2 fine nerves at the
base; heads of flowers disposed in loose racemes; racemes rather longer than the phyllodia; flowers 5-cleft.  

Two-veined-leaved Acacia. Fl. April, June. Clt. 1824. Sh. 2 to 3 feet.

66 A. cultriformis (Cunningh. mss.) branches smooth, angular; phyllodia cultriform, ending in an acute hooked mucrone, which leans to one side, and furnished with a gland on the middle of the upper margin, 1-nerved; the nerve nearly parallel with the lower margin; heads crowded, disposed in racemes, which are either axillary or terminal.  

Cultriform-leaved Acacia. Shrub 4 to 6 feet.

68 A. verna (Cunningh. mss. phyllodia straight, linear, obtuse, mucronulate, 1-nerved in the middle, and furnished with one gland on the upper margin at the base; branches angular, the angles fringed, as well as the phyllodia; heads of flowers racemose, axillary.  

Fringed Acacia. Shrub 4 to 6 feet.

69 A. lunata (Sieb. pl. exsic. nov. holl. no. 461.) phyllodia obliquely oblong, rather falcate, narrowed at the base, terminating in an oblique callous mucron, convex beneath the middle on the margin, and furnished with a minute gland in the convex part, and are glabrous, as well as the branches; heads of flowers disposed in racemes, which are longer than the phyllodia.  

Lunate-leaved Acacia. Fl. April, May. Clt. 1810. Shrub 2 to 4 feet.

70 A. abercrombiei (Lodd. bot. exsic. 1255.) phyllodia elliptic, ending in a spine-like mucrone, 1-nerved, and feather-nerved, glabrous, glabrescent, with a gland on one side; branches angular, smooth; heads of flowers racemose, longer than the phyllodia.  

Short-leaved Acacia. Fl. April, June. Clt. 1820. Shrub 3 to 4 feet.

71 A. obtusa (Sieb. pl. exsic. nov. holl. no. 441.) phyllodia oblong-cuneate, obtuse, attenuated at the base, 1-nerved, entire, and glandless, coriaceous, and are, as well as the branches, glabrous; heads of flowers disposed in racemes, which are shorter than the phyllodia; flowers 5-cleft.  

72 A. bennetiana (Cunningh. in Field's new south wales. p. 344.) phyllodia oblong, ovate, acute, bearing a gland on the upper margin; heads of flowers axillary, twice the length of the phyllodia.  

73 A. russula (Wendl. diss. no. 20. t. 8.) phyllodia linear, 1-nerved, thickish, quite entire, attenuated at the base, rounded at the apex, and ending in an inflexed mucrone; heads of flowers usually borne axile; flowers 5-cleft.  

Thickish-leaved Acacia. Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

74 A. suaveolens (Wild. spec. 4. p. 1050.) phyllodia linear, tapering a little at the base, acute, mucronulate, 1-nerved, quite entire; heads of flowers racemose; calyx 5-parted; ovary glabrous.  

Native of New Holland, on the eastern coast.  

75 A. angustifolia (Wendl. diss. no. 22.) phyllodia linear, tapering a little to the base, acute, mucronate, 1-nerved, quite entire; heads of flowers racemose; calyx 4-toothed; ovary tomentose.  

Native of New Holland, about Port Jackson.  

Narrow-leaved Acacia. Fl. April, May. Clt. 1816. Shrub 3 to 6 feet.

76 A. divisa (Cunningh. mss.) phyllodia straight, elongated, linear, attenuated at the base, but rounded at the apex, in a callous mucron, which forms a right angle with the phyllodia, 1-nerved, and bearing a gland on the upper margin between the middle and the base; heads of flowers crowded, disposed in terminal and axillary racemes.  

Hooked Acacia. Shrub 3 to 6 feet.

77 A. linearis (Wild. spec. 4. p. 1051.) phyllodia narrow, mucronate, 1-nerved, quite entire; heads of flowers racemose; racemes length of the phyllodia; calyx sinuately 5-toothed; ovary glabrous.  

Native of New Holland, on the east coast.  

Hooked Acacia. Fl. May, June. Clt. 1790. Sh. 3 to 4 ft.

78 A. arhizina (Wild. spec. 4. p. 1051.) phyllodia narrow, linear, mucronate, 1-nerved, quite entire; heads of flowers racemose; racemes longer than the phyllodia.  

Native of New Holland. Perhaps this is merely a variety of the preceding species.

Fir-like Acacia. Fl. April, June. Clt. 1823. Sh. 3 to 6 ft.

79 A. subulata (Bonpl. nav. t. 45.) phyllodia very long and linear, subulate and mucronate at the apex; heads of flowers racemose; racemes one-half shorter than the phyllodia; calyx 5-cleft; ovary tomentose.  

Native of New Holland. Wendl. diss. no. 25.

Subulate-leaved Acacia. Fl. April, June. Clt. 1824. Shrub 3 to 6 feet.

80 A. rubida (Cunningh. in Field's new south wales, p. 344.) phyllodia ovate-lanceolate, ending in an oblique innocuous mucron at the apex, bearing a gland on the upper margin; racemes small, pedunculate, axillary, and terminal; the rib and margins of the leaves coloured with red.  

Native of New Holland, frequent on the edge of rills on the blue mountains.

Reddish Acacia. Fl. April, June. Clt. 1823. Sh. 4 to 6 feet.

§ 3. Spicate (from spicatus, spiked; disposition of flowers). Flowers disposed in cylindrical spikes. Stipulas usually wanting, or when present they are small and un armed.  

81 A. tanifolia (Wild. spec. 4. p. 1050.) phyllodia in whorls of threes, lanceolate; spikes axillary, solitary, rather ovate; flowers 4-cleft, tetradrome.  

Native of Cochin-
LEGNMINOSÆ.

A. oxyzæbrus (Sieb. pl. excis. nov. holl. no. 457.) stipula- 
aphas spinose; phyllodia scattered or somewhat verticillate, lanceo- 
late-linear, ending in a pungent point, 3-nerved, glabrous, with 
nerve-formed glandless margins; spikes axillary, solitary, elong- 
gated; flowers 4-cleft. ∨ G. Native of New South Wales, 
Sweet, fl. austr. 6. Hook. bot. mag. 2928. A. pugionifömsis, 
Cunning, mss. A. taxifölia, Lodd. bot. cab. 1225. Branches 
and rachis of spikes clothed with velvety villi.

38 A. venticillata (Willd. spec. 4. p. 1040.) phyllodia 
linear, ending in a pungent mucrone, disposed somewhat verti- 
cillately; spikes axillary, solitary, oblong; flowers 5-cleft; 
young legumes pubescent. ∨ G. Native of New Holland, on 
the south coast, and of Van Diemen’s Land. Phyllody probably 
tern, the middle one the proper phyllodium, and the lateral ones 
are probably diluted stipulas, assuming the form of phyllody.

Var. α, glabræ (D. C. prod. 2. p. 453.) branches and pedun- 
clés phyllodia glandulæ sparse; legymes very narrow. 
Var. β, virgata (D. C. l. c.) branches and peduncles velutine; 
phyllody linear-subulate; legumes very narrow. Mimosa ver- 
t. 63.

Var. γ, latifolía (D. C. l. c. p. 454.) branches and peduncles 
velutine; phyllodia oblong-obovata or oblong-lanceolata; legumes 
broadish. Mimosa ulicifòlia, Salisbury. prod. 324. Mimosa ver- 
ticillata, Wendl. coll. t. 1. t. 30.

Whorled-leaved Acacia. Fl. March, May. Ct. 1780. Shrub 
6 to 10 feet.

38 A. rugosifòlia (Cunningham, mss.) phyllodia lanceolate, 
ending in a pungent mucrone, somewhat verticillately disposed; 
spikes axillary, solitary, cylindrical; branches stiff, deflexibly-
divaricate. ∨ G. Native of New Holland. Nearly allied to A. venticillata, but differs in the more rigid dwarf habit.

Shrub 2 to 3 feet.

38 A. lineâris (Sims, bot. mag. t. 2156.) phyllodia narrow-
linear, very long, 1-nerved, and quite entire; spikes axillary, 
numerous, usually branched; calyx sinuate 4-toothed. ∨ S. 
Native of New Holland. Legume narrow-linear, attenuated at 
both ends, when young pubescent. Petals 4, distinct.

Var. β, longissima (Wendl. diss. no. 31. t. 11.) phyllodia 
longer, and more spreading, but not erect. ∨ G. Native of New 
395. is a plant intermediate between the species and the variety.

Lineâr-leaved Acacia. Fl. May, June. Ct. 1819. Shrub 
3 to 6 feet.

38 A. mucronâta (Willd. enum. suppl. 68.) phyllodia linear-
spatulate, 1-3-nerved, rounded and mucronate at the apex; 
spikes axillary, solitary or twin, simple; calyx sinuately 4-tooth-
ed. ∨ G. Native of New Holland. Wendl. diss. no. 32. 
t. 12. Sims, bot. mag. 2747. Petals 4, joined at the base. Ovary 
clothed with white tomentum.

3 to 6 feet.

38 A. florîbundâ (Willd. spec. 4. p. 1051.) phyllodia linear-
lanceolate, attenuated at both ends, quite entire, with 3-5 fine 
nerves; spikes axillary, solitary, simple; calyx sinuately 4-
toothed. ∨ G. Native of New Holland, on the east coast. 
Mimosa florîbunda, Vent. choix. t. 13. A. longifòlia, Sieb. pl. 
excis. nov. holl. no. 440. Petals 4, joined at the base, reflexed 
at the apex. Ovary rather silky.

Buddle-flowered Acacia. Fl. May, June. Ct. 1796. Shrub 
6 to 10 feet.

88 A. homomâlæ (Wendl. diss. no. 34. t. 13.) phyllodia 
linear-lanceolate, attenuated at both ends, falcate, 3-nerved, 
white on both surfaces, but pubescent at the base; spikes twin, 
but solitary on the peduncles, axillary; calyx 5-toothed. ∨ G. 
Native of New Holland. Petals 5, joined at the base.

88 A. holoskéacea (Cunningh. mss.) aspect silky-white; 
phyllodia oblong-lanceolate, obliquely-cuneated at the base, 
ending in a soft mucrone at the apex, 3-nerved, and furnished 
with one gland on the upper margin, spikes axillary, usually 
twin. ∨ S. Native of New Holland within the tropic. A. 
heteromâlâ, Sweet. A. leucocephala, Sweet. Phyllodia 6 inches 
long, and 1 inch broad.

Whole-silly Acacia. Fl. May, July. Ct. 1818. Tr. 10 to 20 ft.

90 A. longifòlia (Willd. spec. 4. p. 1052.) phyllodia lan- 
cateated, attenuated at both ends, 2-3-nerved at the base, and 
quite entire, the rest many nerved; spikes axillary, twin, on short 
peduncles; calyx 4-cleft. ∨ G. Native of New Holland, on 
malm. 52. M. macrostâchya, Poir. suppl. 1. p. 61. A. florî- 
bundâ, Sieb. pl. excis. nov. holl. no. 353 and 439. There 
are varieties of this species with acute and obtuse, narrower (Sims, 
bot. mag. 1827.) and broader (Sims, bot. mag. 2166.) phyllodia. 
Petals 4, joined at the base.

Long-leaved Acacia. Fl. March, May. Ct. 1792. Tree 
10 to 20 feet.

91 A. doratoxyloû (Cunningh. in Field’s new south wales, 
p. 345.) leaves lanceolate-linear, falcate, striated, attenuated 
at the base; spikes cylindrical, axillary, twin, nearly sessile. ∨ G. 
Native of New Holland, on pine ridges on the Macquarie river. 
This is the spearwood of certain tribes in the interior of the 
country.

92 A. interrêta (Sieb. pl. excis. nov. holl. no. 453.) phy- 
llodia long-lanceolate, bluntish, straight, attenuated at the base, 
bearing on the upper margin at the base an inconspicuous gland, 
2-nerved, reticulated with anastomosing veins, and are, as well 
as the branches, glabrous; spikes twin; flowers 4-cleft. ∨ G. 
Native of New Holland. A. obtusifòlia, Cunningham, in Field’s 
new south wales, p. 345. A. thegonocârpa, Cunningham, mss. 
in Loud. hort. brit. p. 407. no. 2470. Phyllodia 6 inches long, 
and half an inch broad. Spikes an inch long.

Intermediate-nerved Acacia. Fl. April, June. Ct. 1824. Shrub 
4 to 6 feet.

93 A. glaucescens (Willd. hort. berol. t. 101.) phyllodia ob-
long, rather falcate, quite entire, many-nerved, 2 or 3 of the 
nerve very evident; spikes axillary, solitary, pedunculate; calyx 5-
toothed. ∨ G. Native of New Holland. Petals 5, joined at 
the base, and spreading at the apex.

94 A. cineraeâns (Sieb. pl. excis. nov. holl. no. 448.) phy- 
llodia oblong, somewhat falcate, acuminated at both ends, quite 
entire, many-nerved, 2 or 3 of the nerves very evident; spikes 
axillary, solitary, pedunculate; flowers 4-cleft. ∨ G. Native 
of New Holland. Branches angular, and are, as well as rachis 
of the spikes, clothed with short, velvety, white down. Very 
early allied to A. sophoræa.

Greyish Acacia. Fl. March, May. Ct. 1824. Sh. 4 to 6 ft.

95 A. sophoræa (R. Br. in hort. kew. 5. p. 462.) phyllodia 
obovate-oblong or lanceolate, quite entire, many-nerved, someti- 
times there are bipinnate leaves at the tips of the shoots of 
young ones and branchlets rather velvety; spikes axillary, twin; 
calyx 4-cleft. ∨ G. Native of New Holland, on the south coast, 
and at Cape Van Diemen. A. sophoræa, Labill. nov. holl. 2. t. 237. 
Legume tororo or umbilical funicle plicate. Petals 4, distinct.
**Leguminosae.**

**Sect. II. Conzuga'to-pinnate.** Leaves with one pair of pinnae, each pinna bearing few or many pairs of leaflets. This is an artificial section, composed of a heterogeneous mass of species, the most part of which are not well known.

96. A. amennus (Moc. et Sesse, fl. mex. con. incd. D. C. prod. 2. p. 455.) glandular; spines stipular, straight; pinnae bearing 5 pairs of oblong leaflets; petiole very short; spikes oblong, pendulous, axillary, sessile. 

b. S. Native of New Spain. Spikes dense, resembling the aments of a salix. Legumes unknown. Flowers yellow.

**Amentaceous Acacia.**

97. A. laxifolium (D. C. prod. 2. p. 455.) unarmored, glabrous; pinnae bearing 3 pairs of petiolulate oval leaflets; petiole elongated; panicles axillary, loosely branched; heads 1-3-flowered. 

b. S. Native of the island of Timor. Flowers polyandrous. Leaflets 2-3 inches long, and 1 1/2 inch broad. A very distinct species.

**Loose-flowered Acacia.**

98. A. coronillotélia (Desv. cat. hort. par. ed. 2. p. 207.) glabrous; spines stipular, straight; pinnae bearing 5-9 pairs of linear, obtuse, rather glaucous leaflets; petiole very short, or hardly any, bearing a sessile gland between the pair of pinnae. 

b. G. Native of the north of Africa, near Mogador. Mimosa Giraffé, Brous. in hort. monsp. Mimosa coronillotélia, Pers. ench. no. 44. Heads of flowers ovate, pedunculate. It differs from the following species in the petioles being very short.

**Coronilla-leaved Acacia.** Ct. 1817. Tree.

99. A. gumifera (Willd. spec. 4. p. 1056.) glabrous; spines stipular, straight; petiole bearing 6 pairs of linear oblong leaflets; petiole bearing a sessile gland between the pair of pinnae; spikes oblong, axillary; legumes somewhat moniliform, clothed with white tomentum. 

b. G. Native of the north of Africa, near Mogador. Sassa gumifera, Gmel. syst. Very like A. Arábica. Gum-arabic is obtained from this species as well as from many others.

**Gum-bearing Acacia.** Ct. 1823. Tree.

100. A. strombusfera (Willd. spec. 4. p. 1055.) glabrous; spines stipular, or nearly wanting; pinnae bearing 4-6 pairs of alternate or opposite, linear, obtuse leaflets, without any gland between the pinnae; legume terete, spirally twisted. 

b. S. Native of Peru, in woods, where it is vulgarly called *retortuna* from the shape of the pods. Mimosa strombusfera, Lam. dict. 1. p. 15. Flowers unknown. Legume indehiscent, which character separates a separate genus.

**Strombus-bearing Acacia.** Shrub 6 to 8 feet.

101. A. magdaleñæ (Bert. in herb. Balb. D. C. prod. 2. p. 455.) unarmored; stipulas lanceolate, striated, erect; pinnae bearing 25 pairs of linear, obtuse, smooth leaflets; petiole pubescent, glandless, much shorter than the pinnae. 

b. S. Native of St. Martha. Flowers unknown. Legume 5 inches long, thickish, straight, and glabrous, with the valves thick and furrowed on the outside.

**Magdalena Acacia.**

102. A. viridis (Bert. in herb. Balb. ex D. C. prod. 2. p. 455.) spikes nearly axillary, spreading, straight; stipulas lanceolate, striated, erect; pinnae with 13 pairs of linear obtuse leaflets; petiole very short, glandless, and is, as well as the branches, pilose. 

b. S. Native of Jamaica. Flowers and legumes unknown. This is a very singular species from having stipular spines, and the stipulas existing at the same time.

**Pilose Acacia.** Ct. 1806. Tree.

103. A. reticulata (Willd. enum. 1051.) spikes stipular, straight, length of the leaflets; leaves with one or more pairs of pinnae; each pinna bearing 6-9 pairs of oblong-linear, obtuse, dis-
and legumes unknown. Perhaps a species of Prosopis, according to H. B. et Kunth, nov. gen. amer. 6. p. 281.

Two-winged Acacia. Cit. 1818. Tree.

115 A. ? salina rum (D. C. prod. 2. p. 456.) spines solitary, straight, rising from the sides of the pods; pinnae bearing 19-20 pairs of linear, oblique leaflets, which are glabrous as well as branches and corollas, with a gland at the top of the petiole, and one between each pair of leaflets; spikes solitary, pedunculate. β. S. Native of Jamaica, in salt marshes. Mimosa salinaria, Vahl. ecl. amer. 3. p. 35. Stamens 10. Ovary hairy.

Salt-marsh Acacia. Tree.

114 A. strigosâ (Spreng. syst. 3. p. 137.) leaves with 1 pair of pinnae, each pinna bearing 2 pairs of oblique leaflets, which are pilose beneath; heads of flowers globose; legume strigose. β. S. Native of Peru. Mimosa strigosa, Pers. ench. 2. p. 263.

Strigosae Acacia. Shrub.

115 A. seloi (Spreng. syst. 3. p. 137.) leaves almost sessile, with 1 pair of pinnae, each pinna bearing about 12 pairs of linear, shining leaflets; heads of flowers pedunculate, usually solitary; legume straight, lanceolate, with thickened margins.

β. S. Native of Brazil.

Sellos's Acacia. Tree.

116 A. elácaida (Spreng. syst. 3. p. 137.) branches and petioles elongated and filiform, flaccid, glabrous; stipular linear; leaves with 1 pair of pinnae, each pinna bearing 6 pairs of obliquely oblong, nerved, pubescent leaflets; heads of flowers pedunculate.

Placcidae branched Acacia. Shrub.

117 A. inca in (Spreng. syst. 3. p. 137.) branches clothed with fleshy down; leaves with 1 pair of pinnae, each pinna bearing about 20 pairs of oblong, obtuse, nerveless leaflets, which are hoary and lepidoted beneath; heads of flowers twin, pedunculate. β. S. Native of Brazil.

Hoary Acacia. Shrub.

118 A. setôsa (Spreng. syst. 3. p. 137.) branches hairy; leaves with 1 pair of pinnae, each pinna bearing many pairs of linear leaflets, which are ciliate with strige on the margins.

β. S. Native of Brazil.

Setose Acacia. Shrub.

Sect. III. Stípeliöse (from spica, a spike, and flos, a flower; in reference to the disposition of the flower in spikes). Leaves bipinnate, with few or many pairs of pinnae, each pinna bearing many pairs of leaflets. Flowers disposed in spikes.

* Unarmed trees or shrubs.

119 A. caudâta (D. C. prod. 2. p. 456.) unarmed; leaves with 2-3 pairs of pinnae, each pinna bearing 7-8 pairs of linear-oblong, very blunt, somewhat emarginate, quite glabrous leaflets, which are oblique at the base, the outer ones largest; petioles glandless; spikes twin, disposed in terminal raceme. β. S. Native of Cayenne. Mimosa caudata, Vahl. ecl. amer. 3. p. 55.

Tailled Acacia. Tree.

120 A. cyclosepâma (D. C. prod. 2. p. 456.) unarmed; leaves with 3 pairs of pinnae, each pinna bearing 3-4 pairs of obvate-oblong, rather coriaceous leaflets, which are cuneated at the base, and are glabrous as well as the petioles, with a depressed gland between each of the pairs of pinnae, and also between each of the pairs of leaflets; spikes supra-axillary, solitary; seeds flat, orbicular. β. G. Native of New Caledonia. Flowers 5-cleft. Legume 4-5 inches long, compressed.

Circle-seeded Acacia. Tree.

121 A. granulôsa (Labill. cal. p. 67. t. 66.) unarmed; leaves with 5 pairs of pinnae, each pinna bearing 12 pairs of alternate, obliquely ovate-oblong, obtuse leaflets; spikes axillary, solitary; stamens monoepalous; branches granular. β. G. Native of New Caledonia. Legumes moniliform, 6-7-seeded.

Granular-branched Acacia. Shrub 4 to 6 feet.

122 A. fullo s (Labill. cal. p. 68. t. 67.) unarmed; leaves with 2-3 pairs of pinnae, each pinna bearing 3-4 pairs of elliptic, oblate leaflets, which are attenuated at both ends; spikes of flowers length of leaves. β. G. Native of New Caledonia.

Shining Acacia. Shrub 12 feet.

123 A. distachyâ (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 456.) unarmed; leaves with 4 pairs of pinnae, each pinna bearing 3-4 pairs of oval, obolate leaflets, which are rather villous as well as the petioles; spikes axillary, twin. β. S. Native of New Spain. Partial petioles jointed at the base. Co- rolla 5-parted. Stamens 97 monadophalous at the base. Legume unknown.

Two-spiked Acacia. Tree.

124 A. Thibaudia na (D. C. prod. 2. p. 456.) unarmed; leaves with 4 pairs of pinnae, each pinna bearing 7-9 pairs of ovate, somewhat rhomboidal leaflets, which are rather oblate at the base and villous beneath, as well as the petioles, which bear a sessile gland each; legumes compressed, contracted between the seeds. β. S. Native of South America, but in what place is unknown. Sophora obliqua, Pers. ench. 1. p. 452.

Thibaud's Acacia. Tree.

125 A. rolhdia na (D. C. prod. 2. p. 457.) unarmed; leaves with 4 pairs of pinnae, each pinna bearing about 10-11 pairs of somewhat trapexiform, obtuse, glabrous leaflets, which are beset with yellow villi on the ribs, with a gland between each of the pairs of leaflets; spikes solitary, pedunculate, axillary, length of leaves. β. S. Native of South America. Mimosa nigricans, Vahl. ecl. amer. 3. p. 57. t. 29. but not of Labill. Plant becoming black on drying.

Rhôrs Acacia. Tree.

126 A. nudiflôra (Willd. spec. 4. p. 1058.) unarmed; leaves with 4-6 pairs of pinnae, each pinna bearing 12-15 pairs of elliptic, obtuse leaflets, with a depressed gland between each of the pairs of pinnae; spikes of flowers axillary and lateral, filiform. β. S. Native of Porto Rico. Leaves downy beneath as well as the petioles, when young. Legume linear, flat, glabrous.

Naked-flowered Acacia. Tree 20 feet.

127 A. maricata (Willd. spec. 4. p. 1058.) unarmed; leaves with 5 pairs of pinnae, each pinna bearing 12-15 pairs of ovate, retuse, rather emarginate leaflets, with a depressed gland between each of the pairs of pinnae; spikes cylinrdrical, subulate, aggregate at the top of the branches; branches warty. β. S. Native of the West Indies. Mimosa muricata, Lin. spec. 1504. —Plum. ed. Burn. t. 11. Flowers white.

Maricate-branched Acacia. Tree.

128 A. rostrata (Humb. et Bonpl. in Willd. spec. 4. p. 1060.) unarmed; leaves with 6 pairs of pinnae, each pinna bearing numerous pairs of linear, glabrous leaflets; petioles pilose, bearing an urceolate gland at the base; spikes axillary. β. S. Native of South America. Mimosa ignavi, H. B. et Kunth, nov. gen. amer. 6. p. 259. Flowers unknown. Legume linear, beaked at the apex.

Beaked-podded Acacia. Tree.

129 A. callosâ (Spreng. syst. 3. p. 138.) branches beset with calloous warts; petioles pubescent, bearing a gland at the base; leaves with 7 pairs of pinnae, each pinna bearing many pairs of linear, shining leaflets; spikes disposed in panicles.

β. S. Native of Brazil.

Callous-warted Acacia. Tree or shrub.

130 A. areno sa (Willd. 1. c.) unarmed; leaves with 6 pairs of pinnae; each pinna bearing 16 pairs of linear, acute, ciliate leaflets; petioles pubescent, bearing a gland between each of

3 G
the pairs of pinnae; spikes twin, filiform. \( \gamma \). S. Native of Caracass, on the sandy banks of rivers.

Saud Acacia. Ch. 1818. Tree 10 to 12 feet.

131 A. lophanthoides (D. C. prod. 2. p. 457.) unarmed; leaves with 8-9 pairs of pinnae, each pinna bearing 12 pairs of oval-oblong, obtuse leaflets; petioles glandless, and are as well as the branches pubescent; racemes usually short, short, axillary; calyces glabrous. \( \gamma \). S. Native of Jamaica. Flowers and habit of the following species. Legumes unknown.

Lophanthe-like Acacia. Ch. 1820. Tree.

132 A. lophantha (Wildl. spec. 4. p. 1070.) unarmed; leaves with 8-10 pairs of pinnae, each pinna bearing 25-30 pairs of linear, bluntish leaflets; petioles and calyces clothed with velvety down, with a gland at the base of the common petiole, and one between each of the two extreme pairs of leaflets; racemes ovate-oblong, axillary, twin. \( \gamma \). G. Native of New Holland. Sims, bot. mag. 2108. Mimosa distichya, Vent. cels. t. 20. but not of Cav. Mimosa elegans, Andr. bot. rep. t. 563. A. lophantha, Lodd. bot. cab. 716. This and the preceding species would almost constitute a proper section from the flowers. Perhaps A. insignis of Hoffmans. ver. 1824. p. 159. is not distinct from the present species. Flowers yellow.

Crest-flowered Acacia. Fl. May, Jul. Ch. 1803. Sh. 6 to 10 ft.

133 A. guianensis (Wildl. spec. 4. p. 1061.) unarmed; leaves with 10 pairs of pinnae, each pinna bearing 10 pairs of elliptic, obtuse, glabrous leaflets; petiole rather velvety, furnished with a convex gland at the base; spikes filiform, solitary, axillary. \( \gamma \). S. Native of Guiana and Cayenne. Legume lanceolate, flat. Mimosa Guianensis, Aubl. guian. 2. t. 357. Flowers small, glabrous, white.

Guiana Acacia. Ch. 1803. Tree 40 feet.

134 A. psilostachya (D. C. prod. 2. p. 457.) unarmed; leaves with 7-10 pairs of pinnae, each pinna bearing 15-20 pairs of oblong-linear, obtuse, glabrous leaflets, which are truncate at the base, with an adpressed gland at the base of the petiole, and one between the extreme pair of pinnae; spikes filiform, slender, solitary, axillary. \( \gamma \). S. Native of French Guiana. Flowers small, as in the preceding, but pubescent.

Smooth-spired Acacia. Tree.

135 A. acapulcoensis (Kunth, mim. 78. t. 24. nov. gen. amer. 6. p. 267.) unarmed; leaves with 8-9 pairs of pinnae, each pinna bearing 35-45 pairs of oblong-linear, glabrous leaflets, with a gland between 2 or 3 of the extreme pairs of pinnae, and one at the base of the petiole; spikes cylindrical, axillary, solitary, twin, or tern. \( \gamma \). S. Native of Mexico, about Acapulco, in the sand by the sea-side. Flowers white. Stamens numerous, monadelphous. Legumes unknown.

Acapulco Acacia. Ch. 1825. Tree.

136 A. elephasencora (Burch. cat. geogr. no. 2410.) unarmed; leaves with 10-12 pairs of pinnae, each pinna bearing 25 pairs of linear, glabrous leaflets; petioles glandless; branches and flowers glabrous; spikes axillary, cylindrical, solitary. \( \gamma \). G. Native of the Cape of Good Hope. Petals 15. Stamens 10. Perhaps a species of Prosopis.

Elephant-root Acacia. Ch. 1818. Shrub.

137 A. sclerophyla (Tussac, fl. antil. t. 21.) unarmed; leaves with 10-15 pairs of pinnae, each pinna bearing an indefinite number of leaflets, with an uncurled gland below the lower pair of pinnae; spikes filiform, solitary; branches warded. \( \gamma \). S. Native of the French West India Islands, where it is called Tendre à caillou batard, with many other species.

Hard-wooded Acacia. Tree 60 feet.

138 A. pulcherella (Willd. spec. 4. p. 1061.) unarmed; leaves with 13 pairs of pinnae; each pinna bearing numerous pairs as well as the petioles, and with a convex gland at the base of the petiole; spikes of flowers axillary, twin, filiform. \( \gamma \). S. Native of Para, in Brazil. Flowers pilose, 5-cleft.

Piares Acacia. Ch. 1823. Tree 50 feet.

139 A. dumetorum (D. C. prod. 2. p. 458.) stem furnished with a few prickles; branches sulcate, pubescent; leaves bipinnate, each pinna bearing many pairs of minute, linear-elliptic leaflets, which are glandularly dotted beneath; spikes axillary, twin, slender; corolla profusely 5-cleft; stamens free; ovary villous. \( \gamma \). S. Native of Brazil, in the province of Minas Novas. Mimosa dumetorum, St. Hil. pl. rem. bras. 1. p. 1. Legume unknown.

Bush Acacia. Shrub 2 to 3 feet.

140 A. adstringens (Mart. reis. bras. ex Schlecht. Linnea. 5. p. 41.) unarmed; leaves with 4-5 pairs of pinnae, each pinna bearing 4-5 pairs of broad-ovate, glabrous leaflets, which are unequal at the base, obtuse, and glabrous, with a gland between the superior pair of pinnae; petioles and young branches clothed with chestnut-coloured tomentum; spikes cylindrical, axillary, with the rachis and calyces tomentose. \( \gamma \). S. Native of Brazil. Legume oblong, compressed.

Astringent Acacia. Shrub 2 to 3 feet.

141 A. macrodora (Willd. spec. 4. p. 1060.) unarmed; leaves with 16 pairs of pinnae, each pinna bearing many pairs of linear, falcate, acuminate leaflets, which are angular at the base; petioles with 2 hairy lines on the upper side; spikes filiform, solitary, axillary. \( \gamma \). S. Native of Para, in Brazil.

Long-podded Acacia. Tree 40 to 50 feet.

142 A. sprengeli; branches glandless; petioles hairy; leaves with 6 pairs of pinnae, each pinna bearing 15 pairs of oblong, obtuse, pubescent leaflets; spikes short, twin. \( \gamma \). S. Native of Jamaica. A. Bertiariana, Spreng. syst. 3. p. 138, but not of Spreng. in herb. Balb. D. C.

Sprengel's Acacia. Tree.

143 A. aspidioleus (Meyer. prim. essq. 165.) unarmed; leaves with 15-18 pairs of pinnae, each pinna bearing many pairs of linear, glabrous leaflets, and bearing on the under side at the base a transverse gland each; petals glandless, pubescent; spikes cylindrical, disposed in terminal racemes. \( \gamma \). S. Native of Guiana, in the island of Arowabish, in humid places. Petals 5, white, hardly connected at the base. Stamens 10. Legume curved. Aspidium-like Acacia. Tree 50 to 40 feet.

144 A. dealbata (Link. enum. 2. p. 445.) unarmed; leaves with 15 pairs of pinnae, each bearing many pairs of minute, equal, pubescent leaflets, with a perforated gland seated between one of the pairs of pinnae; racemes lateral. \( \gamma \). S. Native country and legumes unknown.

Whitened Acacia. Tree.

145 A. wallichiana (D. C. prod. 2. p. 458.) unarmed; branches and leaves pubescent; leaves with 10-12 pairs of pinne, each pinna bearing about 50 pairs of approximate, linear leaflets; petiole bearing a gland beneath the pinnae, and one between each of the pairs of pinnae; spikes cylindrical, elongated; legumes flat, lanceolate; quite glabrous, 6-10-seeded. \( \gamma \). S. Native of the East Indies. Stamens 20-25.

Wallich's Acacia. Ch. 1820. Tree 30 feet.

** Prickly or spiny trees or shrubs.

146 A. ferruginea (D. C. prod. 2. p. 458.) spines stipular, straightish, conical, broadest at the base; leaves with 2-4 pairs of pinnae, each pinna bearing 10-12 pairs of linear, bluntish, glabrous, glaucous leaflets; petiole furnished with a large, depressed gland; spikes of flowers cylindrical, slender, disposed in a panicle; legumes oval, hard, compressed, 1-2-seeded, indehiscent. \( \gamma \). S. Native of Coromandel. Mimosa ferruginea, Roxb. hort. beng. p. 41. Stamens 20-25. Allied to A. Suandra and A. Cátchce.
Rusty Acacia. Clt. 1818. Tree 12 to 20 feet.

147 A. Subtilifolia (H. B. ct Kunth, nov. gen. amer. 6. p. 268.) spines prickly, nearly erect; leaves with 5-10 pairs of pinnae, each pinna bearing about 30-45 pairs of linear leaflets, which are puberulous beneath; petioles bearing 1 gland in the middle and one at the top of the rachis; spikes cylindrical, solitary; legumes oblong, unarmed. $\natural$. Native of New Granada, on the banks of the river Chota. Stamens 10, free.

Subtil-leaved Acacia. Tree.

150 A. Fasciculata (Kunth, min. 75. t. 23. nov. gen. amer. 6. p. 267.) prickles scattered or twin, straight; leaves with 15 pairs of pinnae, each pinna bearing 9-14 pairs of obliquely oblong leaflets; petioles glandless, rather prickly, and are as well as the branchlets pubescent; spikes cylindrical, fasciculately panicled. $\natural$. Native of Mexico, near Guanaxuto. Flowers white, 5-clft, octandrous or decandrous. Legumes unknown.

Fasciculated-spiked Acacia. Tree.

151 A. Viridiflora (Kunth, min. 81. t. 25. gen. amer. 6. p. 269.) prickles recurved; leaves with 6-15 pairs of pinnae, each pinna bearing 15-35 pairs of linear-oblong leaflets, which are puberulous beneath as well as the petioles, which are furnished with 1 gland at the base, and 2 or 3 along the rachis; spikes cylindrical, solitary. $\natural$. Native of South America, in the province of Bracamora, near St. Felipe. Flowers greenish-white, 5-clft. Stamens 10, free. Legume unknown.

Green-flowered Acacia. Clt. 1823. Shrub 4 to 6 feet.

152 A. Caesia (Willd. spec. 4. p. 1079.) prickles stumpy, twice recurved; leaves with 10 pairs of pinnae, each pinna bearing 20-30 pairs of lanceolate-linear, obtuse, glabrous leaflets, with a depressed gland at the base of the petiole; spikes cylindrical, axillary. $\natural$. Native of the Cape of Good Hope. Mimosa Caffra, Thunb. prod. 92. fl. cap. 433. Legumes linear-lanceolate.

Caffrian Acacia. Clt. 1800. Tree 10 to 20 feet.

153 A. Polyaeantha (Willd. spec. 4. p. 1079.) prickles stumpy, dilated; leaves with 10 pairs of pinnae, each pinna bearing 30-40 pairs of linear, obtuse, ciliated leaflets, with a gland both at the base and apex of the common petiole, which is prickly beneath; spikes cylindrical, twin, axillary. $\natural$. Native of the East Indies. Mimosa spinosissima, Poir. suppl. 1. p. 78.

Many-spined Acacia. Tree.

154 A. Stellata (Willd. spec. 4. p. 1078.) prickles stumpy, recurved; leaves with 10 pairs of pinnae, each pinna bearing 13 pairs of oblong leaflets, which are obtuse at both ends; petioles bearing 2 or 3 recurved prickles at the origin of each pinna; racemes of flowers compound. $\natural$. Native of Arabia Felix, on Mount Kurma. Mimosa stellata, Forsk. descript. 177. Vahl. symb. 1. p. 81. Petals 5. Stamens 10. Legume compressed, lanceolate, membranous.

Starry Acacia. Tree.

155 A. Velutina (D. C. prod. 2. p. 458.) prickles petiolar, scattered, hooked; leaves with 11 pairs of pinnae, each pinna bearing 25-35 pairs of oblong, linear leaflets, which are pubescent as well as the petioles, peduncles, and flowers; petioles furnished with a gland at the base, and one between each of the two extreme pairs of pinnae. $\natural$. Native of Brazil. Corolla 5-furrowed, pubescent. Stamens numerous. Legume unknown.

Veletty Acacia. Tree.

156 A. Ataxacantha (D. C. prod. 2. p. 459.) prickles hooked, scattered in a loose manner along the branches and petioles; leaves with 6-8 pairs of pinnae, each pinna bearing 20-30 pairs of linear, ciliated leaflets, with an oblong gland on the petiole, both between the lower and upper pair of pinnae; stipulas lanceolate, dilated on the outside at the base; spikes twin, axillary, cylindrical. $\natural$. Native of the banks of the rivers Senegal and Gambia. Stamens 20-25. Legumes unknown.

Unorderly-spined Acacia. Shrub 6 to 8 feet.

157 A. Macrosta'chya (Reichb. in Sieb. pl. exsic. senec. no. 44.) prickles hooked, scattered without any order along the branches; stipulas foliaceous, large, rather reniform, acute; leaves with 20 pairs of pinnae, each pinna bearing 20-30 pairs of linear, villous, and ciliated leaflets; spikes of flowers elongated, and are as well as the petioles and branches velutin. $\natural$. Native of Senegal and Gambia, where we have seen it and the preceding species growing in plenty about Bathurst, near the mouth of the river. Spikes of flowers clothed with hoary tomentum, 3 inches long. Flowers glabrous, 5-clft.

Long-spiked Acacia. Shrub 8 to 10 feet.
158 A. Senegal (Willd. spec. 4. p. 1077. exclusive of figure cited), prickles stellate, straight, short; leaves with 5–8 pairs of pinnae, each pinna bearing 15–18 pairs of oblong-linear obtuse leaflets, which are glabrous, as well as the petioles and branches, with a sessile gland between each of the pairs of pinnae on the petiole; spikes axillary, solitary, slender. -indent. Native of Arabia, and the interior of Africa. Mimosa Senegal, Lin. spec. 1506. Flowers small, glabrous, distant. Branches white. Prickles sometimes wanting. Axillary branches abortive, and becoming spines. The spines at the base of the leaves are said to be three by Linnaeus. Gum-senegal is the produce of this tree; it is usually sold in the shops as gum-arabic; its medicinal uses are the same, and it is procured in the same way from the trees. It was not until the beginning of the 17th century that the Dutch made gum-senegal known in Europe. After the French got possession of that river they directed their attention to it as an important object of commerce, and ascertained by experiments made in the latter half of the 17th century that gum-senegal was superior to the best gum-arabic. M. Adanson examined all the gum trees of West Africa with great care. They amount to 40 in number, but the three great forests which supply the Senegal market consist chiefly of two kinds, one which produces a white gum called vereek, and another called neubueb, which yields a red gum.

Senegal Acacia. Clt. 1823. Tree 20 feet.

159 A. Arbida (Delili. fl. Egypt. 143. p. 52. f. 3.) prickles stellate, straight; leaves with 3–4 pairs of pinnae, each pinna bearing 9–10 pairs of oblong-linear, obtuse, rather mucronate, glaucous leaflets, which are glaucous, as well as the branches, with a sessile gland between each of the pairs of pinnae; spikes cylindrical, exceeding the leaves. -indent. Native of Upper Egypt, near Syene. Legume unknown.

White-leaved Acacia. Tree 20 feet.

160 A. Monacantha (Willd. enum. 1056.) prickles stellate, infra-axillary, solitary, recurved; leaves with usually 8 pairs of pinnae, each pinna bearing 17–20 pairs of oblong leaflets; spikes cylindrical, paniced, axillary. -indent. Native of Brazil.

One-skipped Acacia. Clt. 1818. Tree.

161 A. Daelea (Desv. journ. bot. 1814. vol. 1. p. 69.) spines straight, elongated, solitary, pubescent, stellate; leaves bipinnate, pubescent; spikes 3-together, axillary, on short peduncles. -indent. Native of the East Indies. Flowers rose-coloured.

Datea-like Acacia. Tree.

162 A. Seini (Balbi. in Spin. cat. supp. 1823, p. 8. Col. hort. ripul. append. t. 5.) prickles stellate, infra-axillary, solitary, hooked; leaves with 3–4 pairs of pinnae, each pinna bearing 3–5 pairs of elliptic leaflets, the lower ones the smallest; spikes cylindrical, solitary or twin, axillary. -indent. Native country unknown. Flowers greenish yellow. Legumes coarctate between the seeds, prickly on the sutures.

Spinis Acacia. Shrub 5 to 8 feet.

163 A. Cornigera (Willd. spec. 4. p. 1080.) prickles or spines stellate, conuate at the base, compressed, large; leaves with 5 pairs of pinnae, each pinna bearing about 20 pairs of glabrous leaflets; gland petiolet; spikes axillary, cylindrical. -indent. Native of Mexico, Cuba, and in the woods of Carthagea.—Plum. pl. 122. f. 1.—Comm. hort. 1. t. 107. Jacq. Amer. 266. The legume is filled with pulp according to Jacquin, and it is therefore probably a species of Inga or Prosopis.

Horn-bearing Acacia or Cuckold-tree. Clt. 1692. Tree 10 to 14 feet.

164 A. Tenuploera (Willd. spec. 4. p. 1088.) prickles scattered, incurved; leaves with 5 pairs of pinnae, each pinna bearing many pairs of ciliated leaflets; petioles pubescent, rather prickly; spikes filiform, length of the leaves. -indent. Native of Caracaca. Legumes membranous, sub-lanceolate, 3–5-seeded.

Fine-flowered Acacia. Tree.

165 A. Modeesta (Wall. pl. rar. asiat. 2. p. 27. t. 190.) arborescent; branches flexuous; spines axillary, subulate; leaves with 2–3 pairs of pinnae, each pinna bearing 4 pairs of oblong, obtuse, glabrous, glaucous leaflets; petioles pilose, bearing 1 gland in the middle; spikes axillary and terminal, usually solitary, cylindrical, nodding, on short peduncles; flowers hermaphrodite; filaments distinct, twice the length of the corolla; legume stipitate, linear-oblong, flat, glabrous, rather membranous, 6-seeded, acute at both ends. -indent. Native of Hindostan. Flowers white, fragrant. Spines thin, stouter.

Modest Acacia. Fl. April. Shrub 8 to 12 feet.

166 A. Latrosum (Willd. spec. 4. p. 1077.) spines stellate, two-together, connate; leaves with 4 pairs of pinnae, each pinna bearing many pairs of small leaflets; spikes usually twin, elongated, axillary; legume semi-lunate. -indent. Native of the East Indies. Linnaea latronum, Lin. fl. suppl. 438. Spines milk-coloured, straight. Flowers white. This species of Acacia form impenetrable thickets from their interwoven branches and terrible spines in the mountainous parts of India, and are the secure retreat of the smaller animals and roges. Lin. suppl.

Rogue's Acacia. Clt. 1820. Shrub 4 to 6 feet.

167 A. Azak (Willd. l. c.) spines stellate, 3-together; straight; leaves with 3 pairs of pinnae, each pinna bearing 5 pairs of leaflets, with a gland on the petiole between the lower pair of pinnae. -indent. Native of Arabia Felix. Mimosa Azak, Forsk. descr. 176. Vahl. symb. 2. p. 104. Flowers and fruit unknown. Azak is the Arabian name of the tree.

Azak Acacia. Shrub.

168 A. Cauda (Humb. et Bonpl. in Willd. spec. 4. p. 1089.) prickles scattered, rather hooked; leaves with 4–6 pairs of pinnae, each pinna bearing 5–10 pairs of oblique, oval, obtuse leaflets, which are pubescent beneath, without any gland on the petioles; spikes ovate, pedunculate, axillary, solitary or twin; stamens 8–10; legumes ciliated, with prickles. -indent. Native of Peru, near Gualtiquango on the banks of the river Cachiyacun. Kunth, nov. gen. amer. 6. p. 206. Legume hardly known.

Caducous Acacia. Tree.

Prosopis-like Acacia. Tree.

170 A. Adiantoides (Sprung. syst. 3. p. 146.) prickles short, few, straight; petioles tomentose; leaves with 4 pairs of pinnae, each pinna bearing usually 8 pairs of alternate, dimidiatly-oblong, obtuse, shining leaflets; spikes axillary, sessile. -indent. Native of Brazil, Sello.

Adiantum-like Acacia. Tree.

171 A. Hostilis (Mart. reis. bras. ex Schlecht. Linnaea. 5. p. 43.) shrubby, branches elongated, spreading; prickles scattered, straight; leaves bipinnate, clothed with clamyphy pubescence, with 4–6 pairs of pinnae, each pinna bearing 20 pairs of linear leaflets; stipular prickles and those between the stipulas straight; spikes solitary; legumes membranous, linear-oblong, 2–3-seeded, pubescent. -indent. Native of Brazil.

Hostile Acacia. Shrub.

Sect. IV. Glorioleae (from globus, a globe, and flos, a
flower; in reference to the flowers being collected into globose heads on the tops of the peduncles). Leaves bipinnate, with few or many pairs of pinnae, each pinna bearing few or many pairs of leaflets. Flowers collected into globose heads at the tops of the peduncles.

* Prickles all stipular and straight. Legumes unwarmed. Stamina 20 or more.

§ 1. Aculeate (from aculeatus, prickly; plants furnished with stipular prickles).

172 A. nyida (Willd. spec. 4. p. 1086.) Spines twin, leaves with 2 pairs of pinnae, each pinna bearing 5 pairs of oblong leaflets, which are narrowest at the base, and shining above, with a gland between each of the pairs of pinnae; petioles pubescent; heads of flowers pedunculate, twin. "S. Native of the East Indies. Mimosa tortuosa, Burm. fl. ind. p. 224. Heads of flowers larger than those of M. tortuosa. Legume unknown.

Burmastri's Acacia. Clt. 1818. A. Shrub 4 to 6 feet.

178 A. veera (Willd. spec. 4. p. 1085.) Spines twin, branches and leaves glabrous; leaves with 2 pairs of pinnae, each pinna bearing 8-10 pairs of oblong-linear leaflets, with glands on the petioles, one between each pair of pinna; heads of flowers usually twin, pedunculate, axillary; legume (ex Willd.) moniliform. "S. Native of Africa, from Senegal to Egypt. Mimosa Nilotica, Lin. spec. 1506. But not of hort. chift. Woodv. med. bot. 187. t. 67.—Lob. icon. 2. p. 95. f. 1.—Herm. mex. 866. fl. 1. Gom- mier rouge, Adans. Branches and spines red. Flowers yellow. This is the tree which yields the gum-arabic of the shops, and succus acaciae. According to Hasselquist the Arabs call it chasaid. The gum is gathered in vast quantities from the trees growing in Arabia Petraea, near the north bay of the Red Sea at the foot of mount Sinai; this gum is called by dealers Thur or Tar, which is the name of the harbour in the north bay of the Red Sea, thereby distinguishing it from gum-arabic. The gum-thur is also more pellucid and white, whereas gum-arabic is of a brown or dirty yellow colour, and generally opaque.

Gum-arabic is a concrete juice, which exudes from various species of Acacia, but especially from A. vera, A. Arábia, and A. Sénégal, natives of the sandy deserts of Africa, Arabia, and other parts of Asia. It either exudes spontaneously or from incisions made in the bark, and afterwards hardens in the air. The barks of all the species are highly astringent, and some are used in India for tanning. There are two kinds of gum found in the shops in this country, and often sold promiscuously, but distinguished in commerce by the names of gum-arabic and East India gum. Gum-arabic consists of roundish transparent tears, colourless, or of a yellowish colour, without smell or taste, and almost perfectly soluble in water. The pieces which are most transparent and have least colour are reckoned the best. They are, sometimes selected from the gum-arabic and sold for about double the price, under the name of picked gum. The East India gum is darker coloured than gum-arabic, and is not so readily soluble in water. Gum-thur, the produce of Acacia Arábia, is almost colourless, and resembles the picked gum, and gum-senegal resembles the East India gum.

About the middle of November, that is, after the rainy season, which begins early in July, a gummy juice exudes spontaneously from the trunk and principal branches. In about 15 days it thickens in the furrow down which it runs, either into a vermicular shape, or more commonly assuming the form of round or oval tears, about the size of a pigeon's egg, of different colours, as they belong to the white or red gum tree. About the middle of December the Moors encamp on the borders of the forest, and the harvest lasts 5 weeks. The gum is packed in very large sacks of tanned leather, and brought on camels and bullocks to certain ports, where it is sold to the French and English merchants. Mr. Jackson, in his account of the empire of Morocco, informs us, that from Mogodor they export two sorts of gum, one is common gum-arabic, the other finer, called gum-soudan, brought from Tumbuctoo by the caravans. He also says that the gum called Morocco or Barbary-gum, is produced from a thorny tree called Attache. It yields most gum during the parch-
ing heat of July and August, and the hotter the weather, and the more sickly the tree appears, the more gum it yields.

The gum is highly nutritious. During the whole time of the gum harvest, of the journey, and of the fair, the Moor of the desert live almost entirely upon it, and experience has proved that six oozes are sufficient for the support of an adult during twenty-four hours. The characters generally given of gum as a vegetable principle belong only to fine gum-arabic, which is transparent and colourless, easily reduced to powder, without smell, and of a slightly sweetish taste. The solution of gum in water constitutes mucilage; it is thick and adhesive, and soon dries when exposed to the air. Gum is also soluble in weak acids, but is totally insoluble in alcohol. Gum is very little disposed to spontaneous decomposition. By oxygenization with nitric acid it forms successively mulo, malic, and oxalic acid; with oxymuriatic acid it forms citric acid. By exposure to heat it does not melt, but softens, swells, and becomes charred.

In medicine gum-arabic possesses the powers of a mucilaginous emollient in a high degree. It is useful in all cases where there seems to be a natural deficiency of mucus in the intestinal canal; dissolved in milk, barley-water, or almond emulsions, it removes tenesmus. It is useful in an irritable state of the respiratory passages in catarrh, hoarseness, and cough; for this purpose it may be either administered in substance as a troche, or in a strong solution, and may be combined with a little opium. It is also useful in salivation after mercury, or in small pox. Externally it is applied in powder to bleeding vessels of a small size as a styptic, operating by geling them up. It is also used in solution as an injection in gonorrhoea.

True Acacia or Gum-arabic-tree, or Egyptian-thorn. Clt. 1596. Tree 20 feet.

179 A. ARABICA (Willd. spec. 4. p. 1085.) spines twin; branches and petioles pubescent; leaves with 4-6 pairs of pinna, each pinna bearing 10-20 pairs of oblong linear leaflets, with a gland on the petiole beneath the lower pair of pinna, and usually with one between the upper pair; heads of flowers pedunculate, axillary, usually 3-together; legume moniliform. h. S. Native of the East Indies, Senegal, Egypt, and Arabia. Mimosa Ará- bica, Lam. dict. 1. p. 19. Roxb. cor. 2. t. 149. A. Nilotica, Delil. ill. fl. acynt. p. 31. Legume at length smooth. Flowers yellow, polyandrous. This is the tree from which the white transparent gum-arabic, called gum-thur, is obtained; the brown or common gum-arabic being the produce of the preceding species. The wood is strong, tough, and durable, and makes excellent knees and crooked timber in ship building. The bark is astrignent and is used for tanning leather, and to dye various shades of brown. A decoction of the bark is used as a substitute for soap. According to Dr. Roxburgh, a large portion of East India gum is also obtained from this species. Perhaps the Arabian plant is distinct from the East Indian one.

Arabian Acacia or Gum-thur-tree. Clt. 1820. Tr. 30 to 40 ft.

180 A. HEBECLADA (D. C. monsp. p. 73.) spines twin; branches, petioles, and peduncles pubescent, and rather hispid; leaves with 3-5 pairs of pinna, each pinna bearing 10 pairs of oblong-linear, glabrous leaflets; gland petiolar; heads of flowers pedunculate, 2-3-together, axillary. h. G. Native of the south of Africa. A. stolonifera, Burch. cat. no. 2567. The heads of flowers are very like those of A. Farnesiana, but without scent. Young-branched Acacia. Clt. 1816. shrub 3 to 6 feet.

181 A. MAUROCCONIA (D. C. cat. hort. monsp. p. 74.) spines twin; branches, petioles, and peduncles pubescent; leaves with 3-8 pairs of pinna, each pinna bearing 10-20 pairs of oblong-linear, glabrous leaflets, with a gland on the petiole beneath the lower pair of pinna; heads of flowers solitary or 2-4-together, axillary, pedunculate. h. G. Native of Morocco. Mimosa Maurôccônia, Desf. cat. 181. Heads of flowers white.

Moor's Acacia. shrub 1 to 6 feet.

182 A. FARNESIANA (Wild. spec. 4. p. 1083.) spines twin; tops of branches, petioles, and peduncles rather pubescent; leaves with 3-8 pairs of pinna, each pinna bearing from 15-20 pairs of linear glabrous leaflets, with a gland on the petiole between the lower pair of pinna, and usually between the extreme pair; heads of flowers axillary, usually twin, on unequal peduncles; legume terete, rather attenuated at both ends. h. G. Native of St. Domingo, but now cultivated in the south of Europe and the north of Africa. Aln. farn. p. 2. 4. and 7. with a figure. Mimosa Farnesiana, Lin. spec. 1506. Duham. ed. nov. 2. p. 28. Mimosa scopioidea, Forsk. Heads of flowers yellow, sweet-scented, sessile when in a young state, but at length becoming pedunculate. This species of Acacia has been dispersed through most parts of Europe, has been made familiar to the Italian gardens since it was introduced to the Farnese garden in 1616, and is cultivated in great plenty in Spain and Portugal. In Italy it is called gacia.

Var. fi. pedunculata (Wild. spec. 4. p. 1084.) branches and petioles hardly pubescent; peduncle a little longer than those of the species, scarcely glabrous at the apex. h. S. Native of Java and Timor. Perhaps this is hardly different from A. Giraffé of Sieb. pl. exsic. n. 45. which only differs from Wildenow's specimen in the situation of the glands.

Var. g. curtipinna (D. C. prod. 2. p. 463.) spines somewhat incurved; leaves with 2 pairs of pinna; leaflets ovate. A. Farnèsiana, Coll. hort. rip. p. 2. Perhaps a distinct species.

183 A. PARVIFOLIA (Willd. spec. 4. p. 1086.) spines stipular; branches glabrous; petioles pubescent; leaves with 5-9 pairs of pinna, each pinna bearing 10-20 pairs of small linear leaflets, with a gland situated on the petiole beneath the lower pair of pinna; heads of flowers axillary, solitary, pedunculate. h. S. Native of the West Indies, in sandy places by the sea-side. Mimosa parvifolli, Swartz, fl. ind. occ. 2. p. 984. Mimosa Antillarum, Poire. suppl. 1. p. 80. Mimosa Mengânsis, Jacq. amer. 267.? The spines, according to Jaccouin, are stipular and distinct, but according to Swartz they are solitary under the branchlets. Heads of flowers white and green, void of scent.

Small-leaved Acacia. Tree 20 feet.

White Acacia. Tree 20 feet.

185 A. ALICANS (Kunth, min. 87. t. 27. nov. gen. amerc. 6. p. 272.) spines twin; branchlets and petioles pubescent; leaves with 8-9 pairs of pinna, each pinna bearing 19-32 pairs of oblong-linear glabrous leaflets, with glands on the petiole, one between the superior and another beneath the inferior pair of pinna; heads 2-5, aggregate, rising in racemes from the axils of the leaves. h. S. Native of Mexico, on the sea shore near Campeachy. Flowers white, polyandrous. Legume unknown.

Whitish Acacia. shrub.

186 A. LECOPHELEA (Roxb. cor. 2. t. 150.) spines twin; branches, leaves, and peduncles glabrous; leaves with 8-12 pairs of pinna, each pinna bearing 20-20 pairs of linear-oblong leaflets, with a gland on the petiole between the lower and higher pairs of pinna; heads of flowers racemose; the racemes disposed in a terminal panicle. h. S. Native of Coromandel, on dry mountains. Flowers pale yellowish, polyandrous. Legume linear, compressed, rather falcate. The specimen in Wildenow's
herbarium, under the name of *A. leucophloia*, has the branches and petioles puberulous, and the leaflets rather ciliated. The bark is very astringent, and the natives distil an ardent spirit from it, mixed with palm wine and a little coarse sugar.

*White-juiced Acacia.* Tree.

197 A. *cochlearia* (Humb. et Bonpl. in Willd. spec. 4. p. 1081) spines twin, compressed, concave; branches glabrous; petioles and peduncles pubescent; leaves with 9-10 pairs of pinnae, each pinna bearing 19-24 pairs of linear, very minute, ciliated leaflets; racemes of leaves bearing 4 glands; heads of flowers axillary, twin, pedunculate. /renderer. Native of Quito, near Guayaquil, Kunth, mirm. 93. t. 29. nov. gen. amer. 6. p. 274. *Flowers white, polyandrous. Legume unknown.*

*Twisted-spined Acacia.* Shrub 6 to 10 feet.

188 A. *hematoxylon* (Willd. enum. 2. p. 1056) spines twin, slender, and are, as well as the branches, glabrous; branchlets, leaves, peduncles, and flowers clothed with hoary velvet down; leaves with 5-16 pairs of pinnae, each pinna bearing 18-24 pairs of very minute, obtuse, crowded leaflets, with a gland below or between the lower pair of pinnae; heads of flowers axillary, 2-3 together, pedunculate. /renderer. Native of Good Hope. A. atomiphyla, Burch. trav. 1. p. 341. cat. no. 1085 and 2440. Leaflets so much crowded as to appear joined together. Legume, according to Bureh, tomentose, linear, and indescendent.

*Red-wooded Acacia.* Clt. 1816. Shrub 2 to 3 feet.

189 A. *tomentosa* (Willd. spec. 4. p. 1087) spines twin; branches, petioles, puberulous, and under side of leaves tomentose; leaves with 10 pairs of pinnae, each pinna bearing 20 pairs of linear obtuse leaflets, with a gland on the petiole below the pinna, and one between each of the extreme pairs of leaflets; heads of flowers axillary, aggregate, pedunculate. /renderer. Native of the East Indies. Mimosa *Kleini*, Poir. suppl. 1. p. 82. Perhaps the same as *Mimosa caeca-tomosa*, Roxb. which is the same as *Mimosa tomentosa*, Rothl. nov. act. nat. eur. 1813. p. 208. of which it is said that the peduncles are bracteate, and that the legumes are inovulate and compressed.

*Tomentose Acacia.* Clt. 1816. Tree 15 to 20 feet.

*Indian Acacia.* Clt. 1800. Tree 20 feet.

*Dotted Acacia.* Tree.

192 A. *macracanthoides* (Humb. et Bonpl. in Willd. spec. 4. p. 108) spines twin, lanceolate, compressed; branchlets and petioles pubescent; leaves with 14-18 pairs of pinnae, each pinna bearing 30 pairs of oblong-linear ciliated leaflets, with a gland between the ultimate pair of pinnae, and 2 or 3 between the pairs of leaflets; heads of flowers axillary, 2-8 together, pedunculate. (renderer. Native of Quito, near Guayaquil. Kunth, mirm. 90. t. 28. nov. gen. amer. 6. p. 273. *Flowers yellow. Spines very long. Petiole furnished with a gland at the base.*

*Long-spined Acacia.* Tree large.

193 A. *macracantha* (Bert. in herb. Balb. D. C. prod. 2. p. 463) spines twin, terete; branches, petioles, and peduncles pubescent; leaves with 12-14 pairs of pinnae, each pinna bearing about 25 pairs of oblong-linear ciliated leaflets, with a gland on the petiole beneath the lower pair, and one between the extreme pair of pinnae; heads of flowers twin, axillary, pedunculate. (renderer. Native of Jamaica. Very like the preceding species.

194 A. *sieberiana* (D. C. prod. 2. p. 463) spines twin, terete, rather connate at the base, and are, as well as the branches, glabrous; leaves with 15-20 pairs of pinnae, each pinna bearing 25-30 pairs of elliptic-oblong, obtuse, rather ciliated leaflets; heads of flowers globose, twin; peduncules twice the length of the heads, and are, as well as the petioles, puberulous. (renderer. Native of Senegal. A. flexuosa affinis, Sieb. pl. exsic. seneg. no. 43. but it differs from *A. flexuosa* in the spines being white, not brown, as in that species, and in the peduncles being twice the length, and fewer.

*Sieber’s Acacia.* Tree.

195 A. *flexuosa* (Humb. et Bonpl. in Willd. spec. 4. p. 1082) spines twin, connate; leaves with 16 pairs of pinnae, each pinna bearing 25 pairs of linear, obtuse, ciliated leaflets, with a depressed gland below the base of the petiole, and one between the extreme pair of leaflets; heads pedunculate, 5-6-together, axillary, about the length of their own peduncles. (renderer. Native of South America, near Cumana. H. B. et Kunth, nov. gen. amer. 6. p. 271. *Spines brown, shining. Legume unknown.*

*Flexuosus Acacia.* Clt. 1824. Shrub.

196 A. *obus* (Humb. et Bonpl. in Willd. spec. 4. p. 1087) spines twin; leaves with 16-20 pairs of pinnae, each pinna bearing many pairs of glabrous, ciliated, linear leaflets, with a gland at the base of the petiole, and one on the petiole between each of the 2 extreme pairs of pinnae; legume linear, arched, obtuse, glabrous. (renderer. Native of Caracas, ex Kunth, on the banks of the Orinoco, ex Willd. H. B. et Kunth, nov. gen. amer. 6. p. 272.

*Obus-leafed Acacia.* Tree.

197 A. *suberomus* (Bert. in herb. Balb. D. C. prod. 2. p. 463) spines twin, subulate, short, sometimes wanting; branches, petioles, and peduncules pubescent; leaves with 30-40 pairs of pinnae, each pinna bearing 30-40 pairs of linear-oblong, glabrous leaflets, with 2 glands beneath the lower pair of pinnae, and 2 or 4 between the ultimate pairs of pinnae; heads of flowers pedunculate, 2-3-together, axillary. (renderer. Native of Jamaica. Flowers yellow. Legume linear, flat, glabrous, 6-7-seeded.

*Almost-unarmed Acacia.* Tree.

**Prickles stipular, twin, usually also peduncular, and along the ribs of the legume. Stamens 10.**

198 A. *acanthocarpa* (Willd. enum. 1057) stipular; prickles twin, hooked; petioles glandless, prickly; leaves with 6-8 pairs of pinnae, each pinna bearing 6-15 pairs of oblong-pubescent leaflets; heads of flowers axillary, twin, pedunculate; legumes flat, compressed, falcate, prickly on the rib on both sides. (renderer. Native of New Spain. Mimosa *acanthocarpa*, Or. dec. 134. A. aculeaticarpa, Lag. nov. gen. et spec. 16. *Flowers dirty white, or rather flesh-coloured. Leaves irritate or sensible to the touch.*

*Spiny-fruited Acacia.* Clt. 1822. Shrub 6 to 8 feet.
199 A. revolu'ta (Kunth, min. 84. t. 26. nov. gen. amer. 6. p. 270.) stipular spines twin, straight; petioles unarmed; leaves with 2-3 pairs of pinnae, each pinna bearing 8-12 pairs of oblong, ciliately-scabrous leaflets; heads axillary, 2-3-together, pedunculate; legumes flat, compressed, falcate, prickly on the exterior or convex suture. ʂ Native of Peru, at Caxamarca. Flowers white, but the petals are green. *Revolute*-poded Acacia. Shrub 6 feet.

200 A. Cave'nia (Hook. in Beech, voy. append. bot. p. 21.) stipules spinuliferous, about half an inch long, thin, straight; petioles furnished with 1 obscure gland; leaves with usually about 5 pairs of pinnae, each pinna bearing 9-10 pairs of linear-oblong leaflets, which are clothed with scabrous pubescence; peduncles axillary, aggregate; heads of flowers globose; flowers polyandrous. ʂ Native of Chili. Mimosa Cavinia, Mol. chil. At Valparaiso the flowers are called Flor d'Araroua, and the tree *Equisino* by the inhabitants. It is used for various purposes, especially as yielding the best charcoal. *Cavenia* Acacia. Tree 20 feet.

201 A. Domine'nsis (Bert. exd. D. C. prod. 2. p. 464.) stipular spines hooked, sometimes wanting; petioles prickly, glandless; leaves with 4 pairs of pinnae, each pinna bearing 10-12 pairs of oblong leaflets, which are pubescent beneath; heads of flowers almost sessile, racemose; legumes flat, membranous, pricklely on both margins. ʂ Native of South America. H. B. et Kunth, nov. gen. amer. 6. p. 279. Flowers pale rose-coloured. Perhaps belonging to the following division. *Spiny*-poded Acacia. Clt. 1823. Shrub 6 feet.

**Rameal prickles scattered without order. Stems erect.**

202 A. acantho'loba (Humb. et Bonpl. in Wildl. spec. 4. p. 1859.) prickles scattered, hooked; petioles unarmed, pubescent; leaves with 3-4 pairs of pinnae, each pinna bearing about 10-12 pairs of leaflets, which are pubescent beneath; heads of flowers almost sessile, racemose; legumes flat, membranous, prickly on both margins. ʂ Native of Madagascar. Legumes unknown. *Sourly*-branched Acacia. Shrub.

205 A. *tamarindifólia* (Willd. spec. 4. p. 1092.) rameal prickles straight, scattered; leaves with 4-6 pairs of pinnae, each pinna bearing 10-15 pairs of oblong, obtuse, quite glabrous leaflets; petioles rather prickly, and furnished with a gland at the base; stipulas cordate, upper ones in the form of fructules; heads of flowers pedunculate, disposed in a panicle. ʂ Native of the West India islands and South America. Mimosa tamarindfólia, Lin. spec. 1509. Jacq. schenbr. 3. t. 396.—Plum. ed. Burm. t. 7. Flowers white. Legume broad-linear, flat, straight. *Tamarind-leaved* Acacia. Clt. 1774. Tree 40 feet.

206 A. Guadalupe'nsis (D. C. prod. 2. p. 464.) rameal and petiole prickles very few, scattered, and recurved; leaves with 7-9 pairs of pinnae, each pinna bearing 15-20 pairs of oblong-linear, glabrous leaflets; petioles glandless; heads of flowers pedunculate, disposed in a terminal panicle. ʂ Native of Guadaloupe. Flowers yellow, polyandrous. Legumes flat, glabrous, on short stipes, 3-4 inches long, and 9 lines broad. *Guadaloupe* Acacia. *Tree or shrub.*

207 A. Intsia (Willd. spec. 4. p. 1091.) rameal as well as petiole prickles scattered and recurved; leaves with 6 pairs of pinnae, each pinna bearing about 12 pairs of incurved leaflets, with a gland between the lower pairs of leaflets; prickles shorter than the stipulas; heads of flowers pedunculate. ʂ Native of the East Indies.—Rhode. mal. 6. t. 4.—Pluk. phyt. 122. f. 2. Mimosa Intsia, Lin. spec. 1508. *Intsia* is the Malabar name of the tree. *Intsia* Acacia. Clt. 1778. Tree 20 feet.

208 A. intstoides (D. C. prod. 2. p. 464.) rameal as well as petiole prickles scattered and recurved; leaves with 8-10 pairs of pinnae, each pinna bearing about 25 pairs of linear-oblong, somewhat incurved leaflets, with a gland at the base of the petiole; heads of flowers pedunculate, aggregate, somewhat panicled, with the branches between the flowers unarmed. ʂ Native country unknown. Leaves and branches glabrous. Heads of flowers about the size of those of *A. Farnesiana*. It has very much the appearance of the preceding species and to the figure of Rhode, and it differs at first sight from the following in heads of flowers being larger. *Intsia*-like Acacia. Tree.

209 A. penn'ata (Willd. spec. 4. p. 1000.) rameal as well as petiole prickles scattered and recurved; leaves with 8-16 pairs of pinnae, each pinna bearing 20-30 pairs of linear-oblong leaflets, with a depressed gland at the base of the petiole; heads of flowers on short peduncles, aggregate, disposed in a terminal prickly panicle. ʂ Native of Ceylon (Burm. zeyl. t. 1.), and Madagascar (Commeron). Mimosa pennată, Lin. spec. 1507. The whole plant is glabrous. Heads of flowers yellow, smaller than those of *A. Farnesiana*. Legume unknown. Perhaps different from *A. pterophylla* of Hoffmans. verz. 1824. p. 207, which has glands between the exterior pairs of pinnae. In Cochinchina the bark is converted into a sort of tow, which is used to fill up with houses as well as in boats. *Feather-leaved* Acacia. Clt. 1773. Shrub.

210 A. Westi'ana (D. C. prod. 2. p. 464.) rameal as well as petiole and peduncular prickles recurved; leaves with 8 pairs of pinnae, each pinna bearing 15-27 pairs of linear acute leaflets, with a gland at the base of the petiole, and one between the outer pair of leaflets; heads of flowers disposed in a terminal panicle; pedicels from 2-5, rising from the same dot or centre. ʂ Native of the island of Santa Cruz. Mimosa paniculata, West. beschir. 312. ex Vahl. ced. amer. 13. p. 39. It differs from *A. paniculata* of *Wildl.* It is perhaps the same as *Mimosa temui'dula*, Lin. spec. 771. but the description is not sufficient to decide this point. *West's* Acacia. *Tree.*

211 A. ce'isia (Willd. spec. 4. p. 1090) rameal as well as petiole prickles scattered and recurved; leaves with 5-7 pairs of pinnae, each pinna bearing 12-16 pairs of oblong-lanceolate leaflets, with an oblong gland above the base of the petiole; heads of flowers pedunculate, disposed in a terminal panicle; branches of panicle prickly. ʂ Native of the East Indies. Pluk. t. 330. bad. Mimosa ce'isia, Lin. spec. 1507. but not of Burm. *Grey* Acacia. Clt. 1773. Tree.

212 A. centrophyl'ea (D. C. prod. 2. p. 465.) prickles of the branches, petioles, and panicles numerous, scattered, and re-
curved; petioles glandless, bearing subulate prickles between the pairs of pinnae; leaves with 6-9 pairs of pinnae, which are callous and bispinulate at the base, each pinna bearing 8-12 pairs of oblong-linear, mucronate, glabrous leaflets, which are obsolete at both ends; heads of flowers pedunculate, disposed in a terminal raceme. \( \text{P.} \) S. Native. Cultivated in the gardens of Jamaica, where it was observed by Bertero. Flowers white, deciduous. A very distinct species, but the legume is unknown.

**Spur-leaved Acacia.** Clt. 1818. Tree 20 feet. 213 A. COURRANTIA (D.C. prod. 2. p. 465.) prickles on the branches, petioles, and panicles, few and recurved; petioles glandless; leaves with 8-10 pairs of pinnae, each pinna bearing 15-20 pairs of linear-oblong leaflets; heads of flowers pedunculate, disposed in terminal and axillary racemes. \( \text{P.} \) S. Native country unknown, but is cultivated in the gardens of Teneriffe. The whole plant is of a greyish or greenish glaucous colour, and is related to A. ceo siva.

**Courrant’s Acacia.** Clt. 1818. Tree. 214 A. RIPA’RIA (H.B. et Kunth, nov. gen. amer. 6. p. 276.) prickles scattered, hooked; leaves with 10-11 pairs of pinnae, each pinna bearing 30-50 pairs of linear, ciliated leaflets, with a gland above the base of the common petiole, and one between each of the 2 ultimate pairs of leaflets; heads axillary, solitary; legumes linear, flat, rather hooked at the apex. \( \text{P.} \) S. Native at the confluence of the Amazon and Chamaya. Flowers unknown.

**River-side Acacia.** Tree very tall. 215 A. STRIBATA (Humb. et Bpipl. in Willd. spec. 4. p. 1089.) rameal prickles scattered, erect; branches striated, and are as well as petioles pubescent; leaves with 9 pairs of pinnae, each pinna bearing 13-16 pairs of leaflets, which are rather pilose beneath; heads of flowers pedunculate, disposed in a terminal panicle; legume compressed, rather falcate, obtuse, beset with a few short hairs. \( \text{P.} \) S. Native of South America. Heads of flowers small.

**Striately-branched Acacia.** Shrub. 216 A. MEGALADENA (Desv. journ. bot. 1814. 1. p. 69.) rameal as well as petiolar prickles scattered and minute; leaves with many pairs of pinnae, each pinna bearing many pairs of leaflets, which are linear and glabrous, with a pellate gland above the base of the petiole; heads of flowers pedunculate, disposed in racemes; legumes compressed, rather falcate, quite glabrous. \( \text{P.} \) S. Native of the East Indies.

**Large-glanded Acacia.** Tree. 217 A. AREOPHULA (D. Don, prod. fl. nep. 247.) rameal as well as petiolar prickles recurved; petiole furnished in the middle with a large depressed broad gland; leaves with many pairs of pinnae, each pinna bearing many pairs of linear, unequal-sided, obtuse leaflets, which are ciliated as well as the rachis; panicle terminal; heads of flowers globose, solitary, or 3, pedunculate. \( \text{P.} \) S. Native of Sirinagur, where it is called Arroophul by the natives.

**Arroophal Acacia.** Clt. 1818. Tree 20 feet. 218 A. SCANDENS (Willd. enum. 1057.) prickly; stem climbing, sulcate, tomentose; leaves with many pairs of pinnae, each pinna bearing many pairs of leaflets, with a gland between each of the 10 or 12 ultimate pairs of pinnae; heads of flowers panicked, axillary, and terminal. \( \text{P.} \) S. Native of Brazil. The rest unknown.

**Scandent Acacia.** Clt. 1780. Shrub cl. 219 A? GUILANDIOE (D.C. prod. 2. p. 465.) rameal as well as petiolar prickles small and recurved; stem sub-scandent; branches and leaves glabrous; leaves with 4 pairs of pinnae, each pinna bearing 2 pairs of leaflets, with a gland under the ultimate pair of leaflets; heads of flowers pedunculate, disposed in a loose terminal panicle. \( \text{P.} \) S. Native of Cayenne. Heads of flowers small, yellow. Legume unknown.

**Guiilandina-like Acacia.** Clt. 1820. Shrub cl. 220 A. SARMENTOSA (Desv. journ. bot. 1814. 1. p. 70.) quite glabrous; rameal and petiolar prickles scattered and hooked; leaves bipinnate, with 7 pairs of pinnae, each pinna bearing many pairs of obsolete, linear, somewhat imbricate leaflets, with a minute gland above the base of the petiole. \( \text{P.} \) S. Native country, flowers, and fruit unknown. Mimosa sarmentosa, Desf. cat. hort. par. 180. Pers. ench. 2. p. 265. SARMENTOSA Acacia. Clt. 1820. Shrub cl. § 2. Unarmed trees or shrubs.

* **Trichodes** (from \( \text{trichos} \), thrichis, thrichos, hair; in reference to the hairy anthers). **Anthers hairy. Stigma peltiform. Perhaps a proper genus.** 221 A. TRICHODES (Willd. spec. 4. p. 1063.) unarmed, glabrous; leaves with 2-3 pairs of pinnae, each pinna bearing 3-5 pairs of ovate, acute leaflets, with an oblong, erect gland between the lower pair of pinnae; heads of flowers twinned, pedunculate, axillary. \( \text{P.} \) S. Native of Caracas, ex Jacq., and about Lima, ex Domby. Mimosa trichodes, Jacq. schmbr. t. 364. Branches slotted. Legume flat, compressed, linear, rather obtuse at both ends, and somewhat mucronate at the apex, glabrous. Seeds flat, compressed. Flowers white.

**Henry-anthered Acacia.** Clt. 1818. Shrub 6 to 10 feet. 222 A. PSEUDOTRICHODES (D.C. prod. 2. p. 466.) unarmed, glabrous; leaves with 2 pairs of pinnae, each pinna bearing 2-4 pairs of leaflets; petioles glandless; heads of flowers 3-5, axillary, pedunculate. \( \text{P.} \) S. Native of St. Domingo. Legume like that of the preceding species, linear, flat, glabrous, somewhat stipitate at the base. Branches glabrous.

**False Trichodes Acacia.** Shrub. **Anthers glabrous. Stigma simple. Julibrissinace.** 223 A. FORMOSA (Kunth, mimm. p. 102. t. 32. nov. gen. et spec. 6. p. 275.) unarmed, glabrous; leaves with 2 pairs of pinnae, bearing 5-7 pairs of obovate-elliptic leaflets; petioles glandless; stipulas large, oblong, obtuse; heads of flowers axillary, 2-6 on a common peduncle. \( \text{P.} \) S. Native of Mexico, near Guanaxuato. Flowers white, polyanthorous. Legume unknown.

**Beautiful Acacia.** Clt. 1825. Shrub 6 to 12 feet. 224 A. NIGRICANS (R. Br. in Ait. hort. kew. 4. p. 465.) unarmed, glabrous; leaves with 2 pairs of pinnae, bearing 5-7 pairs of obovate-oblong, obtuse leaflets on each of the superior pinnae, and 2 or 3 pairs on each of the lower pinnae, with 1 or 2 glands on the petiole; stipulas subulate-setaceous; heads of flowers solitary. \( \text{P.} \) G. Native of New Holland, on the south-west coast. mimosa nigricans, Labill. nov. l. 2. t. 238. A. nigricans, Sims, bot. mag. 2188. The whole plant becomes black on drying. Legume linear, flat, straight, 6-seeded. Flowers yellow, polyanthorous.

**Blackish Acacia.** Fl. May, Jul. Clt. 1803. Sh. 6 to 10 feet. 225 A. STRIGOSA (Link. enum. 2. p. 444.) unarmed, pilose; leaves with 2 pairs of pinnae, each pinna bearing 2-3 pairs of leaflets; stipulas somewhat setaceous, caducous; heads of flowers solitary. \( \text{P.} \) G. Native of New Holland, on the south-west coast. A. ciliata, R. Br. in hort. kew. 5. p. 465. but not of Wild. Flowers yellow.

**Strigosac Acacia.** Fl. Mar. Ju. Clt. 1803. Sh. 6 to 10 ft. 226 A. UNGULATA (Desv. journ. bot. 1814. 1. p. 68.) unarmed; branches and branchlets pubescent; leaves with usually 3 pairs of pinnae, each pinna bearing several pairs of linear, nearly glabrous leaflets; heads of flowers on long peduncles;
legumes macronate, cartilaginous, thickened, ending in an incurved point. \( \text{specific} \) S. Native of the West Indies. The rest unknown.

Clam-podded Acacia. Shrub or tree.

227 A. va'a (Willd. spec. p. 1606.) unarmed; leaves with 3 pairs of pinnae; leaflets smoothish, with 3 pairs on each of the terminal pinnae, and either 1 or 2 pairs on the lower pinna; heads of flowers pedunculate, 2 or 3-together, axillary. \( \text{specific} \) S. Native of Brazil. Mimosa vaàga, Lin. spec. 1503. Exclusive of the country, and the synonyme of Bryenius, which is evidently referrible to a species of Inga.—Pis. bras. p. 80. f. 2. Marg. bras. p. 111. f. 1.

Wandering Acacia. Clt. 1818. Tree.

228 A. MULTIFOLIA (H. B. et Kunth, nov. gen. amer. p. 277.) unarmed; leaves with 3 pairs of pinnae, each pinna bearing 6-9 pairs of oblong, acute, glabrous leaflets; petioles glandless; racemes axillary, 2-5-together; heads in fascicles; stamens 15. \( \text{specific} \) S. Native of the eastern declivities of the Andes, near St. Felipe. Legume unknown.

Many-flowered Acacia. Tree 20 feet.

229 A. LeBEK (Willd. spec. p. 1606.) unarmed, smoothish; leaves with 2-4 pairs of pinnae, each pinna bearing about 6-8 pairs of oval, somewhat dimidiate leaflets, which are obtuse at both ends; petioles glandless; heads of flowers pedunculate, aggregate; flowers pedicellate. \( \text{specific} \) S. Native of Upper Egypt, but now cultivated in both the East and West Indies. Mimosa Lébek, Lin. spec. 1503. A. Hábiás, Link. enum. 2. p. 444 (?). but not of Delile. Cásia planifolia, Burm. ind. 96, but probably exclusive of the leaves. Legume broad-linear, flat, rather long, attenuated at both ends, 7-8-seeded.—Plak. mant. 2. t. 331. f. 1. The Arabs call the tree Lisaàch. It is cultivated in gardens for the sake of the beauty and scent of the flowers.

230 A. PROCÉRA (Willd. spec. p. 1606.) unarmed, smoothish; leaves with 4 pairs of pinnae, each pinna bearing about 5-8 pairs of ovate, acute leaflets, with a depressed gland at the base of the petiole, heads of flowers pedunculate, disposed in a terminal panicle. \( \text{specific} \) S. Native of the East Indies. Mimosa prócrèa, Roxb. cor. 2. t. 21. Flowers pale yellow, polyandrous. Stamens monadelphous. Legume flat, glabrous, attenuated at both ends, 6-7 inches long.

Tall Acacia. Clt. 1816. Tree 60 feet.

231 A. odoratiSSIMA (Willd. spec. l. c.) unarmed, smoothish; leaves with 3-4 pairs of pinnae, each pinna bearing 10-12 pairs of oval-oblong leaflets, lower ones very minute, with a depressed gland at the base of the petiole, and one beneath the extreme pair of pinnae; heads pedunculate, aggregate, forming a terminal panicle. \( \text{specific} \) S. Native of the coast of Coromandel. Mimosa odoratissima, Roxb. cor. 2. t. 120. Flowers pale yellow, very sweet-scented. Legume nearly like that of the preceding species.

Very sweet-scented-flowered Acacia. Clt. 1790. Tr. 30 to 40 ft.

232 A. LEBEKEKIDES (D. C. prod. 2. p. 467.) unarmed, smoothish; leaves with 3-8 pairs of pinnae, each pinna bearing 10-20 pairs of oval-oblong, glabrous leaflets; petioles puberulous, glandless; legumes flat, glabrous, 7-9-seeded. \( \text{specific} \) S. Native of the Island of Timor. Very nearly allied to A. Lébek. but differs in the leaflets being narrower, more numerous, as well as in other respects.

Lebekb-like Acacia. Tree 30 feet.

233 A. L'AX (Willd. spec. p. 1606.) unarmed, glabrous; leaves with 4 pairs of pinnae, each pinna bearing 12-24 pairs of linear-oblong leaflets, which are glaucescent beneath; petioles beset with rusty villi; heads of flowers axillary, on long peduncles. \( \text{specific} \) S. Native of Caracas. Branches terete, divaricate. Fl.
Native of St. Domingo. Flowers not seen, and therefore its affinity with the present species is rather doubtful.

241. A. PORTORIECENSIS (Willd. l. c.) unarmed; leaves with 5 pairs of pinnae, each pinna bearing 20 pairs of linear, oblong, smoothish leaflets; petioles glandless, and are, as well as the branches, pubescent; heads of flowers pedunculate, 2-3-together, axillary; calyx with eiliated margins. ɣ. S. Native of Porto Rico. Mimósia Portoricensis, Jacq. icon. Hortic. 1753. ɣ. S. Native of Porto Rico. Stamens with long white filaments.

242. A. CARACCASSANA (Willd. l. c.) unarmed, smoothish; leaves with 4-5 pairs of pinnae, each pinna bearing about 20 pairs of linear bluntish leaflets; petioles glandless, and as, well as the branches, rather pubescent; heads of flowers pedunculate, 2-3-together, axillary, and somewhat terminal; calyxes with glandular margins. ɣ. S. Native of Caracas. Mimósia Caraccassana, Jacq. icon. Hortic. 1753. ɣ. S. Native of Porto Rico. Stamens with purple filaments.

Caracas Acacia. Clt. 1817. Shrub 6 to 12 feet.

243. A. LYCOPODIODÉS (Desv. journ. bot. 1814. 1. p. 60.) unarmed; branches tetragonal; leaves with 3 pairs of pinnae, each pinna bearing many pairs of minute rather pubescent leaflets; flowers in capitulate spikes, on long peduncles; stipulas distinct, lanceolate, striated. ɣ. S. Native country unknown. Mimósia lycopodioides, Pers. enc. 2. p. 263. Poir. suppl. 1. p. 68.

Club-moss-like Acacia. Shrub.

244. A. LAMBERTIA (D. Don, in bot. reg. 1721.) unarmed; branches terete, and are, as well as the leaves, villous; leaves with 2-3 pairs of pinnae, each pinna bearing 9-12 pairs of oval-oblong leaflets, which are oblong at both ends; petiole glandless; heads of flowers usually ternate, pedunculate, axillary. ɣ. S. Native of Mexico. Stamens 20-25, with purple exerted filaments, like those of Tunga purpurea. Legume unknown.

Lambert’s Acacia. Fl. May, Ju. Clt. 1818. Sh. 6 to 10 feet.

245. A. QUADRANGULÁRIS (Link. enum. 2. p. 445.) unarmed; branches tetragonal; leaves with 5 pairs of pinnae, each pinna bearing many pairs of linear, acute, eiliated leaflets, the lower and outer ones the shortest; petiole pubescent, glandless; heads of flowers usually ternate, pedunculate, axillary. ɣ. S. Native country, as well as the legumes, unknown. Stipulas lanceolate, and are, as well as the peduncles, striated longitudinally. Filaments long, white.

246. A. TETRAGOÓNA (Willd. spec. 4. p. 1069.) unarmed, glabrous; branches tetragonal; leaves with 5-6 pairs of pinnae, each pinna bearing 16-20 pairs of linear acute leaflets, the outer ones the largest; heads of flowers pedunculate, usually ternate, axillary; legume linear, obtuse, with thickened margins. ɣ. S. Native of Caracas, in sand on the banks of the rivers. Flowers white.

Tetragonal-branched Acacia. Clt. 1820. Shrub 6 to 8 feet.

247. A. DISCOLOR (Willd. spec. 4. p. 1068.) unarmed; leaves with 5 pairs of pinnae, each pinna bearing 9-12 pairs of oblong, glabrous, acute leaflets, which are pale beneath; petioles glandular at the base, and are, as well as the branches, pubescent; heads of flowers pedicellate, disposed along the axillary peduncles in long racemes. ɣ. G. Native of New Holland. Mimósia discolor, Andr. bot. rep. 2. p. 235. Mimósia botrycophila, Vent. cels. t. 1. A. discolor, Sims, bot. mag. 1750. Branches nearly terete. Flowers yellow. Legume flat, broad-linear, obtuse, 2½ inches long, and 8-10 lines broad.
255. A. BIMUCRONATA (D. C. prod. 2. p. 469.) unarmed; branches, petioles, and pedicels pubescent; leaves with 6-8 pairs of pinnae, each pinna bearing 28 pairs of oblong-linear glabrous leaflets, with 2 retrograde mucrones on the lower part of each pinna, and with an absolutely villous gland between each pair of pinnae; heads of flowers forming a loose terminal panicle. "S. Native of Brazil. Legume unknown.

Two-pointed-leaved Acacia. Tree.

256. A. DIVARIATA (Willd. spec. 4. p. 1070.) unarmed, glabrous; leaves with 6-9 pairs of pinnae, each pinna bearing 40 pairs of linear obtuse leaflets, with a convex sessile gland beneath the lower pair of pinnae; stipulas semi-ovate, falcate; heads of flowers pedunculate, 1-3-together, axillary. "S. Native of the East Indies. Flowers white, polyandrous. Mimosa divari-
cata, Jacq. schoehr. t. 395. Legume unknown.

Dierarctica Acacia. Clt. 1820. Tree.

257. A. FLAVA (Spreng. in herb. Balh. D. C. prod. 2. p. 469.) unarmed, glabrous; leaves with 7-9 pairs of pinnae, each pinna bearing 18-25 pairs of linear, mucronate, glabrous leaflets; petiole pubescent, with a gland at the base; legume flat, compressed, glabrous, obtuse, ending in a short mucrone, 8-10-seeded. "S. Native of St. Martha. Flowers yellow.

Yellow Acacia. Tree.

258. A. UMBELLIFERA (Kunth, mim. p. 100. t. 31. nov. gen. amer. 6. p. 275.) unarmed; leaves with 7-10 pairs of pinnae, each pinna bearing 17-37 pairs of linear ciliate leaflets; pedunules axillary, bearing numerous umbellules of flowers; flowers pedicellate. "S. Native near the city of Mexico. Flowers white, polyandrous. Legume unknown.

Umblelle-bearing Acacia. Tree.

259. A. ARBOREA (Willd. spec. 4. p. 1064.) unarmed; branches and petioles clothed with rusty velvety down; leaves with 7-12 pairs of pinnae, each pinna bearing 16-18 pairs of oblong, dimidiately-glabrous leaflets, with a depressed gland on the petiole between each pair of pinnae; heads of flowers 2-6-together, axillary, pedunculate. "S. Native of Jamaica and Porto-Rico. Mimosa arborea, Lin. spec. 1503. Swartz, obs. 390. Mimosa filicifolia, Lam. dict. t. 1. p. 12.—Pluk. phyt. 251. f. 2.—Sloan, hist. 2. t. 182. f. 1 and 2. Flowers of a pale flesh colour. The legume, according to Swartz, is nearly terete, arcuated, and twisted.

Tree Acacia. Clt. 1768. Tree 40 feet.

260. A. AMARA (Willd. spec. 4. p. 1074.) unarmed; branches, petioles, and peduncles clothed with velvety hairs; leaves with 8-10 pairs of pinnae, each pinna bearing 20-25 pairs of linear, bluntish, glabrous leaflets; heads of flowers axillary, from 2-6-together, pedunculate. "S. Native of the East Indies. Mimosa amara, Roxb. cor. 2. t. 122. Flowers yellow, polyandrous. The legume, according to Roxburgh, is linear, flat, acute, and 8-seeded. The bark is bitter and astringent.

Bitter Acacia. Clt. 1816. Tree 30 feet.

Nemu Acacia. Tree.

262. A. JULIBRISIN (Willd. spec. 4. p. 1065.) unarmed; leaves with 8-12 pairs of pinnae, each pinna bearing about 30 pairs of dimidiately-oblong, acute, rather ciliate leaflets, with a depressed orbicular gland at the base of the petiole; heads of flowers pedunculate, forming a terminal somewhat corymbose panicle; legumes flat, membranous, glabrous. "H. Native of the Levant. Mimosa arborea, Forsk. descr. 177. Lam. dict. 1. p. 15. Mimosa Julibrissin, Scop. del. 1. t. 8. Flowers white. Stamens flesh-coloured at the apex. The specific name is of Persian origin, where the tree is called Gil-e-brussin according to Fischer, or Ghul-ibrissin according to Mangels, from its silky flowers. In Turkey it is called Irbsin. It is an elegant, hardy, deciduous tree.

263. A. POLYTHYLLA (D. C. cat. hort. monsp. p. 74.) unarmed, glabrous; leaves with 11-12 pairs of pinnae, each pinna bearing 30 pairs of dimidiate-oblong ciliate leaflets, which are somewhat puberulous beneath, with a small orbicular gland in the middle of the petiole, and one between each of the 2 or 3 uppermost pairs of pinnae; heads of flowers pedunculate, forming an ample terminal panicle; legumes flat, membranous, glabrous. "S. Native of St. Martha. Acacia riparia, Bertero, but not of Kunth. Leaves like those of A. Julibrissin, but the heads of flowers are much smaller, and the stamens are about 40 in each flower, hardly 5 lines in length, while those of A. Julibrissin are nearly an inch long.

Many-leaved Acacia. Clt. 1834. Tree 20 feet.

264. A. BERTERIA'NIA (Balbis, herb. ex D. C. prod. 2. p. 470.) unarmed, glabrous; leaves with 9-10 pairs of pinnae, each pinna bearing about 40 pairs of oblong-linear glabrous leaflets, which are shining above, and pale beneath, with a sessile gland at the base of the petiole, and one between the extreme pair of pinnae; heads of flowers pedunculate, disposed in a panicle; legumes flat, membranous, glabrous. "S. Native of St. Domingo. Stamens 15, 3 times the length of the corolla.

Bertero's Acacia. Tree.

265. A. DECUR'ENS (Willd. spec. 4. p. 1072.) unarmed, glabrous; leaves with 9-11 pairs of pinnae, each pinna bearing 30-40 pairs of narrow, linear, distant leaflets, with a gland on the rachis between each pair of pinnae; petioles and branches with acute angles; heads pedicellate, disposed in racemes along the axillary peduncles. "G. Native of New Holland, Sieber. Flowers yellow.

Gland-bearing Acacia. Tree 10 to 20 feet.

266. A. ADENO'PHORA (Spreng. syst. 3. p. 140.) branches and petioles glandular and glabrous; leaves with 8 pairs of pinnae, each pinna bearing many pairs of linear, bluntish, glabrous leaflets; heads of flowers disposed in axillary racemes. "G. Native of New Holland, Sieber. Flowers yellow.

Gland-bearing Acacia. Tree 10 to 20 feet.

267. A. MOLL'ISSIMA (Willd. ennum. 1633.) unarmed; branches and petioles angular, pubescent; leaves with from 8-18 pairs of pinnae, each pinna bearing 30-40 pairs of linear, much crowded, pubescent leaflets, with glands on the rachis, one between each pair of pinnae; heads of flowers pedicellate, disposed in racemes along the axillary peduncles. "S. Native of Van Die-
men's Land. A. decurrrensis, b. mol-
is, Ker. bot. reg. 371. A. mollis, Sweet, fl. austral. t. 12. Leaves glaucous, when young clothed with yellowish velvety down. Legume linear, glabrous, obtuse, flat; seeds 8-9 in each legume, rather tumid, cuneated and narrowed at the base. (fig. 54.)

Native I'nga

Tree.

Legume p.

Flowers yellow. The glands between the pairs of pinnae perforated.

260 A. moeiri (Wall. pl. rar. assat. 2. p. 76. t. 177.) arboreous, erect, unarmed; leaves with 4-8 pairs of pinnae, each pinna bearing numerous pairs of villous, half-ovate, acute leaflets, with a concave gland above the base of the petiole, and one between each of the ultimate pairs of pinnae; heads of flowers pedicellate, disposed in racemes along the axillary peduncles. h. G. Native of New Holland. Flowers yellow. Filaments red. Tree villous in every part.

Soft Acacia. Tree 40 to 50 feet.

270 A. rivera (Sieb. ex Spreng. syst. 3. p. 141.) branches brown, as well as petioles, which are glandless; leaves with 15-20 pairs of pinnae, each pinna bearing numerous pairs of villous, half-ovate, acute leaflets, with a concave gland above the base of the petiole, and one between each of the ultimate pairs of pinnae; heads of flowers in fascicles, on long peduncles, disposed in corymbs at the tops of the branches; filaments very long, monadelphous at the base. h. G. Native of Nipaul, where it is grown in gardens at Katmandu, under the name of Laklavy. Corolla yellow. Filaments red. Tree villous in every part.

Soft Acacia. Tree 40 to 50 feet.

270 A. controversa (D. C. prod. 2. p. 470.) unarmed; branches nearly terete, and are, as well as the leaves, glabrous; leaves with 12-16 pairs of pinnae, each pinna bearing 30-35 pairs of linear approximate leaflets, with an urceolate gland on the petiole beneath the lower pair of pinnae; legume very long, spirally twisted, flat, glabrous. h. S. Native of Brazil. Flowers unknown. Peduncles axillary, solitary, an inch long. Legume a foot long.

Twisted-podded Acacia. C1t. 1825. Tree.

272 A. senicillifera (Lag. nov. gen. et spec. 16. no. 208.) unarmed; petioles clothed with adpressed pubescence, glandless, and ciliate; leaves with about 12 pairs of pinnae, each pinna bearing 20-50 pairs of linear, obtuse, rather ciliate leaflets; heads of flowers pedunculate. h. S. Native of New Spain. A weak twiggy shrub, with the habit of A. fistulosa. Legume unknown.

Pencil-bearing Acacia. Shrub 2 to 3 feet.

273 A. esculenta (Moc. et Sesce, fl. mex. Icon. ined. D. C. prod. 2. p. 470.) unarmed, glabrous; leaves with 17 pairs of pinnae, each pinna bearing 52 pairs of linear obtuse leaflets; heads pedunculate, thin, disposed in a terminal panicle; legumes linear, flat, glabrous, tapering much to the base. h. S. Native of Mexico, where it is called Pinax. Legume eatable. Flowers white, decandrous.

Eclipsed-podded Acacia. C1t. 1825. Tree.

274 A. peregrina (Wall. spec. 4. p. 1073.) unarmed, nearly glabrous; leaves with 15-20 pairs of pinnae, each pinna bearing 25-30 pairs of oblong-linear ciliate leaflets, bearing one gland in the middle of the petiole, and 1 or 2 at the top of the pinna; heads of flowers 2-4-together, pedunculate; anthers bearing a pedicellate gland at the apex. h. S. Native of New Granada, at the river Chota. Kunth, min. p. 96. t. 30. nov. gen. amer. 6. p. 274. Mimosa peregrina, Lam. spec. 1504. Flowers white, decandrous.

Foreign Acacia. Tree 40 feet.

275 A. bivla (Spreng. syst. 3. p. 141.) branches and petioles hairy; petioles glandless; leaves with 15 pairs of pinnae, each pinna bearing many pairs of minute, imbricated, linear, strigose leaflets; heads of flowers disposed in racemes. h. S. Native of Brazil.

Pretty Acacia. Tree.

276 A. angustifolia (D. C. prod. 2. p. 470.) unarmed, nearly glabrous; leaves with 15-20 pairs of pinnae, each pinna bearing 30-40 pairs of linear, acute, ciliate leaflets, with a gland at the base of the petiole, and one between the extreme pair of pinnae; heads of flowers 2-4-together, pedunculate; anthers glandless. h. S. Native of the West India Islands. Mimosa angustifolia, Lam. dict. 1. p. 12. but not of Wend. Legume flat, glabrous, with the margins rather sinuate, tapering into a stipule at the base, 6 inches long, and 6-8 lines broad.

Narrow-leafletted Acacia. Tree.

277 A. gratia (Willd. enum. 1056.) unarmed; leaves with 20 pairs of pinnae, each pinna bearing many pairs of linear leaflets, with scabrous margins; petiole glandular above the base; legumes repand. h. S. Native of Brazil. The rest unknown.

Grateful Acacia. Tree.

278 A. microphylla (Willd. enum. p. 1056.) unarmed; leaves with 25 pairs of pinnae, each pinna bearing 50-60 pairs of linear, acute, ciliate leaflets, with a large gland at the base of the petiole; branches and petioles pubescent; heads of flowers axillary, pedunculate, twin. h. S. Native of the Caracenas, on stony hills. Mimosa parvifolia, Poir. suppl. 1. p. 74. Legume linear, 9 inches long.

Small-leafletted Acacia. Tree.

279 A. paniculata (Willd. spec. 4. p. 1074.) unarmed; leaves with 20-25 pairs of pinnae, each pinna bearing 10 pairs of linear, ciliate leaflets, with a gland on the petiole beneath the lower pair of pinnae; petioles and branches pubescent; heads of flowers pedunculate, disposed in axillary panicles. h. S. Native of Para, in Brazil. Legume unknown. The specimen of this species sent by Willdenow to Desfontains is furnished with hooked scattered spines; it is, therefore, perhaps a different plant, or it should be placed in a different division of the genus.

Panicled-flowered Acacia. Tree.

280 A. brasiliensis (Spreng. syst. 3. p. 142.) branches terete, hairy, as well as the petioles, which are glandless; leaves with many pairs of pinnae, each pinna bearing many pairs of linear, minute, strigose, imbricated leaflets; heads of flowers disposed in spikes. h. S. Native of Brazil, Sello.

Brazil Acacia. Tree.

281 A. multiflora (Spreng. syst. 3. p. 142.) branches angular, glabrous; petioles glandless; leaves with many pairs of pinnae, each pinna bearing many pairs of smooth, lanceolate, falcate leaflets; heads of flowers disposed in panicles. h. S. Native of Brazil, Sello.

Many-flowered Acacia. Tree.

282 A. ? pentinata (H. B. et Kunth, nov. gen. amer. 6. p. 282, but not of Hoffmannsegg,) unarmed; leaves with 15-16 pairs of pinnae, each pinna bearing 50-60 pairs of linear, obtuse, mucronate leaflets, which are glabrous above, but clothed with rusty pubescence beneath, as well as the petioles; petioles glandless. h. S. Native of South America, at the river Cassiquiare. Leaflets on each pinna usually about 60 pairs. Inga pentinata, Wall. spec. 4. p. 1126. Flowers and fruit unknown.

Pentinata-leaved Acacia. Tree.

283 A. Niöro (Humb. rel. hist. 2. p. 630. H. B. et Kunth, nov. gen. amer. 6. p. 282.) unarmed; leaves with 20-25 pairs of pinnae, each pinna bearing 50-70 pairs of linear, rather falcate, acute, membranous, glabrous, ciliate, obliquely 1-nerved leaflets, with a gland on the petiole above the base, and one between the extreme pair of pinnae; legumes linear, beaked. h. S. Native of South America, near Maypures and Attures, &c. on the Orinoco. Inga Niöra, Willd. spec. 4. p. 1027. Niöpo is the South American name of the tree.

Niöpo Acacia. Tree.

**Golden-flowered Acacia.** Tree.

285. **A. sebeltoides** (Neuv. reis. bras. 2, with a figure, ex flora, 1821, p. 303.) unarmed; leaves with 2-3 pairs of pinnae, each pinna bearing 12-15 pairs of leaflets; petioles hairy; spikes terminal, corymbose, globose, pedunculate. *S. Native of Brazil. Stamens long, purple. Scleropodium-like Acacia. Tree or shrub.

286. **A. incurvata** (Mart. reis. bras, ex Schlecht. Linnaeus. 5, p. 43.) arboreal, glabrous; petiole bearing one gland in the middle, and one at the apex; leaves with 5 pairs of pinnae, each pinna bearing 12-15 pairs of oblong-lanceolate, oblique, unequal-sided, nerved leaflets, which are shining above, but glaucous beneath; heads of flowers pedicellate, disposed in racemes along the axillary peduncles, shorter than the leaves; petioles and peduncles pubescent. *S. Native of Brazil.

**Inundated Acacia.** Tree.

† *Species of Acacia not sufficiently known.

* Leaves with only one pair of pinnae, each pinna bearing few or many pairs of leaflets.

287. **A. gutefolia** (Link. enum. 2, p. 443.) leaves with one pair of pinnae; leaflets unequal; flowers yellowish.

**Rus-leaved Acacia.** Clt. 1810. Shrub.

288. **A. olophylla** (Hoffmans. verz. 1824, p. 201.) unarmed; leaves with one pair of pinnae, each pinna bearing 3-4 pairs of ovate-oblong, apiculate leaflets; stipulas filiform. *S. Native country unknown, as well as the flowers and fruit.

**Few-leaved Ascelli.** Clt. 1817. Tree.

**Unarmed trees and shrubs, with bipinnate leaves.**

289. **A. Hoffmenseggii** (D. C. prod. 2, p. 471.) unarmed; leaves with 4 pairs of pinnae, each pinna bearing many pairs of linear, equal-sided, bluntly acute leaflets, which are unequal at the base; petioles pubescent, with a gland below the lower pair of pinnae, and one between the upper pair of pinnae. *S. Native of Brazil, about Rio Janeiro. H. pectinata, Hoffmans. verz. 1824, p. 201, but not of others. Said to be allied to *A. rostrata*, but the flowers and fruit are unknown.

**Hoffmensegg's Acacia.** Tree.

290. **A. venusta** (Willd. enum. p. 1052.) unarmed; leaves with 3-5 pairs of pinnae, each pinna bearing from 15-20 pairs of falcate, acutish, quite glabrous leaflets. *S. Native of South America. Flowers and fruit unknown.

**Beautiful Acacia.** Tree.

**Java Acacia.** Tree.

292. **A. Guachapele** (H. B. et Kunth, nov. gen. amer. 6, p. 291.) unarmed; leaves with 4-5 pairs of pinnae, each pinna bearing 5-6 pairs of obvate or subelliptic-oblong membranous leaflets, which are pubescent on both surfaces, with a gland on the middle of the petiole, and between each of the 3 superior pairs of pinnae; flowers capitulate; stamens monadelphous; legumes linear, ending in a long beak. *S. Native of Quito, in woods near Guayaquil. Guachapele is the vernacular name of the tree.

**Guachapele Acacia.** Tree 50 to 60 feet.

293. **A. Hadie** (D. C. prod. 2, p. 472.) unarmed; leaves with 3 pairs of pinnae, lower pair furnished with one scale, upper pair furnished with a double scale, each pinna bearing about 14 pairs of oval-linear leaflets, middle ones the longest. *G. G. Native of Arabia, about Hadie. Mimôsa Sejál, Forsk. desirip. p. 197, but not of Delile.

**Hadie Acacia.** Tree.

294. **A. prismatica** (Hoffmansseg, verz. 1824, p. 150.) unarmed; leaves with 7-8 pairs of pinnae, each pinna bearing 14-17 pairs of oblong two-coloured leaflets; branches angled; petioles glabrous; young leaves glabrous. *S. Native country unknown. Said to be allied to *A. dissecta*, but the flowers and fruit are unknown.

**Prismatica Acacia.** Tree.

295. **A. cockilocarpa** (Gomez, mem. acad. daz. sci. lisb. 3, p. 194, under *Mimôsa*), leaves with 3 pairs of pinnae, each pinna bearing about 3 pairs of leaflets; legumes compressed and spiral. *S. Native of Brazil. Abarantóimo, Pis. bras. Its root is known by the name of *Cortex Brasilidiris*, and is a very powerful astringent. The plant is known in Brazil by the name of Barbataina.

**Twisted-fruited Acacia.** Tree.

*** Prickles stipular, twin, but without any petiolar ones.

296. **A. platyloba** (Bert. ined. in herb. Balb, ex D. C. prod. 2, p. 472.) glabrous; prickles stipular, hooked; leaves with 3 pairs of pinnae, each pinna bearing 2-3 pairs of obvate obtuse leaflets; petioles glandless; legumes flat, rather stipitate. *S. Native of St. Domingo. Inga Magdalenæ, Spreng. in herb. Balb. Legume 6 inches long, and 1 1/2 inch broad, 2-valved, dry inside. Seeds flat, shining. Flowers unknown. A very doubtful species, allied to *A. Lébek* and *A. Latidique*, but differs in being prickly. Perhaps it ought to be inserted between the sections *Glabiflorae* and *Spiciflorae*.

**Broad-podded Acacia.** Tree.

297. **A. ?Lepetrophylla** (D. C. cat. hort. monsp. p. 74.) prickles stipular, straight, setaceous, distinct, short; leaves with 4-5 pairs of pinnae, each pinna bearing 12 pairs of oblong distant leaflets, which are pubescent beneath, as well as the petioles and branches, with a gland on the petiole between the lower pair of pinnae. *S. Native of South America. Flowers and fruit unknown.

**Slender-leaved Acacia.** Clt. 1854. Tree.

298. **A. ?Vuluxences** (D. C. l. c.) glabrous; prickles stipular, setaceous, straight, distinct; leaves with 2 pairs of pinnae, each pinna bearing 15-20 pairs of oblong-linear leaflets, with an obsolete gland on the petiole between the lower pair of pinnae. *S. Native of South America. Flowers and fruit unknown.

**Grenich-flowered Acacia.** Clt. 1820. Tree.

299. **A. lentiscifolia** (Desf. cat. hort. par. ed. 2, p. 208.) glabrous; spines subulate, stipular, straight; leaves with usually 4 pairs of pinnae, each pinna bearing about 10 pairs of ovate, mucronate, rather coriaceous, shining leaflets, with a sessile gland between each of the pairs of pinnae. *S. Native of Mexico. Mimôsa lentiscifolia, Pers. euch. 2, p. 263. Poir. suppl. 1, p. 84. Flowers and fruit unknown.

**Lentisicuous-leaved Acacia.** Tree.

300. **A. patula** (Humb. et Bonpl. in Willd. enum. 1055.) spines stipular, connate, twin, compressed at the base and dilated; leaves with 5 pairs of pinnae, each pinna bearing 15-20 pairs of linear leaflets, which are glabrous on both surfaces; petioles rather pilose and glandless. *S. Native of South America. Flowers and fruit unknown.

**Spreading Acacia.** Clt. 1818. Tree.

301. **A. Pereziana** (Humb. et Bonpl. in Willd, enum. p.
1055.) spines stipular, setaceous, twin; leaves with 2 pairs of pinnae, each pinna bearing 11-15 pairs of obtuse, glabrous leaflets. \( \& \) S. Native of Peru. Allied to A. dipetala, according to habit.

Peruvian Acaia. C1t. 1820. Tree.

302 A. ? Guayaquilensis (Desf. hort. par. ed. 2. p. 208.) spines stipular, opposite; leaves with 2 pairs of pinnae, each pinna bearing 3-5 pairs of ovate, obtuse, glaucous leaflets, lower ones the smallest. \( \& \) S. Native of Peru, near Guayaquil. Flowers and fruit unknown.

Guayaquil Acaia. Tree.

303 A. Brachyacantha (Humb. et Bonpl. in Willd. eninn. 1055.) spines stipular, twin, hooked; leaves with usually 10 pairs of pinnae, each pinna bearing about 10-12 pairs of ciliated leaflets. \( \& \) S. Native of South America. Flowers and fruit unknown.

Short-spined Acaia. C1t. 1824. Tree.

304 A. ? Glabella (Humb. et Bonpl. in Willd. eninn. 1056. but not of Alt.) spines stipular, subulate, twin, straight; leaves with 4-3 pairs of pinnae, each pinna bearing 15 pairs of distant, ciliated leaflets. \( \& \) S. Native of South America. Flowers and fruit unknown.

Acicular-spined Acaia. Tree.

306 A. Giraftree (Willd. eninn. 1054.) spines stipular, twin, connate, about equal in length to the leaves; leaves with 3-6 pairs of pinnae, each pinna bearing 10-20 pairs of leaflets, with 1 gland between each pair of pinnae on the petiole. \( \& \) G. Native of the Cape of Good Hope, in the interior of the country. Flowers and fruit unknown. It is on this tree that the Cape giraffe or camel-leopard feeds.

Giraftree’s Acaia. Tree 40 to 70 feet.

307 A. ? Micracantha (Desv. journ. bot. 1814. 1. p. 69.) prickles stipular, very slender; leaves pubescent, bipinnate; leaflets linear, rather falcate, very thin; flowers disposed in spike-like racemes, on short peduncles. \( \& \) S. Native of Cayenne. Mimosa semi-spinosa, Lin. ex Desv.

Small-spined Acaia. Tree.

*** Spines or prickles all scattered in an irregular manner, or some of them are stipular, and those on the branches and petioles are scattered.

308 A. ? Rhodacantha (Desf. cat. hort. par. ed. 2. p. 208.) glabrous; stipular prickles twin, petiolar ones scattered; leaves with about 7 pairs of pinnae, lower pair the smallest, each pinna bearing from 6-20 pairs of oblong-linear, somewhat ciliated leaflets, with a depressed gland at the base of the petiole. \( \& \) S. Native country, flowers, and fruit unknown. Mimosa rhodacantha, Pers. ench. 2. p. 266.

Red-spined Acaia. Tree.

309 A. Heterocantha (Burch. cat. no. 1710. ext. trav. 1. p. 389.) some of the spines are twin, short, recurved, and brown, others are straight, longer, and white; leaves pubescent as well as the branches, with 4-6 pairs of pinnae, each pinna bearing 10-14 pairs of approximate, oblong leaflets. \( \& \) G. Native of the Cape of Good Hope, near the river Gariep or Orange River. Legume linear.

Variable-spined Acaia. C1t. 1816. Tree.

310 A. Bancroftiana (Bert. in herb. Babl. Coll. hort. ripul. p. 1.) glabrous; rameal prickles scattered, petiolar ones twine at the origin of the pinnae; leaves with 2-5 pairs of pinnae, each pinna bearing about 2-5 pairs of obovate, obtuse leaflets; petioles glandless. \( \& \) S. Native of Jamaica. This species approaches in habit to A. platyphloia. Flowers unknown. Fruit ovate-oblong, glabrous, rather fleshy, few-seeded, sessile.

Bancroft’s Acaia. Tree 20 feet.

311 A. ? Polycephala (D. C. prod. 2. p. 473.) rameal as well as petiolar prickles scattered and a little hooked; leaves with 6-9 pairs of pinnae, each pinna bearing 20 pairs of linear, acute leaflets, which are puberulous beneath and on the margins; petioles furnished with a large depressed gland at the base, and one between the extreme pair of pinnae; petioles, branches, and peduncles clothed with velvety hairs; heads of flowers numerous, pedunculate, in fascicles, which are disposed in terminal racemes. \( \& \) S. Native of the Mauritius. Heads of flowers globose, reddish brown before the flowers expand. Stamens numerous, white. Legume unknown. The species is very like A. concinna, but differs in the absence of stipulas.

Many-headed Acaia. Tree.

312 A. Silenecephala (Schlecht. et Cham. in Linneea. 5. p. 308.) leaves unknown; racemes axillary, usually bearing heads on short peduncles, ovate-roundish; flowers polyandrous; legume inflated, aciniiform, tapering to both ends, 12-18-seeded; seeds egg-shaped, compressed; spines red, white, or black. \( \& \) S. Native of Mexico, near Actopan and Vera Cruz. Prospis species, Schiede. in litt.

Round-headed Acaia. Tree.

313 A. Spadigera (Schlecht. et Cham. l. c.) leaves unknown; racemes usually twin, leafy; spikes referrible to the spadix of an aroidceous plant, cylindrically elevated, spikes twin, stipular; peduncles very thick; flowers dense, polyandrous, propped by scales as in the preceding species. \( \& \) S. Native of Mexico, near La Laguna Verde.

Spadix-bearing Acaia. Tree.

† Species, the names of which are only known from Rozburgh’s Hortus Bivalentia, under Mimosa.

1 A. Kallóia, Roxb. 2 A. fruticosa, Roxb. 3 A. Smithiana, Roxb. 4 A. semicordata, Roxb. 5 A. palmata, Roxb. 6 A. pedunculata, Roxb.

Cult. The greenhouse or New Holland species of Acaia are the most ornamental of greenhouse plants in the winter season and early in spring, bearing flowers from Christmas to April. They are hardy and easily managed. The best soil for them is an equal quantity of sand, loam, and peat. Cuttings taken off by a joint from young wood, and planted in a pot of sand, with a bell-glass placed over them, root freely. Some of the kinds that do not strike readily by cuttings may be increased by taking off pieces of the roots, planting them in the same kind of soil as recommended for the plants, leaving only their points above the surface, and then plunging them in a little bottom heat. The greater part of the species might be propagated by this means. The stowe species are furnished with very elegant flowers, but seldom flower in this country. Their culture and propagation are the same as for the greenhouse species, with the exception that they require more heat. The Acaia Julibrissin, A. acanthocephala, A. decurtens, and A. mollissima are the only species that can be considered sufficiently hardy to stand our climate in the open air, and these are liable to be injured in severe winters, unless protected by matting. The best situation for them is against a south wall, where they will make a very fine appearance. They may be propagated either by slips of the root or by young cuttings, planted in sand, with a bell-glass placed over them. The surest way to raise all the kinds is by seeds, when they can be procured.

CCXXXIV. ERYTHROPHILEUM (from erythros,
red; in reference to the red juice which flows from the tree when cut). Azelius, ms. R. Br. Congo, and in Denh. and Clapp. trav. append. p. 30.

1 G. Guineense (G. Don, in Edinb. phl. Journ. 1824.), b. N. Native of Sierra Leone, and probably parts of other countries of Guinea. The red juice in which the tree abounds is used as an ordeal by the natives of many parts of western Africa, as well as of the interior, to detect the innocence or guilt of those who are accused of any crime. The red juice is taken in large draughts, and those who are not sufficiently strong to withstand this ordeal are pronounced guilty, and those who are considered innocent.

Guineca Gregree-tree or Ordeal-tree. Fl. Feb. C1t. 1823. Tree 100 feet.

Cult. See Acacia for culture and propagation, p. 424.

Suborder IV. Cesalpiniæ (plant agreeing with Cesalpinia in some important characters). R. Br. gen. rem. p. 19. congo. p. 10. D. C. legum. mem. xiii. p. 473. Petals perigynous, unequal, disposed in a papilionaceous or sub-papilionaceous manner (f. 55. c. f. 56. b.). Petals irregularly imbricate in aestivation, never valvate, sometimes wanting, but never joined together, always free (f. 55. c. f. 56. b.). Stamens more or less unequal (f. 56. c. f. 57. d.). Petals perigynous, and usually free, rarely in Tribe Geoffrya having the filaments concreted. Embryo straight (f. 21. g. h. i. m.) with the plumule usually large and conspicuous.

Tribe IX.

Geoffrya (plants agreeing with Geoffroya in particular characters). D. C. legum. mem. xiii. pro. 2. p. 473. Petals perigynous, unequal, disposed in a papilionaceous or sub-papilionaceous manner (f. 55. c.). Incestuation. Stamens monadelphous or diadelphous. Cotyledons fleshy or oily (f. 21. l.). This is an artificial tribe, which ought perhaps to have been brought or come among the Papilionaceae, from the perigynous papilionaceous flowers and connected stamens, but it agrees with the sub-order Cesalpiniæ in the embryo being straight, as in the rest of that sub-order. The genera belonging to this tribe are also very dissimilar in habit, and ought perhaps to have formed 4 or 5 distinct tribes.

CCXXXV. Arachis (Aracos, a name under which Pliny speaks of a plant with neither leaves nor branches, which comes from a priv. and paxo, rakis, a branch, the present plant, however, has nothing to do with the plant of Pliny). Lin. gen. no. 876. Lam. ill. 615. D. C. legum. mem. n. t. 20. f. 106. Voandzou, Fl. Mad. 118. Glycéine subterrânea, Lin. dec. 37. t. 17. Arachis Africana, Burm. ind. p. 22. Flowers yellow. In Surinam and various parts of Africa the seeds are good, and are boiled in an unripe state like peas. They are also very good when ripe. The Surinam name of the plant is Gobbe.

Cult. See Arachis for culture and propagation.

Lin. syst. Didiálphæa, Decandria. Calyx furnished with 2
opposite bracteoles, which are longer than it, with a short tube, the 3 lower segments deep, elongated, and linear-lanceolate, the 2 superior ones joined into a lip, which is bidentate at the apex. Stamens diadelphous. Style filiform, simple at the apex. Legume oblong, compressed, flattened, 4-8-seeded, stipitate, or stipitately sessile, roundish, or nearly circular, mucronate at the apex; ovary sessile; legume furrowed with a narrow wing on the seminferous suture. Native of New Spain, between Chilpancingo and Zumpano. Pedicels 5-10 lines long. Flowers violaceous.

**Lupin-like Peralteia.** Shrub 1 to 2 feet.

Cult. The species of *Peralteia* are very elegant when in flower; they thrive best in a mixture of loam, peat, and sand, and young cuttings root readily if planted in a pot of sand, with a bell-glass placed over them in heat.

**Lin. Syst. Diadelphia, Decandria.** The characters of the genus are the same as *Peralteia*, but differs in the legume being seated on a more distinct stipe, and in the seminferous suture being more or less at the mouth. Perhaps it ought to be joined to *Peralteia*.

1 B. mollis (H. B. et Kunth, nov. gen. amer. 6. p. 465. t. 587.) leaves with 4-5 pairs of ovate-elliptic acute leaflets, which are puberulous above, but clothed with soft villous pubescence beneath, as well as on the margins. Native of New Spain, on the mountains between Zumpano and Tasco. Legume on a long pedicle. Flowers large, purple.

**Soft Brongniartia.** Shrub 1 to 2 feet.

2 B. podalyrioides (H. B. et Kunth, nov. gen. amer. 6. p. 465. t. 588.) leaves with 2-3 pairs of leaflets; leaflets elliptic-oblong, rounded, and mucronate at the apex, clothed with adpressed villi on both surfaces, but silky when young; branches and petioles glabrous. Native of New Spain, in warm places between Tasco and Cuernavaca. Legume on a short pedicle. Flowers large, purple.

**Podalyria-like Brongniartia.** Shrub 1 foot.

Cult. Elegant plants when in flower. For their culture and propagation see *Peralteia*.

**Lin. Syst. Diadelphic, Decandria.** Calyx turbinate-campanulate, 5-toothed; teeth nearly equal, acute, and erect. Co-rollera papilionaceous, with a roundish emarginate vexillum, which is longer than the keel. Stamens diadelphous, 9 joined, and 1 free. Ovary 3-ovulate. Legume stipitate, rather orbicular, hard, 1-celled, 1-seeded, when mature it is divisible into 2 valves according to Swartz.—Unarmed trees, with unipari-pinnate leaves, opposite petiolulate stipulate leaflets, and terminal panicles of purple flowers. This genus is nearly allied to *Geoffroya*, from which it is probably not distinct.

**Racemose-flowered Andira.** Ct. 1818. Tree 20 to 60 feet.

**Tall Andira.** Tree 40 feet.

3 A. brasiliensis (H. B. et Kunth, nov. gen. amer. 6. p. 385.) leaflets 13, oblong, acuminate, rounded at the base; quite glabrous, and shining above; panicle simple; calyx turbinate-campanulate, clothed with rusty down. Native of New Granada, on the banks of the river Magdalena near the mouth of the Rio Opon. Petiolules stipulate, glabrous. Flowers red.

**River-side Andira.** Tree 20 to 30 feet.

4 A. incurvata (H. B. et Kunth, nov. gen. amer. 6. p. 385. In a note) leaflets 13-15, ovate-lanceolate, acute, glabrous on both surfaces; flowers panicked on short pedicles; calyx urceolate, clothed with rusty pubescence. Native of Jamaica, Trinidad, Martinico, Porto-Rico, St. Domingo, and Guiana, in woods and on river banks. Geoffroy's incurvata, Swartz, fl. ind. occid. 1255. Wright in phill. trans. 1777. p. 512. t. 70. The bark of this tree is of a grey colour externally, but black and furrowed on the inside. The powdered wood looks like japa. It has a mucilaginous and sweetish taste, and a disagreeable smell. Its medical effects are great. When properly exhibited it operates as a powerful astringent. It is given in the form of powder, decoction, syrup, and extract, but should always be given in small doses. The decoction is preferred, and is made by slowly boiling an ounce of the dried bark in a quart of water until it assumes the colour of Madeira wine. This sweetened is the syrup; evaporated it forms the extract. It commonly produces some sickness and purging, and sometimes violent effects, as vomiting, delirium, and fever, but these are usually the effects of an over dose, and are relieved by warm water, castor oil, or vegetable acid. The tree is called Cabbage-tree.

**Unarmed Andira.** Ct. 1773. Tree 20 to 30 feet.

5 A. retusa (H. B. et Kunth, nov. gen. amer. 1. c. in a note) leaflets 11-13, oval, retuse, and somewhat emarginate, glabrous on both surfaces. Native of Cayenne. Geoffroy's retusa, Lam. ill. 602. f. 2. dict. 8. p. 182.

**Retuse-leafletted Andira.** Tree 20 to 30 feet.

+ A doubtful species.

6 A. tortilis (Lecch. ann. mus. 16. p. 481. t. 12.) leaflets 3-5, oval, acute, glabrous; flowers disposed in loose racemes; calyx gibbous above at the base; legume olive-form. Native of Java, on the mountains. Seeds bitter.
Leguminosae. CCXL. Geoffroya. CCXL. Brownea.

Flowers white. This plant ought to be removed from the present genus.

Horsfield's Andira. Shrub.

Cult. See Geoffroya for culture and propagation.

CCXL GEOFFROYA (in honour of M. E. F. Geoffroy; he was author of a Materia Medica, and died in 1731.) Jacq. amer. 207. Lin. gen. no. 878. D. C. prod. 2. p. 476.—Acouros, Aubl. guian. 3. p. 10. and 753.—Drakensteinia, Neck. elem. no. 1344.

LIN. SYST. Diadelphia, Decandria. Calyx campanulate, half-5-cleft, somewhat bilabiate. Corolla papilionaceous, with the wings and keel about equal in length, but shorter than the vexillum. Stamens didelphous, 9 joined, and one free. Ovary bilocular. Legume drupaceous, egg-shaped, 1-celled, 1-seeded, marked with a furrow on both sides, 2-valved inside. Seeds thick. Cotyledons fleshy. Embryo straight.—American thorny or unarmed trees, with impari-pinnate leaves, axillary racemes or panicles of flowers, and edible seeds. This genus is closely allied to Amygdalaceae.

1 G. spinosa (Jacq. amer. 207. t. 180. f. 62.) spines on the trunk and branches few, and subulate; leaves 15-15, oblong, obtuse, glabrous. S. Native of Carthagia, in woods by the sea side, and perhaps of Brazil, if the Umâri of Magreff, Brasil, p. 121. f. 1. be the same. Flowers of a dirty fulvous colour, diffusing widely a most fetid odour. The drupe is very like an almond, with a tomentose rind of a greenish yellow colour. The pulp is soft, sweet, and yellowish, has a nauseous smell, and stains the hand with rust colour not easily washed out. The nut or stone is white, adheres closely to the pulp, and contains a white kernel that has a farinaceous astringent taste. This plant having papilionaceous flowers, and a drupe for a fruit indicates the close relationship of Leguminosâe with Amygdalaceae, the following order.

Spinose Geoffroya. Clt. 1818. Tree 12 to 20 feet.

2 G. spinulosa (Mart. ris. ex Schlecht. Linnaea. 5. p. 45,) trunk unarmed; branches covered with spongy bark; leaves 7, ovate, obtuse, pubescence, and reticulated beneath; petals winged, the wing spinulose at the base of the leaves; racemes forming a spreading panicule. S. Native of Brazil.

3 G. spinu'sa (Humb. et Bonpl. pl. equin. 2. p. 69. t. 100.) unarmed, and ciliate leaves 13-17, oblong, obtuse, somewhat emarginate; branches and calyxes pubescent. S. Native on the banks of the river Amazon near Tomependa, where it is called Almen'don or Almoud. Flowers yellow. Leaves nearly like those of the tamarind-tree (ex Kuth), shining and puberulous above, but glaucous and paler beneath (ex Bonpland), glabrous above, and pubescent beneath (ex D. C.). The fruit is much like that of the last species.

Superb Geoffroya. Tree 24 feet.

4 G. BREDEMeyeri (H. B. et Kunth, nov. gen. amer. 6. p. 379.) unarmed; leaves 17-55, oblong, shining above, but with a few scattered hairs, pubescent beneath; adult branches glabrous; calyx clothed with coarser tomentum. S. Native of Caracas, on dry hills and in valleys near New Valencia, and at Cumana. Robinsia striata, Willh. spec. 3. p. 1132. Flowers yellow. Drupe similar to the two preceding species.

Bredemeyer's Geoffroya. Shrub 6 to 8 feet.

5 G. Verbescens (Rich. in act. soc. hist. nat. par. p. 151.) unarmed; leaves 11-13, elliptic-obovate, obtuse, and somewhat emarginate, clothed with white pubescence beneath, as well as the calyx. S. Native of Cayenne. Flowers pedunculate, purple. Leaves 2 inches long, and about an inch broad.

Verbescent Geoffroya. Tree.

6 G. Vermifuga (Mart. ris. ex Schlecht. Linnaea. 5. p. 44.) trunk unarmed; branches covered with spongy bark; leaves with 9-11 roundly elliptic leaflets, which are glabrous above; petals wingless, furrowed, covered with rusty tomentum, as well as the primary veins of the leaves on the under surface; racemes panicled, pyramidal, clothed with fulvous tomentum, as well as the calyces. S. Native of Brazil.

7 G. Violacea (Pers. ench. 2. p. 278.) unarmed; leaves 7, alternate, ovate-oblong, acuminate, and somewhat emarginate, glabrous on both surfaces. S. Native of Guiana, on the banks of rivers. Acouros violacea, Aubl. guian. 753. t. 501. Flowers violaceous.

Violaceous-flowered Geoffroya. Geoffroya. Tree 50 feet.

8 G. Tomentosa (Poir. dict. 8. p. 181.) leaves 11, oval, oblong, obtuse or emarginate, glabrous above, and tomentose beneath, as well as the calyces, peduncles, and branches. S. Native of Senegal. Petals nearly equal, velvety on the outside. Stamens 8; monadelphous, very villous. Legume unknown. This is a very doubtful species of the present genus.

Cult. The species of Geoffroya grow freely in sandy loam, or a mixture of loam and peat, and cuttings will strike root if planted in sand, with a hand-glass placed over them in heat.

LIN. SYST. Monadelphia, Deca-Polyandria. Bracteoles 2, constituting a bird-shaped to the calyx (f. 55. a.). Calyx coloured, 5-cleft (f. 55. b.), with the tube permanent, and the lobes long, usually cohering to each other in various ways. Petals 5 (f. 55. c.), unguiculate (f. 55. e.). Stamens 10-15, monadelphous, with the tube or sheath cleft longitudinally. Ovary furnished with a stipe, which is adnate to the calyx. Style filiform. Legume 1-celled, many-seeded, aciculiform, compressed. Seeds ovate, covered with fugal fibres.—Small American trees, with abruptly-pinnate leaves, when young they are glabrous, and with the leaflets revolute at the edges. Leaf-bud long and stipulaceous. Flowers elegant, of a rose scarlet colour, rising in fascicled heads from the axillary buds.

1 B. rosa (Pers. ench. 2. p. 237.) leaves with 2-3 pairs of oval-oblong acuminate leaflets; stamens twice the length of the corolla; branches and petioles glabrous; flowers in dense heads; leaflets of the involucre roundish, imbricated, and when in a young state are rather velvety. S. Native of South America, about Porto-bello, also of Guadaloupe, where it is cultivated. Hermèsia, Linn. tit. 278. B. rosa de monte, Ber. act. angl. 1771. p. 171. t. 8, 9. Lam. ill. 575. f. 8. B. speciosa, of Reichh. in Schult. fl. trin. exsic. no. 68. does not differ from the present plant unless in the stamens being less elongated. Flowers scarlet.

3 B. LATI'ROLLA (Jacq. fragm. p. 25. t. 17.) leaves with 1-3 pairs of ovate or obovate cuspitate leaflets; flowers in dense fascicles; involucre tomentose; calyx compressed, with the two inferior lobes joined together into an emarginate lip. S. Native of Caracas and Trinidad. Flowers red. Stamens 11.

Broad-leaved Brownea. Clt. 1824. Shrub 6 to 8 feet.
4 B. racemosa (Jacq. frgm. p. 25. t. 16.) leaves with 4 pairs of unequal-sided, oblong or oblong-lanceolate, cuspidate-acuminate leaflets, which are glandular-filose at the base; flowers in racemes; involucrum and calyx clothed with fine tomentum; calyx apparently of 3 lobes, one free, and the others joined by pairs. ½. S. Native of Caracas, at Guiripe, and of Trinidad. H. B. et Kunth, nov. gen. amer. 6. p. 321. Flowers rose-coloured. Stamens 11-12.

Racemose - flowered Brownea. Shrub 4 feet. 5 B. capitella (Jacq. frgm. p. 26. t. 18 and 19.) leaves with from 2-7 pairs of oblong cuspidate leaflets; flowers disposed in dense heads; ovary villous. ½. S. Native of Caracas, where it is named Rosa-Macho. Flowers scarlet.

Headed-flowered Brownea. Shrub 6 to 10 feet. 6 B. leucantha (Jacq. frgm. p. 26. t. 20 and 21.) leaves with 6-8 pairs of oblong-lanceolate cuspidate leaflets, outer ones the largest, lower ones small, ovate, cordate; flowers disposed in heads. ½. S. Native of Caracas. Flowers white.

White-flowered Brownea. Shrub 8 feet. 7 B. grandiceps (Jacq. coll. 3. p. 287. t. 22. f. a. i. fragm. t. 22 and 23.) leaves with usually 12 pairs of oblong-lanceolate glandless leaflets, ending in a long cuspidate acumen; branches and petioles pubescent; flowers in dense capitate spikes. ½. S. Native of mountain woods at Caracas, and in woods near Cumaná, also of Trinidad. H. B. et Kunth, nov. gen. amer. 6. p. 313. Lam. ill. 575. f. 2. Corolla red. Stamens 11.

Large-headed Brownea. Clt. 1829. Tree 60 feet. Cult. All the species of Brownea are very splendid when in bloom, and are therefore worthy a place in every collection of stove plants. A mixture of loam, peat, and sand is a soil well adapted for them, and care should be taken not to over water the plants in winter, as too great a supply of water at that season is almost sure to destroy them. Cuttings should be taken off from ripened wood, and planted in a pot of sand, and placed under a hand-glass in a moist heat, where they will strike root freely.

CCXLII. DIPTERIX (from δις, dis, double, and πτερός, pteros, a wing; in reference to the 2 upper lobes of the calyx, which appear like 2 wings). Schreb. gen. no. 1161. D. C. prod. 2. p. 477.—Baryosma, Pers. ench. 2. p. 278.

Lin. syst. Monadelphia, Octo-Decandria. Calyx turbinate, tubular, 3-5-lobed, 2 superior lobes largest and wing-formed, and nearly opposite, the lower ones smaller. Petals 5, disposed into a papilionaceous corolla. Stamens 8-10, monadelphous, with the sheath or tube cleft longitudinally above. Style ascending. Legume ovate, rather compressed, thick, 2-valved, 1-celled, 1-seeded. Seed ovate-oblong, pendulous in the cell, exalbuminous. Embryo straight, with thick cotyledons. —

Trees, with abruptly-pinnate coriaceous leaves, and panicles of flowers.

Sect. I. Coumarou'na (Coumarou is the name of the tree in Guiana). Aubl. guian. 2. p. 740. t. 296. Cumariuna, Lam. ill. t. 601.—Baryosma, Gaertn. fruct. 2. t. 98.—Heinzia, Seop. Stamens 8. Lower segment of calyx undivided; perhaps it is simple, or perhaps composed of 3 joined sepalas.

M. pterygosper'ma (Wild. spec. 3. p. 810.) leaves alternate, composed of 5-6 alternate leaflets; petiole margined. ½. S. Native of Guiana, in woods. Coumarou'na odorada, Aubl. l. c. Baryosma Tongo, Gaertn. l. c. Flowers purple dashed with violet, disposed in racemose panicles. The seeds of this tree are the Tongo or Tonquin-beans, well known as giving a grateful scent to snuff. The Creoles put them into chests in order to drive away insects, as well as for their fragrance.

Sweet-scented Tonquin-bean. Clt. 1795. Tree 60 feet.

Sect. II. Tara'lea (Tarala is the name of the tree in Guiana). Aubl. guian. 2. p. 745. t. 298. D. C. prod. 2. p. 473.—Bolducia, Neck. elem. no. 1342. Stamens 10; lower segments of the calyx 3 or only one, which is trifid.

2 D. oppositifolia (Wild. spec. 5. p. 519.) leaves opposite, bearing 6-8 nearly opposite leaflets; petiole wingless. ½. S. Native of Guiana, in woods. Tara'lea oppositifolia, Aubl. l. c. Baryosma oppositifolia, Pers. ench. 2. p. 278. Flowers in axillary and terminal panicles, when blown their fragrance is very diffusive. Petals violaceous.

Opposite-leaved Tonquin-bean. Tree 60 feet. Cult. These trees grow best in a loamy soil, and ripened cuttings will strike root if planted in a pot of sand, with a hand-glass placed over them, in a moist heat.

Tribe X.

CASSIA (plants agreeing with Cassia in important characters). D. C. legum. mem. xiii. prod. 2. p. 478.—Cassie and Cercoc, Brom. diss. Lobes of calyx imbricate by expanision (f. 57. a.). Petals perigonious, nearly equal (f. 56. b. f. 57. b.), rarely somewhat papilionaceous, always imbricate in aestivation. Stamens distinct (f. 56. c. f. 57. c.), never with the filaments concrete. Legume usually dry, and 2-valved (f. 56. e. f. 58. g.). Cotyledons foliaceous, rarely fleshy. Leaves sometimes bipinnate, sometimes tripinnate, sometimes simply pinnate, but rarely simple. The habit variable. This tribe will need still to be further divided when the characters of the genera are better known. Some of the genera have the sepals joined at the base, or in a long tube, which is staminiferous at the apex.

Lin. syst. Decandria, Monogynia. Calyx of 5 nearly equal, oblong, deciduous sepals, which are a little concrete at the base. Petals 5, nearly equal, oblong, the upper one ascending. Stamens 10, unequal, separate, sometimes 5 of which are sterile. Style filiform, acute. Legume silique-formed, 3-valved. Seeds trigonal, exalbuminous, fixed to the centre of the fruit. Embryo straight, with thick oily cotyledons, which are inclosed within the spermoderm through germination. Plumule none.—Unarmed trees, with impari-bipinnate or tripinnate leaves. Racemes panicled. Legume constantly composed of 3 carpels, which are closely joined together, but which separate at maturity, leaving only the semiiniferous sutures. Perhaps a proper tribe.

M. pteroygosper'ma (Gaertn. fruct. 2. p. 314. t. 147.) legumes triquetrous; seeds trigonal, with the angles expanded into wings; leaves sub-bipinnate. ½. S. Native of the East Indies and South America, where it has probably been introduced. Guianandina Moringa, Lin. spec. 540. Hyperanthera Moringa, Vahl. symb. 1. p. 30. Moringa oleifera, Lam. l. c. Anoma Moringa, Lour. cox. p. 279. Moringa Zeylanica, Pers. ench. 1. p. 460.—Rheed. mal. 5. t. 11.—Rumph. amb. t. 74. and t. 75. Flowers pale yellow, the upper petal whitish. The root of this tree when young is scraped, and used by the inhabitants of the places of its natural growth as horse-radish is in Europe, having much the same sharp taste, as have also the seeds.
Horse-radish tree or Winged-seeded Moringa. Clt. 1759. Tree 20 to 30 feet.

2 M. polyphona (D. C. prod. 2. p. 478.) legumes many-angled; seeds trigonal, with the angles expanded into wings. η. S. Native of Bengal and other places in the East Indies. Anóma Moringa, Lour. 879. Hyperanthéra decándra, Willd. 2. p. 555. Burm. zeyl. t. 75? Flowers pale yellow. Perhaps only a variety of the preceding species.

*Many-angled-Fruited Moringa.* Tree 15 to 20 feet.

*Arabian Moringa.* Tree 30 to 40 feet.

*Cult.* The species of Moringa thrive well in light loamy soil, and cuttings strike root readily in sand, under a high glass, in heat.

**CCXLIV. GLEDITSCHIA.** (in honour of Gottlieb Gleditsch, of Leipzig, one a professor at Berlin, and defender of Linnaeus against Siegesbeck; author of Medichus Fungorum, 1758; Systema Plantarum a Staminum sita, 1764, and many other smaller works). Lin. gen. 1159. Lam. ill. 857. D. C. prod. 2. p. 479.

**LIN. Syst.** Polygámiá, Di-céia. Flowers unisexual from abortion, or hermaphrodite. Calyx of 3-4-5 equal sepals, which are connected together at the base into a cupula. Petals equal in number to the sepals, rising from the tube of the calyx, sometimes fewer or abortive, or 2 of them are connected together into a carina. Stamens equal in number to the sepals, or fewer from abortion. Style short. Stigma pubescent above. Legume continuous, divided internally in many cells by disseminations, furnished with more or less pulp, which surrounds the seeds, rarely 1-celled, 1-seeded, or dry. Seeds compressed.—Trees with the supra-axillary branches usually converted into branched spines. Leaves abruptly pinnate and bipinnate on the same tree. Flowers greenish, disposed in spikes.

1 G. triac'anthos (Lin. spec. 1500.) spines robust, compressed at the base, but cylindrically conical at the apex, simple, or trifid; leaflets linear-oblong, lucid; legumes compressed, flat, a little twisted, many-seeded, 10 times or more longer than broad. η. H. Native of Virginia and Carolina, and other parts of North America. Duhulm. arb. 1. t. 105. ed. nov. 4. t. 25. Michx. fl. arb. 2. p. 161. t. 10. Hort. ang. t. 21. Wats. deod. brit. t. 138.—Pluk. mant. t. 352. f. 2. Spines supra-axillary. This tree is known in North America by the name of Honey-locust, and it is called by gardeners the Three-thorned Acacia.

Three-thorned Acacia or Honey-locust. Fl. June, July. Clt. 1700. Tree 30 to 50 feet.

*Short-fruiting Gleditschia.* Fl. June, July. Tr. 30 to 50 feet.

*China Gleditschia.* Fl. June, Jul. Clt. 1771. Tr. 30 to 50 ft.

5 G. macrá'nta (Desf. arb. 2. p. 246.) spines strong; branched, conical, numerous; leaflets lanceolate, rather rigid; legumes elongated, thickened, pulpy inside. η. H. Native country unknown. Spines very spiny; of the branches axillary. Leaflets nearly 2 inches long, crenately toothed. The pulp in the fruit is more auster than in any other species.

6 G. ré'rox (Desf. arb. 2. p. 247.) spines robust, much compressed, trifid; leaflets lanceolate, acute. η. H. Native country unknown. G. orientalis, Bosc. Spines of the branches supra-axillary, large, compressed almost their whole length, furnished with short, lateral, opposite branches. The trunk of the tree is thickly beset with strong, branching thorns.

7 G. Ca'spíca (Desf. arb. 2. p. 247.) spines slender, trifid; leaflets elliptic-lanceolate, obtuse. η. S. Native of Persia, at the Caspian sea, and at Lenkeran. Flowers and fruit unknown. Spines of the branches supra-axillary, decurrent along the bark at the base on all sides. Leaves usually bipinnate. Flowers and fruit unknown.

*Persian Gleditschia.* Clt. 1822. Tree 30 to 40 feet.

8 G. î'náca (Pers. ench. 2. p. 623.) spines slender, conically subulate, simple, or branched; leaflets elliptic-oblong, acute. η. G. Native of Bengal. Spines axillary.

† The following names occur in the gardens, but they are in all probability synonyms of some of those above.

1 G. micråc'àntha, Lodg. cat. 2 G. latíassíquó, Lodg. cat.

*Cult.* The trees are remarkable in producing large strong branching thorns on the main stems. They will grow in any kind of soil, and are generally raised from seeds, which are usually procured from the native countries of the trees. The seeds may be sown one inch deep in a bed prepared for the purpose, and if the spring prove dry they will not vegetate until the second year. The first year from seed the plants should be sheltered from frost.

**LIN. Syst.** Dioécia, Decándria. Flowers dioecious from abortion. Calyx tubular, 5-cleft. Petals 5, equal, oblong, ex-
sired from the tube. Stamens 10, inclosed. Legume oblong, thick, filled with pulp inside.—An unarmed tree, with obuse branches, bipinnate leaves, with 4-7 pairs of pinnae, the lower pinna bearing 1 leaflet, the rest bearing 6-8 pairs of leaflets. Flowers white, disposed in racemes.

Canadian Gymnocladus. Cit. 1748. Tree 30 to 40 feet.

Cult. A fine deciduous tree, with large, bipinnate leaves. It will grow in any common soil, and is increased by slips from the roots, which should be planted in spring, with their ends upwards.

CCXLVI. ANO MA (agropo, anemos, without law; irregular; the corolla as well as the legume are irregular). Lour. cib. p. 279. Juss. in ann. mus. 8. p. 327. D. C. prod. 2. p. 480.

Lin. syst. Decándria, Monogénia. Calyx of 5, nearly equal sepals, which are concrete at the base. Petals 5, oblong, nearly equal. Stamens 10, ascending, the 5 alternate ones sterile. Legume oblong, thick, 1-celled, 2-valved, many-seeded.—A small tree, with opposite, bipinnate leaves, according to Loureiro, but perhaps they are alternate and tripinnate, some-what ovate, tomentose leaflets, and panicles of white flowers.

Cochin-china Anoma. Tree.

Cult. See Casselplia for culture and propagation, p. 432.

1 G. Bödun'e (Lin. spec. 545.). leaves pubescent, velutty; leaflets ovate; prickles solitary; seeds yellow. H. Native of the East Indies, Africa, Arabia, and South America, on the sea-shore. Rumph. amb. 5. t. 48. G. Bödune, var. a. majus, D. C. prod. 2. p. 480. Flowers yellow. Seeds large, yellowish. Leaves with 7 pairs of pinnae each, bearing as many pairs of leaflets. Bödune, a necklace in Arabic; use of seeds.

Bödune or Nicker-tree. Cit. 1640. Shrub 6 to 10 feet.

2 G. Bödun'e'se (Lin. spec. 545.). leaves pubescent; leaflets ovate-oblung; prickles two; seeds grey. H. Native of the East Indies, Africa, and South America. Schrank, hort. mon. t. 66. Glycyrrhiza aculeata, Forsk. desc. 135.—Rumph. amb. t. 40. f. 1. This plant differs from the last in having much smaller leaves set closer together, and below each pair of leaflets are two short, stiff, crooked spines, which are opposite, not solitary, as in the last species. The seeds of this plant are usually used by boys instead of marbles, they being about the same size and shape. In Egypt the seeds of both this and the preceding are used by women, string in necklaces, and hung about their children by way of amulet, to guard them from sorcery. They are often thrown on shore on the coast of Scotland and Ireland, and are called by the inhabitants of the former Molucca beans. The bark and seeds are bitter and tonic.

Small Bondur or Nicker-tree. Cit. 1700. Sh. 6 to 8 feet.

3 G. cili'ata (Berg. herb. Wicks. obs. fl. St. Barth. p. 411.) branches clothed with rusty tomentum; leaves pubescent, with 3-4 pairs of pinnae; leaflets nearly orbicular, oblique at the base, emarginate at the apex, pilose beneath at the base on the middle nerve. H. Native of the island of St. Bartholomew. Flowers in terminal, spicate racemes. Peduncles and pedicels clothed with rusty tomentum.

4 G. microps'hyl'a (D. C. cat. heron. monsp. 114.) leaves smooth, with 3-4 pairs of opposite pinnae, each pinna bearing 6-8 pairs of oval obtuse leaflets. H. Native country, flowers, and fruit unknown. Perhaps this species is referrible to the figure in Rumph. amb. 5. t. 49. f. 2.

5 G. ola'bra (Mill. dict. no. 3.) leaves glabrous, with 4 pairs of alternate pinnae, pinna bearing oval, acute, opposite leaflets.

6 G. cep'ina (Lour. coh. 265.) leaves glabrous, simply pinnate; leaves 2 from the same flower. H. Native of Cochinchina, in woods. Leaves abruptly pinnate. Flowers yellow, disposed in terminal, branched racemes.

Twin-fruit'ed Nicker-tree. Shrub 6 to 10 feet.

Cult. See Casselplia, p. 432. for culture and propagation. The species require a considerable degree of heat to make them thrive.

Lin. syst. Decándria, Monogénia. Calyx turbinate at the base, 5-cleft, the 4 upper lobes nearly equal, the lower one is larger and pectinately toothed, with glands. Petals 5, the upper one the largest. Stamens 10, with the filaments free and somewhat bearded at the base, and with a nectariferous gland on the upper side of the ovary. Style short. Stigma glandularly ciliated. Legume compressed, flat, spongy, hardly deliscent but usually divided transversely into cells inside, 4-6-seeded. Embryo straight.—Shrubs or trees, native of South America, with spines in the axis of the leaves. Leaves abruptly bipinnate. Flowers yellow, disposed in racemes. Pedicels articu- lated, under the flower.

Coulter. Shrub 6 to 7 feet.

2 C. hirm'una (H. B. et Kuhn, nov. gen. amer. 6. p. 330. t. 568.) leaflets glabrous, oblong; petioles prickly; calyxes hairy; legumes glabrous, sessile, obliquely oblong. H. Native of the province of Popayan, near Cartagena.

Horrid Coulteria. Cit. 1824. Shrub 6 to 8 feet.

*Diyer's* Tar. Clt. 1822. Shrub 6 to 10 feet.

4 C. Mexica (D. C. prod. 2 p. 481.) leaves, calyces, and legumes glabrous; leaflets obovate, emarginate; legumes rather torose at the seeds, acuminated at both ends. H. S. Native of New Spain. Cassalpina vesciaria, Sesse et Moc. fl. mex. icon. ined. Flowers yellow, but with the superior petal reddish. Stamens approximate. Leaves with 4 pairs of leaflets.

*Mexican* Tar. Shrub.

5 C. Chilensis (D. C. prod. 2 p. 481.) flowers pendentrous. H. G. Native of Chili. Tarra tinctoria, Mol. chil. 1. ex Schult. syst. p. 5. p. 407. The leaves are said to be opposite.

*Chili* Tar. Shrub.

*Cult.* See *Cassalpina* for culture and propagation, p. 432.

Lin. syst. Decandria, Monogynia. Calyx cup-shaped at the base, 5-lobed; lobes unequal, the lower one largest and a little arched. Petals 5, unequal, unguiculate, the upper one shorter than the rest. Stamens 10, with the filaments villous at the base and ascending; anthers all fertile. Style filiform. Legume unarmed, compressed, 2-valved. Seeds oval-oblong, compressed. Embryo with an elongated plumule.—Prickly or unarmed trees or shrubs, with abruptly bipinnate leaves, and simple or branched racemes of yellow flowers, with the pedicels bractless at the base.

1 C. *Nuga* (Ait. hort. kew. 3. p. 32.) primary petiole prickly beneath; leaves with 3-4 pairs of pinne, each pinna bearing 2-3 pairs of ovate, acute leaflets; flowers in racemose panicles. H. S. Native of the Moluccas. Rumph. amb. 5. t. 345. Guilaindina Nuga, Lin. spec. 546. Legume flat, short, ending in an incurved mucrone. Guilaindina Nuge of Burn. ind. 99, is very different from this plant in the simply pinnate leaves. Roots diuretic.

Axillary-flowered Cassalpina. Tree.

Sect. II. *Brasilieta* (Brasilieta is the name of C. Brasi- 

4 C. scaldens (Roth, nov. spec. 209.) petioles and branches prickly; leaves with 3 pairs of pinne, each pinna bearing 4 pairs of ovate, acuminated leaflets, which are tomentose beneath; flowers disposed in loose panicles. H. S. Native of the East Indies. Legume roundish, oval, glabrous, 2 inches long and 1½ inch broad. Flowers and seeds unknown.

5 C. Brasilensis (Lin. spec. 544. exclusive of Catesby's synonyme) unarmed; leaves with 7-9 pairs of pinne, each pinna bearing about 15 or 16 pairs of oval-oblong, obtuse, glabrous leaflets; rachis and calyces pubescent; racemes rather panicled; pedicels rather shorter than the corollas, flowers and stamens. H. S. Native of Jamaica, St. Domingo, and perhaps of Brazil, according to the name. This is the tree which affords the Brasilieta or Brazil-wool, which is much used in dyeing. It is an excellent timber wood, but seldom exceeds 8 or 10 inches in diameter. It is elastic, tough, and durable, and bearing a fine polish; it is of a beautiful orange and red colour, full of resin, and yields a fine tincture by infusion.

6 C. ferrea (Martius, ms. in herb. Lamb.) unarmed, pubescent in every part; leaves with 2 pairs of pinnae, each pinna bearing 4-6 pairs of elliptic, oblique leaflets; racemes panicled; legume oblong-ovate, mucronate, pedicellate. H. S. Native of Brazil, in the province of Bahia, where it is called Pau-ferro or Iron-tree.

Iron Brasilieta. Tree.

7 C. Sappan (Lin. spec. 544.) leaves with 10-12 pairs of pinne, each pinna bearing 10-12 pairs of unequal-sided, obliquely oval-oblong leaflets, which are emarginate at the apex; flowers panicled; calyces glabrous. H. S. Native of the East Indies. Roxb. cor. 1. t. 16.—Rheed. mal. 6. t. 2. Legume compressed, woody, glabrous, obliquely truncate at the apex. Flowers yellow. Ovary pubescent, ending in the short style. The uses of the wood of this tree in dyeing are numerous throughout Asia; it is an ingredient in the red dye on the coast of Coromandel, commonly called the clay dye. Where a cheap red is required for cotton cloth, the wood is employed by the Telinga dyers, but they cannot make it stand. The process of the Telinga dyers is as follows:—The cotton cloth is well washed, to remove any remains of the quick-lime, &c. used in bleaching; an infusion of half a pound of the powdered calceous in a pint and a half of cold water strained is employed to prepare the cloth, which is done by wetting it twice in the same infusion, drying it between and after. The following day it is twice wetted in a strong solution of alum, and as often dried in the sun. Next day a decoction of the Sappan-wood is prepared as follows: take 1 pound of Sappan-wood in powder, water 12 quarts, boil it till a third is consumed, divide the remaining 8 quarts into 3 parts, one of 4 and the other two of 2 quarts each; into the 4 quarts put the cloth, wet it well, wring it gently, and half dry it, it is again wetted in one of the small portions, and when half dry wetted for the third and last time in the other remaining portion of the decoction; dry in the shade, which finishes the process. The wood therefore seems to be possessed of nearly the same qualities as the Brasilieta or Brazil-wood.

Sappan Brasilieta. Clt. 1773. Tree 40 feet.
LEGUMINOSÆ. CXXXV. CESAIPINIA.

8 C. dioica (Rottl. ex Willd. nov. act. nat. cur. 1803, vol. 4. p. 193. t. 3.) prickly; leaves with 8-10 pairs of pinnae, each pinna bearing 12-12 pairs of oblong-linear, obtuse leaflets; racemes simple; flowers usually digynous. ½. S. Native of the East Indies. Oval hairy. Stamens not exceeding the petals. Legumes 1-2, glabrous, ovate, oblong, ending in an incurred mucron. Pedicles of flowers very long. Flowers yellow.

Diplogyne-flowered Brasiletto. Tree.

9 C. minosoides (Lam. dict. 1. p. 462. ill. t. 335. f. 2.) prickly; leaves with 6-12 pairs of pinnae, each pinna bearing 8-12 pairs of oval-oblong, obtuse leaflets; racemes simple; flowers usually digynous. ½. S. Native of the East Indies. Racemes dioecious. Flowers yellow. Legume oval, few-seeded, woolly.

Minosa-like Brasiletto. Clt. 1806. Shrub 6 to 8 feet.

10 C. cucullata (Roxb. hort. beng. p. 32.) prickly; prickles hooked; leaves with 4-5 pairs of pinnae, each pinna bearing 4-5 pairs of elliptic, acuminate, glabrous leaflets; racemes forming terminal panicles; flowers crowded; upper segment of the calyx long, cucullate, and arched. ½. S. Native of the East Indies. Flowers yellow. Legume oval, few-seeded, woolly.

Cucullata-sepalled Brasiletto. Shrub cl.

11 C. tortosa (Roxb. hort. beng. p. 32.) prickly; prickles hooked; young branches and rachis clothed with rusty down; leaves with about 15 pairs of pinnae, each pinna bearing 18-20 pairs of sessile, linear, oblong, retuse leaflets, which are glaucous beneath; flowers racemose; stamens length of petals. ½. S. Native of Sumatra. Flowers yellow.

12 C. microphylla (Martius, miss. in herb. Lamb.) unarmed; leaves with 8-10 pairs of pinnae, each pinna bearing 8-10 pairs of small, oblong-roundish leaflets, which are pubescent and pale beneath, but shining above; rachis of leaves beset with pedicellate glands and pubescence; racemes terminal, simple; stamens straight, acuminate, 3-4-seeded. ½. S. Native of Brazil, in the desert of Bahia. Flowers yellow. Legumes unknown.

Small-leafletted Brasiletto. Shrub cl.

13 C. desertorum (Martius, miss. in herb. Lamb.) unarmed; leaves usually with 1-2 pairs of pinnae, each pinna bearing usually 7 broad, alternate, ovate-elliptic, glabrous leaflets, which are sessile and oblique at the base; racemes crowded with flowers, terminal, aggregate. ½. S. Native of Brazil, in the desert of Bahia. Flowers yellow. Legumes unknown.

Desert Brasiletto. Tree.

14 C. hiuga (Swartz, obs. 166.) prickly, but glabrous in every part; leaves with 2 pairs of pinnae, each pinna bearing 2 pairs of obolate leaflets; flowers panicked, on short pedicles. ½. S. Native of Jamaica. Perníoní bignja and Cesaipinia veschiária, Lin. spec. 545.—Sloan. hist. 2. t. 181. f. 2, 3. Flowers yellow. Stamens equal in length to the corolla. Legume oval-oblong, few-seeded, black, furrowed. All parts of the tree have a strong balsamic scent when bruised. The leaflets are broad.

Two-paired-leafed Brasiletto. Clt. 1770. Tree 15 to 20 ft.

15 C. bahamensis (Lam. dict. 1. p. 461.) prickly, but glabrous in every part; leaves with 8 pairs of pinnae, each pinna bearing 3 pairs of obvate, emarginate leaflets; flowers panicked. ½. S. Native of the Bahama Islands. Catesb. car. 2. t. 51. Flowers white. Legume somewhat stipitate, linear, acute. The value of this wood for dyeing has occasioned a scarcity of it in the Bahama islands.

Bahama Brasiletto. Tree.

16 C. crista (Lin. spec. 544.) prickly, but glabrous in every part; leaves with 1-5 pairs of pinnae; leaflets obvate, nearly obolate; racemes simple; pedicles three the length of the flowers; petals shorter than the calyx. ½. S. Native of Jamaica.

maic. Plum gen. 28. t. 9. Flowers yellow. Legume linear, somewhat stipitate, acute, glabrous, 7-8-seeded. Leaflets broad. Great quantities of the wood are sent yearly from the West Indies to England for dyeing, under the name of Brazil-wood.

Crested Brasiletto. Clt? Tree 15 to 20 feet.

17 C. glandulosa (Bert. in herb. Balb. D. C. prod. 2. p. 482.) prickly; leaves with 3 pairs of pinnae, each pinna bearing 5 pairs of oval, glabrous leaflets, with glandular margins; racemes simple, and are as well as the calyces pubescent. ½. S. Native of St. Domingo. Legume sessile, flat, oblong-linear, apiculate by the style, beset with pubescence, and a few broad glands, which are only seen under a lens. C. Bertelli, Spreng. in herb. Balb.

Glandular Brasiletto. Tree.

18 C. australis (H. B. et Kunth, nov. gen. amer. 6. p. 326.) unarmed, quite glabrous; leaves with 5-4 pairs of pinnae, each pinna bearing 4-5 pairs of oblong-elliptic leaflets, which are rounded at both ends and coriaceous; racemes numerous, crowded at the tops of the branches; stamens hardly exceeding the corolla in length; legumes oblong, rather torulose. ½. S. Native of Peru, between Caxamarca and Magdalena. Flowers yellow.

Glabrous Brasiletto. Tree.

19 C. cacaalco (Hum. et Bonpl. pl. equin. 2. t. 137.) prickly, glabrous; leaves with 4-5 pairs of pinnae, each pinna bearing 3-4 pairs of obovate-roundish, emarginate, membranous, shining leaflets; racemes terminal, simple; rachis and pedicels rather hairy; stamens hardly exceeding the corolla; legumes torulose. ½. S. Native of Mexico, between Chilpancingo and Zumpango. H. B. et Kunth, nov. gen. amer. 6. p. 328. Cacalco is the vernacular name of the tree.

Cacalco Brasiletto. Clt. 1824. Tree 10 to 20 feet.

20 C. patau (Ruiz, et Pav. fl. per. 4. t. 375.) unarmed; leaves impari-bipinnate, with 5-7 pairs of pinnae, each pinna bearing 6-7 pairs of small, obuse leaflets; racemes lateral; filaments filiform, hairy; legumes straight, mucronate. ½. S. Native of Peru. Flowers small.

Papai Brasiletto. Shrub.

21 C. praecox (Ruiz, et Pav. fl. per. 4. t. 376.) leaves abruptly bipinnate; petiole ending in a spine; pinna 3 pairs, each pinna bearing 5-7 pairs of small, emarginate leaflets; stipular spines strong, conical; legumes straight. ½. S. Native of Peru.

Early Brasiletto. Tree.

22 C. exostema (Moc. et Sesse, fl. mex. icon. indec. D. C. prod. 2. p. 483.) unarmed, glabrous; leaves with 5-4 pairs of pinnae, each pinna bearing 3-4 pairs of ovate, obtuse leaflets; racemes terminal, simple; stamens twice the length of the corolla. ½. S. Native of Mexico. Corolla yellow. Calyx and stamens reddish. This species comes very near C. Cacaalco.

Exserted-crowned Brasiletto. Tree 20 feet.

23 C. fulguraria (Unarmed; petioles, calyx, and rachis of flowers clothed with rusty down; leaves with numerous pairs of pinnae and leaflets; leaflets elliptic-lanceolate, obtuse at the base and mucronate at the apex, pubescent beneath, with revolute edges; calyx rusty; racemes forming a terminal panicle. ½. S. Native of Brazil, in the province of Bahia, Martius. (v. s. in herb. Lamb.)

Very-fair Brasiletto. Tree.

24 C. selloii (Unarmed; young branches and rachis of leaves beset with glandular bristles; pedicels, calyx, and under side of leaves rusty; leaves with numerous pairs of pinnae and leaflets; leaflets lanceolate, mucronate, shining above; racemes forming a terminal panicle. ½. S. Native of Brazil. Sello. Flowers yellow. (v. s. in herb. Lamb.)

Sello’s Brasiletto. Tree.
Sect. IV. Libidiba (Libidibi is the name of the legume at Curacoa). Legume oblong, spongy, inserted laterally, concrete between the seeds inside, and somewhat many-celled.

26 C. flourea (Wild. spec. 2. p. 532.) unarmed, glabrous; leaves with 6-7 pairs of pinnae, each pinna bearing 15-20 pairs of linear, obtuse leaflets; racemes panicled; pedicels shorter than the flowers. S. Native of Curacoa, Carthagena, St. Domingo, in salt marshes by the sea-side. Ponciana coriaria, Jacq. amer. 129. t. 175. f. 36. C. coriaria, Kunth, min. t. 45. C. Thomea, Spreng. in herb. Bull. The legumes are called Libidibi, and are used in tanning leather when ripe by the Spaniards and natives. The flowers are small and yellow.

Hides Brasileto. Tree 15 to 20 feet.

26 C. duavia (Spreng. syst. 2. p. 343.) leaves with 16 pairs of pinnae, each pinna bearing 2-4 pairs of oblong, oblique, mucronate leaflets, which are discoloured beneath; racemes panicled, and as well as the calyces clothed with rusty down; legume 1-seeded, S. Native of Brazil. Sello.

Doubtful Brasileto. Tree.

† Species not sufficiently known.

27 C. lebbeckoides (D. C. prod. 2. p. 483.) nearly unarmed, glabrous; leaves abruptly bipinnate, with 3-4 pairs of pinnae, each pinna bearing 6-7 pairs of ovate, obtuse, unequal leaflets; legumes compressed, flat, elongated, linear, membranous. G. Native of China. Protuberances under the leaves almost spinose. Legume almost like that of Ascidia Lébbeck. Umbilical funicle straight. Flowers unknown.

Lebbek-like Brasileto. Tree.

29 C. ? echinata (Lam. dict. 1. p. 461.) prickly; leaves bipinnate; leaflets ovate, obtuse; legumes echinata. S. Native of Brazil, where the wood is used for dyeing. Guianalana echinata, Spreng. syst. 2. p. 327. Perhaps a true species of Guianalana. Flowers yellow. This species is said to produce the best Brazil-wood or Brasileto.

Echonated-podded Brasileto. Tree.

30 C. ? cassioides (Willd. enum. 444.) stipulas spinose; leaves with 2-3 pairs of pinnae, each pinna bearing 6-7 pairs of oblong, retuse leaflets; petioles rather pilose. S. Native of South America. Ponciana cassioides, Poir. suppl. 4. p. 448. Flowers and legumes unknown.

31 C. ? mucronata (Willd. enum. 444.) prickly; leaves bipinnate, with 3 pairs of pinnae, each pinna bearing 7 pairs of oblong, obtuse, mucronate, glabrous leaflets. S. Native of Brazil. Ponciana mucronata, Poir. l.c. Flowers and legumes unknown.

Mucronate-leafletted Brasileto. Shrub.

32 C. ? flourea (D. C. prod. 2. p. 483.) unarmed; leaves impari-pinnate, with 5-8 pairs of pinnae, which are abruptly pinnate; bearing 10-12 pairs of unequal, rhomboid-ovate, glabrous leaflets; gland axillary, ovate; racemes terminal; pedicels and calyces clothed with robus velvet down. S. Native of Brazil. Cubaé flourea, Leandr. sac. ined. According to the testimony of Leandr, water flows from the young branches, and falls from them in drops like rain. The superior segment of the calyx is longer than the rest. The vexillum is shorter than the other petals. Stamens with the filaments villous at the base. Legume 1-celled, few-seeded. All ex Leandr.

Rainy Brasileto. Tree 40 to 60 feet.

33 C. procera (Poppig. ex Spreng. syst. 2. p. 343.) leaves simply pinnate, with many pairs of oblong-linear, obtuse, glabrous leaflets; racemes few-flowered; stamens about equal in length to the corolla. S. Native of Cuba. Flowers yellow. Tall Brasileto. Clt. 1824. Tree.

† Species only known by name from Roxburgh's Hortus Bengalesensis, p. 32, and p. 90.

1 C. enneaspyllia, Roxb. 2 C. oleosperma, Roxb. 3 C. Chinensis, Roxb. 4 C. leccera, Roxb. 5 C. recurvata, Roxb. 6 C. paniculata, Roxb. 7 C. Sumatranus, Roxb. 8 C. polyphylly, Roxb.

Cult. Cesalpinia is a genus of fine flowering trees and shrubs, but in our collections they are never allowed to grow to a size large enough for flowering, in consequence of their being prickly, and are not admired on that account. A mixture of loam and peat suits them best. Cuttings are difficult to root, but sometimes will succeed if taken off from the mother plant in a growing stage and planted in sand, with a hand-glass placed over them in a moist heat.

—Poinciana, Neck. elem. 1282.

Lix. syst. Decidaria, Monogynia. Calyx cup-shaped at the base, permanent, 5-cleft, lower segment arched. Petals 5, stipitate, upper one deformed. Stamens 10, very long, all fertile, with the filaments hairy at the base. Style very long. Legume flat, compressed, 2-valved, somewhat many-celled from the seeds being separated by a kind of cellular spongine substance. Seeds obovate, compressed, with the endupera gelatinous when placed in water. Embryo with flat cotyledons, and an oval plumule.—Very elegant prickly or unarmed shrubs and trees, with abruptly-bipinnate leaves, and corymbose panicles of showy flowers, on long bracteate pedicels.

1 P. pulcherrima (Lin. spec. 554.) prickly; leaflets obovate; calyx glabrous; petals on long stipes, fringed. S. Native of the East Indies and tropical Africa, from whence it has migrated to South America and the West India Islands. Reich. gart. mag. t. 93. D. C. legum. mem. xi. t. 23. f. 111. Sims, bot. mag. 9. —Merian. sur. t. 45.—Rhed. mal. 6. t. 1.—Rumph. amb. 4. t. 20. Cesalpinia pulcherrima, Swartz, obs. 166. To this species the P. pulcherrima, P. alata, and P. trijuga of Burm. ind. p. 333. appertain. The Barbadoes flower-fence is planted in the West Indies as hedges to divide the lands, whence the English name. It is called Spanish carnation in some of our West Indian colonies. Sir Hans Sloane calls it wild-semma, and Dr. Browne calls it Barbadoes-pride. Its French name is Poinciane or fleurs de Paradis. Ligon says the seeds were first carried to Barbadoes from the Cape de Verd Islands. The flowers are beautifully variegated with a deep red or deep orange colour, yellow, and some spots of green; they have a very agreeable odour, sometimes the flowers are deep orange, and sometimes yellow, without any admixture. All parts of the plant are thought to be very powerful amemegoses, and are frequently used for that purpose among the negroes.

2 P. instinctus (Kunth, min. t. 44. H. B. et Kunth, nov. amer. 6. p. 333.) prickly; calyx glabrous; petals entire, standing on very short stipes. S. Native of South America. Flowers copper-coloured, painted with purple veins.

3 P. elata (Lin. spec. 554.) unarmed; leaflets linear, obtuse,
end in a small crenum; calyx clothed with velvety tomentum; petals fringed, on long stipes. ... S. Native of the East Indies and Abyssinia. Cassinia elata, Swartz, obs. 106. Leaves with 5-6 pairs of pinnae, each pinna bearing 18-20 pairs of trapezoid-oblong, retuse leaflets; calyx and legumes woolly; petals fringed, stipitate. ... S. Native of the East Indies. Cassinia inermis, Roxb. hort. p. 90. but not of Lin. Flowers with yellow petals, and purple filaments.

Roxburgh's Flower-fence. Tree.

5 P. compressa (Sesse et Moc. in herb. Lamb.) unarmed; leaves with 3 pairs of pinnae, each pinna bearing 4-5 pairs of elliptic, obtuse, emarginate, glaucous leaflets; petals entire, about twice the length of the calyx, on short stipes; stamens much exserted. ... S. Native of Mexico and Peru. Racemes terminal, simple. Pedicels an inch long. Flowers with yellow petals and purplish stamens.

Compressed Flower-fence. Shrub 8 to 10 feet.

6 P. hyspida; branches beset with stiff curved bristles; leaves with 10 pairs of pinnae, each pinna bearing 10-11 pairs of obovate emarginate leaflets, with a bristle at the notch at the end; petals crenated, on short stipes. ... S. Native of Mexico, Pavon. Racemes terminal, few-flowered. Pedicels 2 inches long. Flowers apparently yellow. (v. s. in herb. Lamb.)

Hyspida Flower-fence. Shrub 6 to 10 feet.

7 P. Gilliesii (Hook. bot. misc. 1. p. 129, t. 34.) unarmed; leaves bipinnate; leaflets oblong; petals glandular, dentilulate, by-ciliolate at the apex; legume acuminiform, glandular, 1-celled, dry. ... S. Native of Chili, about Mendoza. Flowers sulphur-coloured; they have a sickly disagreeable smell, and are considered by the common people in Chili to be injurious to the sight; hence the vernacular name mal de ojos. The shrub will not grow unless in irrigated places.

Gillies's Flower-fence. Shrub 4 to 6 feet.

Cult. Beautiful shrubs, with very showy flowers, and are therefore worth cultivating in every collection of stone plants. They require to be kept in a strong heat to have them to flower freely. A mixture of loam and peat is the best soil for them. Young cuttings may be rooted if planted in a pot of sand, with a hand-glass placed over them, in a moist heat; but the plants are usually raised from seeds received from abroad.

CCLI. MEZONEURUM (from }\textit{mezo}, meso, the middle, and }\textit{neuron}, neuron, a nerve; in reference to the seminiferous suture of the pod being expanded into a wing). Desf. mem. mus. 4. p. 245. D. C. prod. 2. p. 484.

Lin. syst. Decandria, Monogyneia. Calyx of 5 sepals, which are concrete at the base; the lower one arched, involving the others, which are orbicular before expansion. Petals 5, unguiculate, upper one the smallest. Stamens 10, declinate, villous at the base. Style incurved. Legume foliaceous, flat, ovate-oblong, indiseiscent, 1-celled, many-seeded, having the seminiferous suture expanded into a wing.—Trees, with abruptly and oppositely bipinnate leaves, having two hooked prickles at the base of each pair of pinnae. Racemes simple, bracteless. This genus is nearly allied to }\textit{Cassania}, but it is distinguished from it by the winged legume.

1 M. glabrum (Desf. l. c. t. 10.) leaves glabrous; legume very flat. ... S. Native of the Island of Timor. Glabrous Mezoneurum. Tree 20 feet.

2 M. pubescens (Desf. l. c. t. 11.) leaves pubescent; legume inflated and reticulated in the middle part. ... S. Native of Java.

Pubescent Mezoneurum. Tree 20 feet.

Cult. See }\textit{Poinciana} for culture and propagation.

Lin. syst. Decandria, Monogyneia. Sepals 5, joined into a campanulate crenulated calyx. Petals 6-10, unequal, disposed in a somewhat papilionaceous manner. Stamens 10, distinct, cohering together beneath the middle by a beard. Ovary somewhat pedicellate. Style filiform. Stigma dilated. Legume sarnaroid, ending in an oblong wing. This genus is not sufficiently known.

1 R. hexapetala (Roth, l. c.) corolla 6-petalled; leaves abruptly bipinnate, and arc, as well as the stems, prickly. ... S. Native of the East Indies. Cassinia ligulata, Heyne ex Roth. Flowers about the size of those of }\textit{E. reum}.

2 R. decapetala (Roth, l. c.) corolla 10-petalled; leaves abruptly and simply pinnate; stem prickly. ... S. Native of the East Indies. Cassinia, spec. nov. Heyne ex Roth. Legume unknown.

Ten-petalled Reichardia. Tree.

Cult. See }\textit{Poinciana} for culture and propagation.

CCLIII. LABICHEA (in memory of M. Labiche, an officer of the French ship Uranie, who accompanied Freycinet in his voyage round the world; he died on his passage to the Moluccas). Gaud. in Freycinet, voy. part. bot. p. 486. t. 16.

1 L. cassoides (Gaud. l. c.) 1. G. Native of New Holland, on the western coast, at a place called in French Baie des chiens marins, and in English Shark's Bay. Cassia-like Labichea. Shrub 3 to 4 feet.

Cult. This shrub will grow well in a mixture of loam and peat, and cuttings will probably root if planted in a pot of sand, with a bell-glass placed over them.

Lin. syst. Decandria, Monogyneia. Sepals 5, joined at the base, permanent. Petals 5, unguiculate, spreading, glandular at the base, the superior one the broadest. Stamens 10, with the filaments beset with glandular pilis, one of which is usually casttrated. Stigma clavate. Legume linear, compressed, dry, many-seeded.—Herbs or subshrubs, with bipinnate leaves,
the pinnae sometimes abruptly, sometimes impari-pinnate, and with a pedicellate gland at the base of the petiole on one or both sides. Racemes opposite the leaves. Flowers yellow.

1 H. falcaria (Cav. icon. 4. t. 592.) stems decumbent, hardly suffrutescent; leaves with 3-6 pairs of pinnae, with an odd one, each pinna bearing 3-6 pairs of oval-oblong, glaucous leaflets; legumes falciform. 2. S. Native of Chili, on the mountains about Mendosa, and of Peru. Lárrea glástica, Ort. dec. p. 15. Root creeping, tuberous. Flowers yellow. Sickle-podded Hoffmanseggia. Pl. July, Aug. C1t. 1806. Pl. decumbent.

2 H. trifoliata (Cav. icon. 4. t. 393. f. 1.) stems almost wanting; leaves with 3 pinnae; leaflets ovate, hairy from tomentum; legumes straight, villous. 2. S. Native of South America, near Port Desire. Flowers yellow. Trifoliata Hoffmanseggia. Pl. ½ foot.

3 H. prostrata (Lag. in litt. ex D. C. prod. 2. p. 485.) stems almost wanting; leaves with 2 pairs of pinnae, without an odd one; leaflets ovate-oblong, rather villous; legumes straight, pubescent. 2. S. Native of Peru, about Lima. Flowers yellow. Prostrate Hoffmanseggia. Pl. ¼ foot, prostrate.

4 H. pitava; stems wanting; leaves radical, with 3 pairs of pinnae, each pinna bearing numerous, crowded, imbricate leaflets; racemes radical, simple, few-flowered. 2. S. Native of Peru. Casalphia piliosa, Ruiz et Pav. in herb. Lomb. Petioles and peduncles very pilose. Root tapering. Flowers yellow. Pilose Hoffmanseggia. Pl. ½ foot.

Cult. The species of this genus are small herbaceous plants. They grow best in a mixture of peat and loam, and are increased by seeds, which will ripen in this country.

CCLV. MELANOSTICTA (from μελας, melas, black, and στυῖτος, stytos, marked; in reference to the leaves and calyces being beset with black glands, which have the appearance of black dots or marks). D. C. legum. mem. xii. prod. 2. p. 485.

Lin. syst. Decandria, Monogynia. Sepals 5, nearly equal, joined together at the base into a short permanent tube, but free at the apex, and deciduous. Petals 5, nearly equal, elliptic, attenuated at the base, length of the calyx. Stamens 10, distinct; filaments rather villous at the base from branched hairs. Legume compressed, oblong to ovate, 4-valvate.—A humble shrub, native of the Cape of Good Hope, with somewhat fascicled roots, some of which are cylindrical, and others thickened into tubers. Leaves bipinnate, with 2 pairs of pinnae, each pinna bearing 6-8 pairs of leaflets, with the terminal leaflet elongated. Stipulas pinnatifid. Racemes elongated. This genus is very nearly related to Pomaria, but the fruit is not sufficiently known.

Lin. syst. Decandria, Monogynia. Sepals 5, joined at the base into a short tube, 5-clawed at the apex (f. 56. a.), the segments deciduous. Petals 5 (f. 56. b.), on short claws, the uppermost one concave, and shorter than the rest. Stamens 10, free (f. 56. c.), deciliate, hairy at the base (f. 56. c). Style filiform, crowned by a capitulate stigma. Legume oblong-compressed (f. 56. d.), 2-valved, 1-seeded (f. 56. e.). Seeds ovate.—A shrub, with abruptly bipinnate leaves, pinnatifid stipulas, and axillary racemes of flowers. Branches, calyces, and corollas beset with glands. This genus is very nearly allied to Hoffmanseggia.

1 P. glandulosa (Cav. l. c.) G. Native of New Spain, near Queretaro, and of North America, on the banks of the Canadian river. Flowers yellow. Glandular Pomaria. Shrub 6 feet.

Cult. See Hoffmanseggia for culture and propagation.

CCLVII. HEMATOXYLON (from αἷμα, haima, blood, and ἔξωλον, xylon, wood; logwood is well known for its red colour). Lin. gen. no. 325. Lam. ill. t. 316. D. C. prod. 2. p. 485.

Lin. syst. Decandria, Monogynia. Calyx 5-toothed, the tube permanent, but the lobes are deciduous, oblong, and obtuse. Petals 5, hardly longer than the calyx. Stamens 10; filaments pilose at the base; anthers glandless. Style capillary. Legume compressed, flat, lanceolatet, acuminate at both ends, 1-celled, 2-seeded, with the sutures indistinct, but the valves burst longitudinally to relieve the seeds. Seeds oblong to subglobose. Cotyledons 2-lobed.—A tree, with unarmed branches, or with spines under the leaves. Flowers racemose, hermaphrodite.

1 H. Campechianum (Lin. spec. 549.) G. Native of the Bay of Campeachy at Honduras, and other parts of the Spanish West Indies, but now cultivated in Jamaica and other West India Islands, &c. Plenched. icon. t. 529. Woodyv. med. bot. p. 48. t. 17. Cat. car. 3. t. 66. Sloan. hist. 2. t. 10. f. 1-4. Leaves abruptly-pinnate, in fascicles; leaflets obovate, obcordate. Flowers yellow. Logwood is generally crooked, and seldom thicker than a man’s thigh. It was first cultivated in Jamaica in 1715 from seeds brought from the Bay of Campeachy. It makes impenetrable and beautiful fences. Both the bark and wood are gentle subastringents, but the last excels, and adds a sweetness to its virtue, which makes it more agreeable to the palate. The wood is principally used in dyeing.

Campeachy or Common Logwood. Cult. 320 ft. Cult. Logwood grows well in a mixture of sand and peat; and cuttings will root if planted in a pot of sand, with a handglass placed over them in heat; but the plants are generally raised from seeds sent or brought from the West Indies.

Lin. syst. Decandria, Monogynia. Sepals 5, equal, spreading, reflexed. Petals 5, ovate, flat, upper one roundish, on a long claw. Stamens 10, rather delicate, a little longer than the claw of the superior petal. Style filiform, rather ascending. Legume linear-oblong, acuminate at both ends, torose at the seeds, but compressed between them. Seeds oblong, with the endopleura tumid, and with a linear hyllum. Embryo with oblong cotyledons, and an ovate radicle.—A shrub, furnished with solitary or tern straight prickles or spines. Leaves pinnate; leaflets usually deciduous or abortive. Petioles linear, very long, winged. Racemes loose. Flowers beautiful yellow.

1 P. aculeata (Lin. hort. cliff. 157. t. 13.) G. Native of 8
South America and the West India Islands, and now cultivated in most parts of the world within the tropics. Jacq. amer. 121. t. 90. pict. 63, t. 119. D. C. legum. mem. x. t. 21. f. 112. genm. Flowers yellow, sweet-scented, disposed in pendulous racemes. In Jamaica the shrub is called Jerusalem-thorn, and the French in the West Indies call it Genet épineux.

*Prickly* Parkinsonia. Clt. 1739. Shrub 5 to 10 feet.

*Cult.* This is a most elegant shrub in the West Indies when in flower, but in our stoves it is seldom preserved throughout the winter, although seeds of it are received annually from the West Indies, and great numbers of plants raised yearly.

**CCLIX. C'ADIA (Kadi is the Arabic name of the tree).** Forsk. descr. p. 90. D. C. prod. 2. p. 486.

Lin. syst. Decadria, Monogynia. Calyx campanulate, 5-cleft, glandular on the inside of the tube at the base. Petals 5, equal, inserted in the calyx. Stamens 10, with the filaments gibbously geniculated at the base; anthers glandless. Ovary pedicellate. Stigma sessile, acute. Legume linear, many seeded, 2-valved, on a short stipe.—An unarmed shrub, with impari-pinnate leaves, linear, opposite or alternate leaflets, and pedicellate solitary flowers.

Variable Cadia. Clt. 1777. Shrub 5 to 6 feet.

*Cult.* See Ceratonia for culture and propagation.

**CCLX. ZUCCAGNIA (in honour of Attiuus Zuccagni, M.D., once director of the botanic garden at Florence).** Cav. icon. 5. p. 2. t. 403. but not of Thunb. D. C. prod. 2. p. 486.

Lin. syst. Decadria, Monogynia. Calyx 5-lobed, with a turbinate tube, and oblong obuse lobes, the lower one rather the longest. Petals 5, ovate, the upper one broader and concave. Stamens 10, nearly equal, plicate at the base. Style filiform. Stigma funnel-shaped. Legume nearly ovate, compressed, 1-celled, 2-valved, 1-seeded, hairy. Seed fixed to the top of the stature.—Clammy shrubs, with abruptly pinnate leaves, and racemes of saffron-coloured flowers.

1 Z. *Punctata* (Cav. icon. 5. p. 2. t. 403.) clammy; leaves abruptly pinnate; racemes terminal. igt. G. Native of Chili, on the mountains. Flowers saffron-coloured.

Dotted Zuccagna. Shrub 4 to 5 feet.

2 Z. ? *Angulata* (Hook. in Beec. voy. p. 22.) stems glabrous, and branches angular; leaves conjugately-pinnate and sub-bipinnate; leaflets minute, ovate-oblong; racemes terminal, clothed with glandular pubescence. igt. G. Native of Chili, about Coquimbo.

Angular-branched Zuccagna. Shrub. 

*Cult.* See Ceratonia for culture and propagation.

**CCLXI. CERATONIA (from *esparw*, of Theophrastus, from *esparo*, keratos, a horn or pod; shape of pods).** Lin. gen. 1167. Lam. ill. t. 859. Siliqua, Tourn. inst. t. 344.

Lin. syst. Polypoónia, Diec'ia. Flowers polygamous or dioecious. Calyx 5-parted. Petals wanting. Stamens 5. Stigma sessile, orbicular. Legume linear, coriaceous, indehiscent, many seeded, many celled from the seeds being intercepted by a kind of fleshy substance, and with the valves thick and pulp on the inside.—Trees, with thick trunks, ever-green abruptly-pinnate, coriaceous shining leaves, and racemes of small red flowers. Legumes containing edible pulp.

1 C. *Siliqua* (Lin. spec. 1513.) unarmed; leaflets oval, ob-

tuse, flat, coriaceous, shining, dark green. igt. G. Native of the south of Europe, Mauritania, and the Levant. Cav. icon. f. 113. Andr. bot. rep. 567. D. C. legum. xi. t. 23. f. 114. germ. Tusano in act. nap. 1787. p. 248. t. 18. f. 2.—Blackw. herb. t. 209. The carob-tree is much cultivated in the south of Europe for the sake of the pods, the pulp of which is eaten; they are 4 inches and more in length, of a dusky ferruginous colour, as well as the seeds. Ignorance of eastern manners and natural history induced some persons to fancy that the locusts which John the Baptist fed on were the tender shoots of this plant, and that the wild honey was the pulp in the pods of the carob, whence it has the name of St. John's bread; there is better reason to suppose that the shells of the carob-pod might be the husks which the prodigal son desired to partake of with the swine.

Chili Ceratonia. Tree 20 to 30 feet.

*Cult.* Loam and sand is a good mixture for the carob-tree, and ripened cuttings will strike root if planted in sand, with a hand-glass placed over them.

**CCLXII. CASTANOSPERMUM (from *esparw*, kastanon, a chestnut, and *σμέρα, sperma*, a seed; in reference to the seeds, which taste like chestnuts).** Cunningham. in Hook. bot. misc. 1. p. 241. t. 51 and t. 52.

Lin. syst. Decadria, Monogynia. Calyx coloured, somewhat bilabiately, with a short tube, upper lip bifid, lower one triform. Petals 5, papilionaceous, with the wings and keel nearly equal in length. Stamens 10, free. Ovary on a long stipe. Legume stipitate, large, oblong-cylindrical, 2-valved, usually 4-seeded; valves coriaceous, spongy inside.—A large tree, with impari-pinnate leaves, and larger rather compound racemes of flowers. Leaflets broad, smooth, and entire.

1 C. *Australe* (Cunningh. 1. c.) igt. G. Native of New Holland, in Morton Bay. The legumes are produced from 2 years old wood, containing usually 4 seeds as large as Spanish chestnuts, which are eaten by the natives about Morton Bay on all occasions, and they have when roasted somewhat of the flavour of Spanish chestnuts, and even Europeans who have subsisted on them for 2 or 3 days together have found no bad effects from them when roasted.

Southern Morton Bay Chestnut. Clt. 1828. Tree 40 to 50 ft.

*Cult.* For culture and propagation see Ceratonia.

Lin. syst. Octo-Decadria, Monogynia. Sepals 4, but usually 5, ovate, equal, hardly cohering at the base. Corolla none. Stamens 8, but usually 10, free, inserted in the bottom of the calyx, or perhaps in the torus, the 5 which alternate with the sepals are a little larger than the rest. Anthers ovate, somewhat apiculated. Style short. Stigma peltate. Legume lanceolate, 1-celled, 1-seeded, 2-valved, deciduous at the apex. Seed hanging from the apex of the legume, constricted, membranous on the posterior side.—Smooth Indian trees, with abruptly-pinnate leaves, bearing 1 or many pairs of leaflets. Stipulas small, caducous. Pannicles terminal and axillary. Flowers of a dirty yellow colour.

1 H. *bina* (Roxb. cor. 3. t. 203.) leaves with 1 pair of leaflets; petiole ending in a bristle; leaflets opposite, obliquely

3 x 2
ovate, semi-cordate, 3-nerved. \( \gamma \) S. Native of Coromandel, on the mountains. Flowers dirty yellow. The wood is excellent.

*Binate-leaved Hardwickia.* Cilt. 1820. Tree 40 feet.

2 H. *PINNATA* (Roxb. hort. beng. p. 33.) leaves with 3 pairs of alternate, ovate-lanceolate, acuminate leaflets, which are 1-nerved in the middle, the ultimate one almost terminal. \( \gamma \). S. Native of the East Indies. Flowers dirty yellow.

*Pinnate-leaved Hardwickia.* Cilt. 1818. Tree 40 to 50 feet.

Cult. The species of *Hardwickia* grow freely in a light loamy soil, and large cuttings root readily if planted in sand, with a hand-glass placed over them, in heat.

**CCLXIV. JONESIA** (in honour of the celebrated Sir William Jones, whose knowledge of botany, independent of his other incomparable qualifications, entitles him to this mark of distinction). Roxb. in asiat. res. 4. p. 355. D. C. prod. 2. p. 487.

—Saraca, Burm. ind.

*LIN. SYST.* *HEPTO-OCTANDRIA, MONOGYNIA.* Calyx with 2 oate-roundish opposite bracteae at the base, coloured and funnel-shaped, with a long closed fleshy tube, and a 4-lobed spreading limb, the lobes ovate. Petals none. Stamens 8 (sometimes 7-9), rising from the throat of the calyx, much exerted beyond the calyx, free, or sometimes connected at the base. Ovary stipitate, with the lower part of the stipe adnate to the tube of the calyx, but free in the upper part. Style filiform. Legume 4-seeded, compressed, flat, acinaciform, with callous sutures.

—Asiatic unarmed trees, with abruptly-pinnate leaves, and somewhat fasciculate racemes of flowers. The more recent name of Roxburgh has been preferred to the more ancient one of Burman, and Lineaeas Saraca, to prevent its being confounded with Saraca

2 J. *SEA-ASOECA* (Roxb. hort. beng. p. 26.) stem climbing.

—S. S. Native of Sumatra. The rest unknown.

Cult. For culture and propagation, see *Hardwickia*.

**CCLXV. TACHIGALIA** (Tassi or Tachigali is the name of *T. paniculata* in Guiana). Aubl. guian. 1. p. 372. exclusive of the fruit. Lam. ill. 329. D. C. prod. 2. p. 487.—Cuba'a, Schreb. gen. no. 702.—Valentinia, Neck. elem. no. 1283. but not of Swartz.—Tassia, Rich. med.—Tachia, Pers. ench. no. 1077. but not of Aublet.

*LIN. SYST.* *DECANDRIA, MONOGYNIA.* Sepals 5, joined together into an obconical striated tube, with the free parts rather unequal and obsolete. Pedals 5, inserted in the throat of the calyx, unequal. Stamens 10, exerted, with the filaments villous at the base, the 3 shortest one crenate. Ovary somewhat stipitate. Style filiform, acute. Legume compressed, flat, membranous, indehiscent, 1-seeded, oblong, nearly as in *Dalbergia*.

——Trees, with abruptly pinnate leaves, with the petioles as well as the peduncles trigonal, and pinnacles of yellow flowers, which are bracteate, and crowded in a spike manner along the branches of the panicle.

1 T. *PANCULA* (Aubl. l. c. t. 143. f. 1.) leaves with 6 pairs of opposite, ovate-oblong, acuminate leaflets. \( \gamma \). S. Native of Guiana, on the banks of rivers, where it is called Tassi or Tachigali.

*Pinnate-flowered Tachigalia.* Tree 60 feet.

2 T. *TRIGONA* (Aubl. l. c. f. 2.) leaves with 6 alternate leaflets.

\( \gamma \). S. Native along with the preceding, of which it is perhaps only a variety. Cuba'a a trigona, Willd.

*Trigonal-peduncled Tachigalia.* Tree 60 feet.

4 T. *EMARGINATA*; leaves with usually 4 pairs of elliptic, emarginate, coriaceous leaflets, which are discoloured beneath; racemes compound, pubescent. \( \gamma \). S. Native of Brazil. Sello. Cuba'a emarginata, Spreng. syyst. 2. p. 345.

*Emarginate-leaved Tachigalia.* Tree.

Cult. For culture and propagation see *Hardwickia*, p. 436.

**CCLXVI. BARYXYLUM** (from *barys*, barys, heavy, and *xylos*, xylon, wood; the wood of the tree is very heavy). Lour. chtch. p. 266. D. C. prod. 2. p. 487.

*LIN. SYST.* *DECLANDRIA, MONOGYNIA.* Calyx of 5, ovate-oblong, reflexed, equal, deciduous sepals, which are hardly concretes at the base. Stamens 5, filiform, nearly equal, on short claws. Stamens 10, free, unequal, hypogynous? Anthers 4-celled. Style filiform. Legume thick, obtuse, nearly terete, a little curved, many-seeded. Seeds roundish, angular.—A tree, with brownish-red, heavy wood, abruptly pinnate, glabrous leaves, with few pairs of leaflets, and loose racemes of yellow flowers.

1 B. *REXUM* (Lour. l. e.) leaflets oblong, obtuse. \( \gamma \). S. Native of Cochín-china, on the mountains. Wood iron-coloured, very heavy and very hard.

*Brown-wooded Baryxylum.* Tree 50 feet.

Cult. For culture and propagation, see *Ceratonia*, p. 435.

*LIN. SYST.* *DECLANDRIA, MONOGYNIA.* Calyx of 5 sepals, which are concrete at the base. Petals 5, nearly equal. Stamens 10, free, glabrous, 9 of which are fertile and shorter than the claws of the petals, the other one 3-times longer than the rest, sterile, and bearing a pilose anther, which is dissimilar to those on the 9 fertile filaments. Style 1. Legume linear-oblong.—A tree, with simply or doubly pinnate leaves and yellow flowers. This genus is allied to *Cäsia* and *Tachigalia*, according to the author.

1 M. *FLORIBUNDA* (Schrad. l. e.). \( \gamma \). S. Native of Brazil. *Cuba'a speciosa,* Spreng. syyst. append. 170.

*Bundle-flowered Moldenhawera.* Tree.

Cult. For culture and propagation see *Hardwickia*, p. 436.

*LIN. SYST.* *PENTANDRIA, MONOGYNIA.* Calyx with a short tube, 4-leaf; segments oblong, nearly equal. Petals 5, nearly equal, inserted in the mouth of the calyx. Stamens 5, glabrous. Ovary pedicellate. Style filiform. Legume oblong, compressed.

——An unarmed tree, with flexuous branches, abruptly pinnate leaves, bearing about 4-6 pairs of ovate-oblong, acuminate leaflets, the lower pair situated at the very base of the petioles and appearing like stipulas. Stipulas truly transversely linear-oblong. Racemes axillary, with a solitary bractea under each pedicel, but with 2 bracteoles at the top of each pedicel.
LEGUMINOSÆ. CCLXIX. HETEROSTEMON.

1 A. laurifolia (Vahl. l. c.) S. Native of Java. Batśzia laurifolia, Vahl. l. c. 
Laurel-leaved Humboldtia. Tree 30 to 40 feet. 
Cult. For culture and propagation see Hardwickian, p. 436. 

CCLXIX. HETEROSTEMON (τετράχρωμοι, hétéròs, variable, and στριγῶν, stérmowa, a stamen, in reference to the variable length of the stamens, as well as in some being fertile and others sterile). Desf. mem. mus. 4. p. 248. D. C. prod. 2. p. 488. 
LIN. SYST. Monadelphus, Octándria. Calyx tubular, 4-cleft, girded at the base by 2 connate, calyculate bracteas, the segments oblong and acute. Petals 3, obovate, inserted in the throat of the calyx. Stamens 8, unequal, long, declinate, monadelphous below and pilose above, the 3 lower ones longer and fertile, and 5 bearing barren 2-blobed anthers. Stipe of the ovary concrete with the calyx. Style filiform. Legume flat, tapering to both ends, many seeded.—A tree, with abruptly pinnate leaves and winged petioles, bearing linear, obtuse, emarginate, glabrous leaflets. Flowers large, few, somewhat corymbose. This genus is allied to Tamariödis. 

1 H. mimósoïdes (Desf. l. e. t. 12.) S. Native of Brazil. Mimosa-like Heterostemon. Tree. 
Cult. See Tamarindus for culture and propagation, p. 438. 

CCLXX. AMHERSTIA (named by Dr. Wallich after the Right Honourable Countess Amherst and her daughter Lady Sarah Amherst, the zealous friends and constant promoters of all branches of natural history, especially botany, who, during their residence in India performed an arduous and extensive journey to the northern regions of Northern and Western Hindostan, spending many weeks among the mountains near the Himalaya, where they obtained a very interesting collection of preserved specimens of plants). Wall. pl. rur. asiat. 1. p. 1. t. 1. 
LIN. SYST. Diadelphus, Decándria. Sepals 4, connate into a tube at the base, which is permanent and bears the staminal column at the apex, girded by 2 large opposite bracteas at the base, which are valvate in aestivation. Petals 5, unequal; 2 lower ones very minute and curved, lateral ones cuneiform, divaricate, upper one large, spreading, obcordate, and unguiculate. Stamens 10, 9 of the filaments joined together into a long tube, but free at the apex, alternate ones shortest, the tenth free, and adnate to the pedicel of the ovary at the base. Anthers versatile, all fertile. Ovary stipitate, falcate, 4-6-ovulate, with the stipe adhering to the calyccine tube. Style filiform, crowned by a small convex stigma. Legume pedicellate, flat, oblong, few-seeded.—A tree, with large, impari-pinnate leaves, bearing 6-8 pairs of leaflets, and long pendulous axillary racemes of showy scarlet flowers. 

1 A. xôbilis (Wall. l. c.). S. Native of the Burman Empire, in the garden of a decayed kïou, a sort of monastery, 2 miles from the right bank of the Saluen River, and 27 miles from the town of Martaban, but its native place of growth is still unknown, as the trees found in the garden have undoubtedly been planted there. The flowers are large, of a fine vermillion colour, diversified with yellow spots. This tree, when in foliage and blossom is the most superb object that can possibly be imagined, and not surpassed by any plant in the world. The Burmese name of the tree is Thoka. Handsfuls of flowers were presented as offerings in the cave before the images of Buddha. Along with this tree were found some trees of Mesúia fërréa and Jônésia Aësca. It is not a little remarkable that the priests of these parts should have manifested so good a taste as to select three sorts of trees as ornaments to their objects of worship which can hardly be surpassed in beauty. 

Noble Amherstia. Tree 30 to 40 feet. 
Cult. For culture and propagation see Hardwickian, p. 436. 

CCLXXI. TAMARINDUS (Tamar, in Arabic is the name of the date, Indus, Indian; Indian date). Lin. gen. no. 46. Lam. ill. t. 25. D. C. prod. 2. p. 488. 
LIN. SYST. Monadelphus, EOxenándria, and Decándria. Calyx tubular at the base, cleft; the 3 upper lobes are reflexed and oblong, 2 lower ones also reflexed and joined together into one broad, 2-nerved lobe, which is usually bidentate at the apex. Petals 3, alternating with the 3 upper lobes of the calyx, the 2 lateral ones ovate, and the middle one cucullate. Stamens 9–10, 2 or 3 of which are longer than the others, monadelphous at the base and antheriforous, the other 7 very short and sterile. Style subulate. Legume pedicellate, aciciniform, compressed, 1-celled, 3-6-seeded, the valves filled with pulp between the epicap and endocarp. Seeds ovate-quadrate, obliquely truncate at the hyalum. Cotyledons unequal at the base.—Trees with abruptly pinnate leaves, bearing many pairs of small leaflets, and racemes of flowers. 

1 T. indica (Lin. spec. 48. exclusive of the synonyme of Laxf.) legumes elongated, 8–12-seeded, 6-times or more longer than broad. S. Native of the East Indies and the tropical parts of Africa. Woodl. med. bot. t. 166.—Rheed. mal. l. t. 23.—Rumph. amb. 2. t. 23.—Blackw. herb. t. 221. D. C. legum. mem. xi. t. 24. f. 113. germ. A large spreading tree, with the leaves of a pale colour. Flowers with a straw-coloured calyx and yellow petals, beautifully streaked with red, and purple filaments and brown anthers. The timber of the Tamarind-tree is heavy, firm, and hard; sawed into boards it is converted to many useful purposes in building. The pulp contained in the pods is used both in food and medicine. The tamarinds which are brought from the East Indies are darker and drier, but contain more pulp; being preserved without sugar they are fit to be put into medicines than those from the West Indies, which are much redder, but being preserved with sugar are more pleasant to the palate. The use of tamarinds was first learned from the Arabians; they contain a larger proportion of acid with the saccharine matter than is usually found in acid fruits. The epicarp of the pod is thin, and the acid pulp for which they are esteemed is the sarcocarp. Tamarindus are preserved in two ways; commonly by throwing hot sugar from the boilers on the ripe pulp; but a better method is to put alternate layers of tamarinds and powdered sugar in a stone jar. By this means the tamarinds preserve their colour, and taste more agreeably. Preserved tamarinds should be fresh and juicy, and should have an agreeable acid taste. They should not have a musty smell; the seeds should not be soft and swollen; and the blade of a knife should not get a coating of copper by being immersed among them. Tamarinds contain sugar, mucilage, citric acid, supertartrate of potass, tartaric acid, and malic acid. In medicine the pulp of tamarind, taken in the quantity of from 2 to 3 drachms to an ounce or more, proves gently laxative and purgative, and at the same time by its acidity quenches thirst and allays immoderate heat. It increases the action of the sweet purgatives cassia and manna, and weakens that of the resins cathartics. Salts, whose base is potass, form an improper addition to tamarinds, for they are decomposed, and the tartaric acid of the fruit is precipitated in the form of supertartrate of potass. 

East Indian Tamarind. Fl. June, July. Clt. 1653. Tree 40 to 60 feet. 

2 T. occidentalis (Gurt. fruct. 2. p. 310. t. 146.) legumes short, 1–4–seeded, hardly 3–times longer than broad. S. Native of South America and the West India Islands. Jacq. amer. p. 10. t. 179. f. 98. Blackw. herb. t. 201. Flowers with a straw-coloured calyx and yellow petals streaked with red, and purplish stamens. A large spreading tree. The pods of the West Indian tamarind are shorter and redder than those of
the East Indian *tamarind*, and are not so good. In many parts of America, particularly in Caruca, the natives eat abundance of the pulp raw without any inconvenience, except that of gently relaxing the body. In Martinique they eat even the unripe fruit. In the West Indies it is frequently made an ingredient in punch.

West Indian *Tamarind*. Fl. Feb. Clt. 1839. Tr. 30 to 50 ft.

*Cult.* Loam and peat is a good mixture to grow the species of *tamarind* in. Cuttings will root if planted in a pot of sand, with a hand-glass placed over them, in heat; but as seeds are annually received both from the East and West Indies, this is an unnecessary mode of increasing the plants. The seeds should be raised on a hot-bed, and the plants put into separate pots, as soon as they are about 2 or 3 inches high.

**CCLXII. CASSIA (κασσία, cassia, of Dioscorides. According to Olaus Celsius, this name is to be traced to the Hebrew *kezith*, rendered by κασσιαν in the Septuagint, and Latinized by cassia).** Lin. gen. 514. Lam. ill. t. 332. Collad. mon. 1816. in 1830. B. C. prod. 2. p. 492.

Lin. *syst.* Decandria, Monogynia. Calyx of 5 sepals, which are hardly connected together at the base (f. 57. a.) and more or less unequal. Petals 5, unequal. Stamens 10, free, unequal (f. 57. c. d.), 3 lower ones the longest, the 4 middle ones short and straight, the 3 superior ones (f. 57. d.), bearing abortive disassembled anthers. Fertile anthers opening by 2 pores at the apex (f. 57. f.). Ovary situate, usually arched. Legume dehiscence, compressed, transversely many-celled inside; cells 1-seeded.—Shrubs or herbs, with abruptly pinnate leaves and opposite leaflets. The petioles are usually glandular. The flowers of all are yellow.

1 C. alata (Lin. spec. 541.) leaves with 8-12 pairs of obovate-oblong, glabrous leaflets, outer ones the largest, lower ones approximating to the axes; petioles glandless. 2. S. Native of South America and the West India Islands. Sloan. hist. t. 176. f. 1. C. *Herpetica*, Jacq. obs. 2. t. 45. f. 2. Flowers large, yellow. The leaves are finely pubescent on the under surface, according to H. B. et Kunth, nov. gen. amer. 6. p. 347. This is therefore a different plant.

*Winged*-padded Cassia. Clt. 1731. Pl. 6 feet.

2 C. bracteata (Lin. fil. suppl. 232.) leaves with 10 pairs of oblong, obtuse leaflets, which are soft and hoary beneath; petioles glandless. 4. S. Native of Surinam. Flowers yellow. Leaves more than a foot long.

**Sect. II. Sena** (Senna or Sena meckii, the Arabic name for senna). Tourn. inst. t. 390. Gaertn. fruct. 146. D. C. in Collad. mon. 92. prod. 2. p. 492. Sepals obtuse. Anthers opening by 2 pores at the apex. Legumes membranous, broad, flat, and compressed, hardly dehiscent, torose at the seeds, divided internally into many cells by transverse dissepiments; cells hardly pulpy inside. Seeds vertical, compressed, nearly obcordate, shorter than the breadth of the legume, but the length of the funicle.

3 C. obovata (Collad. mon. p. 92.) leaves with 6-7 pairs of obovate, obtuse leaflets; petioles glandless; legumes flat, compressed, arched, tumid, and a little crested in the middle. 5. S. but φ. in the gardens. Native of Egypt, Senegal, and Rome; cultivated in the south of Europe and the West Indies for its leaves, which are one kind of *Senna*. C. *Senna*, Lam. ill. t. 332. f. 2. a. b. d. and f. 3. b. f. g. Jacq. fil. cel. 1. t. 87. Flowers yellow. This is the Italian senna.

4 C. lanceolata (Forsk. egyp. p. 85.) leaves with 4-5 pairs of oval-lanceolate, acute leaflets; petiole glandular; legumes flat, compressed, straightforward, tumid in the middle. 4. S. Native of Upper Egypt. Lam. ill. t. 332. f. 2. c. and f. 3. a. Cassia orientalis, Pers. encl. t. 1. p. 457. C. acutifolia, Delil. fl. egyp. 75. t. 27. f. 1. Flowers yellow. This is the official Alexandrian senna.

*Senna* is the leaves of C. lanceolata and C. obovata, both natives of Egypt; they are mixed with the pods. Those of the former are most esteemed; they are of a freely yellowish green colour, while those of the latter are green without any yellowish cast. With the true *senna* are mixed the leaves of another plant, *Cynanchum Aegypti*. Bouville says that at Cairo the traders mix these in the proportion of 500 of C. lanceolata and 300 of C. obovata and 200 of *Cynanchum Aegypti*. But the greater part of the *senna* now used in this country is of a different kind. It is called East Indian. In America they now use the leaves of C. *Marylandica*. In medicine *senna* is a very useful cathartic, operating mildly and yet effectually; and if judiciously dosed and managed, rarely occasioning the bad consequences which too frequently follow the exhibition of the stronger purges. Its nauseous flavour, and its being apt to give rise, are the only inconveniences complained of in this drug. These are best obviated by adding some aromatic substance to the *senna*, as cardamon, ginger, cinnamon, &c., and by facilitating its operating by drinking plentifully of any mild diluent. *Senna* may be given in substance to the extent of half a drachm night and morning. It is more conveniently given in the form of infusion, which is generally made by pouring 6 ounces of boiling water upon from 2 to 6 drachms of *senna* leaves in a teapot, and letting it stand about an hour. *Senna* ought never to be used in decoction, Green says, because it becomes perfectly inert by the total dissipation of the nauseous and volatile principle, on which its purgative effects depend. The tincture, on account of the menstruum, cannot be given in doses large enough to have any effect.

5 C. lioustrinoides (Schrank, in akad. munb. 6. p. 179.) leaves with 5 pairs of glabrous, lanceolate leaflets, the lower ones the smallest; petioles glandless; flowers racemose; legumes much compressed, glabrous, rounded at the apex. 5. S. Native of Arabia. Flowers yellow. This kind of *senna* is confused with the Alexandrian *senna* in the shops.

6 C. pistachiufolia (H. B. et Kunth, nov. gen. amer. 6. p. 349.) leaves with 6 pairs of oblong leaflets, which are retuse at the apex and glabrous above but pubescent beneath; petioles glandless; flowers racemose; legumes transversely veined. 5. S. Native of South America, between Popayan and Meneses. Flowers yellow.

*Pistachio*-leafed Senna. Tree 24 feet.

7 C. strobilacea (H. B. et Kunth, nov. gen. amer. 6. p. 347.) leaves with 11-12 pairs of oblong, emarginate leaflets, which are rather plicate above, but pubescent beneath; petioles glandless; racemes axillary; bracteae long; legumes com-
pressed, torulose. ū. S. Native of South America, on the banks of the river Magdalen, near the Boaca of St. Bartholomew. Flowers yellow.

**Strobile-like-racemose Semna.** Tree 12 to 20 feet.

8 C. **Taraman** (H. B. et Kunth, nov. gen. amer. 6. p. 348.) leaves with 11 pairs of oblong, acute leaflets, which are pilose above but pubescent beneath; petioles glandless; flowers racemose?; legumes compressed, torulose. ū. S. Native of South America, near Cumana, where it is called Taraman.

**Ash-leaved Semna.** Shrub 3 to 5 feet.

10 C. **Browniana** (Kunth, mim. p. 135. t. 41.) leaves with 8-13 pairs of oblong, obtuse, mucronate, rather ciliate, glabrous leaflets; racemes axillary, length of leaves; legumes oblong-linear, mucronate, furnished with a narrow wing on both sutures. ū. S. Native of Mexico, near Guanaxauto. H. B. et Kunth, nov. gen. amer. 6. p. 350. Flowers yellow.

**Brown's Semna.** Shrub 12 feet.

11 C. **Richardiana** (Kunth, mim. p. 139. t. 42.) leaves with 18-20 pairs of oblong leaflets, which are puberulous beneath, with a small gland on the petiole, between the lower pair; panicle terminal; legumes compressed, membranous, transversely veined, glabrous. ū. S. Native of South America, on the banks of the river Atapato, near the head of the Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 351. Flowers yellow.

**Sect. III. Chamaesenna (chama, on the ground, and senna; dwarf senna).** D. C. in Collad. mon. p. 95. prod. 2. p. 493. Sepals obtuse. Anthers oblong, opening by 2 pores at the apex. Legumes compressed, deciduous, rather tumid at the sutures, divided internally into many cells, by complete or incomplete transverse dissections. Cells not pulpy inside. Seeds vertical, compressed, ovate, or somewhat square, about equal to the breadth of the legume, but longer than the funicule.

§ 1. **Trigonelloideae** (Trigonella, and idea, like; plants with the habit of Trigonella). Annual plants, having the leaves furnished with but few pairs of leaflets.

12 C. **sericea** (Swartz, fl. ind. occ. 2. p. 724.) leaves with 4 pairs of oval leaflets, which are clothed with silky hairs, with subulate glands on the petiole, one between each pair of leaflets; legumes hairy, somewhat tetragonal, transversely somewhat articulated. ō. S. Native of the West Indies and Brazil. C. sensitiva, Jacq. icon. rar. t. 459. C. ornithopoidea, Lam. dict. 1. p. 644.

13 C. **ciliata** (Hoffm. verz. 1824. p. 208.) leaves with 8-4 pairs of obovate, acutish, pubescent leaflets, which are ciliate with silky down, and furnished with stipitate glands on the petiole, one between each of the pairs of leaflets, except the outer pair; spikes axillary, somewhat capitate; legumes terete, beaked, impressed. ō. S. Native of Cuba. Perhaps sufficiently distinct from C. sericea. **Ciliated-leafletted Wild-senna.** Fl. Ju. Jul. Clt. 1820. Pl. 1 ft.

14 C. **obtusifolia** (Lin. spec. 539. exclusive of the synonyme of Rumph.) leaves with 3 pairs of obovate, obtuse leaflets, which are pubescent beneath, with an oblong, cylindrical, acute gland on the petiole, between the lower pair of leaflets; stipulas linear-subsulate; legumes long, slender, recurved. ō. S. Native of Cuba and Jamaica among rubbish. C. Tora, H. B. et Kunth, nov. gen. amer. 6. p. 35. which was gathered in the fields of Popayan.—Dill. orth. bot. 71. t. 62. f. 72. Sloane, jam. t. 180. f. 5.

15 C. **numularia** (Collad. mon. p. 96.) leaves with 3 pairs of obovate, obtuse leaflets, with an oblong gland on the petiole between the lower pair; petiole without an awn at the apex; legumes arched, compressed, with callous margins. ō. S. Native of South America, Caribbee Islands, and Carolina. C. Tora, Li. spec. 538. C. Tula, Desv. journ. bot. 1814. p. 73.—Plum. ed. Bumr. t. 76. f. 2.

16 C. **Tora** (Lin. spec. 538. exclusive of var. ō and the synonyme of Mill.) leaves with 3 pairs of obovate, obtuse leaflets, with an oblong gland between each of the 2 lower pairs on the petiole; petiole ending in a bristle; legumes straight, compressed, with callous margins. ō. S. Native of the East Indies, Arabia, Japan, and Cochín-china. Dill. orth. bot. 72. t. 63. f. 73. C. flustra, Sal. prod. 326. C. glaminaria, Collad. mon. p. 96. C. toroidea, Hortul. C. obtusifolia and C. Tora, Bumr. ind. p. 95. exclusive of the synonyme. —Rumph. amb. 5. t. 97. f. 2.

**Tora Wild-senna.** Fl. Aug. Clt. 1693. Pl. 2 to 5 feet.

17 C. **linternius** (Lam. dict. 1. p. 643.) leaves with 3-4 pairs of obovate, very blunt, glabrous leaflets; racemes axillary, many flowered, about equal in length to the leaves. ō. S. Native of Peru. Perhaps the same as C. pentagonia, of Mill. fig. t. 82. from Campeachy.

**Lima Wild-senna.** Pl. 1 to 2 feet.

18 C. **ciatlina** (Collad. mon. p. 98.) leaves with 2-3 pairs of semi-ori-bacciform, vein leaflets, the 2 outer ones the largest; stipulas cordate, lanceolate, with ciliate margins. ō. S. Native of the East Indies. C. tagéra, Lin. spec. 538. exclusive of the synonyme of Rheed. Plant filiform, procumbent.

**Ciatlary-stipuled Wild-senna.** Pl. procumbent.

19 C. **tagéra** (Lam. dict. 1. p. 635.) but not of Lin.) leaves with 3 pairs of obovate leaflets; peduncles very short, 1-flowered; legumes straight, linear. ō? S. Native of Malabar, where it is called Ponnam-Tagera. Rheed. mal. 2. p. 103. t. 53.

§ 2. **Coluteae (from Colutea, and idea, like; plants with the habit of Colutea).** Plants shrubby. Leaves with few or many pairs of leaflets.

* **Inter glandulose (from inter, between, and glandula, a gland).** Glands situated on the petiole, between the pairs of leaflets.

20 C. **venustula** (H. B. et Kunth, nov. gen. amer. 6. p. 352.) leaves with 3-4 pairs of obovate-elliptic, puberulous leaflets, which are rounded at the apex, with a gland on the petiole above the lower pair; panicle terminal, with 2-flowered branches; legumes linear, beaked, puberulous. ū. S. Native of South America, near Cumana, in arid places.

**Pretty Wild-senna.** Shrub.

* **Juglansludulose (from jugum, a yoke, and glandula, a gland).** Glands one or more on the petiole between the pairs of leaflets.

21 C. **viminea** (Lin. aman. 5. p. 397.) leaves with 2 pairs of obovate-oblong, acuminate, glabrous leaflets, with an oblong acute gland on the petiole between the lower pair; petiole ending in an awn; spines tridentate, on the old branches. ū. S. Native of Jamaica, on the Blue Mountains, and of Porto Rico.—Sloane, jam. t. 180. f. 6. 7. A rambling or climbing shrub. **Twitty Wild-senna.** Clt. 1786. Shrub cl.
LEGUMINOSÆ.

22 C. chrysôtricha (Collad. mon. p. 99. t. 13.) leaves with 2 pairs of rather pubescent ovate leaflets, lower pair the shortest and rounded on the outside, with an oblong gland on the petiole between the lower pair; stipules truncate on the old branches.

23 C. rußsā (Linn. in Herb. Brot.) with 2 pairs of ovate-oblong, glabrous, acuminate leaflets, which are rounded at the base and somewhat emarginate and mucronate at the apex, pubescent beneath, with the veins and nerves very prominent; racemes forming a terminal paniculate; petiole bearing glands, one between each pair of leaflets; stipules subulate.

Wrinkled-leaved Wild-senna. Shrub.

24 C. macranthera (D. C. in Collad. mon. p. 99. t. 8.) leaves with 2 pairs of ovate-oblong, glabrous, acuminate leaflets, with an oblong-ovate gland on the petiole between the lower pair; petiole ending in a thick caducous bristle.

25 C. sca'ndens (Ruiz et Pav. in herb. Lamb.) branches angular, pubescent; leaves smooth, membranous, with 2 pairs of elliptic-oblong, acute, cuspidate leaflets, lower pair one half smaller than the upper; petiole bearing a large obtuse gland between the lower pair of leaflets; stipules and bracteas lanceolate-subulate; racemes long, puberulous, shorter than the leaves.

Climbing Wild-senna. Shrub cl.

26 C. quinquangulara (Rich. act. soc. hist. nat. par. p. 108.) leaves with 2 pairs of ovate coriaceous, acuminate leaflets, which are glabrous above but pubescent beneath, and unequal at the base, with an ovate thick gland between each of the pairs on the petiole; racemes axillary.

Apoenova Wild-senna. Shrub 4 to 8 feet.

27 C. sennoïdes (Jacq. icon. rar. t. 70.) leaves with 2-3 pairs of ovate-oblong, acuminate, glabrous leaflets, which are shining above, with an ovate sessile gland between each of the pairs on the petiole; racemes axillary.

29 C. Alcaparillo (H. B. et Kunth, nov. gener. amer. 6. p. 355.) leaves with 2-3 pairs of oblong glabrous leaflets, which are rounded at the apex, with a gland on the petiole between the lower pair; racemes axillary and terminal, loose.

Native of Peru, in hot places near Olleros, where it is called Alcaparillo. The legume, according to Bonpland, is terete; it is therefore probably a species of Chamefistula.

Alcaparillo Wild-senna. Shrub.

30 C. bicapsula'ris (Linn. spec. 538.) leaves with 3 pairs of obovate, rather marginate, glabrous leaflets, lower ones the roundest, with a somewhat globose gland on the petiole between the lower pair, which is attenuated at the base; stipulas linear-sulcate, spreading.

31 C. arge'n'tea (H. B. et Kunth, nov. gener. amer. 6. p. 358.) leaves with 3 pairs of sub-elliptical leaflets, which are rounded at the apex, and clothed with silky pubescence, but silvery beneath, with a gland on the petiole between the lower pair; flowers axillary, solitary, and disposed in racemes at the tops of the branches; legumes slender, clothed with adpressed pubescence.

Native of Mexico, on the banks of the river Mescala. Silvery Wild-senna. Shrub 3 to 4 feet.

32 C. gen'culata; clothed with scurfy stellate tomentum; leaves with 8 pairs of ovate oblique leaflets, tapering to the apex, with a hairy gland on the petiole between the lower pair; racemes short, corymbose, axillary; legumes articulated.

Native of Peru. (v. s. in herb. Lamb.)

33 C. mollisima (Hum. et Bonpl. in Willd. enum. 440.) leaves with 3 pairs of ovate acuminate leaflets, which are clothed with soft pubescence beneath; petiole pilose, bearing a hairy gland between each pair of leaflets.

Native of South America. Legumes unknown.

34 C. reniformis; branches pubescent; leaves with 3 pairs of elliptic, acuminate, glabrous leaflets, tapering to the ends, lower ones the smallest, with an elongated gland between each pair; stipulas large, reniform, acuminate on one side.

Native of Brazil, Sello. Perhaps a species of Chamefistula.

35 C. artemisium (Gaud. in D. C. prod. 2. p. 405.) clothed in every part with velvety canescent down; leaves with 3-4 pairs of linear-liliform leaflets, with a small gland on the petiole between the lower pair; racemes axillary, 5-8-flowered, a little shorter than the leaves.

G. Native of New Holland, in the interior of the country.

36 C. glutinosæ (D. C. prod. 2. p. 495.) leaves with 3-4 pairs of oblong, acuminate, glabrous leaflets, which are clamy as well as the branches, with a small sessile gland on the petiole between the lower pair; racemes axillary, usually 4-flowered.

G. Native of New Holland, on the eastern coast. Legume broad, linear, on a short stipule, mucronate by the style.

Clamy Wild-senna. Shrub.

37 C. oxa'de'nxa (D. C. prod. 2. p. 475.) leaves with 4-5 pairs of obovate glabrous leaflets, outer ones the longest, all glaucous beneath; petals glabrous, furnished with a subulate acute gland, which is situated between the lower pair of leaflets.

G. Native of Jamaica. C. discolor, Desv. journ. bot. 1814. p. 73? C. frutescens, Mill. dict. no. 2.

Sharp-glanded Wild-senna. Shrub 5 to 6 feet.

38 C. dispar (Willd. enum. 441.) leaves with 4-5 pairs of oblong usually obtuse leaflets, outer ones the largest, with a gland between each pair on the petiole.

G. Native of South America. Compare it with C. floribunda.
40 C. olau'ca (Lam. dict. 1. p. 647.) leaves with 4-6 pairs of oval, acutish, glaucous leaflets, which are sessile, with a pedicel long on the petiole between each of the 3 lower pairs; stipulas linear, subulate, spreading. η. S. Native of the East Indies. C. Surratanensis, Burm. ind. 97. Glaucescent Wild-senna. Fl. Ju. July. Clt. 1818. Shrubs 4 to 6 feet.
41 C. pedidi's'enna (Ruiz et Pav. in herb. Lamb.) pubescent; leaves with 5 pairs of elliptic-lanceolate cuspidate leaflets, which are glaucous beneath, with a gland on the petiole between the lower pair; racemes axillary, shorter than the leaves. η. S. Native of Mexico. Leaves pale, with purple veins.

Very-leafitted Wild-senna. Shrubs.
42 C. sul'phu'rea (D. C. in Collad. mon. p. 84.) leaves with 5-6 pairs of oval-oblong leaflets, which are glaucous beneath, in the adult state they are glabrous, but when young they are puberulous, as well as the branches and petals; petals furnished with glands, one between each of the 3 or 4 lower pairs of leaflets; stipulas linear-subulate, rather falcate; racemes axillary, erect, shorter than the leaves. η. S. Native of the East Indies and the Mauritius, where it is probably cultivated. Rheea, mal. 6. t. 9. and t. 10. C. arborascens, Vahl. symb. 3. p. 56, but not of Mill. Robinia jayavica, Burm. fl. ind. 163. Legume flat, compressed, 4-5 inches long, erect. Flowers sulphur-coloured. Sulphur-coloured-flowered Wild-senna. Fl. Ju. July. Clt. 1800. Shrubs 5 to 10 feet.
43 C. coluteo'idès (Collad. mon. p. 102. t. 12.) leaves with 5-6 pairs of ovate, retuse, glabrous leaflets, outer ones the longest, with an oblong gland on the petiole between the lower pair; corymb terminal; 2 of the stamens are very long. η. S. Native country and legumes unknown. Colutea-like Wild-senna. Shrubs 4 to 6 feet.
44 C. nemoró'sa (H. B. et Kunth, nov. gen. amer. 6. p. 558.) leaves with 5-7 pairs of elliptic, emarginate, glabrous leaflets, with a gland on the petiole between the lower pair; peduncles axillary and terminal, 2-flowered. η. S. Native of South America, between the provinces of Jaen de Bracamaros in groves. Said to be allied to C. polyphylla. Groce Wild-senna. Shrubs 1 to 2 feet.
45 C. rie'föra (Lin. amen. 5. p. 397.) leaves with 6-8 pairs of ovate-oblong or obovate, rather glabrous leaflets, with a subulate gland on the petiole between the lower pair; peduncles axillary, more slender, 2-flowered. η. S. Native of South America and the West India Islands. Sims, bot. mag. t. 810.—Plum. ed. Burm. t. 78. f. 1. Var. β, semperfervens (D. C. cat. hort. monsp. p. 90. no. 56.) leaflets emarginate, glabrous; flowers smaller.

47 C. obcord'a'ta (Swartz, herb. Wicks. obs. fl. St. Barth. vol. ii.)

CCLXXII. CASSIA. 441. p. 411.) stems angular, glabrous; branches terete, pubescent; leaves with 3-7 pairs of obcordate, cuspidate, glabrous leaflets, with a pedicellate gland on the petiole between the lower pair; legumes compressed, pubescent; peduncles sub-terminal, filiform, 1-flowered, bibracteolate both at the base and in the middle. η. S. Native of the Island of St. Bartholomew. Flowers large, yellow.

Obcordate-leafleted Wild-senna. Shrubs.
48 C. fal'lid'a (Vahl. ccl. amer. 3. p. 12.) leaves with 5-6 pairs of oval glabrous leaflets, outer ones somewhat cuneate and mucronate, with a clavate gland on the petiole between the lower pair; peduncles axillary, usually 4-flowered. η. S. Native of St. Martin. Legume linear, straight.

49 C. torrentó'sa (Lam. dict. 1. p. 647.) leaves with 6-8 pairs of oval-oblong obtuse leaflets, which are nearly glabrous above, but clothed with hoary tomentum beneath; petiole furnished with glands, usually with one between each pair of leaflets; legumes compressed, pubescent. η. S. Native of South America, near Santa-Fe-de-Bogota. H. B. et Kunth, nov. gen. amer. 6. p. 548. C. multiglandulosa, Jacq. icon. rar. 1. t. 72. Var. β, álvida (Oert. dec. 8. p. 92.) leaves with 2-5 pairs of oblique oval leaflets; glands subulate. η. S. Native of New Spain. Flowers pale yellow.

50 C. ca'na (Nees et Mart. nov. act. bonn. 12. p. 53.) leaves with 6-8 pairs of oblong, oblique, acutish leaflets, which are tomentose beneath, with a large subulate gland between each pair except the lower one; stipulas reniform, one of them furnished with a cuspidate lobe on one side; racemes axillary. η. S. Native of Brazil, at Barra-das-Veredas. The whole shrub is clothed with canescent tomentum. The legume is unknown, but the plant itself is said to be nearly allied to C. tomentósa. Hoary Wild-senna. Shrubs 4 to 6 feet.
51 C. me'xi'ca'na (Jacq. hort. schenbr. t. 203.) leaves with 5-7 pairs of oval-oblong, bluntish pubescent, ciliated leaflets, which are unequal at the base, with an ovate-cylindrical gland on the petiole between the lower pair; petioles and branches velvety. η. S. Native of Mexico and St. Domingo.

52 C. barclay'a'na (Sweet, fl. austr. t. 32.) leaves with 6-8 pairs of linear-lanceolate, acute, glabrous leaflets, with a fasicule of glands between each of the pairs of pinnae, and one large depressed one at the base of the petiole; peduncles axillary and terminal, many-flowered, shorter than the leaves; 4 of the stamens sterile. η. G. Native of New Holland. (f. 57.)

53 C. au'stra'lis (Hook. bot. mag. 268.) leaves with 12 pairs of oblong-lanceolate leaflets, with a subulate pedicellate gland between each of the pairs; petals and sepals nearly equal; peduncles usually 4-flowered. η. G. Native of New Holland. Flowers large, yellow.

54 C. Berteriana (Balb. herb. ex D. C. prod. 2. p. 496.) leaves with 7-10 pairs of elliptic mucronate leaflets, which are unequal at the base, with a thick oblong gland on the petiole, sometimes at the base, and sometimes between the lower pair; under side of the leaves, as well as the petioles and branches rather puberulous; peduncles axillary, short, few-flowered. h. S. Native of St. Domingo. It is allied to C. frondosa, but differs in the glands being very obtuse, not acutely ovate, as in that species.

Berteria's Wild-senna. Shrubs 5 to 6 feet.

55 C. Colea; leaves with 3 pairs of ovate, glabrous, mucronulate leaflets, which are margined with white, with a pedicellate gland on the petiole between the lower pair; stipulas linear, lanceolate, short; flowers axillary, racemose. h. S. Native of the West Indies. C. Bertéria, Coll. Hort. rip. p. 30. t. 24.

56 C. stipulacea (Ait. hort. 2. p. 52.) leaves with 8 pairs of ovate-lanceolate glabrous glands, with a gland on the petiole between the lower pair; stipulas ovate, large. h. S. Native of Chili. Feuill. per. 2. p. 56. t. 42.

57 C. auriculata (Lin. spec. 542.) leaves with 8-12 pairs of oval, obtuse, rather mucronate leaflets, which are puberulous when young, but at length become nearly glabrous, with numerous subulate glands on the petiole; stipules reniform; racemes axillary; bracteas oval-oblong, mucronate. h. S. Native of the East Indies.—Pluk. alm. t. 314. t. 4. Glands on the petioles sometimes wanting.

58 C. Gaudechaudii (Hook. in Beech. voy. append. p. 81.) leaves with 4 pairs of elliptic-oblong, rather emarginate, glabrous leaflets, which are pale beneath, with a linear obtuse gland on the petiole between the lower pair; stipulas subulate; racemes axillary, shorter than the leaves; legumes pendulous, linear, compressed, membranous, usually 8-seeded. h. G. Native of the Sandwich Islands.

Gaudechaud's Wild-senna. Shrubs.

59 C. Chatelainiana (Gaud. in Freycinet, voy. part. bot. p. 483. t. 111.) leaves with 4-5 pairs of lanceolate-linear, thickish, glabrous leaflets, with stipitate glands on the petiole, one below each pair of leaflets; umbels axillary, stalked, few-flowered; sepals obtuse; legumes membranous, flat, smooth. h. G. Native of New Holland, on the western coast.

Chatelain's Wild-senna. Shrubs.

60 C. suffruticosa (Roth, nov. spec. 213.) leaves with 9 pairs of oval, obtuse, rather pilose leaflets, which are glaucous beneath, with a pedicellate gland between each of the 2 lower pairs on the petiole; stipulas linear, rather falcate; corymbs fastigate. h. S. Native of the East Indies.

Suffruticose Wild-senna. Shrubs.

61 C. fastigia (Vahl. symb. 3. p. 57.) leaves with 9 pairs of oblong-obtuse, obtuse, glabrous leaflets, with a pedicellate gland between each of the pairs of pinnae on the petiole; calyx clothed with canescent villi. h. S. Native of the East Indies.

62 C. frondosa (Ait. hort. kew. 2. p. 35.) leaves with 9 pairs of oval-oblong, smoothish, bluntish leaflets, with a cylindrical gland on the petiole between the lower pair; racemes axillary, shorter than the leaves. h. S. Native of South America.

Var. a, tenuissima (Zucc. obs. no. 70.) branches and petioles rather pubescent; leaflets smaller. h. S. Native of Cuba, about the Havannah.

Var. b, cripta (Jacq. icon. rar. 1. t. 74.) branches and petioles smoothish; leaflets larger. h. S. Native of Florida and St. Domingo.

Var. c, gealegifolia (Collad. l. c.) glabrous; leaflets larger, deep green; flowers sublateral.

63 C. polyphylla (Jacq. icon. rar. t. 460.) leaves with 10-12 pairs of elliptic-obtuse, somewhat mucronate, ciliated leaflets, with an oblong gland on the petiole between the lower pair; peduncles 2-flowered, shorter than the leaves. h. S. Native of Porto-Rico. There is sometimes a gland between more of the pairs of leaflets than the lower one.

64 C. lutescens; stems clothed with yellowish tomentum, as well as the petioles and under surface of the leaves, peduncles, and calyces; upper surface of the leaflets hardly pubescent; leaves with 7-8 pairs of lanceolate, mucronate leaflets, which are oblique at the base; petiole bearing glands, one of each pair of leaflets; racemes shorter than the leaves, somewhat corymbose at the apex. h. S. Native of Peru. C. pubescens, Ruiz et Pav. in herb. Lamb. Stem simple.

Yellowish Wild-senna. Shrubs.

65 C. angustifolia (Ruzî et Pav. in herb. lamb.) pubescent; leaves with 6 pairs of elliptic, oblique, obtuse, mucronate leaflets, with an acute gland on the petiole between the lower pair; racemes axillary, longer than the leaves. h. S. Native of Peru. Flowers orange-coloured.

Orange-flowered Wild-senna. Shrubs.

66 C. angustissima (Lam. dict. 1. p. 649.) leaves with 10 pairs of oblong, acute, awned leaflets, with a pedicellate gland on the petiole between the lower pair of leaflets; legumes linear, compressed. h. S. Native of St. Domingo. Plum. ed. Burn. t. 78. f. 2. Flowers large.

Narrow-podded Wild-senna. Shrubs 6 to 8 feet.

67 C. marginata (Wild. enum. 444. but not of Roxb.) leaves with usually 15 pairs of linear-elliptic leaflets, with a subulate gland on the petiole between each of the pairs. h. S. Native of Surinam; the rest unknown.

Marginated Wild-senna. Shrubs.

68 C. sellata; branches and petioles pubescent; leaves with numerous pairs of lanceolate-linear mucronate leaflets, which are glaucous beneath, with a gland between the lower pair; racemes forming terminal panicles. h. S. Native of Brazil, Sello.

Sello's Wild-senna. Shrubs.

69 C. callistia (Meyer, prim. ess. 169.) leaves with 24 pairs of oblong-linear, glabrous leaflets, with a subulate gland on the petiole between the lower pair; racemes terminal; legumes glabrous. h. S. Native of Guiana, near Essequibo. Flowers large. According to Meyer this species is allied to Poneiana.

Beautiful-flowered Wild-senna. Shrubs.

70 C. mutisia (Kunth, min. 142. t. 43. nov. gen. amer. 6. p. 395.) leaves with 40-50 pairs of oblong-linear leaflets, which are rounded at the apex, puberulous above, but hairy-pubescent beneath, as well as the petioles; branches very hispid; glands on the petiole, one between each pair of leaflets; racemes axillary, solitary, and twin. h. S. Native of New Granada. Legume linear, membranous, glabrous. Seeds 20-26.

Mutis's Wild-senna. Shrubs.

**** Basiglandulose (from basis, the base, and glandula, a gland; leaves furnished with a gland at the base of the petiole).

Leaves with a sessile gland at the base of the petiole.

71 C. longisiliqua (Lin. fil. suppl. 230.) leaves with 4-5 pairs of ovate-oblong, acute, glabrous leaflets, outer ones the
longest, with acute glands on the petiole, one beneath or be-
tween the lower pair of leaflets, and another between the outer
pair.  ב. S. Native of St. Domingo. From the situation of the
glands this species appears to be intermediate between the present
and the preceding division of the genus.

72 C. falcata (Lin. spec. 539.) leaves with 4 pairs of ovate-
lanceolate, retro-falcate leaflets, outer ones the largest, and with
the outer side broadest, with a gland at the base of the petiole.
ב. S. Native of South America.

Falcate-leafletted Wild-senna. Pl. 1 to 2 feet.
73 C. venenifera (Meyer, prim. essq. 167.) leaves with 4
pairs of oval hairy leaflets, with a gland at the base of the petiole;
racemes axillary, few-flowered; legumes pubescent.  ב. S. Native of Guiana, near Essequibo, in bushy sandy places, where
it is called Pianini, and where the roots are used by the inhabi-
tants to intoxicate fish by throwing them in the water.

Poison-bearing Wild-senna. Shrub 3 to 6 ft.
74 C. ÆGYPTICA (Willd. num. 447.) leaves with 6 pairs of
lanceolate, acute, glabrous leaflets, outer ones the largest, with
a lanceolate gland at the base of the petiole; racemes terminal;
peduncles 2-flowered.  ב. S. Native of Egypt.

Egyptian Wild-senna. Fl. May. C. 1822. Sh. 3 to 4 ft.
75 C. occidentalis (Lin. spec. 539.) leaves short with 4-6 pairs
of large lanceolate leaflets, with pubescent margins, and with
a thick gland at the base of the petiole; peduncles short, 2-4-flow-
cered, lower ones axillary, the rest disposed in a terminal raceme;
legumes flat, compressed, with the sutures tumid.  ב. S. Na-
tive of South America and the West India Islands. Sloane,
hist. 2. p. 175. f. 9, 4. Ker, bot. reg. t. 83. C. planifoliula, Lin.
spec. 540. C. Caroliniæa, Walt. car. 135 ? ex Ell. sketch. 471. C.
occidentalis, Burm. ind. 96. This is a very common species
about Kingston in Jamaica, where it is called stinking-need.
The tops of the plant are commonly employed in all resolutive
baths, and it is accounted a very powerful ingredient on such
occasions.

Var. β. glabra (D. C. prod. 2. p. 497.) leaflets nearly elliptic,

Var. γ. aristata (D. C. l. c.) leaflets ovate-lanceolate, with
pubescent margins, and with mucronate at the apex. Collad.
mon. p. 108.

76 C. purpurea (Roxb. et Jacq. fil. ex Schrad. in litt. D. C.
prod. l. c.) leaves with 5 pairs of ovate-lanceolate glabrous leaf-
lets, with a small obtuse gland at the base of the petiole;
peduncles 3 times shorter than the leaves, 4-6-flowered.  ב. S.
Native of the East Indies. Lindl. bot. reg. 556. Stems purplish
at the base. Flowers yellow, as in the rest of the species. Le-
gume unknown. Very like C. occidentalis.

3 to 4 feet.
77 C. foetida (Ruiz et Pav. in herb. Lmb.) hairy; leaves
with 5 pairs of ovate acute leaflets; racemes axillary, about the
length of the leaves; legumes ovate, membranous, cuspitate.
ב. S. Native of Chili. Stipulas ovale, oblique at the base.
Petiole bearing a gland below some of the pairs of leaflets.

Petit Wild-senna. Shrub.
78 C. hisbura (Lin. fil. suppl. p. 231.) leaves with 4-6 pairs
of hairy, broadly-ovate, acuminate leaflets, with a depressed
gland at the base of the petiole; racemes axillary, short, crowded;
calyx very villous.  ב. S. Native of South America. C. Caracasca,
Jacq. hort. schrad. t. 270.

79 C. linearis (Michx. fil. bor. amer. 1. p. 261.) leaves with
5-6 pairs of oval-lanceolate, acute, glabrous leaflets, with a gland
at the base of the petiole; peduncles usually 2-flowered, axil-
ary, and terminal; legumes linear, strait.  ב. S. Native of
Carolina. Said to be nearly allied to C. occidentalis. Leaflets
narrow and very acute, see Michxs. ovate ex Ell. sketch. 472.
Legume compressed, ex Michxs., terete, ex Ell.

1 to 2 feet.
80 C. fatula (Ait. hort. kew. 2. p. 51.) leaves with 5-6 pairs
of oblong, acute, glabrous leaflets, with a gland at the base of
the petiole; branches short.  ב. S. Native of the West Indies.

81 C. pubescens (Jacq. fragm. 46. t. 57.) leaves with 3-5
pairs of ovate-lanceolate acuminate leaflets, which are pubes-
cent beneath and on the margins branches and petioles, with an
obovate thick gland at the base of the petiole; racemes ter-
inal; peduncles short, 2-4-flowered.  ב. S. Native country
unknown.

82 C. canca (Cav. descrip. pl. 131.) leaves with 6 pairs of
ovate-lanceolate, somewhat ciliated leaflets, with a sessile gland
at the base of the petiole; flowers sub-umbellate; legumes
almost quadrangular.  ב. S. Native of Cumana. Lag. ex Rod.
in ann. scienc. nat. 1802. vol. 5. p. 70. Perhaps sufficiently
distinct from C. occidentalis.

Canca Wild-senna. Shrub 2 to 3 feet.
83 C. sulcata (D. C. cat. hort. monsp. p. 90. no. 58.) leaves
with 6-9 pairs of oval-oblong bluntish leaflets, which are pubes-
cent beneath and on the margins, with an ovate thick gland at
the base of the petiole; branches glabrous, furrowed.  ב. S.
Native of South America. Collad. mon. p. 110. t. 6. C. cern-
ula, Balb. cat. hort. taur. 1813. p. 22.

84 C. ruscicola (Jacq. icon. rar. 1. p. 71.) leaves with 6
pairs of ovate-lanceolate, almost glabrous leaflets, with a terete
gland at the base of the petiole; legumes compressed, oblong-
linear, tapering at both ends, with the sutures prominent.  ב. S.
Native of Caracas. H. B. et Kunth, nov. gen..amer. 6. p. 355.

Rusces-leaved Wild-senna. C. 1816. Shrub 4 to 6 feet.
85 C. loustrina (Lin. spec. 541.) leaves with 7 pairs of
lanceolate, acuminate, rather ciliated leaflets, with a terete eruc-
gland, which is rather distant from the base of the petiole.  ב. S.
Native of America, from Cayenne to Virginia.—Dill. hort. clth.
350. t. 250. f. 328.

86 C. robinoides (Willd. num. 443.) leaves with 6-9 pairs
of lanceolate, acuminate, glabrous leaflets, with a sessile gland
at the base of the petiole.  ב. S. Native of South America.

Robinia-like Wild-senna. C. 1823. Tree 10 to 20 feet.
87 C. marialenda (Lin. spec. 541.) leaves with 8-9 pairs
of ovate-oblong, equal, mucronate leaflets, with an ovate gland
at the base of the petiole; racemes axillary, many-flowered, shorter
than the leaves; legumes compressed, linear, hispid, at length
glabrous.  ב. H. Native of North America, in temperate places.
Schkuhr, handb. 1. t. 113.—Dill. hort. clth. t. 260. f. 339.
Root with black fibres. The leaves are used in North America as a substitute for senna.

88 C. polyanthia (Moc. et Sesse, in Collad. mon. p. 112.
t. 2.) leaves with 12 pairs of oval mucronate leaflets, with an
ovate thick gland at the base of the petiole; flowers paniced,
corymbous; legumes compressed, and furnished with a narrow
wing on both sutures.  ב. S. Native of New Spain.

Many-flowered Wild-senna. Shrub.
3 1 2
and racemes axillary and terminal; legumes flat, membranous. Agr. S. Native of Guayaquil. Flowers pale yellow, painted with purple veins.

Native-leafed Wild-senna. Shrub.

99 C. DAMINGENIENSIS (Spreng. neev. emd. 3. p. 55.) leaves with 5 pairs of ovate-tomentose leaflets; petioles terete, glandless, rather ferruginous. Agr. S. Native of South America. C. latifolia, Desf. cat. hort. par. ed. 1. p. 182?

100 C. DOMINGOensis (Spreng. neev. emd. 3. p. 55.) leaves with 1-6 pairs of oblong, acuminate, glabrous leaflets, ending in an awn; petioles glandless; racemes panicked, very long. Agr. S. Native of St. Domingo. Leaflets on long petiolules. Legumes flat, very glabrous, rather shining, 1/2 inch long, on a short pedicel within the calyx.

St. Domingo Wild-senna. Shrub.

101 C. ANGUSTIFOLIA (Vahl. symb. 1. p. 29.) leaves with 7 pairs of lanceolate glabrous leaflets, outer ones the largest; petioles glandless; legumes pendulous. Agr. S. Native of Arabia. Narrow-leaved Wild-senna. Shrub.

102 C. FLORIDA (Vahl. symb. 3. p. 57.) leaves with 7 pairs of oval-oblong, glabrous, emarginate leaflets; petioles glandless; racemes axillary, many-flowered; bracteas spatulate, ending in a long mucronate. Agr. S. Native of the East Indies.

103 C. SIAMEA (Lam. dict. 1. p. 648.) leaves with 8-9 pairs of oblong-obtuse, obtuse, glabrous leaflets; petioles glandless; legumes flat, compressed, margined. Agr. S. Native about Siam.

Siamese Wild-senna. Shrub.

104 C. ODONTOIDES (Bert. ined. D. C. prod. 2. p. 499.) leaves with 9 pairs of oval leaflets, which are obtuse at both ends, and pubescent beneath, outer ones the largest, and obovate; petioles glandless, and are, as well as the branches, pubescent; legumes very flat, attenuated at the base, but obtuse and mucronate at the apex. Agr. S. Native of St. Martha. Stipules rather spinose. Perhaps distinct from the following.

Hedge Wild-senna. Shrub.

105 C. CATHARTICA (Mart. reis. bras. ex Schlecht. Linnæa. 5. p. 41.) plant beset with pili, which are glandular at the base and viscid; petioles glandless; leaves with 8-10 pairs of oblong-elliptic, bluish, almost matic leaflets, which are rather unequal at the base; peduncles axillary; legumes linear, rather convex, an inch long. Agr. S. Native of Brazil.

Cathartic Wild-senna. Shrub.

106 C. KRETICULATA (Wildl. enum. p. 443.) leaves with 10 pairs of oblong leaflets, which are rounded and obtuse at both ends, and pubescent beneath, outer ones the largest; petioles glandless; legumes compressed. Agr. S. Native of Para, in Brazil.

Reticulated-leaved Wild-senna. Shrub.

108 C. AVERSIFLORA (Herb. mss. Hook. bot. mag. 2638.) leaves with 7 pairs of obovate leaflets, with a fulvous oblong gland on the petiole between the lower pair; peduncles 2-flowered, axillary, glabrous; stipules hispid; legume falcate. Agr. S. Native of Brazil. Flowers large.

110 C. Petit'géra (D. C. prod. 4. p. 499.) leaves with 10-12 pairs of leaflets, which are glabrous, as well as the branches; leaflets oval-oblong, obtuse at both ends, each ending in a deciduous bristle, glaucous beneath; petioles glandless; racemes axillary, terminal, disposed in panicles; legumes fl. $S$. Native of the East Indies.

110 C. Montána (Roth. nov. spec. 214.) leaves with about 12 pairs of oblong-oval, somewhat emarginate leaflets, which are glabrous on both surfaces; petioles glandless; racemes axillary; flowers heptandrous. $S$. Native of the East Indies.

Mountain Wild-senna. Shrub.

111 C. Timoire'nis (D. C. prod. 2. p. 499.) leaves with 12-15 pairs of oval-oblong leaflets, which are obtuse at both ends, mucracted with awns, and clothed with hairy pubescence beneath; petioles glandless, and are as well as the branches puberulous; racemes many-flowered, shorter than the leaves; legumes flat, inmarginate. $S$. Native of Island of Timor.

Timor Wild-senna. Shrub.

SECT. IV. BASOPHYLUM (from βάσις, basis, and ψάλων, phyllon, a leaf; in reference to the lower pair of leaflets being at the base of the petiole). D. C. in Collad. mon. p. 115. Sepals obtuse. Stamens nearly equal. Anthers oblong, all fertile, opening by 2 chinks at the apex. Legume flat, compressed, 1-celled, destitute of pulp. Seeds vertical, compressed, oval, longer than the funicle, but hardly shorter than the breadth of the valve.

112 C. cytisoi'des (D. C. in Collad. mon. p. 116. t. 14.) leaves with 2 pairs of obovate-orbicular, glabrous leaflets, the lower pair approximating the axil, with a sessile gland on the petiole, between the 2 lower pairs of leaflets. $S$. Native of Brazil.

Cytisus-like Cassia. Shrub.

SECT. V. A'Bus (a name which Prosper Alpinus gave to C. A'büs, from the name of a river in Palestine). D. C. in Collad. mon. p. 116. prod. 500. Sepals bluish or acutish. Petals nearly equal. Stamens 5-10, nearly equal, all fertile. Anthers opening by 2 chinks at the apex. Legumes flat, compressed, destitute of pulp, 1-celled, or many-celled from obsolete dissepiments. Seeds vertical, or parallel to the valves, ovate, compressed, with the funicle short and scale-formed.—Annual herbs or subshrubs. Leaves with 2 pairs of leaflets. Bracteoles small, along the pedicels.

113 C. A'büs (Lin. spec. 537.) leaves with 2 pairs of obovate, glabrous, ciliated, dotted leaflets, with small glands on the petiole between the lower pair of leaflets; branches and petiolo pubescent; lower flowers solitary in the axils of the leaves, upper ones disposed in a naked terminal raceme. $S$. Native of Ceylon (Burm. zeyl. t. 97.) and Egypt, also of Jamaica, where it has probably been introduced. Collad. mon. p. 77. and 117, Jacq. ecl. 1. t. 53. Flowers copper-coloured or yellow, pentandrous. The seeds are used in ophthalmia, when reduced to powder. A'büs Cassia. Fl. June, July. Clt. 1777. Pl. 2 to 3 feet.

Tho'i'ning's Cassia. Fl. June, July. Clt. 1824. Pl. 14 ft. 116 C. viscósa (H. B. et Kunth, nov. gen. amer. 6. p. 360.) leaves with 2 pairs of obovate, emarginate, ciliated leaflets, and are as well as the petiolo glandular, clammy, and pilose; branches, pedicels, and calyces clothed with clammy pilis; racemes terminal and lateral, many-flowered. $S$. Native of New Granada, near Contreras and Ibagne. Flowers yellow.

Clammy Cassia. Shrub 5 to 6 feet.

117 C. fauci'flóra (H. B. et Kunth, l. c.) leaves with 2 pairs of obovate, obtuse, clammy leaflets; petiolo glandless; branches and pedicels clammy; racemes terminal, few-flowered. $S$. Native of Mexico, near La Venta del Peregino. C. brachy'stachya, Moc. et Sesse, fl. mex. icon. ined. Very like the preceding species.

Few-flowered Cassia. Shrub 2 to 3 feet.

118 C. lotódes (H. B. et Kunth, l. c.) leaves with 2 pairs of obovate, glabrous leaflets, which are rounded at the apex; petiolo glandless; branches and pedicels clothed with clammy hairs; racemes terminal. $S$. Native of Cunana, near Càripe, and on sand on the banks of the Orinoco. Procumbent. Flowers yellow, large.

Lotus-like Cassia. Fl. June, July. Clt. 1812. Sh. procumb. SECT. VI. CHAMEÆRISTA (a name given by Breynius to this section). Breyn. prod. 2. p. 29. D. C. in Collad. mon. p. 118. prod. 2. p. 500.—Grímàldé, Schrank, ex Birolli, cat. hort. bot. taur. 1815. p. 36. Sepals acuminated, nearly equal. Stamens 10, or only 5-7 from abortion. Anthers oblong, glabrous, opening by 2 pores at the apex. Legumes flat, compressed, dehiscence, destitute of pulp. Seeds vertical, compressed, ovate, or nearly square.—Herbs or subshrubs. Stipulas many-nerved at the base. Pedicels bearing 2 acute bracteoles each, axillary, sometimes joined with the branches at the base, and therefore may be said to be supra-axillary. Flowers and fruit erect. Leaflets lying over each other, when in sleep or at night.

119 C. baúhi'niformis (Kunth, micr. p. 128. t. 37.) leaves with 1 pair of obovate, emarginate, obliquely cordate leaflets, with the margins undulate repand, and puberulous on both surfaces; petiolo glandless, and are as well as the branches clothed with soft pubescence; stipulas cordate, acuminate; peduncles 1-3, axillary, 1-flowered, hibracteate, pilose at the apex as well as the calyces. $S$. Native on the sandy banks of the Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 364.

Bauhiniá-leaved Cassia. Shrub 2 to 3 feet.

120 C. cotinó'rula; glabrous; leaves with 1 pair of roundish, retuse, coriaceous, repand leaflets; racemes bristly, simple, and panicled. $S$. Native of Brazil. Scillo. (v. s. herb. Lumb.) Cotinus-leaved Cassia. Shrub 6 to 10 feet.

121 C. diphyí'la (Lam. dict. 1. p. 642) leaves with 1 pair of obovate, 5-7-nerved leaflets, which are unequal at the base, and quite glabrous, as well as the branches; stipulas lanceolate, ciliated at the base, permanent; petiole ending in an awn. $S$. Native of Porto Rico, Cayenne, and about Acapulco. Cav. icon. 6. t. 600.

122 C. bifolia (D. C. in Collad. mon. 120. t. 9. f. B.) leaves with 1 pair of leaflets, which are as well as the branches and petioles pilose; leaflets oblong, 5-nerve at the base; stipulas coriaceae, lanceolate, ciliolate; petiole without any awn. # S. Native of Brazil, very common about Rio Janeiro. C. pentandria, Radcli. pl. bras. add. p. 29. Flowers pentamous, ex Radcli. C. mammularia, Vahl. ined. C. rountondifolia, Pers. is perhaps the same, ex Juss. Legume puberulous.

Bifoliate Cassia. Fl. June, July. Ch. 1826. Sh. 1 to 2 ft.

123 C. fabarinifolia (H. B. et Kunth, nov. gen. amer. 6. p. 368.) leaves with 1 pair of oblong-lanceolate, falcately-ensiform, glabrous leaflets, which are denticulate ciliolate at the apex; petiole furnished with 1 gland beneath the leaflets; branches marked by a pilose line; peduncles axillary, solitary, 1-flowered, bicrataceae, glabrous. # S. Native of Mexico, on the burning mount Jorullo.

Fabago-leaved Cassia. Shrub 1 to 2 feet.

124 C. cultrifolia (H. B. et Kunth, nov. gen. amer. 6. p. 363.) leaves with 1 pair of oblong-lanceolate, falcately-ensiform, glabrous leaflets, which are denticulate ciliolate at the apex; petiole furnished with 1 gland beneath the leaflets; branches marked by a pilose line; peduncles axillary, solitary, 1-flowered, hairless, bicrataceae. # S. Native of the banks of the river Oriano.

Knife-leaved Cassia. Shrub 1 to 2 feet.

125 C. linearifolia; leaves with 1 pair of long, linear, coriaceous, glabrous, acuminate leaflets; sepals acute. # S. Native of Brazil. Sello. (v. s. herb. Lamb.)

Lincom-leaved Cassia. Shrub 2 to 3 feet.

126 C. pulchra (H. B. et Kunth, nov. gen. 6. p. 362.) leaves with 2 pairs of obovate-oblong, glabrous leaflets, which are rounded at the apex; petiole furnished with 1 gland beneath the leaflets; branches marked with 5 rows of stiff hairs; peduncles axillary, solitary, 1-flowered, bicrataceae. # S. Native of South America, near San Carlos del Rio Negro.

Palm Cassia. Shrub 1 to 2 feet.

127 C. gracilis (Kunth, mim. p. 120. t. 36.) leaves with 2 pairs of obovate-oblong, obtuse, glabrous leaflets; branches also glabrous; petiole bearing 1 gland beneath the leaflets; pedicels solitary, axillary, 1-flowered, bicrataceae, glabrous, twice the length of the leaves. # S. Native of the banks of the river Orinoco. H. B. et Kunth. nov. gen. amer. 6. p. 360. Legume glabrous, rather twisted.

Slender Cassia. Fl. June, July. Ch. 1817. Sh. 1 to 2 ft.

128 C. rotundifolia (Pers. ench. 1. p. 456.) leaves with 2 pairs of roundish leaflets; branches rather villous; stipulas small, ovate, acuminate, about equal in length to the petals; pedicels axillary, 1-flowered, elongated. # S. Native of Brazil. Legume pubescent, flat, 10-12-seeded, length of pedicel.

Round-leaved Cassia. Shrub 1 to 2 feet.

129 C. persoonii (Collad. mon. p. 119.) leaves and branchy glabrous; leaves with 2 pairs of obovate veiny leaflets; stipulas lanceolate, adpressed, about equal in size to the leaflets. # S. Native of Cayenne. C. lanceolata, Pers. ench. 1. p. 456. but not of Forsk.

Person's Cassia. Shrub 1 to 2 feet.

130 C. uniflora (Spreng. neue entl. 1. p. 291.) leaves with 2 pairs of glabrous, obovate-lanceolate, veiny leaflets; branchlets pubescent; petioles glabrous, in the middle; stipulas coriaceous, lanceolate; pedicels axillary, 1-flowered, 10-times longer than the petals. # S. Native of Brazil. Flowers redish. According to Neuw. reis. bras. vol. 2. the leaflets are shining and silky beneath, with a gland on the petiole between the lower pair. The flowers corymbose, and the legumes covered with yellow hairs. This is perhaps the same or perhaps a different species.

One-flowered Cassia. Shrub 1 to 2 feet.

131 C. brevispes (D. C. in Collad. mon. 119. t. 9. f. A.) leaves with 2 pairs of glabrous leaflets; young branches and petioles tomentose; leaflets oblong; stipulas coriaceous, lanceolate, many-nerve at the base; petioles glandless; pedicels axillary, 1-flowered, rather shorter than the petals. # S. Native of Panama.

Short-pedicelled Cassia. Shrub 1 to 2 feet.

132 C. kundthiana (Schlecht. et Cham. in Linnaea. 6. p. 590.) stems trailing, filiform, puberulous; leaves distant, with 3 pairs of approximate leaflets; rachis ending in a bristle-like mucrone; leaflets obliquely-obovate, mucronulate, 3-nerve, and reticulately veined, glabrous, obliquely-ciliolate; petiole pubescent, bearing a gland between the lower pair of leaflets; stipulas coriaceous, acutum, acuminate, many-nerve, ciliolate, peduncles axillary, solitary, bicrataceae, pubescent on the inner side, exceeding the leaves. # S. Native of Mexico, on hills near Hacienda de la Laguna.

Kundth's Cassia. Shrub procerum.

133 C. foliosula; branches pubescent; leaves with 3-4 pairs of elliptic, obtuse, mucronate, glabrous leaflets; pedicels 2-3, axillary; sepals acutum; legumes flat, lanceolate; stipulas linear-subulate. # S. Native of Peru. (v. s. in herb. Lamb.)

Leafy Cassia. Shrub.

134 C. tenella (H. B. et Kunth, nov. gen. amer. 6. p. 365.) leaves with 2-4 pairs of oblong, glabrous leaflets; stems procerum, puberulous; petiole bearing 1 gland; glabrous; pedicels puberulous, axillary, solitary, 1-flowered, bicrataceae. # S. Native of the banks of the river Oriano, near San Borja. Weak Cassia. Fl. June, July. Ch. 1820. Sh. procerum.

135 C. mucronula (Spreng. syst. 2. p. 341.) leaves with 3 pairs of oblong-elliptic, mucronate, glabrous leaflets, with an unarticulated gland between the lower pair; peduncles axillary, 1-flowered. # S. Native of Brazil.

Mucronate-leaved Cassia. Shrub 1 to 2 feet.

§ 2. Mimosoidea (from Mimosa, and idea, like; plants with the habit of Mimosa.) D. C. prod. 2. p. 502. Leaves with from 5 to 50 pairs of leaflets.

136 C. lineata (Swartz. fl. ind. occ. p. 726.) erect; leaves with 5 pairs of oblong, obtuse, mucronulate leaflets, which are pubescent beneath, but glabrous above as well as the petals and branches, with a sessile gland at the base of the petiole; pedicels 1-flowered, axillary, and lateral; legumes hairy. # S. Native of Jamaica, among rubbish.

137 C. cuneata (D. C. in Collad. mon. p. 121.) erect; leaves with 5 pairs of oblong-obovate, obtuse, mucronate leaflets, which are pubescent beneath as well as the branches and petals, with a sessile gland at the base of the petiole; pedicels axillary, aggregate; legumes pubescent, spirally twisted. # S. Native of South America.

Cuneate-leaved Cassia. Shrub 1 to 2 feet.

138 C. prostrata (Humb. et Bonpl. in Willd. ennum. 441.) prostrate; leaves with 5-7 pairs of oblong-linear, curviform, obtuse, mucronate leaflets; petiole pilose, bearing a pedicellate gland at the base; pedicels axillary, solitary, 1-flowered, glabrous; legumes pubescent. # S. Native of South America, near the Oriano. Stipulas and petals cicatricial at the base. H. B. et Kunth. nov. gen. amer. 6. p. 365.

139 C. pygmaea (D. C. mem. soc. nat. gen. 2. p. 2. t. 131.) prostrate; leaves with 4-6 pairs of linear, mucronate leaflets,
which are pubescent as well as the branches and petioles; petiole bearing a pedicellate gland at the base; pedicles solitary, axillary, 1-flowered, longer than the leaves, bracteate above the middle; legumes rather pubescent.  

**Pygmy Cassia.** Pl. prostrate.

140 C. *Pilosa* (Lin. spec. 510.) erect; leaves with 5 pairs of oblong, ciliated leaflets, ending in a bristle; petioles glandless; stems straight, and are as well as the petioles beset with long, spreading, stiff hairs; pedicels axillary, 1-flowered, solitary, bracteate at the base, longer than the leaves.  

**Pilose Cassia.** Pl. June, July. Clt. 1818. Pl. 1 to 2 feet.

141 C. *Gra'mica* (Spreng. neue entd. 5. p. 55.) erect; leaves with 6-7 pairs of canescenct, pubescent leaflets; branches and petioles clothed with velvety hairs; leaflets oblong, mucronate, veiny beneath, with a pedicellate gland on the petiole below the lower pair of leaflets; pedicels axillary, solitary, 1-flowered, length of petiole; legumes pubescent.  

**Written-veined Cassia.** Pl. 1 to 2 feet.

142 C. *Se'sepens* (Lin. spec. 541.) plant rather procumbent; leaves with 7 pairs of oblong-linear, mucronate leaflets; petioles and branches glabrous, with a sessile gland on the petiole beneath the leaflets; pedicels 2-3-together in a fascicle, supra-axillary, 1-flowered, shorter than the petioles; legumes smooth, apiculate, by the style.  

**Fasci-cled-flowered Cassia.** Pl. 1 to 2 feet.

144 C. *Triplóra* (Jacq. hort. schenbr. t. 480.) erect; leaves with 6-10 pairs of oblong, obtuse, mucronlate, glabrous, rather ciliated leaflets, with a sessile gland on the petiole beneath the lower pair; pedioles and branches puberulous; pedicels 3 in a fascicle, supra-axillary, bracteate above the middle, shorter than the petioles; bracteoles and stipulas linear-lanceolate, many-nerved.  

**Three-flowered Cassia.** Pl. June, July, Clt. 1816. Pl. 1 ft. 145 C. *Polyade'na* (D. C. mem. soc. hist. nat. gen. 2. p. 2. t. 132.) erect; leaves with 6-8 pairs of oblong, obtuse, glabrous leaflets, which are cuneate at the base; branches and petioles glabrous; glands 2-4 on the petiole, sessile, placed beneath and among the pairs of leaflets; pedicels 6-3-together, in a fascicle, supra-axillary, bracteate above the middle, shorter than the petioles; bracteoles and stipulas acute and small.  

**Many-glanded Cassia.** Pl. 1 1/2 foot.

146 C. *Burma'nni* (D. C. prod. 2. p. 502.) erect? leaves with 7-9 pairs of oblong, awnly mucronate, glabrous, rather ciliated leaflets, with a sessile gland at the base of the petiole; pedicels axillary, bracteolate, in fascicles; legumes glabrous, but puberulous at the sutures.  

147 C. *Viró'ta* (Swartz, fl. ind. occ. p. 728.) erect; leaves with 10 pairs of ovate-lanceolate, mucronate leaflets, which are rather villous beneath, with a pedicellate gland on the petiole beneath the lower pair; pedicels hairy, 1-flowered, axillary, longer than the petioles.  

**Twirry Cassia.** Pl. June, July. Clt. 1810. Sh. 2 to 3 feet.

148 C. *Swártzii* (Wicks. obs. fl. st. Barth, p. 411.) branches pubescent; leaves with 9-12 pairs of obliquely linear, glabrous leaflets, which are obuse and mucronate at the apex; petioles furnished with a gland at the base; stipulas lanceolate, acuminate, pubescent on the outside; sepals acuminate.  

**Swartz's Cassia.** Shrub 1 foot.

149 C. *Brevíflóra* (Lam. dict. 1. p. 651.) plant diffusely; leaves with 10-12 pairs of oblong, glabrous, obtuse, somewhat 3-nerved leaflets; pediole glandless; stipulas lanceolate-linear, acuminate; pedicels 1-flowered, axillary, twice the length of the leaves, bracteolate above the middle.  

**Short-leafletted Cassia.** Shrub 1 foot.

150 C. *Nic'tans* (Lin. spec. 549. exclusive of the synonyme of Rumpl.) erect; leaves with 8-12 pairs of oblong-linear, obtuse, mucronate leaflets; petioles villous, bearing a somewhat pedicellate gland beneath the lower pair of leaflets; pedicels supra-axillary, very short; legumes pubescent.  

**Cassia.** Native of the West Indies, Carolina, and Pennsylvania. Lin. hort. cliff. t. 36.—Phil. t. 314. f. 5. Grimáldia assírgens, Schrkn. Plants pentandrous.

151 C. *Chameec'hiста* (Lin. spec. 545. exclusive of the synonyme of Comm.) erect; leaves with 10-12 pairs of oblong-linear, mucronate leaflets; with a sessile gland on the petiole, beneath the lower pair; pedicels 2-3-together, in a fascicle, supra-axillary, shorter than the petioles; legumes rather hispid.  

**Var. p. stri'cta** (Schrkn. hort. mon. t. 34.) leaves with 10 pairs of leaflets; flowers nearly axillary.  

**Cassia.** Native of Jamaica.

**Ground-crista or Dwarf Cassia.** Pl. June, Sept. Clt. 1699. Pl. 1 foot.

152 C. *Glandulósa* (Lin. spec. 542.) erect; leaves with 10-12 pairs of oblong, mucronate, glabrous leaflets, with a pedicellate gland on the petiole beneath the lower pair, and some between the leaflets; pedicels aggregate, supra-axillary; legume smooth.  

153 C. *Ciné'rea* (Schelech. et Cham. in Linneza. 5. p. 599.) a much-branched procumbent shrub, clothed with grey adpressed down; leaves with 12-15 pairs of linear, rather cultiform, obliquely semi-cordate leaflets, with a marginal mucron each; petiole furnished with a gland beneath the lower pair of leaflets; stipulas ovate-lanceolate, acuminate, 5-nerved; pedicels solitary or twin, axillary, or supra-axillary, bracteate; stamens all fertile.  

**Cassia.** Native of Mexico, on the sea-shore between Tecoluta and Villa Rica. Legume 4-12-seeded, black.

**Cinerve Cassia.** Shrub procumbent.

154 C. *Pavonia'na*; stem pubescent, simple; leaves with 10-20 pairs of linear, cuspidate, nerved leaflets; stipulas subulate, nerved; peduncles 1-2-flowered, bracteate; petiole bearing a gland beneath the lower pair of leaflets.  

**Pavonia's Cassia.** Pl. 2 feet.
155. *Mimosoides* (Lin. spec. 541.) erect; leaves with 10-15 pairs of linear, mucronate leaflets, with a pedicellate gland on the petiole between the lower pair; pedicels axillary, 1-2-together, 1-flowered, much shorter than the petioles; branches pubescent; legumes glabrous. G. Native of Java and Ceylon.

156. *Calycopterae* (D. C. in Collad. mon. 155. t. 20. f. B.) erect; leaves with 10-15 pairs of linear, mucronate leaflets, which are lined with nerves beneath, with a pedicellate gland on the petiole beneath the lower pair; pedicels 1-2, rather supra-axillary, beset with villi. G. Native of South America, on the banks of the Orinoco.

*Yellow-haired* Cassia. Shrub 1 to 2 ft.

158. *C. ramossissima* (H. B. et Kunth, nov. gen. amer. 6. p. 367.) branches tomentose; leaves with 12-15 pairs of linear-oblong glabrous leaflets, with rather scabrous margins, and with the nerve pilose beneath; petiole bearing a stipitate gland beneath the lower pair of leaflets; pedicels usually solitary, supra-axillary, villously pubescent. G. Native of New Granada, near Fusagasuga, and of Mexico, near Jalapa. C. hirta, H. W. no. 7988.

*Darkish* Cassia. Shrub 1 to 2 ft.

160. *C. Felipénsis* (H. B. et Kunth, nov. gen. amer. 6. p. 368.) branches hairy; leaves with 14-16 pairs of oblong-linear, ciliiform, pilose leaflets, with a stipitate gland on the petiole beneath the lower pair; pedicels solitary or twine, pilose, hardly supra-axillary; legumes pilose. G. Native of New Granada, near Essequebo, and of Mexico. *Very like C. Escynomene.*

Related Cassia. Shrub 3 to 4 ft.

165. *C. Pumila* (Lam. dict. 1. p. 651.) plant diffusey procumbent; leaves with 12-15 pairs of linear, rather mucronate, ciliated leaflets, with a pedicellate gland on the petiole beneath the lower pair; pedicels near axillary, 1-flowered, solitary, bibracteate above the middle, much shorter than the petioles; branches and legumes pubescent. G. Native of the East Indies. C. procumbens, Lin. spec. ed. 1. p. 580, but not ed. 2. Collad. mon. p. 127.—Plak. alm. t. 120. f. 1.

*Diffuse* Cassia. Shrub proc. 166. *C. pedicellariae* (D. C. prod. 2. p. 504.) branches pubescent; leaves with 15-20 pairs of glabrous, linear, mucronate leaflets, with a pedicellate gland on the petiole beneath the lower pair; pedicels 1-flowered, solitary, length of the leaves; legumes glabrous. G. Native of St. Domingo. Nearly allied to *C. diffusa*, but the flowers are 3 times the size.

*Pedicellate* Cassia. Shrub diffuse. 167. *C. riparia* (H. B. et Kunth, nov. gen. amer. 6. p. 260.) branches pubescent; leaves with 16-19 pairs of linear glabrous leaflets, which are adpressedly ciliated on the margins; petiole bearing a stipitate gland beneath the ultimate pair of leaflets; pedicels 1-2, pilose, supra-axillary; legumes pilose. G. Native on the banks of the river Magdalena, near Mompex.

*River-side* Cassia. Shrub 1 to 2 ft.

*Aescynomenes-like* Cassia. Fl. June, July, Ct. 1810. Sh. 1 ft.

169. *C. stipulata*; stem, petioles, and peduncles thickly beset with horizontal, stiff, yellowish hairs; leaves with 18-20 pairs of lanceolate, cuspitate, hairy, nerved leaflets; stipulas ovate, cuspitate, nerved, oblique at the base, tapering much to the apex. G. Native of Peru. (V. s. in herb. Lamb.)

*Stipulata* Cassia. Shrub 1 to 2 ft.

170. *C. Patellaria* (D. C. in Collad. mon. p. 125. t. 16.) erect, clothed with villose pubescence; leaves with 18-20 pairs of linear cuspitate leaflets, with 1 or 2 sessile glands along the petiole; pedicels supra-axillary, short, in fascicles; calyx and legumes hairy. G. Native of Cayenne and Panama.

*Little-Dish* Cassia. Pl. 1 to 2 ft.

171. *C. Parkeriana* (D. C. prod. 2. p. 565.) erect, puberulous; leaves with 20 pairs of oblong, mucronate, glabrous leaflets, with a pedicellate turbinate gland on the petiole beneath the lower pair; pedicels supra-axillary, branched, many-flowered; legumes shining, rather pilose. G. Native about Demerara. Habitat of *G. Lecchenauliton*, but differs in the glands being pedicellate.

172. *C. Otterbeinii* (Mey. prim. essq. 160.) leaves with 20 pairs of oblong-linear glabrous leaflets, with a pedicellate gland on the petiole between the lower pair; petioles, pedicels, and branchlets clothed with canescent pili; pedicels 2-3-together, extra-foliaceous; legumes shining, rather pilose. G. Native of Guiana, in bushy places near Essequibo.

*Otterbein’s* Cassia. Shrub 1 to 2 ft.
LEGUMINOSÆ.

CCLXII. CASSIA.

449

173 C. aspera (Mühl. cat. ex Ell. sketch, p. 474.) erect, hispid; leaves with 24 pairs of linear-lanceolate ciliated leaflets; petiole bearing a turbinate gland beneath the lower pair of leaflets; peduncles few-flowered, supra-axillary; flowers either heptandrous or euneandrous, with 3 of the stamens longer than the rest. O. H. Native of Georgia, in the Island of Eding. Habit of C. nitens.

174 C. leschenaultiana (L. C. M. mem. soc. hist. nat. gen. 2. p. 132.) erect; leaves with 20-25 pairs of oblong-linear ciliate leaflets, which are blunt at both ends; petiole bearing a sessile gland beneath the lower pair of leaflets, and ending in an aihn at the apex, and is, as well as the branches, pubescent; pedicels in fascicles, supra-axillary; flowers heptandrous. O. H. Native of Bengal. Stamens very unequal. Pedicels when in fruit about 3-4 lines long. Stipulas ending in long taper points, many-nerved at the base, 8 lines long. Calyx smooth, teeth acuminate._leschenaultiana. Cassia. Shrub 1 to 2 feet.

175 C. Wallaceiana (D. C. I. c.) erect; leaves with 20-25 pairs of oblong-linear mucronate leaflets, which are obtuse at both ends; petioles bearing a sessile gland beneath the lower pair of leaflets, and ending in a bristle at the apex, and is, as well as the branches and calyxes, pubescent; pedicels in fascicles, supra-axillary; flowers decandrous. O. H. Native of Nepaul. C. dimidiiata, Roxb. hort. beng. p. 32. D. Don, prod. fl. nep. 247. Stamens nearly equal. Stipulas 4-6 lines long. Sometimes there are 2 glans on the petiole, one between each of the 2 lower pairs of leaflets.

176 C. angustissima (Lam. dict. 1. p. 650.) erect; leaves with about 30 pairs of very small, linear, mucronate leaflets; stipulas lanceolate-setaceous; peduncles twin or 2-parted, and hairy as well as the branches. O. S. Native of Java and Amboyna, ex Rumph. ambl. 6. t. 67. f. 1._Very-narrow-leafletted Cassia. Fl. July, Aug. Clt. 1820. Pl. 1 foot.

178 C. guineensis; stem erect, simple, flexuous; leaves with 4 pairs of oval-lanceolate, entire, acute, glabrous leaflets; pedicels 1-flowered, axillary, and terminal. O. S. Native of Guinea, in the Island of St. Thomas._Guinean-stemmed Cassia. Shrub 1 foot.

179 C. microphylla (Willd. spec. 2. p. 529.) erect; leaves with about 50 pairs of oblong-linear leaflets; petioles narrowly margined between the pairs of leaflets, and bearing a sessile gland beneath the lower pair of leaflets; pedicels solitary, supra-axillary; legumes villous. O. S. Native of the Island of Santa-Cruz. Stem branched, pubescent. Stipulas lanceolate, acuminated. Perhaps many species are confused under this name._Var. g, guineensis (D. C. prod. 2. p. 505.) leaves with about 40 pairs of leaflets; petiole not margined; pedicels solitary. O. S. Native of Guinea. C. geminata, Vahl, ex hort. Puer._Var. y. facetophylla (D. C. in Collad. mon. p. 128. t. 13.) glans usually twin beneath the leaflets; pedicels 2-3, aggregate; legumes at length smoothish. O. S. Native of Tobago._Var. d, Senegalensis (D. C. l. c.) leaves with about 40 pairs of leaflets; petiole a little margined; legumes smoothish. O. S. Native of Senegal, at Richard-Tole._Small-leafletted Cassia. Fl. June, Sept. Clt. 1810. Pl. 1 ft. 180 C. arenaria (H. B. et Kunth, nov. gen. amer. 6. p. 370.) branches flexuous, tetragonal, puberulous; leaves with 45-50 pairs of linear glabrous leaflets, with rather hispid scabrous margins, lower ones and stipulas ciliated; petiole bearing 2 glands beneath the lower pair of leaflets; peduncles 1-2, pilose, axillary. O. S. Native on the banks of the Orinoco, near Maypures, in sandy shady places._Sand Cassia. Fl. June, May. Clt. 1819. Shrub 1 to 2 ft. + Species not sufficiently known.

181 C. tetraphylla (Coll. mon. 130.) leaves with 2 pairs of ovate leaflets; stems procumbent; flowers solitary, axillary; legumes hairy. O. S. Native of Mexico, about Vera Cruz. C. procumbens, Mill. dict. no. 50. but not of Lin. Perhaps the same as C. hispida._Four-leafletted Cassia. Pl. proc.

182 C. desvauxii (Coll. mon. 131.) leaves with 2 pairs of glabrous, veiny, ovate-lanceolate leaflets; stem shrubby; legumes villous. O. S. Native of South America. C. tetraphylla, Desv. journ. bot. 1814. p. 72. but not of Mill._Desvaux's Cassia. Shrub.

183 C. latifolia (Meyer, prim. essq. 166.) leaves with 2 pairs of oblong glabrous leaflets, with a large gland between the lower pair, and a small one between the superior pair. O. S. Native of Guiana. Flowers large, yellow._Broad-leafletted Cassia. Shrub 0 to 8 feet.

184 C. glabra (Coll. mon. 131.) leaves with 2 pairs of oblately ovate-roundish, obtuse, quite glabrous, veiny leaflets; branches angular, glabrous. O. S. Native of Brazil. C. venosa, Desv. journ. bot. 1814. p. 72. but not of Zucc._Glabrous Cassia. Shrub.

185 C. arborea (Mill. dict. no. 15. but not of Vahl.) leaves with 2 pairs of oblong-ovate leaflets, which are villous beneath; flowers corimbosae; stem erect, arborescent; legumes compressed. O. S. Native of Mexico, about Vera Cruz._Arborescent Cassia. Tree 20 to 30 feet.

186 C. aurea (Coll. mon. p. 131.) leaves with 2 pairs of oblong-lanceolate, curred leaflets, with a large ovate gland between the lower pair. O. S. Native of Brazil. Vand. fl. lus. et bras. in Röm. script. p. 104._Eared-leafletted Cassia. Shrub or tree.

187 C. cubensis (Hoffm. verz. 1824. p. 209.) leaves with 2 pairs of ovate, acuminate, ciliated, rather pilose leaflets, which are unequal at the base, outer ones the largest, with a gland on the petiole between the lower pair; legumes slender, terete, obtuse, somewhat incurved. O. S. Native of Cuba._Cuba Cassia. Shrub 6 to 8 feet.

188 C. monanthia (D. C. prod. 2. p. 506.) leaves with 3 pairs of ovate, acuminate, villous leaflets; flowers solitary, axillary; legumes erect, terete; stem erect, herbaceous. O. S. Native of Mexico, about Campeachy. C. uninod, Mill. dict. no. 5._One-leafletted Cassia. Pl. 1 foot.

189 C. milleri (Coll. mon. p. 132.) leaves with 3 pairs of obtuse umarginate leaflets; stems pilose; flowers solitary, axillary, longer than the petioles; legumes flat. O. S. Native of Jamaica. C. emarginata, Mill. dict. no. 13. but not of Lin._Miller's Cassia. Shrub.

190 C. villosa (Mill. dict. no. 14.) leaves with 3 pairs of oblong-oval, equal, villous leaflets; legumes articulate; stem erect, arborescent. O. S. Native of Mexico, about Campeachy. Flowers small, straw-coloured._Villous-leaved Cassia. Tree 14 to 16 feet.

191 C. homophylla (Hoffm. verz. 1824. p. 209.) leaves with 3-4 pairs of elliptic-oblong, obtuse, glabrous leaflets, outer ones hardly larger than the others; petiole furnished with 1 or 2 subulate sessile glands between 1 or 2 of the lower pairs of 3 M.
leaflets. h. g. Native country; flowers, and fruit unknown. Said to be allied to C. occidentalis.

Equal-leaffletted Cassia. Shrub.

192 C. Houstonia (Coll. mon. p. 132.) leaves with 4 pairs of oblong-ovate leaflets; stems procumbent; peduncles axillary, 2-flowered. h. g. Native of Jamaica. C. biiflora, Mill. dict. no. 14, but not of Lin.

Houston’s Cassia. Pl. proc.

193 C. macrodeca (Collad. mon. p. 132.) leaves with 4 pairs of oblong, eared, mucronate leaflets, bearing a large orbiculate gland at the base of the petiole. h. g. Native of Brazil. Vand. in Reem. script. p. 104.

Long-glanded Cassia. Shrub.

194 C. pubescens (Lag. gen. et spec. p. 14. no. 184.) leaves with 4 pairs of rather hairy, ovate, acuminate leaflets, outer ones lanceolate, with a conical, somewhat pedicellate gland at the base of the petiole.—Native of Guayaguay.

Pubescent Cassia. Shrub.

195 C. arachnoideus (Burch. cat. no. 1680, ex tr. 1. p. 341.) leaves with 4-5 pairs of obvate leaflets, which are rounded or obcordate at the apex; stems herbaceous, trailing; racemes simple, axillary; leaflets ovate-orbicular, membranous, flattened.—Native of the Cape of Good Hope.

Arachis-like Cassia. Pl. trailing.

196 C. singulara (Gaill. fl. a mereoc, 1826.) branches tomentose at the apex; leaves with 7 pairs of obtuse intercalary leaflets, pubescent on the back and margins. h. g. Native of Egypt, about Singue.

Singue Wild-secca. Shrub.

197 C. aschren (Forsk. descrip. p. 86.) leaves with 4-5 pairs of oblong-obovate, glabrous, oblong, acuminate leaflets, with a subulate gland between each pair; leaflets flat. h. g. Native of Arabia at Mecca, where it is called Aschrech.

Aschrech Cassia. Pl. 1 foot.

198 C. plummeri (D. C. prod. 2. p. 506.) leaves with 5 pairs of ovate-lanceolate acuminate leaflets; leaflets compressed, long, straight, pendulous, torose at the seeds. h. g. Native of Guadaloupe. Plum. ed. Burm. t. 77. C. planisiliqua, Lam. dict. 1. p. 645, but not of Lin.

Plumer’s Cassia. Tree.

199 C. frutescens (Mill. dict. no. 2.) leaves with 5 pairs of ovate glabrous leaflets, outer ones the longest; stem pubescent; leaflets long, terete. h. g. Native of Jamaica.

Shrubby Cassia. Shrub. 5 to 6 feet.

200 C. tierra (Wild. num. suppl. 23.) leaves with 5 pairs of oblong hairy leaflets, with an oblong gland on the petiole between the lower pair; stipulas subulate; branches hairy. h. g. Native country unknown.

Hairly Cassia. Shrub.

201 C. Sabak (Gaill. fl. a mereoc, 1826.) branches smooth, ferruginous; corolla an inch and a half; flowers numerous. h. g. Native of Egypt, on mount Agaro, where it is called Sabak, and where the inhabitants use the husks of the pods to tan leather.

Sabak Cassia. Shrub.

202 C. sumatra (Roxb. ex Horn, hort. hafn. suppl. p. 135.) leaves with 4-5 pairs of elliptic coriaceous leaflets, which are retuse and mucronate at the apex. h. g. Native of Sumatra.

Sumatra Cassia. Shrub.

203 A. toledo (Dum. Cours. bot. cult. ed. 2. vol. 6. p. 34.) leaves with 4 pairs of ovate-orbicular, mucronate, glabrous leaflets, which are palest beneath; petioles glandless. h. g. Native country unknown.

Glandless Cassia. Shrub. 4 to 6 feet.

204 C. tuberculata (Collad. mon. p. 135.) leaves with 7-8 pairs of oblong acuminate leaflets, lower ones the smallest; petiole glandless; stem angular, tubercled. h. g. Native of Brazil. Vand. in Reem. script. p. 104.

Tubercled-stemmed Cassia. Shrub.

205 C. decipiens (Desv. journ. bot. 1814, p. 73.) leaves with usually 8 pairs of linear-lanceolate, acute, quite glabrous leaflets; leaflets compressed, elongated, somewhat oriform. h. g. Native of America.

Decieving Cassia. Shrub.

206 C. sophoroides (Collad. mon. p. 134.) leaves with 8-10 pairs of lanceolate, acute, glabrous leaflets, with rather villous margins; petiole bearing an oblong gland at the base; leaflets compressed. h. g. Native of the East Indies. C. Sophora, Lam. dict. 1. p. 649, but not of Lin.

Sophora-like Cassia. Shrub. 6 to 8 feet.

207 C. chamechnittoides (Collad. mon. p. 134.) leaves with many pairs of linear leaflets; stems procumbent, frutescent; flowers large, solitary, axillary; leaflets glabrous. h. g. Native of Mexico, about Vera Cruz. C. chamechistis, Mill. dict. no. 17, but not of Lin.

Chamechistis-like Cassia. Shrub proc.

208 C. hornemannii (D. C. prod. 2. p. 507.) erect; leaves with many pairs of elliptic, ciliate, mucronate leaflets, bearing one sessile gland on the petiole. h. g. Native country unknown. C. venosa, Horn. hort. hafn. suppl. p. 46, but not of Zucc. Hornemann’s Cassia. Pl. 1 to 2 feet.

209 C. multijuga (Rich. in act. soc. hist. nat. par. 108.) arboreous, quite glabrous; leaves with 20-25 pairs of oblong elliptic leaflets, which are white beneath; panicle terminal, multiple. h. g. Native of Cayenne.

Many-paired-leaffletted Cassia. Tree 20 to 30 feet.

210 C. discolor (Herb. Desv. Hamilt. prod. p. 38.) stem shrubby; leaves with usually 6 pairs of obovate, oblong, rather emarginate, glabrous leaflets, cuneeous beneath; flowers terminal, sub-racemose; legumes broad, oblong, compressed. h. g. Native of Jamaica.

Discoloured-leaved Cassia. Shrub.

211 C. himbuta (Herb. Desv. Hamilt. prod. p. 38.) stem shrubby; leaves with usually 6 pairs of ovate, obtuse, mucronulate leaflets, which are tomentose beneath; flowers axillary, spicate; legume glabrous, compressed, very long, and linear. h. g. Native of Jamaica.

Hairly Cassia. Shrub.

Cult. All the species of Cassia are of easy culture; they thrive best in a mixture of loam and peat, and cuttings of the shrubby kinds root readily in sand under a glass-haiv; those of the stinee species in heat. The C. Mariafloria being the only hardly perennial species, should be grown in a sheltered situation in peat soil, and it may either be increased by seeds or by dividing the plant at the root in spring.

1 D. ovalifolia (Desv. 1. c.) leaves oval-elliptic, canescent beneath; flowers axillary; legumes hairy, usually twined. h. g. Native of Brazil. Cassia simplicifolia, Desv. journ. bot. 1814. p. 72. D. C. prod. 2. p. 505.

2 Ovel-leaved Delaria. Shrub.

Delaria (Desv. 1. c.) h. g. Native of Guinea. Nothing further is known to us of this plant.

Pear-leaved Delaria. Shrub.

Cult. A mixture of loam and peat is the soil best suited to the
species of Delaria, and cuttings will root readily if planted in a pot of sand, with a hand-glass placed over them in heat.

**CCLXXIV. CHAMEFFISTULA.** *(chame, a word usually applied in botany to signify false, and fistula, a pipe; in reference to the cylindrical pods; but it has nothing to do with the true Fistula, which is the Cathartocarpus Fistula).* Cássia, section II. Chameffistula, D. C. in Collad. mon. p. 87. D. C. prodr. 2. p. 450.—Chamaecassia, Breyn. prod. 2. p. 28. 

**Linn. syst. Decidinria, Menogynia.** Sepals 5, very obuse, hardly joined at the base, more or less unequal. Petals 5, unequal. Stamens 10, free, unequal, the 3 lower ones longest, the 4 middle ones short and straight, and the 3 superior ones bearing disposed abortive anthers. Anthers opening by 2 pores at the apex. Ovary stipitate. Legumes terete, hardly distinct, slender, membranous, divided by transverse disseminae into 1-seeded divisions internally, and filled with pulp. Seeds elliptic, compressed, horizontal. —Trees or shrubs, with abruptly pinnate leaves, bearing glands on the petioles. Flowers of all yellow.

* Leaves with 2 pairs of leaflets. **Petiole bearing a gland between the lower pair of leaflets.**

1. **Cacellaria;** leaves with 2 pairs of ovate, obtuse, oblique leaflets, with a gland on the petiole between the lower pair; racemes axillary, pedunculate; legumes cylindrical, acute. h. **Native of Surinam.** Cássia cacellaria, Lin. fil. suppl p. 231. Houst. rel. t. 17. Jacq. fragm. t. 85. f. 4 ? Cathartocarpus Bacillus, Lindl. bot. reg. t. 881. Legume a foot long, terete.

2. **Speciosa;** leaves with 2 pairs of rather coriaceous unequal-sided leaflets, which are shining above and glabrous, but densely clothed with tomentose pubescence beneath, ultimate pair twice the size of the other, obovate-oblong, with a cylindrical gland on the petiole between the lower pair; corynbs terminal. h. **Native of Brazil.** Cássia microcarpa, Nees. in fl. 1821. p. 229. C. speciosa, Schrad. in Gott. anz. 1821. p. 718. Ovary nearly terete, on a short style, thickly clothed with yellow hairs. Style short, glabrous, uncinate, thick. Anthers large.

4. **C. inaequilatera;** leaves with 2 pairs of ovate, rather acuminate, glabrous leaflets, which are unequal-sided at the base, with a sessile gland on the petiole between the lower pair; racemes axillary, pedunculate; legumes incurved. h. **Native of St. Martha.** C. inaequilatera, Bert. ined. ex. D. C. prodr. 2. p. 490. Very like the following species, but differs in being glabrous.

5. **Unequal-sided-leafletted Chameffistula.** Tree 20 feet.

6. **C. macrophylla;** leaves with 2 pairs of elliptic-oblong, bluntish leaflets, which are glabrous above, but clothed with soft hairs beneath as well as the branchlets and petioles, with an obtuse gland on the petiole between the lower pair of leaflets; racemes axillary, pedunculate; legumes incurved. h. **Native of New Granada.** At the mouth of the river Sinu near Carthagena. Cássia macrophylla, Kunth, mim. p. 126. t. 38. nov. gen. amer. 6. p. 340. Lateral leaflets nearly equal at the base.

7. **Long-leaved Chameffistula.** Tree.

8. **C. rubescens;** leaves with 2 pairs of unequal-sided, elliptic-oblong, acute leaflets, which are glabrous above, but clothed with adpressed pubescence beneath, as well as on the branches and petioles, lower pair smaller, ovate-roundish, with an oblong-conical gland on the petiole between the lower pair; racemes axillary, pedunculate. h. **Native of New Granada.** Cássia rubescens, H. B. et Kunth, nov. gen. amer. 6. p. 341.

**Puberulous Chameffistula.** Tree.

9. **Corymbosa;** leaves with 2 pairs of unequal-sided, acuminate-cuneate leaflets, which are pubescent above, but clothed with soft tomentose pubescence beneath, superior pair oblong, lower small and ovate, bearing an oblong, clavate gland on the petiole between the lower pair; racemes few-flowered. h. **Native of New Andalusia, on Mount Cocollar.** Cássia corymbosa, Kunth, mim. p. 129. t. 39. H. B. et Kunth, nov. gen. amer. 6. p. 342.

9a. **Shorty-leafletted Chameffistula.** Tree 50 feet.

10. **C. melanoarpa;** leaves with 2 pairs of ovate-lanceolate, acuminate leaflets, which are shining above and quite glabrous beneath, as well as the branches and petioles, lower pair one half smaller than the outer pair; gland cylindrical, acute, situated on the petiole between the lower pair of leaflets; racemes pedunculate, axillary; legumes straight, terete. h. **Native of Jamaica.** Cássia melanocarpa, Bert. ined. ex. D. C. prodr. 2. p. 491. Legume smooth, black, on a short stipe within the calyx, obtuse, mucronulate by the style, rather torulose.

**Black-fruited Chameffistula.** Tree 20 to 30 feet.

11. **C. promiscens;** leaves with 2 pairs of ovate-elliptic, acuminate, glabrous leaflets, lower pair the smallest, with a prominent gland between; branches and peduncules pubescent; racemes forming a large, terminal, corymbose panicle. h. **Native of Brazil.** Sello. Legume unknown. (v. s. herb, Lam.) Prominent-glanded Chameffistula. Tree.

12. **C. ruiziana;** leaves with 2 pairs of broad, elliptic, obtuse, glabrous leaflets, which are oblate at the base, with a large obtuse gland between the lower pair on the petiole; racemes twain, short, corymbose, axillary. h. **Native of Guaiqui.** Cássia macrophylla, Ruiz et Pav. in herb. Lamb. Locium unknown. Lower pair of leaflets the smallest.

13. **Oblique-leafletted Chameffistula.** Tree.

14. **C. elegans;** glabrous; leaves with 2 pairs of oblique, elliptic, acuminate, coriaceous leaflets, lower pair the smallest, with a prominent oblong-conical gland on the petiole between each pair. h. **Native of Peru.** Legumes unknown. Perhaps a species of Cássia.

**Elegant Chameffistula.** Tree.

**Leaves with 3 or more pairs of leaflets.**

15. **C. astrotites;** close in every part, with stellate, fleshy tomentum; leaves with 3-4 pairs of leaflets, floral ones with only 2 pairs; leaflets oblongly ovate-lanceolate, acuminate, ultimate one the largest, with a clavate gland on the petiole, between the lower pair, or one between both of the two lower pairs; stipulas setaceous; racemes axillary, pedunculate, corymbose; branches filiform. h. **Native of Mexico, in Plan del Rio.** Cássia astrotites, Schlecht. et Cham. in Linneea. 5. p. 597. Legume elongated, somewhat moniliform.

**Starry-haired Chameffistula.** Tree.

17. **Corymbosa-flowered Chameffistula.** Shrub 6 to 10 feet.

18. **C. inflata;** leaves with usually 3 pairs of obovate-roundish, glabrous leaflets, which are glabrous beneath, with a clavate gland on the petiole between the lower pair; racemes panicked; legumes inflated. h. **Native of South America,

Inflated-podded Chamaefistula. Shrub.
15 C. contorta; erect, branched; leaves with 3 pairs of obovate, pubescent, mucronate leaflets; pedicels axillary, solitary, 1-flowered; legume linear, subterete, twisted. h. S. Native of Guinea, in the island of St. Thomas. Flowers large, yellow.

Twisted-podded Chamaefistula. Shrub.
16 C. crotalariaioides; leaves with 3-4 pairs of oval, rather mucronate, pubescent leaflets, with a sessile elongated gland on the petiole, between each of the pairs of leaflets, except the upper one; branches pubescent; legumes ovate-oblong, puberulous, mucronate. h. S. Native of South America. Càssia crotalarioioides, Kunth, mimm. t. 40. Sepals oblong, blunted, 3-nerved. Stipulas linear, subulate, elongated. Perhaps a species of Càssia.

Crotalaria-like Chamaefistula. Shrub 1 to 2 feet. 17 C. floribusida; leaves with 3-5 pairs of oblong-lanceolate, glabrous leaflets, with an oblong gland on the petiole between the lower pair; branches glabrous; peduncles many-flowered; legumes nearly cylindrical, 3-times the length of the pedicel. h. S. Native of New Spain. Càssia floribunda, Cav. ex. Collad. mon. p. 88. Càssia corymbosa, Ort. dec. p. 124, but not of Lam.

Tree or shrub.
18 C. herbértiana; leaves with 5 pairs of lanceolate, acuminate leaflets, which are smooth above but pubescent beneath as well as the branches and petioles; petiole bearing small, sessile glands, one between each pair of leaflets, except the 2 extreme pairs; racemes axillary and terminal, sub-corymbose. h. S. Native of Barbadoes. Càssia herbértiana, Lindl. bot. reg. 1422. Flowers large, straw-coloured.

Smooth Chamaefistula. Shrub 6 to 12 feet.
20 C. pendula; leaves with 4 pairs of oblong, rounded leaflets, which are glaucous beneath, and glabrous on both surfaces as well as the branches; petiole bearing a clavate gland between the lower pair of leaflets; racemes axillary, many-flowered; legumes terete, rather torulose, glabrous. h. S. Native of New Granada, near Guadua. Càssia penda, Willd. enum. 1. p. 446. H. B. et Kunth, nov. gen. amer. 6. p. 343.

21 C. indecora; leaves with 4 pairs of obovate-oblong leaflets, which are rounded at the apex, glabrous above, but clothed with soft pubescence beneath as well as the branches and petioles; petiole bearing a gland between the lower pair of leaflets; peduncles axillary, many-flowered; legumes compressed, puberulous. h. S. Native of Caracas. Càssia indecora, H. B. et Kunth, nov. gen. amer. 6. p. 343. Legume 5-6 inches long, divided internally into about 75 cells.

Indecorous Chamaefistula. Tree.
22 C. torosa; leaves with 4-7 pairs of obovate-lanceolate, glabrous leaflets, with a gland at the base of the petiole; branches glabrous; legumes cylindrical, torulose. h. G. Native of China. Càssia torosa, Cav. descr. pl. p. 191. Càssia Chinesíum, Jacq. icon. rar. t. 73. but not of Lam. Càssia torulosa and Càssia Índica, Poir. suppl. 2. p. 126 and p. 127.

23 C. chinesí; leaves with 3-5 pairs of oval, acutish leaflets, which are smoothish as well as the branches; petiole bearing a solitary gland; peduncles very short, 3-4-flowered. h. G. Native of China. Càssia Chinesíum, Lam. dict. 1. p. 644, but not of Jacq. Càssia grandiflora, Pers. ench. 1. p. 457. but not of Desf.

China Chamaefistula. Fl. June. Clt. 1807. Sh. 4 to 6 ft. 24 C. glácta; leaves with 4-5 pairs of oval leaflets, which are attenuated at the base, and obtusely, somewhat emarginate and mucronate at the apex, glabrous as well as the branches; petiole glandless; racemes axillary, rather velvety, the upper ones disposed in a kind of panicle. h. G. Native of Jamaica, where it is cultivated under the name of Càssia arboreíscens, Càssia gigantea, Bert. exd. ex. D. C. prod. 2. p. 492. Sepals roundish. Pedicels crowded, an inch long. Bracteas subulate. Legumes unknown.

Giant Chamaefistula. Tree 20 to 30 feet.
25 C. excélsa; leaves with 10-20 pairs of elliptic-oblong leaflets, which are unequal at the base, mucronate at the apex, smoothish above and shining, but pubescent beneath as well as the petioles and peduncles; corymbs of flowers pannicled. h. S. Native of Brazil. Càssia excélsa, Schrad, in grett. anz. p. 717. Càssia fastigíata, Nees. et Neuw. reis. bras. ex. flora, 1821. p. 308 and p. 329.

Tall Chamaefistula. Tree.
26 C. coromandelíana; leaves with G-10 pairs of lanceolate acute leaflets, which are glabrous as well as the branches; petiole bearing an ovate thick gland near its base; legumes terete, smooth. h. S. Native of the East Indies. Càssia coromandelíana, Jacq. fragm. 67. t. 100. Very like C. torosa.

Coromandel Chamaefistula. Fl. June, Jul. Clt. 1823. Tr. 27 C. sophéra; leaves with 8-10 pairs of lanceolate, acute, nearly equal leaflets, which are glabrous as well as the branches; petiole bearing an oblong gland at the base. h. S. Native of India in shady woods, as well as in Egypt and China. Càssia Sophéra, Lin. spec. 452.—Rumph. ambi. 5. t. 97. f. 1.—Rheed. mal. 2. t. 52.—Burn. zeyl. t. 98. Racemes corymbose. Flowers large, pale yellow. Perhaps numerous species are confused under the name of C. Sophéra.

pairs of oval-oblong leaflets, which are equal at the base, mucronate at the apex, puberulous above, but clothed with soft tomentum beneath, when young tomentose; petiole glandless; racemes axillary, shorter than the leaves; legumes compressed, wrinkled, very long.  S. Native of the Caribbean islands, Guiana, Brazil, and between Turbaco and Cartagena, &c. Cassia graniitis, Lin. fil. suppl. 230. Cassia mollis, Val. symb. 3. p. 57. Jacq. fragm. t. 85. f. 3. in fruit. Cassia Brasiliâna, Lam. dict. 1. p. 619.—Brey. cent. t. 21. but not t. 14. Legumes a little compressed, a foot and a half long.

**Great Purging-cassia.** Clt. 1829. Tree 30 to 40 feet.

2 C. ferrugineus; leaves with 13-20 pairs of oblong-linear, short-accumulated leaflets, which are euneated on the upper side at the base, and clothed with tomentose pubescence beneath; petiole glandless; racemes about equal in length to the leaves, erect; branches angularly furrowed.  S. Native of Brazil. Bactyrilibium ferrugineum, Schrad. in Gæt. an. 1821. p. 713. Cassia ferruginea, Schrad. in litt. 1825. Hardly distinct from the preceding species, according to Nees. in flor. 1821. p. 328.

**Rusty Purging-cassia.** Tree 30 to 40 feet.

3 C. moschatus; leaves with 14-18 pairs of oblong leaflets, which are rounded at the apex, and clothed with soft pubescence on both surfaces; petiole glandless; legumes cylindrical.  S. Native of South America, near Mompox, on the banks of the river Magdalena. Cassia moschata, H. B. et Kunth, nov. gen. amer. 6. p. 358. The pulp in the fruit has a musky scent according to Böhmian.

**Mussy Purging-cassia.** Tree 40 feet.

4 C. speciosus; leaves with 14 pairs of oblong acutish leaflets, which are smoothish above but clothed with soft pubescence beneath; petiole glandless; racemes many-flowered; legumes terete, rather compressed, undulate-annulated.  S. Native of South America, on the banks of the river Magdalena, near the town of Tenerife. Cassia speciosa, H. B. et Kunth, nov. gen. amer. 6. p. 358. Cassia Humboldtiana, D. C. prod. 2. p. 489.

**Shoey Purging-cassia.** Clt. 1826. Tree 40 feet.

5 C. marginatus; leaves with 12-15 pairs of oval-oblong, unequal leaflets, which are obtuse, emarginate, and mucronate at the apex, clothed with velvety down beneath, as well as the branches and petioles; racemes axillary, much shorter than the leaves.  S. Native of Coromandel. Cassia marginata, Roxb. hort. beng. p. 51. Cassia Roxburchii, D. C. prod. 2. p. 489.

**Marginate-leaved Purging-cassia.** Clt. 1810. Tree 20 ft.

6 C. Trinatâtes; leaves with 8-10 pairs of ovate-oblong, acuminate leaflets, which are rather puberulous, and shining a little above, but paler, and clothed with rather villous down beneath; petioles glandless, and are as well as the branches and peduncles clothed with fine velvety down; paniculate terminal.  S. Native of the island of Trinidad. Cassia Trinatâtes, Reichb. in Sieb. pl. exsic. trim. no. 57.

**Trinidad Purging-cassia.** Clt. 1820. Tree 20 to 30 feet.

7 C. Sieberianus; leaves with 8-10 pairs of ovate-oblong shining leaflets, which are pale and beset with very minute pubescence beneath; petioles glandless; branches, peduncles, and calyxes clothed with fine velvety down; racemes loose, bracteate.  S. Native of Senegal. C. Javânicas affinis, Sieb. pl. exsic. seneg. no. 48. Cassia Sieberiana, D. C. prod. 2. p. 489.

**Sieber’s Purging-cassia.** Tree 20 to 30 feet.

8 C. Consensus (G. Don, in edin. phil. journ. 1824.) leaflets ovate-lanceolate, acuminate, and emarginate, 3-nerved at the base, white beneath; stipulas subulate; racemes pendulous, loose; legumes terete, with elevated sutures.  S. Native of Sierra Leone, where the pods are called Monkey drumsticks. The tree has much the appearance of Laburnum when in flower.

**Conspicuous Purging-cassia.** Fl. Feb. Clt. 1793. Tree 20 to 50 feet.

9 C. Javaicinus (Pers. ench. 1. p. 459.) leaves with 12-15 pairs of ovate, obtuse, glabrous leaflets; petioles glandless; racemes axillary; legumes nearly cylindrical, very long, and transversely torose.  S. Native of Java and the Moluccas, &c. Cassia Javanica, Lin. spec. 542. exclusive of the synonyms. —Rumph. amb. 2. t. 22. Cassia Bacillatus, Gerin. fruct. 1. p. 318. Flowers flesh-coloured. Legumes 2 feet long, rather thick, containing a black cathartic pulp as the rest of the species, which is given to horses, hence its name, Horse-cassia, in the East Indies.

**Java Purging-cassia.** Clt. 1779. Tree 30 to 40 feet.

**Tall Purging-cassia.** Tree 30 to 40 feet.

11 C. Attehë; leaves bipinnate, glandless, glabrous; leaflets ovate-oblong, glandless; legumes long, cylindrical; seeds covered with green pulp when mature.  G. Native of Egypt, at Alo Qoulgei, in the province of Qamanay, where it is called Atteleh. Cassia Atteleh, Gailland, in fl. meroe. 1826. Nearly related to C. Fistula.

**Atteleh Purging-cassia.** Tree 20 feet.

12 C. Fis'tula (Pers. ench. 1. p. 459.) leaves with 4-6 pairs of ovate, rather acuminate, glabrous leaflets; petioles glandless; racemes loose, bracteless; legumes cylindrical, rather obtuse, smooth.  S. Native of the East Indies, from whence it has been introduced to South America and the West Indies. Cassia Fistula, Lin. spec. 540. Gerin. fruct. 2. t. 147. f. 1. Woody. med. bot. 1. t. 164. Regn. bot. with a figure, Lam. ill. t. 333. Neck. voy. aegypt. p. 21. t. 4.—Rumph. amb. 2. t. 21. Planch. icon. t. 327. Pods cylindrical, with elevated sutures, 1-2 feet long, containing a black sweet pulp. This pulp is an easy and gentle laxative. There are two sorts of this drug in the shops, one brought from the East Indies, the other from the West. The pods of the latter are generally large, rough, thick, rounded, and the pulp nauseous; those of the former are smaller, smoother, the pulp blacker, and of a sweeter taste, and are preferred to the other. Such pods should be chosen as are heavy and new, and do not make any rattling noise, from the seeds being loose within, when shaken, indicating that the pulp is dried up. The pulp should be of a bright shining black colour, and have a sweet taste. The greatest part of the pulp dissolves both in water and alcohol, and may be extracted from the pod by either. In the shops they boil the bruised pods in water, and evaporate the solution to a due consistency. Vauquelin has analyzed the pulp, and found it to consist of parenchyma, gluten, gelatine, gum, extractive, and crystallizable sugar. In medicine, the pulp from its saccharine and extractive constituents is a gentle laxative, and is recommended in a dose of some drachms in costive habits. In larger quantities it generally excites nausea, although some recommend it.

**Fistula-podded Purging-cassia or Pudding Pipe-tree.** Fl. June, July. Clt. 1731. Tree 30 to 50 feet.

Rhomb-leaf-jetteted Purging-cassia. Tree 20 to 30 feet. 

14 C. LEC'TA; leaves with 4 pairs of thin elliptic-oblong leaves, which are rather hairy above, and clothed with soft hairy pubescent beneath; petals glandless; peduncles 3-5-flowered. A. S. Native near Guayaquil, on the sea shore. Cassia lecta, H. B. et Kunth, nov. gen. amer. p. 310. Legume unknown. 

Mad Purging-cassia. Tree 30 to 40 feet. 

15 C. FISTULAE; leaves bipinnate, with 2 pairs of pinnae, each pinna bearing 6 pairs of leaflets; racemes erect; legumes terete, obtuse. A. S. Native of Mexico. C. fistula, Moc. et Sesse, fl. mex. icon. med. Cassia fistuloseides, Collad. mon. p. 87. t. 1. This is a very doubtful species of Cathartocarpus from the form of the leaves. 

Fistula-like Purging-cassia. Tree 20 feet. 

Cult. See Cassia for culture and propagation, p. 450. 

CCLXXVI. EXOSTYLIS (from ēkō, exo, without, and στῦλος, stylus, a style; in allusion to the style being much exerted beyond the other parts of the flower). Schott. in Spreng. syst. append. 406. 

1 E. VENUSTA (Schott, l. c.) A tree, with villous branches, impari-pinnate leaves, ovate, rather pilose leaflets, and subracemose bracteate peduncles. A. S. Native of Brazil. 

Beautiful Exostylis. Tree. 

Cult. See Copaifera for culture and propagation, p. 456. 

CCLXXVII. METROCYNIA (an anagram of Cynometra, to which genus the present is nearly allied). Pet. Th. gen. mad. no. 76. D. C. prod. 2. p. 507. 

Lin. syst. Decandria, Monogynia. Sepals 5, joined together into a campanulate tube at the base, with the lobes long and coloured. Petals 5. Stamens 10; filaments hairy, with the anthers inserted on their tops. Ovary pedicellate, hairy. Style length of stamens. Legume short, somewhat reniform, 1-seeded, warty or pilate. —A shrub from Madagascar, with oblong-impari-pinnate leaves, bearing 3 pairs of leaflets. Flowers disposed in dense spikes. This genus is very nearly allied to Schóbia and Cynometra according to M. Du Petit-Thouars. 

1 M. COMMERSONII (D. C. prod. 2. p. 507.) A. S. Native of Madagascar. Shrub smooth. Leaves with 2 pairs of leaflets, the lower pair at the base of the petiole, the upper pair at the apex. Leaflets coriaceous, elliptic-obovate, emarginate. 

Commerson’s Metrocynia. Shrub to 4 feet. 

Cult. See Copaifera for culture and propagation, p. 456. 

CCLXXVIII. AFZELIA (in honour of Adam Afzelius, M.D., professor of botany in the university of Upsal in Sweden, who in his younger days resided many years at Sierra Leone, where he collected a large herbarium of the vegetables of that country, very few of which he published). Smith, in Lin. trans. 4. p. 221. D. C. prod. 2. p. 507. 

Lin. syst. Decandria, Monogynia. Calyx tubular, with a 4-cleft deciduous limb. Petals 4, mucilaginous, upper one largest. Stamens 10, 8 of which are fertile, and the 2 superior ones sterile. Style subulate. Stigma acute. Legume ligneous, many-celled. Seeds arillate at the base; aril cup-shaped, one-half the length of the seed. Embryo straight, at the base of the seed, with a somewhat inclosed radicle and fleshy cotyledons. 

Flowers disposed in racemes, blood-coloured. This genus is not well known. 

1 A. AFREÇANA (Smith, l. c.) 8 of the stamens fertile. A. S. Native of Sierra Leone. Seeds black, with scarlet aril, which becomes yellow on drying. Leaves abruptly pinnate. 

African Afzelia. Tree. 

Pancovia’s Afzelia. Tree. 

Cult. See Copaifera for culture and propagation, p. 456. 

CCLXXIX. MELANOXYLON (from μέλανος, melanos, black, and ὕλη, xylon, wood; wood black). Schott, in Spreng. syst. append. 406. 

1 M. BRAUNA (Schott, l. c.) A. S. Native of Brazil. A tree, with reddish brown wood, impari-pinnate leaves, oblong-lanceolate leaflets, which are hairy beneath, and paneduced racemes of flowers. Flowers clothed with rusty tomentum. 

Brauna Melanoxylon. Tree. 

Cult. For culture and propagation see Copaifera, p. 456. 

1 A. Lentiscifólium (Schott, l. c.) A. S. Native of Brazil. A shrub, with impari-pinnate leaves, elliptic-lanceolate shining leaflets, and yellow flowers. Racemiflorous branches leafless. 

Sweetia tamarindifolia, Spreng. syst. 2. p. 213. 

Lentiscus-leaved Acosmiun. Shrub. 

Cult. For culture and propagation see Copaifera, p. 456. 

Sect. I. Schôtia (see genus for derivation). Calyx tubular at the base, with 5 erect lobes. Fruit unknown. Leaves abruptly pinnate. 

2 S. TAMARINDIFÓLIA (Añz. ex bot. mag. t. 1153.) leaves with 8-10 pairs of ovate, bluish, mucronate orawnless leaflets, rather glabrous in front at the base. A. S. Native of the Cape of Good Hope. Ait. hort. kew. ed. 2. vol. 3. p. 33. Flowers crimson. Légume broad, large, arched, reticulately veiny, and with the sutures thickened.

3 S. stipulata (Ait. hort. kew. ed. 2. vol. 3. p. 33.) leaves with 5 pairs of oval, acute, mucronate leaflets; stipules dimidiate ovate, falcate, mucronate. 5 G. Native of the Cape of Good Hope. Flowers crimson.

Stipulaceous Schotia. Fl. May, Sept. Ct. 1794. Sh. to 6 ft. 4 S. alata (Thunb. fl. cap. ed. Schult. 1. p. 389.) leaves with usually 4 pairs of cuneiform cut, usually convolute leaflets, which are reflexed at the apex. 5 G. Native of the Cape of Good Hope. Flowers axillar, pedunculate. Petiole furnished with a narrow wing.

Sect. II. Schott'ria (an alteration from the generic name).

5 S. simplicifolia (Vahl. ined. D. C. prod. 2. p. 508.) leaves oval, emarginate, obtuse, quite smooth, shining, quite entire, 3-nerved, and reticulately veined; racemes terminal; racis, calyxes, and pedicles clothed with short velvety down; stamens exceeding the petals, and the petals exceeding the calyx. 5 G. Native country unknown. Legume turgid according to Vahl.

Simple-leaved Schotia. Shrub 4 to 6 feet.

Sect. III. Omphaloboles (from Omphalobium, a genus in Conmaracé, and idea, like; resembles that genus in habit).

D. C. prod. 2. p. 508. Sepals only connected with a very little at the base. Filaments somewhat monadelphous at the very base. Legume on a short pedicel, oval, compressed, almost indehiscent, 1-celled, and 2-seeded. Seed girdled by an ampel aril at the base.

6 S. latifolia (Jacq. fragn. 23. t. 15. f. 4.) leaves with 2-4 pairs of obovate, very blunt, mucronate leaflets; sepals 4; petals oblong, hardly attenuated at the base; stamens monadelphous, 4 times longer than the calyx; legume 2-seeded. 5 G. Native of the Cape of Good Hope. Omphalobium Schotia, Jacq. ced. icon. ined. Petals and stamens purple and white. Seeds orbicular, brown, furnished with a yellow arillus.

Broad-leaved Schotia. Fl. May, July. Ct. 1810. Sh. 6 ft. Cult. The species of this genus are very elegant when in flower. They succeed best in a cool part of a stove, as the green-house is rather too cold for them in winter, although they are natives of the Cape of Good Hope. The soil best suited for them is a mixture of loam, peat, and sand, and ripened cuttings will root readily if planted in a pot of sand, with a hand-glass placed over them in a moderate heat.

* Leaves impari-pinnate; leaflets reticulated with ribs.

1 C. Beyrich (Hayne in Schlecht. Linnea. 1. p. 425.) leaves with 2-3 pairs of equal-sided leaflets, each ending in a long emarginate acumen, lower ones oblong, upper ones lanceolate, hardly with pellucid dots. 5 G. Native of Brazil.

Hayne, pl. offic. t. 12.

Beyrich's Balsam of Capevi tree. Tree 20 to 30 feet.

2 C. giagenesis (Desf. mem. mus. 7. p. 376.) leaves with 2-4 pairs of equal-sided leaflets, each ending in a long apiculated point, lower ones ovate, upper ones oblong, full of pellucid dots. 5 G. Native of Guiana, near the Rio Negro. Hayne, pl. offic. t. 13.

Guiana Balsam of Capevi tree. Ct. 1817. Tree 30 to 40 ft.

3 A. Martini (Hayne, l. c.) leaves with 2-3 pairs of ovate, equal-sided, dotted leaflets, ending each in a short emarginate acumen. 5 G. Native of Brazil. Hayne, pl. offic. t. 15.

Martini's Balsam of Capevi tree. Tree 30 to 40 feet.

4 C. jacquiniana (Hayne, l. c.) leaves with 2-5 pairs of ovate, incurved, unequal-sided, bluntly acuminate leaflets, full of pellucid dots. 5 G. Native of Martinique, Trinidad, &c. Hayne, t. 14. C. officinalis, Lin. spec. 557. Jacq. amer. t. 86. Lam. ill. t. 342. Woodv. med. bot. 8. t. 137. H. B. et Kunth, nov. gen. t. 659. The trees which produce the balsam of Capevi, or Capi"fera, are natives of the Spanish West India Islands, and of some parts of South America, and the resinous juice flows in considerable quantities from incisions made in the trunk. The juice is clear and transparent, of a whitish or pale yellow colour, an agreeable smell, and a bitterish pungent taste. It is usually about the consistence of oil, or a little thicker; when long kept it becomes nearly as thick as honey, retaining its clearness; but it has never been observed to grow dry or solid, as other resinous juices do. The best resin of Copaiva comes from Brazil. Pure resin of Copaiva dissolves entirely in alcohol; the solution has a very fragrant smell. Distilled with water it yields a large quantity of a limpid essential oil, but no benzoic acid; it is therefore not a balsam, but a turpentine, a combination of resin and volatile oil. In medicine the resin of Copaiva is a useful tonic, but in some degree irritating. In large doses it proves purgative, and promotes urine, and is supposed to clean and heal ulcerations in the urinary passages more effectually than any of the other resinous fluids. The resin has been principally celebrated in chronic catarrh, gleet, and the fluors albus, and externally as a vulnerary. The dose of this medicine rarely exceeds 20 or 50 drops, though some authors direct 60 or upwards. It may be conveniently taken in the form of an emulsion, into which it may be reduced by triturating it with oil of almonds, with a thick mucilage of gum-arabic, or with the yolk of eggs, till they are well incorporated, and then gradually adding a proper quantity of water.

Jacquin's Balsam of Capevi tree. Tree 30 to 40 feet.

5 C. mirsa (Hayne, l. c.) leaves with 2 pairs of incurved, oval, bluntly-acuminated, unequal-sided leaflets, which are full of pellucid dots. 5 G. Native of Brazil. Hayne, pl. offic. t. 16. Two-paired-leafletted Balsam of Capevi-tree. Tree 30 to 40 feet.

6 C. multijuga (Hayne, l. c.) leaves with 6-10 pairs of somewhat incurved, unequal-sided leaflets, ending each in a long apiculated acumen, lower ones ovate-oblong, upper ones lanceolate, all full of pellucid dots. 5 G. Native of Brazil. Hayne, pl. offic. t. 17. f. c.

Many-paired-leafletted Balsam of Capevi tree. Tree 30 to 40 feet.

** Leaves impari-pinnate; leaflets reticulately veined.

7 C. justifi (Hayne, l. c.) leaves with 5-6 pairs of incurved, nearly equal-sided leaflets, each ending in a long mucronate acumen, lower ones ovate-lanceolate, upper ones oval-oblong, all full
of pellucid dots; petioles glabrous. ‡ S. Native of Peru.
Hayne, pl. offic. t. 17. f.

Jussieu's Balsam of Capevi tree. Tree 30 to 40 feet.

8 C. nitida (Mart. miss. Hayne, l. c.) leaves with 2-4 pairs of incurved, unequal-sided, obtusely-acuminate leaflets, with hardly any pellucid dots, lower ones broad-ovate, upper ones Oblong-ovate; petioles and pedunules glabrous. ‡ S. Native of Brazil.
Hayne, pl. offic. t. 17. a.

Shining-leaved Balsam of Capevi tree. Tree 30 to 40 feet.

9 C. laxa (Hayne, l. c.) leaves with 3-4 pairs of equal-sided, somewhat incurved, emarginate leaflets, lower ones ovate-cordate, upper ones ovate-oblong, all full of pellucid dots; petioles pubescent; peduncles villously tomentose. ‡ S. Native of Brazil.
Hayne, pl. offic. t. 18.

Loose Balsam of Capevi tree. Tree 40 feet.

10 C. longisporae (Desf. mem. mus. t. p. 376. Hayne, l. c.) leaves with 3-5 pairs of equal-sided, obtuse leaflets, lower ones ovate, upper ones ovate-elliptic, all full of pellucid dots; petioles and pedunules pubescent. ‡ S. Native of Brazil.
Hayne, pl. offic. t. 19.

Langsdorf's Balsam of Capevi tree. Tree 30 to 40 feet.

11 C. corniculae (Mart. miss. Hayne, l. c. p. 427.) leaves with 2-3 pairs of elliptic, equal-sided, emarginate dotted leaflets; petioles and pedunules nearly glabrous. ‡ S. Native of Brazil.
Hayne, pl. offic. t. 20.

Coriaceous-leaved Balsam of Capevi tree. Tree 40 feet.

12 C. cordifolia (Hayne, l. c.) leaves with usually 5 pairs of nearly equal-sided, emarginate, dotted leaflets, lower ones ovate-cordate, upper ones elliptic-ovate; petioles and peduncles clothed with pubescent tomentum. ‡ S. Native of Brazil.
Hayne, pl. offic. t. 21.

Heart-leaffletted Balsam of Capevi tree. Tree 30 to 40 feet.

13 C. sellii (Hayne, l. c.) leaves with 3-4 pairs of somewhat unequal-sided, hardly dotted leaflets, lower ones ovate, upper ones lanceolate; petioles and peduncles pubescent. ‡ S. Native of Brazil.
Hayne, pl. offic. t. 22.

Sell's Balsam of Capevi tree. Tree 30 to 40 feet.

14 C. oblongifolia (Hayne, l. c.) leaves with 6-8 pairs of elliptic-oblung, nearly equal-sided, emarginate leaflets, full of pellucid dots; petioles and peduncles pubescent. ‡ S. Native of Brazil.
Hayne, pl. offic. t. 23. a.

Oblong-leaffletted Balsam of Capevi tree. Tree 30 to 40 feet.

15 C. trapezifolia (Hayne, l. c.) leaves with 4-7 pairs of ovate-trapeziform leaflets, which are for the most part emarginate, full of pellucid dots; petioles pubescent. ‡ S. Native of Brazil.

† A species not sufficiently known.

Var. a, crassicaulea (Hayne, l. c.) leaflets for the most part alternate, thicker, full of pellucid dots. Hayne, l. c. t. 23. 5.

Var. b, tenella (Hayne, l. c.) leaflets for the most part opposite, thinner, and very full of pellucid dots. Hayne, l. c. t. 23.

Trapezium-leaffletted Balsam of Capevi tree. Tree 30 to 40 ft.

CCLXXXIII. CYNOMETRA (from κυνή, kyos, a dog, and μέτρα, metra, a matrix; shape and circumference of pods). Lin. gen. 519. Lam. ill. t. 331. C. C. prod. 2. p. 509.—Cynomodrium. Rumpl. amb. l. p. 163, but not of Lin.

LIN. SYST. Decandria, Monoecyina. Calyx bracteless, deciduous, with a very short tube, and a 4-parted limb; the lobes reflexed and pencilled at the apex. Petals 5, oblong, equal, Stamens 10, distinct; anthers bilab at the apex. Legumes half round, fleshy, indehiscent, 1-celled, 1-seeded, turbulated on the outside. Seed filling the cell, and fixed to the middle of the suture. Embryo straight, with thickish, roundish coriaceous cotyledons.—Trees, with bifidate leaves and red flowers rising from the main trunk of the trees. Legumes brown, edible.

§ 1. Genus Cynometra (genus, genuine; this division contains the genuine species). Leaves with one pair of leaflets.

1 C. cauliflora (Linn. spec. 547.) trunk floriferous; leaflets emarginate at the apex. ‡ S. Native of the East Indies. Lam. ill. t. 331. f. 1.—Rumph. amb. l. t. 62. Peduncles rising in fascicles from the trunk, bracteolate, with many peduncles rising in racemes from the roundish bracteas, sometimes short and few-flowered, sometimes elongated and many-flowered. Perhaps two species are confused under C. cauliflora. Flowers white.

Stem-flowered Cynometra. Ch. 1804. Tree 30 to 40 feet.

2 C. ramiflora (Linn. spec. 547.) branches floriferous; leaflets acuminate at the apex. ‡ S. Native of the East Indies. Lam. ill. t. 331. f. 2.—Rumph. amb. l. t. 63.—Rheed. mal. 4. t. 31. Flowers white. Seed compact, whitish, covered with a thin pellicle, having an astringent taste, but without any smell.

Branch-flowered Cynometra. Tree 60 feet.

§ 2. Dichote (from dabus, doubtful, this division contains doubtful species of the genus). Leaves with many pairs of leaflets.

3 C. polyandra (Roxb. cor. 3. t. 286.) branches floriferous; peduncles axillary, short, many-flowered; leaves abruptly pinnate, with 2-3 pairs of leaflets. ‡ S. Native of the East Indies, on the mountains of Silhet. Flowers white, polyandrous. Legume fleshy, not turbulated on the outside. This tree is perhaps generally distinct from Cynometra, from the stamens being 40-50 in number in each flower, and probably hypogynous, and therefore it comes near to Swartzia.

Polyandrous Cynometra. Tree 40 feet.

Pinuate-leaved Cynometra. Tree 60 feet.

Cult. For culture and propagation see Copaifera.

LIN. SYST. Eucosmídria, Monogynía. Calyx campanulate at the base, 5-parted. Petal one, unguiculate, opposite the ovary. Stamens 9, 3 of which are fertile, longer, and decline. Legume oblong, compressed, 3-4-seeded. Seeds oblong, with the intervals between the seeds filled with medulla.—Tall trees, with pinnate leaves.

1 I. Madagascariensis (D. C. prod. 2. p. 509.) leaves with 2 pairs of leaflets, and an odd one; flowers corombose; stamens 9, 6 of which are sterile. ‡ S. Native of Madagascar, where it is called Intsia.

Madagascariensis. Tree 60 feet.

2 I. ? Amboniensis (D. C. prod. 2. p. 509.) leaves abruptly pinnate, with 2 pairs of leaflets; flowers somewhat panicellate, sterile filaments 3. ‡ S. Native of the Moluccas. Caju Besso or Metrosideros Amboniensis, Rumpl. amb. 3. p. 21. t. 10. This tree is placed in the present genus by M. Du Petit
petiole terete. Racemes axillary, very short. This genus is allied to Ossea, Vouapa and Paricdia.

1 A. macrophylla (Beauv. l.c.) f. S. Native of Western Africa, between Warre and Buonopo, along the banks of rivulets. Leaflets 8-10 inches long. Long-footed Anthonota. Shrub 6 to 8 feet.

Cult. For culture and propagation see Copaifera, p. 456.

LIN. SYST. TRIANDRIA, MONOGYNIA. Calyx 5-cleft, furnished with 2 opposite bracteas at the base. Petals 5, 4 of which are very minute or almost wanting, the fifth large, and undulate plicate. Stamens 3-4, long, free, when 4 the fourth is sterile. Ovary pedicellate, terminated by a long style. Legume compressed, 1-celled (1-seeded? ex ovarium).—Trees, natives of Guiana, with abruptly-pinnate leaves, and racemes of flowers.

1 O. multipulga (D. C. prod. 2. p. 510.) leaves with 3-5 pairs of obovate-cuneated, oblong, very blunt, retusely emarginate leaflets. f. S. Native of French Guiana. Stamens 3. Perhaps sufficiently distinct from the following species.

Many-paired-footed Outea. Tree.

Guiana Outea. Clt. 1825. Tree 50 feet?

Cult. For culture and propagation see Copaifera, p. 456.

LIN. SYST. TRIANDRIA, MONOGYNIA. Calyx 4-cleft, furnished with 2 opposite bracteas at the base. Petal one, flat. Stamens 3. Legume pedicellate, coriaceous, 1-seeded.—Trees, natives of Guiana, bearing only one pair of leaflets. Flowers disposed in racemes. This genus is perhaps not sufficiently distinct from Outea.

f. V. bifolia (Aubl. guian. 1. p. 25. t. 7.) leaflets sessile, ovate, acuminate, oblique; bracteas with one elevated nerve each; lobes of calyx spreading, about equal in length to the corolla; legumes winged on one side. f. S. Native of Guiana and of Maranhan in Brazil, where we have seen it in great plenty. Macrolöbiurn hymenoxoide, Willd. spec. 1. p. 186. Macrolöbiurn Voua, Gmel. syst. 1. p. 93. M. bifolium, Pers. ench. 1. p. 39. Petals violaceous.

Two-footed Vouapa. Clt. 1823. Tree 60 feet.

Simira Vouapa. Tree to 50 feet.

3 V. staminea (D. C. prod. 2. p. 510.) leaflets sessile, lanceolate-oblong, bluntest; segments of calyx reflexed; stamens 3 times the length of the corolla; legumes obliquely margined.
on one side. \( \gamma \). S. Native of Guiana, in the Island of Arawa-
bisheh. Macropicalium stamineum, Meyer. esser. 18.

Stamininose Vouapa. Tree 30 to 40 feet.

4 Y. PHASELLACA'RA (Hayne, gen. darst. vesch. ex Schlecht. Lin.
nea. vol. 5. p. 20.) leaflets sessile, obovate-oblong, rounded, and
emarginate at the apex, and unequal at the base; legumes
channelled on both margins. \( \gamma \). S. Native of Brazil?

Phaseus-fruited Vouapa. Tree.

Cult. For culture and propagation see Copaifera, p. 456.

CCXC. HYMENÉ. (from Hymen, the god of marriage; in

Courbaril, Plum. gen. t. 36.

LIN. Syst. Decandria, Monogynia. Calyx furnished with 2
bracteoles at the base, tubular, coriaceous; tube urceolate;
limb 5-parted, the 2 lower segments for the most part joined, all
deciduous. Petals 6, unequal, sessile, lower one usually boat-
shaped. Stamens 10, distinct, inflated in the middle. Ovary
pedicellate, beardless. Style filiform. Legume woody, ovate-
oblong, indentshaped, 1-celled, many-seeded, filled with dry far-
naceous, filamentose pulp. Embryo straight, with fleshy coty-
ledon, and a globose radicle.---Trees, with bifoliate leaves, and
corymbs of white or yellowish flowers.

* Leaflets glabrous.

1 H. venosa (Vahl. eclog. 2. p. 31.) leaflets oblong, unequal-
sided, but equal at the base, ending each in a long obture ace-
num. \( \gamma \). S. Native of Cayenne. Flowers of panicle sessile.

Calyx silky, shining.

Vein-leaved Locust-tree. Tree 40 feet.

2 H. latifolia (Hayne, gen. darst. vesch. ex Schlecht. Lin-
nea. 5. p. 18.) leaflets roundish-oblong, nearly equal-sided, equal at the
base, but emarginate at the apex. \( \gamma \). S. Native of South
America. H. obtusifolia, Wildl. herb.

Broad-leafed Locust-tree. Tree.

3 H. confertifolia (Mart. ms. Hayne, l. c.) leaflets oval,
unequal-sided, but equal at the base, ending in a long obture ace-
num. \( \gamma \). S. Native of Brazil.

Crowded-leafed Locust-tree. Tree.

4 H. confertifolia (Hayne, l. c.) leaflets oblong, unequal-
sided, and unequal at the base, ending in a short acumen. \( \gamma \). S.
Native of Brazil.

Crowded-leaved Locust-tree. Tree.

5 H. courbaril (Lin. spec. 587.) leaflets oblong-ovate, unequal-
sided, and unequal at the base, ending in a long acumen;
legume oblong, compressed, yellowish, shining. \( \gamma \). S. Native
D. C. legum. mem. xii. t. 26. f. 120. germ. Jacq. amer. pict.
p. 63. t. 264. f. 65. Flowers of panicle pedicellate. Petals
yellow, striped with purple. Stamens purple. The filamentose
white substance contained in the pods is sweet as honey, and
is eaten by the Indians with great avidity. It is purgative when
fresh gathered, but loses this quality as it grows old. Between
the principal roots of the tree exudes a fine transparent resin,
white, yellowish or red, which is collected in large lumps, and is
called gum-anime. It makes the finest varnish that is known,
superior even to the Chinese lac; for this latter use it is dis-
solved in the highest rectified spirits of wine. It burns readily,
and with a clear flame, emitting a grateful and fragrant smell,
for which reason it is sometimes ordered by way of fumigation
in the chambers of persons labouring with asthma or suffocative
catarrhs. Its vapours not only strengthen the head, but all
parts of the body affected with cold. Some apply it outwardly,
dissolved in oil or spirits of wine, to strengthen the nerves. An
oil may be distilled from it, useful in palisies, in cramps, and con-
tractions of the sinews. The solution in spirits has been thought
not inferior to guaiacum in consumminal cases. The inner bark is an
excellent vermifuge in spirit or deception. The wild bees are
fond of building their nests in this tree. The timber of old trees
is reckoned excellent, and is in great request for wheel-work in
sugar-mills, particularly for coggs to the wheels, being extremely
hard and tough; it is so heavy that a cubic foot weighs a hundred
pounds; it also takes a fine polish. Courbaril is the name of the
tree in some parts of South America.

Courbaril Locust-tree or Gum-anime-tree. Tree 40 to 60 ft.

6 H. stelliformis (Hayne, l. c.) leaflets oblong, unequal-
sided, and unequal at the base, ending in a short acumen; legume
nearly cylindrical, smooth, and shining. \( \gamma \). S. Native of South
America.

Shining-fruited Locust-tree. Tree.

7 H. candollea'na (H. B. et Kuhn, nov. gen. amer. 6. p.
325. t. 566.) leaflets oblong, unequal-sided, but equal at the
base, and emarginate at the apex. \( \gamma \). S. Native of Mexico,
about Acaulico. Peduncles terminal, many-flowered. Flowers
pedicellate. Calyx 4-parted, clothed with fine canescent down.

De Candolle's Locust-tree. Tree 30 feet.

8 H. stigonocarpa (Mart. ms. Hayne, l. c.) leaflets some-
what cordate-oblong, unequal-sided, and unequal at the base,
obtuse at the apex; legume oblong, compressed, beset with white
dots. \( \gamma \). S. Native of Brazil.

Dotted-fruited Locust-tree. Tree.

* * * Leaflets clothed with villous tomentum.

9 H. rotundata (Hayne, l. c.) leaflets semicordate, ovate,
unequal-sided, and unequal at the base, rounded at the apex.
\( \gamma \). S. Native of South America.

10 H. olfersiana (Hayne, l. c.) leaflets oblong, unequal-
sided, obtuse at the apex, and unequal at the base; lower leaflets
somewhat semi-cordate; corymbs axillary, and terminal. \( \gamma \).
S. Native of South America.

Olfers's Locust-tree. Tree.

11 H. martiana (Hayne, l. c.) leaflets nearly elliptic, une-
qual-sided, retuse, and very unequal at the base; corymbs ter-
mal. \( \gamma \). S. Native of Brazil.

Martius's Locust-tree. Tree.

12 H. sellosia'na (Hayne, l. c.) leaflets oblong-oblong, unequal-
sided, very blunt, unequal at the base; corymbs terminal. \( \gamma \).
S. Native of Brazil.

Sellos's Locust-tree. Tree.

Cult. For culture and propagation see Copaifera, p. 456.

CCXC. (a) TRACHYLOBIUM (from τραχύς, trachy, rough, and
λοξός, loxos, a pod; pods rough on the outside). Hayne,
gat. darst. vesch. ex Schlecht. Linnea. vol. 5. p. 19.

LIN. Syst. Decandria, Monogynia. Calyx bibracteolate at
the base, tubular, coriaceous; tube urceolate; limb 5-parted,
with the segments deciduous, 2 upper ones usually connected.
Petals 3, nearly equal, on long claws. Stamens 10, free. Ovary
pedicellate, bearded. Legume coriaceous, suberose, indentshaped,
1 or few-seeded, filled with solid pulp.---Trees, with bifoliate
leaves, and panicles of white flowers.

1 T. martiana'num (Hayne, l. c.) leaflets sessile, coriaceous,
very veinless, ovate-lanceolate, unequal-sided, and unequal at
the base, ending in an emarginate acumen. \( \gamma \). S. Native of
Juss. gen. in a note, p. 351. Panicle divaricate; peduncles
many-flowered. Legume warty. Ovary stipitate, 5-ovulate.

2 T. hornemannii'num (Hayne, l. c.) leaflets on very short
petiolules, coriaceous, oblone, unequal-sided, and unequal at
the base, ending in a long obtuse acumen. \( S. \) S. Native of South America.

Hormemann's Trachylobium. Tree.

3 T. Gærtneriánnum (Hayne, l. c.) leaves on short petioles, very coriaceous, nearly veinless, oval-ovate, unequal-sided, abruptly acuminate, and unequal at the base. \( S. \) S. Native of Madagascar. Hymenæa verrucosa, Gærtn. fruct. 2. p. 306. t. 193. f. 7.

Gærtner's Trachylobium. Tree.

4 T. Larmorck'lium (Hayne, l. c.) leaves on short petioles, rather coriaceous, reticulately veined, oval-ovate, unequal-sided, and unequal at the base, ending in a short acumen. \( S. \) S. Native of Madagascar? Hymenæa verrucosa, Lam. ill. t. 330. f. 2.

Lamarck's Trachylobium. Tree.

5 T. florin'num; leaves oblong, unequal at the base, coriaceous, ending in a blunt acumen; panicles axillary, branchy; flowers pedicellate; legumes ovate, hairy, 1-2-seeded. \( S. \) S. Native of South America, near Angostura. Hymenæa floribunda, H. B. et Kunth, nov. gen. amer. 6. p. 323. t. 567.

Bundl-flowered Trachylobium. Tree 60 feet.

Cult. For culture and propagation see Copeifera, p. 456.

LIN. SYST. Decandria, Monogynia. Calyx coriaceous, campanulate, 5-toothed. Petals 5, unguiculate, nearly equal. Stamens 10. Style wanting. Legume truncate. Leaves 2-lobed, like those of Bauhinia. It is said by the author to be a genus intermediate between Hymentæa and Bauhinia.

1 S. microstact'hiya (Raddi, l. c.) lobes or leaves ovate, obtuse; branches coriaceous. \( S. \) S. Native of Brazil, near Rio Janeiro, in hedges. Young branches, calyxes, peduncles, and petioles clothed with rusty tomentum.

Small-spiked Schnella. Shrub cl.

2 S. macrostact'hiya (Raddi, l. c. f. 4.) leaves of ovate-roundish; flowers in spikes; spikes axillary and terminal, very long. \( S. \) S. Native of Brazil, about Rio Janeiro, on the high mountains.

Long-spiked Schnella. Shrub cl.

3 S. smilacînus; climbing; branches coriaceous; leaves undivided, ovate, acuminate, 5-nerved, glabrous; racemes spicate, elongate. \( S. \) S. Native of Brazil. Caulopterus smilacinus, Schott, in Spreng. syst. append. p. 406.

Smilas-like Schnella. Shrub cl.

Cult. For culture and propagation see Bauhinia.

CCXCII. BAUHI'NIA (named by Plumier in memory of the two famous botanists of the 16th century, John and Caspar Bauhin, brothers; the leaves being simple but 2-lobed, which circumstance, it is said, gave occasion to Plumier to name this genus from the two brothers). Plum. gen. t. 13. Lin. gen. no. 511. Lam. ill. t. 329. D. C. legum. mem. xii. prod. 2. p. 512.

LIN. SYST. Decandria, Monogynia. Sepals 5, irregularly connected together into 5-cleft calyx, or cleft laterally, membranous. Petals 5, spreading, oblong, rather unequal, upper one usually distant from the rest. Stamens 10, sometimes 9 of which are sterile and monadelphous (f. 58 c.), and the tenth loose and fertile (f. 58 c.), sometimes all are monadelphous at the base, with all or only 5 or 3 of them fertile; the rest sterile. Ovary long, pedicellate. Legume 1-celled, 2-valved, many-seeded. Seeds compressed, oval, with the endopelure tumid. Embryo straight, with an ovate radicle, and flat cotyledons.—Shrubs, with 2-lobed leaves, constantly composed of 2-joined leaflets at the top of the petiole, sometimes nearly altogether free, sometimes nearly joined together to the apex, but usually joined together more or less, and with an awn in the recess. Flowers disposed in racemes.
base, with the nerves on the under side as well as the petioles and branches puberulous; leaflets connected to about the middle, ovate, acuminate, 3-4-nerved, nearly parallel; petals lanceolate. \[\text{Leguminosae.} \]

15 B. leptopetala (Mor. et Sesse, fl. mex. icon. incd. D.C. prod. 2. p. 513) spines stipular; leaves cordate at the base, glabrous; leaflets ovate, acuminate, 3-nerved, parallel, connected beyond the middle; peduncles axillary, 2-flowered, constituting a leafy raceme; petals lanceolate, acute; 5 fertile stamens very long. \[S. Native of New Spain. Flowers greenish. Very nearly allied to B. Pauléti.\]

Strengthened Mountain-ebony. Cll. 1738. Sh. 10 to 12 ft.

16 B. aculeátum (Linn. spec. 535.) spines stipular; leaves rather cordate at the base, glabrous; leaflets ovate, obtuse, 3-nerved, connected nearly to the apex; petals lanceolate, deeply crenated; stamens 9-10, incurved. \[S. Native of South America. Plum. ed. Burm. t. 44. f. 1. Jacq. amcer. p. 119. t. 177. ed. pict. p. 60. t. 260. f. 31. Flowers large, white, with a somewhat unpleasant scent, like Swain.\]

17 B. rotundatum (Mill. dit. no. 7.) spines stipular; leaves somewhat cordate at the base; lobes rounded; petals 3 inches long, about the length of the stamens; flowers small. \[S. Native of Brazil. Flowers white. Stamens not described.\]

Piñeira-leaved Mountain-ebony. Cll. 1823. Sh. 4 to 6 feet.

18 B. emarginátum (Mill. dit. no. 5.) stem prickly; leaves cordate at the base, tomentose beneath; leaflets orbicular, connected almost to the apex. \[S. Native of New Spain, at Carthagena. Flowers large, terminal, of a dirty white colour.\]

Emarginate-leaved Mountain-ebony. Shrub 4 to 6 feet.

* Unarmed shrubs.

20 B. inermis (Pers. ench. 1. p. 455. but not of Forsk.) leaves ovate at the base, ferrugineous beneath; leaflets oblong, acute, 4-nerved, parallel, connected a little beyond the middle; racemes terminal, leafless, simple; petals linear; stamens 10. \[Anthers glabrous. S. Native of Mexico, about Acapulco. Pauléti inermis, Cav, icon. t. 409. B. Panamensi, Spreng. syst. 2. p. 384. Petals yellowish red.\]

Pauléti's Mountain-ebony. Cll. 1820. Shrub 6 to 8 feet.

13 B. glandulósa (D. C. prod. 2. p. 515.) spines stipular; leaves nearly orbicular, rather cordate, membranous, pubescent beneath, and full of glandular dots; leaflets connected, semi-ovate, 4-nerved, obtuse, divaricate; flowers 1-3, opposite the leaves; calyx hairy on the outside; petals oblong-lanceolate. \[S. Native of the vicinity of Panama. Pauléti aculeátum, Cav. icon. t. 410. P. spinosa, Poir. suppl. l. p. 599. B. Panamensis, Spreng. syst. 2. p. 384. Flowers white. Fruit unknown. Allied to B. Pauléti.\]

Glandular Mountain-ebony. Shrub.

14 B. grandiflóra (Juss. in Poir. suppl. l. p. 600.) spines stipular; leaves roundish, cordate at the base, tomentose beneath; leaflets connected to the middle, ovate, obtuse, 3-4-nerved; leaflets and calyxes pubescent; peduncles axillary, 1-3-flowered, constituting a raceme; bracteoles ending in a sessile acumen; stamens shorter than the petals. \[S. Native of Peru. Hook, bot. misc. l. p. 218. t. 91. Flowers white.\]

tive of Caracas. B. aculeata, Jacq. amer. 119. t. 177. f. 2. Flowers white.

Clavell-petalled Mountain-ebony. Clt. 1817. Sh. 5 to 6 ft. 25 B. uscula (Lin. spec. 555.) leaves ovate at the base; leaflets connected to the middle, oval-oblong, parallel, with the inner side straight; petals subulate; stamens 10, alternate 5 short. \( \frac{1}{2} \) S. Native of South America. Flowers white.

Ungulat-petalled Mountain-ebony. Clt.? Tr. 18 to 20 ft. 26 B. variegata (Lin. spec. 555.) leaves coriaceous, leaflets broad, ovate, 5-nerved, connected to the middle; petals ovate, nearly sessile; stamens 10, the 5 longest fertile. \( \frac{1}{2} \) S. Native of Malabar. Rheed. maj. 1. t. 34. Calyx bursting lengthwise. Flowers in loose, terminal racemes. Petals red marked with white, and yellow at the base.

Var. \( \beta \) Cinnam. (D. C. prod. 2, p. 514.) leaves rounded at the base; petals acute, lilac, with 1 purple spot at the base of each. \( \frac{1}{2} \) S. Native of China. Braon, icon. chin. t. 26.

Variegated-flowered Mountain-ebony. Fl. June, July. Clt. 1819. Tree 20 feet. 27 B. cucullata (Desv. journ. bot. 1814. 1. p. 74.) leaves roundish, pubescent on the nerves; leaflets ovate, obtuse, 5-nerved, rather ascending; flowers axillary. \( \frac{1}{2} \) S. Native of the East Indies. Nearly allied to B. variegata, but the flowers are said to be smaller. Calyx bursting lengthwise.

Cuculate-leaved Mountain-ebony. Shrub. 28 B. tomentosa (Lin. spec. 556.) leaves ovate or roundish at the base, under surface villous as well as the petals, branches, stipules, peduncles, bracteas, and calyxes; leaflets connected between the middle, oval, obtuse, 3-4-nerved, nearly parallel; peduncles 3-4-flowered; calyx glabrous, spathulaceous; petals obovate; stamens 10, fertile, unequal. \( \frac{1}{2} \) S. Native of Ceylon. Burm. zeyl. p. 44. t. 15. Petals pale yellow, with a red spot at the claw. The native practitioners of India prescribe the dried leaves and young flowers of this plant in certain dysenteric affections.

Tomentose Mountain-ebony. Ct. 1808. Shrub 6 to 12 ft. 29 B. pubescens (D. C. legum. mem. xiii.) leaves rather coriaceous at the base, pubescent beneath and on the petals; leaflets connected between the middle, oval, obtuse, 4-nerved, nearly parallel; peduncles 3-4-flowered; calyx glabrous, spatulate; petals obovate; stamens 10, fertile. \( \frac{1}{2} \) S. Native of Jamaica. Flowers large, white, much crowded.

Pubescent Mountain-ebony. Clt. 1823. Shrub 4 to 6 feet. 30 B. niceta (D. C. prod. 2, p. 515.) leaves roundish-elliptic, membranous, glabrous; leaflets connected, semi-ovate, acute, spreading, 5-nerved; racemes terminal, solitary; calyx clothed with rusty tomentum; petals oblong. \( \frac{1}{2} \) S. Native of South America, on the banks of the river Magdalena. Paullita pecta, H. B. et Kunth, nov. gen. amer. 6. p. 316. Flowers white, spotted with red.

Painted-leaved Mountain-ebony. Shrub. 31 B. multineervia (D. C. prod. 2, p. 515.) leaves elliptic, rounded at the base, membranous, shining above, but rather pilose beneath, the nerves furrugineus; leaflets semi-ovate, obtuse, approximately, 5-nerved; flowers racemose; calyx clothed with rusty tomentum; petals linear. \( \frac{1}{2} \) S. Native of Caracas and on Mountana de Capaya. Paullita multineervia, H. B. et Kunth, nov. gen. amer. 6. p. 316. Flowers snow white. Legume 8-12 inches long. Perhaps the stem is unarmed.

Many-nerved-leaved Mountain-ebony. Clt. 1817. Tr. 20 ft. 32 B. glaucescens (D. C. l. c.) leaves remiform, profoundly cordate, membranous, glaucescence beneath, scattered with minute hairs; leaflets roundish, spreading, 4-nerved. \( \frac{1}{2} \) S. Native of Cumanas, on mountains near Caribé. Paullita? glaucescens, H. B. et Kunth, nov. gen. amer. 6. p. 316. Perhaps a separate section, and unarmed. Flowers and fruit unknown.

Glaucescent Mountain-ebony. Clt. 1817. Tr. 20 to 30 ft. 33 B. reticulata (D. C. legum. mem. xiii.) leaves coriaceous, coriaceous, at the base, glabrous, minutely reticulated between the nerves; leaflets broadly ovate, obtuse, connected beyond the middle, diverging at the apex; flowers disposed in nearly sessile fascicles in the axils of the leaves; calyxes and ovaries tomentose; legumes broad, linear, glabrous. \( \frac{1}{2} \) S. Native of Senegal and of Arabia, if B. inermis of Forsk. descrip. p. 85. be the same as B. platylobia, Perr. in litt. Stamens 10, free, 8 of which are antheriferous. Petals nearly equal. Ovary stipitate. Legume twice the breadth of that of B. purpurea.

Reticulated-leaved Mountain-ebony. Shrub. 34 B. odoratisima (Newm. miss. in herb. Lamb.) leaves broad, coriaceous; leaflets connected to the middle, 4-nerved, acuminate, coriaceous; racemes long, terminal. \( \frac{1}{2} \) S. Native of Maranhao. Flowers large, very sweet-scented.

Very sweet-scented Mountain-ebony. Shrub.

SECT. III. Symphipyèoda (from συμφυος, συμφυος, to glue together, and πος ποδος, pous podos, a foot; in reference to the foot or stipe of the ovary). D. C. legum. mem. xiii. prod. 2. p. 515. Stamens monadelphous at the base, 3 fertile ones very long, the rest small, sterile, or almost abortive. Ovary stipitate, the stipe adhering to the tube of the calyx. Branches terete.

Racemose-flowered Mountain-ebony. Clt. 1790. Shrub cl. 35 B. racemosa (Vahl. symb. 3. p. 56. t. 63.) branches terete; leaves coriaceous, at the base, clothed with silky villi beneath as well as on the peduncles, petals, branches, calyxes, and petals; leaflets broadly ovate, obtuse, connected to the middle, 5-nerved, rather diverging at the apex; racemes somewhat corymbose; petals obovate, obtuse; flowers triandrous.

\( \frac{1}{2} \) S. Native of the East Indies.

Racemose-flowered Mountain-ebony. Clt. 1823. Shrub cl. 36 B. triandra (Roxb. hort. beng. p. 31.) leaves roundish, glabrous; leaflets joined to the middle, 4-nerved; racemes axillary and terminal; legume stipitate, pubescent. \( \frac{1}{2} \) S. Native of the East Indies. Flowers white. Stamens 3, antheriferous, (v. s. herb. Lamb.)

Triandrous Mountain-ebony. Clt. 1823. Shrub. 37 B. purpurea (Lin. spec. 536.) branches terete; leaves coriaceous, at the base, coriaceous, when young they are clothed with rufous tomentum, but at length becoming glabrous; leaflets connected much above the middle, broadly ovate, obtuse, 4-nerved; petals lanceolate, acute. \( \frac{1}{2} \) S. Native of the East Indies and the island of Timor.—Rheed. maj. 1. t. 33. Petals red, one of them streaked with white on the claw. Legume linear, straight, a foot long, apiculated at one end by the style and at the other by the stipe.

Purple-flowered Mountain-ebony. Clt. 1778. Tree. 38 B. retusa (Roxb. hort. beng. p. 31. but not of Poir.) branches terete; leaves coriaceous, at the base, and emarginately retuse at the apex, coriaceous, glabrous; leaflets connected nearly to the apex, 5-nerved, broadly semi-ovate; panicle loose, terminal; stamens 3, antheriferous, the rest wanting. \( \frac{1}{2} \) S. Native of Bengal. Flowers white. Petals ovate, indagulate, 3-4 lines long.

Retuse-leaved Mountain-ebony. Clt. 1820. Shrub. 39 B. coromandeliana (D. C. prod. 2. p. 515.) branches terete; leaves glabrous, coriaceous, at the base; leaflets semi-ovate, obtuse, parallel, connected to the middle, 4-nerved; raceme pubescent; petals ovate-lanceolate, acute; stamens 3, very long and antheriferous, the rest short and bristle-formd. \( \frac{1}{2} \) S. Native of India, near Pondicherry.

Coromandel Mountain-ebony. Tree. 40 B. coriiscs (Roxb. hort. beng. p. 31.) branches terete, cirsiflorous; leaflets coriaceous, at the base, the nerves on the under surface as well as the petiolas, branches, and calyxes clothed.
with rufous villi; leaflets semi-ovate, obtuse, parallel, connected
to the middle, 3-nerved; stamens 3; petals ovate, stipitate.
\(\gamma\). S. Native of China and the East Indies. D. C. legum.
mem. xii. t. 70. B. scandens, Burm. fl. ind. 94. Flowers white.

**Corymbose-flowed Mountain-ebony.** Cl. 1818. Shrubs cl.
41 B. Podotis; leaves glabrous, roundish, cordate, 11-nerved;
lobes obtuse; racemes terminal, corymbose; legumes clothed
with rusty silky hairs, ending in a long tail; calyx cleft longitudinally above. \(\gamma\). S. Native of Pulo Penang. Potts. (v.s. herb. Lamb.)

*Potts's Mountain-ebony.*

**Sect. IV. Pha'nera (from φανερός, φανερός, manifest; from
the corolla and calyx spreading much).** Lour. coch. p. 37.
D. C. prod. 2. p. 516. Stamens 10, somewhat monadelphous
at the base, 3 of which are very long and fertile, and 7 small
and sterile. Ovary on a short stipe. Branches and stems
compressed, climbing.

42 B. Angust'ana (Roxb. cor. 3. p. 82. t. 285.) stem climbing,
regularly flexuous, compressed, cirihiferous; leaves glabrous,
cordate; leaflets 3-nerved, in the younger plants they are
connected to the middle and very much acuminated, in the adult
plants they are connected almost to the apex, and ending in a
short acumene; panicle terminal. \(\gamma\). S. Native of Malabar,
Silhet, and Chittagong.—Rheed. mad. 8. t. 30 and 31. B. scandens,
Lin. spec. ed. 1. p. 374. exclusive of the synonyme of
Rumph. Flowers small, white. Legume 1-2-seeded. Calyx
ureulate, bluntly 5-cleft, girding the alabastrum of corolla like
cup before expansion.

*Snake Mountain-ebony.* Cl. 1790. Shrubs cl.
43 B. L'Angua (D. C. prod. 2. p. 516.) stems climbing, angular;
branches compressed, cirihiferous; leaves clothed with
rufous villi beneath, cordate; leaflets 3-nerved, semi-ovate,
acuminated, connected almost to the middle; racemes few-
flowered, erect. \(\gamma\). S. Native of Ambyona and the
Mo-lucas, in woods by the sea-side. Foilium lingua, Rumph. amb.
5. p. 1. t. 1. B. scandens, Lin. spec. ed. 1. p. 374. exclusive of
the synonyme of Rheed. Flowers at first white, but at
length change to a yellowish colour. Petals lanceolate, acute.

* Tongue-leaved Mountain-ebony.* Shrubs cl.
44 B. Cocéc'nea (D. C. prod. 2. p. 516.) stem compressed,
unequal; branches climbing, cirihiferous; leaves shining and
rufous beneath, cordate; leaflets 4-nerved, semi-ovate, acumina-
ted, connected to the middle; racemes on long peduncles, per-
dulous, large. \(\gamma\). S. Native of Cochinchina, in woods. 
*Pha'nera cicénnea.* Lour. coch. p. 37. Petals ovate, scarlet.
Legume many-seeded.

*Scarlet-flowed Mountain-ebony.* Shrubs cl.

**Sect. V. Cau-lotret's (from καυλός, καυλός, a stem, and
tροφή, τροφή, to feed; in reference to the stems twining to
a great height on trees).** Rich. herb. ex D. C. prod. 2. p. 516.
—Bauhinia, Kunth. ann. sc. nat. p. 84. H. B. et Kunth, nov.
gener. 6. p. 319. but not of Cav. Stamens 10, all fertile and
free, usually shorter than the petals. Calyx ventricose, 5-
toothed, and somewhat 2-lobed. Ovary sessile. Stems usually
climbing and compressed. Flowers white or yellowish.

* Leaflets free to the base.

45 B. Sple'ndens (H. B. et Kunth, nov. gener. amer. 6. p.
319.) stem climbing, cirihiferous; branches compressed, glab-
rous; leaflets free to the base, dimidiately ovate-oblong, 3-
nerved, membranous, rather shining above, but clothed with
fine, golden, shining down beneath. \(\gamma\). S. Native of
South America, on the banks of the Orinoco. Flowers and
fruit unknown.

*Splendid-leaved Mountain-ebony.* Shrubs cl.

46 B. Ou-tim'ouuta (Aubl. guiana. 1. p. 375. t. 144.) stem sar-
mentose, compressed, cirihiferous; leaflets free to the base,
semi-ovate, acuminated, parallel, 4-nerved, clothed with
pressed silky down beneath; stipulas orbicular, oblique at the
base, upper ones permanent; racemes dense, short. \(\gamma\). S. Native of French Guiana. B. Guianensis, var. Lam. dict. 1.
p. 391. Flowers white. The plant is called Ya-Outimoua in Guiana.

*Outimoua Mountain-ebony.* Shrubs cl.
47 B. Guiana-es'sis (Aubl. guiana. 1. p. 377. t. 145.) stem sar-
mentose, compressed, cirihiferous; leaflets free to the base,
semi-ovate, acuminated, 4-nerved, parallel, smoothish beneath,
and green on both surfaces; stipulas wanting, very small or
deciduous. \(\gamma\). S. Native of Guiana, in woods. Flowers white?

*Guiana Mountain-ebony.* Cl. 1820. Shrubs cl.
48 B. Hetero'phylla (Kunth, mim. t. 46. H. B. et Kunth, nov.
gener. amer. 6. p. 319.) stem erect, cirihiferous; branches
tere, and are as well as the calyses clothed with rusty hairs;
leaflets shining, membranous, clothed with adpressed beneath
pubescence, obliquely-oblong, rather obtuse, rounded at the base,
4-nerved, lower ones connected to the middle, upper ones free;
racemes terminal, solitary, leafless. \(\gamma\). S. Native of South
America, in the valleys of Araogn and near Porto Cabello of
Caparros. Flowers white.

*Variable-leaved Mountain-ebony.* Cl. 1824. Shrubs cl.
49 B. Intern'folia (Roxb. hort. beng. p. 90.) leaflets free,
4-nerved; racemes terminal, corymbose; stamens free; tendrils
hooked; legumes flat, smooth. \(\gamma\). S. Native of the East
Indies. (v.s. herb. Lamb.)

*Entire-leaved Mountain-ebony.* Shrubs cl.

** Leaflets connected to the middle.

50 B. Emargi'na (Roxb. in herb. Lamb.) leaves large
droundish, emarginate, with a mucron in the recess, nerved,
glabrous, or the leaflets are connected nearly to the apex, 4-
nerved; panicles divaricate, terminal; stamens free. \(\gamma\). S. Native of the East
Indies. (v.s. herb. Lamb.)

*Emarginate-leaved Mountain-ebony.* Shrubs cl.
51 B. Ola'bra (Jacq. amer. 119. t. 173. f. 3.) climbing;
branches tere; leaves glabrous, cordate at the base; leaflets
oval, obtuse, parallel, 4-nerved, connected to the middle. \(\gamma\)
S. Native of Carthagena, in woods and among bushes.
Petals oval, attenuated at the base, yellowish-green, spotted
with purple inside. Ovary hairy.

*Glabrous Mountain-ebony.* Cl. 1810. Shrubs cl.
52 B. Suave'o'len (H. B. et Kunth, nov. gener. amer. 6. p.
320.) stem compressed, cirihiferous; leaves membranous, cor-
date, pubescent beneath; leaflets semi-ovate, rounded at the
apex, connected to the middle, 4-5-nerved; racemes terminal
and axillary; calyx clothed with silky pubescence. \(\gamma\). S. Native of
New Spain, on the banks of the river Guanacabamba
near Cavico. Petals white.

*Sweet-smelled-flowered Mountain-ebony.* Shrubs cl.
53 B. Cuman'e'sis (H. B. et Kunth, nov. gener. amer. 6. p.
321.) stem sarmentose; branches glabrous; leaves cordate at
the base, pubescent beneath; leaflets membranous, ovate, acini-
this, 4-nerved, hardly connected to the middle; racemes terminal,
solitary, sometimes bifid or cirihiferous. \(\gamma\). S. Native of
p. 218. \(\gamma\). B. et Sesse, fl. mex. icon. ined. ex. D. C. prod. 2.
Flowers white.

*Cu-manua Mountain-ebony.* Shrubs cl.

* Species not sufficiently known.

* Leaflets connected together to the very apex, and therefore
the leaves are simple and entire.
**Native**

463

Richard's Mountain-ebony. Shrub. 55. B. cinnamomea (D. C. prod. 2. p. 517.) leaves elliptic, obtuse at the base, quite glabrous, acuminate at the apex, 5-toothed, undivided; legume stipitate, compressed, linear, glabrous, straight. †. S. Native of Cayenne. Leaves 3 inches long and 2 broad. The middle nerv is usually double at the base, in consequence of the 2 joined leaflets. Petals 6-9 lines long. Legume 8-9 inches long, standing on a stipe an inch long.

Cinnamom Mountain-ebony. Shrub. 56. B. ? du'bia; stems simple; leaves alternate, cordate, acuminate, glabrous, obsoletely 5-toothed; racemes terminal; petals very long, linear, reflexed; stamens numerous, very long, but shorter than the style. †. S. Native of Maranham. Flowers white.

Double Bush-ebony. Shrub 1 to 2 feet.

**Leaflets connected to the middle into a 2-toothed limb.** 57. B. latissilicu (Cav. icon. t. 408.) leaves subcordate at the base, glabrous; leaflets semiovale-oblong, acuminate, 5-toothed, connected a third part of their length, approximate at the upper part. †. S. Native of the Philippine Islands. Flowers racemose. Legume half a foot long, and an inch and a half broad, broadly winged at the seminferous suture. Perhaps a proper genus.

Broad-podded Mountain-ebony. Shrub 6 to 8 feet. 58. B. macrophylla (Poir. suppl. 1. p. 600.) leaves shining and glabrous above, but clothed with silky fulvous down beneath; leaflets large, hardly connected at the base, semi-ovate, 5-toothed, ending in a long acumen; legume oblong-elliptic, tumid at the sutures. †. S. Native of South America? B. chrysophylla, Vahl. ined. Leaflets 6-8 inches long, and 3-4 broad. Perhaps sufficiently distinct from B. Outimoua. Flowers unknown.

Long-leaved Mountain-ebony. Shrub. 59. B. racemifera (Desv. journ. bot. 1814. 1. p. 74.) stem erect; leaves cordate, cuneate, or the lobes are short, obtuse, divaricate, and acuminate at the apex, 6-toothed; flowers disposed in racemose panicles; calyx villous, somewhat triruplicate. †. S. Native of South America.

Raceme-bearing Mountain-ebony. Shrub. 60. B. armata (Otto, pl. bras. no. 25. in flora, 1821. p. 602.) stem prickly, climbing; leaves 2-lobed; lobes ovate, acute. †. S. Native of Brazil.

Armed Mountain-ebony. Shrub el. 61. B. far'kei (Desv. journ. bot. 1814. 1. p. 74.) leaves cordate at the base; leaflets hardly connected a fourth part of their length, oblong, acutish, 4-toothed, nearly parallel; petals ovate-hypancetal, stipitate. †. S. Native of Abyssinia. Färk. Bruce, trav. 5. t. 18. exclusive of the synonyme. The stamens, according to the figure, are monadelphous and all fertile, but according to Desvau they are diadelphous.

Färk's Mountain-ebony. Shrub. 62. B. tamarinda'cea (Gailland, voy. meroc. 1826.) leaves cordate, 2-lobed, nearly orbicular; nerves running through the whole surface, and leaves from a spaceable gland in the recess, with glands on the under surface at the origin of the confluent nerves; fruit thick, nerv'd, pulp inside; seeds egg-shaped, in many series?—Native of Egypt, on mount Agaro. Tamarind-like Mountain-ebony. Shrub.

**Leaflets free to the base.** 63. B. diphylla (Symes, trav. ava. 1808. t. 7.) leaves distinct to the base, unequal, obtuse, 3-toothed; tendrils simple, lateral. †. S. Native of the East Indies.

Three-leafed Mountain-ebony. Shrub. 64. B. americana (Delan. herb. amont. t. 315.) leaves ovate at the base; leaflets parallel at the apex. †. S. Native of South America. It differs from B. unguiculata, Lin. in the stamens being diadelphous, only one of which is fertile. American Mountain-ebony. Ct. 1800. Shrub 6 feet.

†† The names of undescribed species, some of which are probably identical with some of those described above.

1. B. semibifida, Roxb. hort. beng. p. 31. 2 B. Malabárica, Roxb. 1. c. 3 B. ferruginea, Roxb. 1. c. 4 B. cordifolia, Roxb. 1. c. p. 90. 5 B. anulospica, Link. enum. 1. p. 405. 6 B. f. modica, Lodd. cat. 7 B. microphylla, Hort. 8 B. speciosa, Hortul.

Cult. Some of the species of Bauhinia are very showy when in bloom, and some are elegant climbers, well fitted for covering the rafters in stores or store conservatories. They all thrive well in a mixture of loam, peat, and sand. Cuttings should be taken off at a joint when the plants are in a growing state, neither too ripe nor too young, and planted in sand, with a handglass placed over them in a moist heat. The leaves of the cuttings should be allowed to remain detached.

CCXCVIII. CERCIS (from cespice, keris, a shuttlecock; a name given by Theophrastus to this tree). Lin. gen. no. 510. Lam. ill. t. 328. Gaertn. fruct. t. 144. D. C. prod. 2. p. 518. —Siliquastrum, Tourn. inat. t. 414. Mæch. meth.

LIN. SYST. Deciduaria, Monogynia. Calyx urceolate at the base and gibbous, bluntly 5-toothed at the apex. Petals 5, unguiculate, all distinct, disposed in a papilionaceous manner; the wings or side petals the largest. Stamens 10, free, unequal. Ovary on a short stipe. Legume oblong, slender, compressed, 1-celled, many-seeded, somewhat winged on the seminferous suture, and opening on the other suture. Seeds obovate, with tumid, somewhat aluminous endopleura. Embryo straight, with a short radicle, flat cotyledons, and an inconspicuous plumule.—Trees, with simple, many-nerved, cordate leaves, rising after the flowers have decayed. Pedicels 1-flowered, rising from the trunk and branches in fascicles.—This genus is allied to Bauhinia. The leaves are probably composed of 2 joined leaflets, forming an entire limb.

1. C. siliqua'strum (Lin. spec. 534.) leaves very blunt, emarginate, and quite glabrous. †. S. Native of the south of Europe, Levant, Spain, south of France, Italy near Rome, and on the Appenines. Duh. arb. ed. nov. t. 7. Sims. bot. mag. 1188. Mill. fig. 253. Siliquastrum orbiculatum, Mæch. meth. Flowers of a bright purple colour. There are also varieties with flesh-coloured and white flowers; they are frequently used in salads from their agreeable poignancy. The wood is very beautiful and veined with black, takes an excellent polish, and may be converted to many useful purposes.

Var. B. para'siflora (D. C. prod. 2. p. 518.) A shrub, with white spotted branches, and the flowers only about one-half the size of those of the species. †. S. Native of Daciehania. Perhaps a proper species.

2. C. Canadens'is (Lin. spec. 534.) leaves cordate, acuminate, villous in the axis of the veins beneath. †. S. Native from Canada to Virginia, along the banks of rivers. Mill. fig. t. 2. Siliquastrum cordatum, Mæch. meth. Flowers red, and are frequently put into salads by the inhabitants of North Ame-
rica, and the French in Canada pickle them. The wood is of the same colour and texture as that of the first species. The legumes stand on a long pedicel, and are sacculate at the apex by a longer style. The young branches dye wood of a very fine colour. The tree is called red-wood in America.

**Var. β, pubescens** (Pursh, fl. Amer. sept. p. 308.) leaves pubescent beneath.

**Canadian Judas-tree.** Fl. May, June. Clt. 1730. Tree 12 to 20 feet.

**Cult.** These trees are usually planted with other flowering trees and shrubs as ornaments to pleasure grounds, and for their singular beauty deserve a place in every garden and shrubbery; for when the trees have arrived at a pretty good size the branches are so thickly beset with flowers as scarcely to be seen, and the singular shape of their leaves makes a very agreeable variety in summer. They are generally raised from seeds, which should be sown about the end of March on a bed of light earth; they may also be propagated by layers, but plants raised from seeds thrive best.

**Linn. syst. Ennéandra, Monogynia.** Bracteoles 2 under the calyx, joined into a 2-lobed involucre; tube of calyx obovate, exserted from the involucre, with a 4-5-lobed limb; lobes spreading. Petals 3-4, deciduous, the inner one bearing something like a sterile anther. Stamens 9, exserted beyond the tube of the calyx; filaments free, very long, subulate, reflexed before the expansion of the flowers, as in the order Melastomaceae. Anthers when young linear, 2-celled, straight, fixed by the middle. Ovary stipitate, linear, compressed. Style filiform, glabrous, biplicate when young, crowned by a roundish stigma. Legume (ex Aubl.) oblong, compressed, 2-valved, 1-celled, 6-seeded.—A shrub, with alternate, elliptic, quite entire, glabrous leaflets, which are acuminate at both ends, and pedicellate flowers, which are disposed in umbels at the tops of the branches. Pedicels bracteate.

1 P. Guianensis (Aubl. l. c.) = S. Native of Guiana, in woods. Corolla red.

**Guiana Palovea.** Shrub 5 to 6 feet.

**Cult.** For culture and propagation see Bauhinia, p. 463.

**CCXCV. ALOEXYLON** (from ἀλεύς, aloe, of Dioscorides, the Aloe, and ξύλον, wood; this tree produces the aloe-wood of the shops). Lour. cochin. p. 267. D. C. prod. 2. p. 518.

**Linn. syst. Decandria, Monogynia.** Calyx of 4 sepals or 4-parted; sepals acute, deciduous, lower one falcate, incurred, nearly twice the length of the rest. Petals 5, unequal, longer than the calyx. Stamens 10, distinct. Ovary compressed, curved. Style filiform. Legume woody, smooth, falcate, 1-seeded. Seed oblong, curved, arillate.—A tree, with erect branches, simple, alternate, lanceolate, quite entire, petiolate leaves, and terminal flowers. This genus is hardly known.

1 A. Agallochum (Lour. l. c.) = G. Native of Cochinchina, on the highest mountains, and the Molucca Islands. — Rumph. amb. 2. p. 29, t. 9, ex Lour. Cynometra Agallocha, Spreng. syst. 2. p. 327. The wood is white and scentless, and has long been used as a perfume. Aloe-wood is held in high estimation in the East on account of its fragrant odour as a perfume, for which purpose it is applied to clothes and apartments, and as a cordial medicine in fainting fits, and in cases of paralytic affection. By the Chinese and Heathen Moors it was used as incense in their sacrifices; and employed for setting the most precious jewels that are wrought in the East Indies. It was formerly deemed in that part of the world of greater value than gold, and various fables have been invented as to the origin of the tree that yields it. Some have feigned that it grew in Paradise, and that it was conveyed from thence by the rivers, which overflowed their banks, and swept off the trees in their way. Others pretend that it grows on inaccessible mountains, where it is guarded by wild beasts. The calambeae or eagle-wood should not be confounded with the aloe-wood. See Agallochium.

**Agallocha or Aloe-wood.** Tree 60 feet.

**Cult.** For culture and propagation see Bauhinia, p. 463.

**Linn. syst. Monadelphus, Decandria.** Calyx cylindrical, rounded at the base, permanent, 5-cleft; lobes linear, cohering at the apex, and dehiscing on the sides. Petals 5, equal, obvate, spreading, keeled from the base to the apex. Stamens 10, exsertate, erect, monadelphous, at the top. Ovary oblong, stipitate, tube adnate to the calyx. Style filiform, crowned by a capitate stigma. Legume very long, compressed, pedicellate, torose at the sides, 1-celled, 2-valved, dehiscing. Seeds many, roundish, compressed.—American shrubs, with simple cordate leaves. This genus is unknown to European botanists, but it appears to be allied to Jousia, from the stipitate ovary, and in the stipe adhering to the calyx.

1 A. petiolata (Seb. Mutis. l. c.) leaves petiolate; flowers terminal. = S. Native of New Granada, in the temperate parts.

**Petiolate-leaved Amaria.** Shrub 4 to 6 feet.

2 A. sessilifolia (Seb. Mutis. l. c.) leaves sessile, almost stem-clasping; flowers axillary; peduncles many-flowered. = S. Native of New Granada, in temperate places.

**Sessile-leaved Amaria.** Shrub 4 to 6 feet.

**Cult.** For culture and propagation see Bauhinia, p. 463.

**Linn. syst. Decandria, Monogynia.** Calyx turbinate campanulate, 5-toothed; teeth acute, erect, 2 superior ones approximate. Petals 5, free, disposed in a kind of papilionaceous manner, lateral ones the longest. Stamens 10? free. Legume stipitate, 10-ovulate, compressed, membranous, winged on the seminiferous suture, 1-celled, indehiscent. Embryo straight.—An unarmed tree, with impari-pinnate leaves, clothed with rusty tomentum beneath, as also the branches. Flowers violaceous.

1 B. virgilioides (H. B. et Kunth. l. c.) = S. Native of South America, near Barbula, Laviella del Pao, and at the mouth of the Orinoco, where it is commonly called Aloe cornosa. Leaflets 13, lanceolate-oblong, obtuse at both ends.

**Virgilia-like Bowdichia.** Tree.

**Cult.** For culture and propagation see Bauhinia, p. 463.

**Linn. syst. Octo-Decandria, Monogynia.** Calyx bibracteate at the base, with the tube short and obconical, and the limb 4-cleft and spreading. Petals wanting. Stamens 8-10, exserted from the tube of the calyx, long, free, rather dilated at the base. Ovary ovate, hairy, rather stipitate. Style filiform. Legume coria-
ceous, thick, 1-2-seeded.—Guiana trees, with impari-pinnate glabrous leaves, alternate entire leaflets, and axillary simple racemes of flowers. The genus has the habit of *Swartzia*, but is not well known.

*Spicate-*flowered Crudya. Tree 30 feet.

*Aromatic* Crudya. Tree 40 to 50 feet.

3 C. *parvifolia* (D. C. prod. 2. p. 520.) leaflets 3, ovate, very unequal at the base, acuminate at the apex; racemes equal in length to the leaves, on long peduncles. η. S. Native of Guiana, in woods. Parvöa tomentösa, Aubl. guian. 2. p. 759. and 304. Touchiröa Parvöa, Rich. herb. Flowers purple. The stamens are 10 and distinct, and the ovary is hairy.

*Parvöa* Crudya. Tree 20 feet.

*Vouarana* Crudya. Tree 10 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

**CCXCIX. DIALIUM ( Dialöae, a name employed for the Heliotropium by some Greek writers; it comes from *Dialöos*, but the plant of the Greeks has nothing to do with the present).**

**LIN. SYST. DIÂLIIUM, Monogyönia.** Calyxx 5-parted or of 5 sepals; sepal oblong, obtuse, concave, equal in length, 2 outer ones rather the broadest. Petals none. Stamens 2, inserted in the receptacle on the superior side of the flower; anthers thick, erect, 2-celled. Ovary ovate, sessile. Style subulate, bluntish. Legume pulpy, 1-2-seeded. Seeds cominuted.—Trees, with impari-pinnate glabrous leaves, and panicked racemes of small flowers. This genus is nearly allied to *Codârium*.

1 D. *fused* (Lin. mant. 24.) panicule simple, drooping; leaflets elliptic-oblong, acute; anthers 3 times the length of the filaments. η. S. Native of Java. D. Javanicum, Burm. ind. p. 12, exclusive of the synonyme of Rumph. D. *fundus*, Smith in Rees’ cycld. vol. 11. no. 11. Calyx clothed with white velvety down on the outside.

*Indian* Dialium. Tree 20 to 30 feet.

2 D. *divaricatum* (Vahl. enum. 1. p. 303.) panicule compound, erect; leaflets ovate, acuminate; anthers shorter than the filaments. η. S. Native of Guiana, in woods. Aroinöa Guîanënsis, Aubl. guian. 1. p. 16. t. 5. Arôna divaricata, Willd. spec. 1. p. 49. Legume oval, compressed, indehiscent, dry. Leaflets extipellate, the ultimate one longer and narrower than the others.

*Divaricate* Dialium. Tree 30 to 40 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

**CCC. CODARIIUM (from *swartær*, koddöin, the hide of a beast; in reference to the consistence and hairiness of the pods).**

**LIN. SYST. DIÂNIIUM, Monogyönia.** Calyx 5-parted; lobes equal, spreading; the tube permanent. Petal one, linear-lanceolate, flatish. Stamens 2, inserted in the calyx, free, erect; filaments longer than the anthers; anthers ovate, 2-celled. Legume clothed with black or brown velvety down, 2-valved, 1-seeded. Seeds surrounded by mealy pulp. Alummen, ex Afz. (perhaps endopleura) large, and shell-formed. Cotyledons elliptic. Radicle hemispherical. Plumule ligulate, acute.—Trees, native of Guiana, with impari-pinnate leaves, bearing 2-3 pairs of coriaceous leaflets. Flowers small, reddish, disposed in terminal branched panicles.

1 C. *acutöölium* (Afz. l. c.) leaflets unequal, bluntly somewhat acuminate, the same colour on both surfaces, glabrous. η. S. Native of Sierra Leone, and other parts of Guiana.

2 C. *obtusöölium* (Afz. l. c. Vahl. enum. 2. p. 401.) leaflets equal, rounded at the apex, the same colour on both surfaces, glabrous. η. S. Native of Sierra Leone, and other parts of Guiana.

3 C. *disëcor* (D. C. prod. 2. p. 520.) leaflets elliptic-oblong, attenuated at both ends, glabrous above, but clothed with very minute velvety pubescence beneath. η. S. Native of Sierra Leone, and other parts of Guiana.

*Discoloured-leaved* Velvet-tamarind. Tree 14 to 20 feet.

*Cult.* For culture and propagation see *Copaifera*, p. 456.

**LIN. SYST. unknown.** Flowers unknown. Legume coriaceous, roundish, compressed, ferruginous, wrinkled on one side, with membranous margins, 1-celled, indehiscent. Seed large, roundish, flattened. Embryo straight.—A tree, with impari-pinnate leaves, alternate, oval, glabrous, stiff leaflets, which are cinereous on the under surface. This genus is analogous to *Piceroxöpus* from its fruit, but differs in the embryo being straight.

1 V. *guianaësis* (Aubl. l. c.) η. S. Native of Guiana, on the banks of rivers. The tree is called Graine à l’arbre.

*Guiana* Vatairea. Tree 50 feet.

*Cult.* See *Copaifera* for culture and propagation, p. 456.

**Tribe XI.**

**DETERARIEÆ (plants agreeing with Detarë in important characters).** D. C. legum. mem. xiii. prod. 2. p. 521. Calyx 4-lobed, globose before expansion; lobes valvate. Petals wanting. Stamens 10-25, perigynous, nearly free. Legume fleshy. Cotyledons thick.—African trees, with impari-pinnate leaves. This tribe agrees with *Swartëriæ* in the calyx, but with *Cassëë* in the rest of the characters. It comes very near to the order *Amygdalaceæ* in the drupaceous fruit, and the isocandrons flowers.

**CCCH. DETARIIUM (Detar is the name of the tree in Senegal).** Juss. gen. 365. D. C. prod. 2. p. 581.

**LIN. SYST. Detârëriûm, Monogyönia.** Calyx 4-cleft; lobes valvate before expansion. Alabastrum globose. Petals wanting. Stamens 10; filaments distinct, alternate ones shortest. Ovary 3 O
globose, hispid. Style and stigma one. Drupe orbicular, thick, soft, farinaceous, containing a large, hard, orbicular, compressed, nut, smooth on the sutures, revolute with interwoven fibres in the valves, 1-celled, 1-seeded. Seed large, smooth, compressed, blackish, exalbuninous. Embryo straight, with thick, transversely oval cotyledons, a short radicle, and an ovate plumule.—A tree, with alternate and impari-pinnate leaves, ovate obtuse glabrous leaflets, which are velvety beneath. Racemes axillary, branched, shorter than the leaves.

LIN. SYST. Monadelphia, Decandra. Calyx ovate, ventricose, permanent, 5-cleft; segments lanceolate, spreading. Petals 5, unirugulate, spatulate. Filaments 10, monadelphous at the base; anthers minute. Ovary ovate, rugose. Style one, lateral, filiform, simple, obtuse. Legume roundish, crowned by the style, muricate, 1-celled, 2-valved; valves concave. Seeds numerous, fixed to the superior suture, many of which are abortive, and one of them roundish-reniform.—A decumbent hairy herb, with ovate stipules, trifoliate leaves, obovate leaves, and axillary and terminal peduncles, each bearing 3-4 bracteate flowers at the top. The description is taken from the figure of Thumb.

CCCVIII. VARE'NNEA (named by De Candolle to recall the useful works of M. Varenne de Fenielle on agriculture, and vegetable physiology). D. C. legum. mem. xiv. prod. 2. p. 522.—Viborquía, Orteg. dec. 5. p. 66. t. 9. but not of Thumb. nor Mænch, nor Roth.

LIN. SYST. Monadelphia, Decandria. Calyx tubularly campanulate, permanent, 5-toothed, the 2 superior teeth the broadest. Petals 5, disposed in a sub-papillaceous manner, having the vexillum cuneiform and emarginate; wings spatulate and falicate, and the carina of 2 spatulate petals, which are concave above. Stamens 10, monadelphous, with the sheath left in front (ex Ortega), diadelphous, the tenth one (ex icon. fl. mex. indent.). Ovary oblong. Style filiform, subulate. Stigma capitata. Legume oblong, compressed, flat, rather falicate, 1-seeded. Seed fixed to the top of the legume, oblong-reniform.—A shrub, with impari-pinnate leaves, bearing many pairs of ovate, entire, stipellate leaflets, the odd or terminal one orbiculate, but often deficient. Racemes numerous, spicate, disposed in a panicule. Flowers small, white. The place which this genus should occupy in the order is uncertain. It is said to be allied to Nísòlia and Pterocépaeus.

8
Many-spiked Vareana. Shrub 1 to 2 feet. 
Cult. See Serodum for culture and propagation, p. 466.

CCXX. CRAWFORDIA (named apparently after some botanist or horticulturist of the name of Crawford). Rafin. spech. 1. p. 159. D. C. prod. 2. p. 522.

Lin. syst. Diadelplia, Decandria. Calyx campanulate, 5-cleft; segments nearly equal. Corolla papilionaceous, with a large reflexed vexillum, adpressed wings, which are arched at the base, and an obtuse keel, which is longer than the wings. Stamens 10, diadelphous. Ovary linear. Style filiform; stigma dot-formed, glabrous. Legume usually 2-seeded, linear, turulose, striated. Seed oblong-reniform.—A twining plant, with imparipinnate leaves; leaflets oblong, mucronate, sessile. Petioles longer than the leaves, somewhat spicate; bracteas scarious, subulate, permanent, ciliate. Flowers white. This genus is allied to Galizia and Crotacca according to the author, but from both and from Tephræa it differs in the 2-seeded legume.

1 C. Bracteata (Rafin. l. c.) Y. F. Native of Pennsylvania, on the banks of the river Susquehanna.
Bracteata Crawfordia. Pl. tw. 
Cult. Peat or vegetable earth is a good soil for this plant, and cuttings will be easily rooted.

CCXX. AMMODENDRON (from ammoc, ammos, sand, and dendron, a tree; habituation of the shrub). Fisch. in D. C. legum. mem. xvi. prod. 2. p. 528. Led. fl. alt. 2. p. 110.

—A small, neat, silky shrub, having the petioles hardening into spines. Leaves bilobate; leaflets lanceolate. Flowers purple, disposed in racemes. This genus is closely allied to Halimodendron, which genus it ought to have followed in the body of the order.

Sievers’ Sand-tree. Shrub 2 to 4 feet. 
Cult. For culture and propagation see Halimodendron, p. 244.

1 L. Tripinnervia (Spreng. l. c.) H. S. Native of Brazil. Leaves a span long, and a hand in breadth.
Tripineervia Lacara. Shrub. 
Cult. For culture and propagation see Copaifera, p. 456.

CCXXXIII. HARPALYCE (from Harpalus in mythology, the daughter of Clymenus, remarkable for her beauty; in reference to the beauty of the plant). Moc. et Sesse, fl. mex. leon. inc. ex D. C. prod. 2. p. 528.

Lin. syst. Monadelpia, Decandria. Calyle bilabiate, decidual, bibracteolate at the base, both lips lanceolate, acuminate, and entire. Corolla papilionaceous, with an obovate vexillum, auricled wings, and a 2-edged, elongated, acuminate, rather twisted keel. Stamens 10, monadelphous. Style filiform, incurved with the carina. Legume compressed, flat, narrow at the base, obvate-oblong at the apex, 4-5-seeded, mucronate by the style.—An erect herb, suffrutescent at the base, with imparinipinnate leaves, and axillary peduncles, which are longer than the leaves, bearing racemes of large red flowers. This genus appears to be allied to Phascolus from the bibracteolate calyx, and the incurred carina, but differs particularly from that genus in the leaves being impari-pinnate, but in consequence of the legume being 2-seeded, and the leaves being impari-pinnate, the genus is probably allied to Astragalus, but the calyx is very distinct.

1 H. FORMOSA (D. C. prod. 2. p. 523.) H. S. Native of New Spain, in the hot regions. Astragalus cunnousis, Moc. et Sesse, fl. mex. ined.
Shewy Harpalype. Pl. 1 foot. 
Cult. For culture and propagation see Hoffmanseggia, p. 433.

Lin. syst. Monadelphia, Decandria. Calyx tubular, 5-toothed. Corolla papilionaceous. Filaments 10, connected. Legume 1-celled, flat, many-seeded, spirally involute, serrated on both margins.—An annual hairy herb, 2-3 inches long, with pediato trifoliate leaves, ovate lanceolate stipules, and axillary peduncles, bearing each a head of yellow flowers. This genus is allied to Medicago according to the habit, but from the legume it appears to be more nearly allied to Bisèrula, but it is not sufficiently known.

1 D. Medicaginoides (Viv. l. c.) G. H. Native of Libya, in the great Syria, in fields.
Medick-like Diploprion. Pl. 2 to 3 inches.
Cult. The seeds of this plant only require to be sown in the open border in a dry warm situation.

Lin. syst. unknown. Flowers unknown. Legume stipitate, obliquely-elliptic, compressed, mucronate, chariaceous, 2-valved, 1-seeded. Seed oblong-reniform, fixed to the lower part of the pod, covered with friable white substance. Cotyledons thick. Radicle small, situated beneath the apex of the embryo, pointing to the bottom.—An unarmed tree, with imparipinnate leaves, bearing 1-3 pairs of coriaceous leaflets, having the petiole winged. Peduncles usually terminal. Perhaps this genus belongs to tribe Geoffrée, near Andira, or perhaps to tribe Cassieæ, near Copaifera.

R. nitens (H. B. et Kunth, nov. gen. amer. 7. p. 266. t. 55.) H. S. Native of South America, near Jaen de Bucaramong. 
Shining Riveria. Tree. 
Cult. See Copaifera for culture and propagation, p. 456.

† Additional genera.

CCXXXV. DONIA (to the memory of the late Mr. George Don, of Forfar, whose numerous discoveries have so eminently enriched the Flora of his native land). G. and D. Don, mss. in herb. Lamb. but not of R. Brown nor Pursh.

Lin. syst. Diadelphia, Decandria. Calyx campanulate, 5-toothed or 5-cleft. Corolla papilionaceous. Vexillum oblong-lanceolate, acuminate, rather shorter than the keel, reflexed;
wings lanceolate, acuminate, spreading, half the length of the keel, which is cymbiform, and composed of one petal. Stamens 10, diadephous, one of which is separate from the rest; anthers incumbent. Style long, filiform; stigma truncate. Legume oblong, sown, coriaceous, 1-celled. Seeds many, reniform, disposed in 2 rows, attached by a funicle to the lower suture.—

Procumbent, herbaceous, perennial herbs or subshrubs, with impari-pinnate leaves, and foliaceous, alternate permanent stipules. Flowers large, crimson, about 2 inches long, disposed in umbels or racemes.

1 D. funiculata; suffrutescent, minutely pubescent; leaflets alternate, oblong, retuse, coriaceous; flowers racemose; calyx 5-toothed; legumes smooth. 〒. G. Native of New Zealand, where it was first discovered by Sir Joseph Banks and Dr. Solander, who gave it the name of Clitiunthus puniceus. Flowers large, crimson.

Scarlet-flowered Donia. Shrub 1 to 2 feet.

2 D. speciosa; herbaceous, very villous; leaflets opposite, lanceolate, acute; flowers umbrillate; calyx 5-cleft; legume silky. 〒. G. Native of New Holland, at Regent's Lake. Flowers large, crimson.

Shiny Donia. Pl. procumbent.

3 D. ronchosa; plant herbaceous, very villous; leaflets opposite, ovate; flowers racemose; calyx 5-cleft; legume silky. 〒. G. Native of the North-west coast of New Holland, at the Curlew river. Capt. King.

Beautiful Donia. Pl. procumbent.

Cult. Elegant plants, resembling the Satherlândia fruticosa, when in bloom, their flowers being large, and of a crimson colour. Should ever any of the species be introduced to our gardens, we would recommend their being grown in an equal mixture of loam, peat, and sand, and cuttings will no doubt strike root in the same kind of soil, under a bell-glass.

CCCXVI. MEGASTEGIA (from μεγας, megas, large, and στεγης, stege, a covering; in reference to the large bracteas, which enclose the flower before expansion).

Lin. syn. Montinélhpia, Decáandra. Bracteas 2, large, inclosing the flower before expansion. Calyx bilabiate, upper lip bidentate, lower one trilobed. Corolla papilionaceous, not much longer than the calyx. Stamens 10, monadephous? Legume unknown.—A herbaceous plant, densely clothed in every part with fuscous hairs. Leaves with 10-12 pairs of ovate acuminate leaflets. Pedicels elongated, 1-flowered, solitary or twin, axillary. Flowers large, red or purple.

1 M. speciosa. 〒. G. Native of Mexico. Pavon, Astrágalus ammodytes, Ruiz et Pav. in herb. Lamb. Perhaps the same genus as Harpydecta.

Shiny Megastegia. Pl. 1 to 2 feet.

Cult. For culture and propagation see Hoffmannseggia, p. 533.

CCCXVII. SEBIPIRA (meaning unknown.) Mart. reis. ex Schlécht. Linnaea. 5. p. 44.

Lin. syn. Decáandra, Monogyphys. Calyx tubular, cylindrical, somewhat equally 5-toothed. Corolla of 5 petals, disposed in a somewhat papilionaceous manner; petals erect, unguiculate, flat, crenulate, having the vexillum almost quadrate, shorter than the wings and petals of the keel. Stamens 10, free; anthers globose. Stigma capitata. Legume compressed, linear, membranous, 1-celled, many-seeded, winged on one side. Seeds obovate. Embryo straight. This genus belongs to Tribe Cassiaceae, and ought perhaps to follow Copafera, p. 455. of the present volume.

1 S. majus (Mart. 1 c.) leaves pinnate, with many pairs of alternate, oblong-lanceolate, obtuse leaflets, which are glaucous beneath and hairy; panicle of flowers spreading. 〒. S. Native of Brazil.

Larger Sebipira. Shrub or tree.

Cult. See Copafera for culture and propagation, p. 456.

† Additional Leguminous plants.

Tribe I. Sophórcæ, p. 108.

1 Baptisia minor (Lehm. in nov. act. bonn. 14. p. 803, and 113. no. 8. of the present volume,) stem erect, solid; leaflets rhomboid-lanceolate; stipulas lanceolate; longer than the petals; racemes axillary, bracteate; bracteas coriaceous, lanceolate, lower ones permanent; vexillum entire. 〒. H. Native of North America. Baptisia australis, Hortul. Plant glaucous and pruinose. Flowers blue. This plant differs from the true B. australis in the stem being solid and always smaller, in the lower bracteas being permanent, and lastly in the vexillum being entire, which in B. australis is appendiculate at the base.

2 Gomphocarpum Knightiænium (Lindl. bot. reg. 1468.) leaves ternate and pinnate; leaflets roundish-ovate, ovate, and linear, mucronate, and glabrous; cymes terminal, pedunculate, length of the leaves. 〒. G. Native of New Holland. Flowers rose-coloured. Leaflets variable in shape.

3 Crotalaria eulophiæfolia (Schlecht. et Cham. in Linnaæa. 5. p. 575.) pinnate; stem angularly winged, dichotomously branched; leaves on short petioles, ovate-elliptic, obtuse at both ends, and mucronate; flowers usually twin, pedunculate, near the base of the branches; bracteas rather joined, opposite, stipula-formed, deciduous, hastyly acuminated at the apex. 〇. S. Native of Mexico, near Hacienda de la Laguna. Flowers blue, rather smaller than those of C. verrucosa. Lin. p. 134. no. 12. of the present volume, and to which it is nearly allied.

Buphenum-leafed Crotalaria. Pl. 1 to 2 feet.

4 Crotalaria bracteata (Schlecht. et Cham. in Linnaæa. 5. p. 575.) plant exstipulate; leaves sessile, oblong, obtuse, mucronate, attenuated at the base, clothed with yellowish tomentum beneath, as well as on the branches and calyxes; branches terete; racemes elongated, opposite the leaves, or somewhat terminal on long peduncles; peduncles bracteate; corolla equal in length to the calyx; calyces segments linear, elongated, acuminated, and very acute; legumes glabrous, rather clavate, many-seeded. 〇. S. Native of Mexico, at Hacienda de la Laguna. Flowers propped by bracteas on short pedicels. Corolla flesh-coloured. This species comes nearly to C. Paulinæa, p. 136. no. 55. of the present volume.

Bracteate-flowered Crotalaria. Pl. 1½ foot.

5 Genista tenorei; stems diffusely prostrate; branches angular, striated, and villous; leaves oval-oblong, acute, pilose on both surfaces; flowers axillary, solitary, on short peduncles; calyx somewhat cylindrical, pilose; the teeth seaccose; corolla glabrous; vexillum of a copper-yellow colour, about equal in length to the keel. 〒. H. Native of Lucania, on the mountains.

G. depressa, Tenore, fl. neap. prod. append. 5. but not of Bieb. This species differs from G. prostrata, Lam. p. 153. no. 72. of the present volume, in the leaves being pilose on both surfaces, in the calyx being hairy, and lastly in the calycine teeth being seaccose.

Tenore's Genista. Shrub prostrate.

6 Osénis pedunculæris (Lindl. bot. reg. 1446.) herbaceous, diffuse, beset with glandular pubescence; leaves obovate, toothed, simple; stipulas quite entire, shorter than the petiole; pe-
dunces long, 1-flowered, awned, arched, at length recurved.

G. Native of Teneriffe. Flowers variegated with white and rose colour. Leaves all simple.

7 *Ononis conica* (herb. Lamb.). leaves bifoliolate, nerved, glabrous, oblique, obtuse; stipules large, adnate to the stem at the base, ovate-cordate, acuminate and mucronate; petiole ending in a spine; legume hairy; sepalis acute, lanceolate, longer than the corolla; pedicels 1-flowered, axillary, solitary.

G. Native of Mexico.

Conjugate-leaved Rest-harrow. Shrubs 1 to 2 feet.

8 *Ononis sicula* (Moris. elench. Sard. fasc. iii.) plant clothed with clammy glandular villi; leaves trifoliolate; leaflets oblong-obovate, serrately toothed at the apex; stipules large, length of petioles; peduncles axillary, awned, 1-2-flowered, about equal in length to the leaves; corolla twice the length of the calyx, but the legumes are 3-times longer than it and drooping.

G. Native of Sardinia, in fields, on the south side. Corolla pale yellow, having the keel tipped with purple. It comes very near to *O. viscosa*, Lin. no. 14. of the present volume, in habit, but differs in the leaflets being equal in size and shape, and in the corolla and legume being much longer than the calyx; it also differs from *O. geminiflora*, Lag. p. 160. no. 20. and *O. bisflora* of Desf. p. 153. no. 121. of the present volume, in the hairs being tipped with red glands.

Subtribe II. *Trifoliæ*, p. 167.

9 *Trigonella azuraea* (Meyer, verz. pfl. p. 136.) plant clothed with soft pubescence; stem branched, diffuse; stipules ovate-cuspidate, toothed; leaflets obovate, toothed; heads dense-flowered, pedunculate; legumes villous, nearly linear, compressed, nerved, 4-6-seeded, ending in a hooked beak.

Acro-flowered Trigonella. Pl. 1 foot.

10 *Trigonella arcaia* (Meyer, verz. pfl. p. 136.) plant pubescent, diffuse; leaflets obovate, denticulated; stipules semi-sagittate, toothed at the base; umbels sessile, 6-8-flowered; common peduncle awnless; legume pubescent, nearly terete, erect, arched, reticulately veined.

G. Native of Persia, on the mountains of Talush, near Swant. To follow *T. montepelliaea*, Lin. p. 175. no. 20. of the present volume.

Arched-podiaed Trigonella. Pl. diffuse.

11 *Trigonella moschata* (Meyer, verz. pfl. p. 137.) plant diffuse, puberulous; leaflets obovate, and are as well as the semi-sagittate stipules toothed or cut; legumes axillary, solitary, sessile, elongated, terete, straightish, reticulately veined.

G. Native of Persia, near Lenkeran and Swant. To follow *T. prostrata*, p. 174. no. 7. of the present volume.

One-flowered Fum-Greek. Pl. diffuse.

12 *Trigonella mexicana*; stem erect, leaflets obovate, euneiform, obcordate, sharply toothed at the apex; stipules lanceolate, subulate, ciliated; racemes pedunculate; legumes reticulated, mucronate, rather falcate, many-seeded.

G. Native of Mexico. Flowers white or yellow. To follow *T. striata*, Lin. p. 174. no. 11. of the present volume.

Mexican Trigonella. Pl. 1 1/4 to 1 foot.

13 *Trifolium spinulosum* (Doug. miss. Hook, fl. bor. amer. 135.) prostrate, glabrous; leaflets oblong, acute at both ends, spinulose-denticulated, and terminating in a stiff spine; stipulas ovate, acuminate, shining, serrated; involucrum 1-leaved, laciniately multifid; heads of flowers globose, longer than the involucrum; calyces teeth narrow-subulate, pungent, straight, a little shorter than the corolla.

G. Native of North-west America, very common near springs in the valleys between Spokan and Kettle Falls. This species is allied to *T. sibiricum*, Lindl. p. 185. no. 58. of the present volume, but is sufficiently distinct. The vexillum and wings are shorter and more acute, the flowers smaller, white, the keel and wings tipped with a fine purple, and the whole plant more slender. This plant might prove perhaps very useful as a clover, the herbage forming a dense, short sward. It is extremely nutritious, and preferred to every thing else by deer and horses in its native country.

Spiniolose-toothed Trefoil. Pl. prostrate.

14 *Trifolium polyphyllum* (Meyer, verz. pfl. p. 139.) quite glabrous; leaves radical, petiolate; leaflets 7-9, nearly linear, serrulate; stipulas subulate; scape naked; flowers umbellate, becoming at length reflexed; corolla twice the length of the calyx; calyces teeth nearly equal, subulate; ovary villous.

G. Native of the western region of Caucasus, at the height of 3600 or 4300 feet. Allied to *T. alpinum*, Lin. p. 192. no. 131. of the present volume.

Many-leaved Trefoil. Pl. 3/4 to 1 foot.

15 *Lotus austriacus* (Andr. bot. rep. 624.) stem pilose, her- bacous, and perhaps procumbent; leaflets and stipules about equal in size, obovate-lanceolate; peduncles elongated; flowers 3-6, disposed in racemose heads at the tops of the peduncles; calyces segments longer than the tube; stamens diadelphous, the alternate filaments of the 9 connected ones very dissimilar to the others.

G. Native of New Holland. Flowers large, showy, pink, or rose-coloured. Sims, bot. mag. 1305. This plant should follow *L. Arabicus*, Lin. p. 197. no. 27. of the present volume.

16 *Hoxeria unifoliata* (Hook. fl. bor. amer. 135.) plant decumbent, hairy, much branched; leaves usually with 1 leaflet, rarely with 2 or 3, almost sessile; leaflets oval, acute at both ends; stipulas obsolete; peduncles 1-flowered, with 1 ovate bractea under the flower.

G. Native of North America, on the shores of the Columbia. Corolla yellow. This species approaches *H. decumbens*, Benth. in the size and shape of the leaflets and in the hairiness, but in its flowers to *H. parviflora*, Benth. p. 200. no. 4. of the present volume.

One-leaved Trefoil. Pl. diffuse.

Subtribe III. *Clitóricae*, p. 201.

17 *Psoralea physodes* (Doug. miss. Hook, fl. bor. amer. p. 136.) smoothish; leaves pinnatim trifoliolate, rarely with 5 leaflets; leaflets broadly rhomboid-ovate, acute, mucronate, obscurely glandular, terminal one on a long petiole; racemes pedunculate, loose, axillary, longer than the leaves; calyx much inflated, hairy, hardly shorter than the corolla, with the teeth nearly equal.

G. Native of North America, on the banks of streams, in open sandy, and gravelly soils, from the great falls of the Columbia to the Rocky Mountains. Legumes glandular, 1-seeded. It is easily distinguished from the other species by its broader leaflets, as well as by its large inflated calyx, which almost conceals the flower. The plant comes nearest to *P. incisa*, Nutt. p. 203. no. 42. of the present volume.

Bladder-calysed Psoralea. Pl. 1 1/2 foot.

18 *Psoralea brachia* (Doug. miss. Hook, fl. bor. amer. t. 53.) stem erect, flexuous, a little branched, very villous; leaves palmately 5-foliolate, clothed with adpressed hairs; leaflets elliptic; peduncles axillary, elongated, longer than the leaves; racemes oblong, spirate, rather loose; bracteas and teeth of calyx leafy and lanceolate; flowers erect.

G. Native of North America, on the plains of the Saskatchewan, from Carlton House to Edmonton House. Root fusiform. Flowers
with a white vexillum and a blue keel, which is united to the wings. According to Mr. Douglas this is the *Nuect de Prairie* of Canadian voyagers and not the *P. esculenta*, Pursh, p. 203, no. 40, of the present volume, to which the present plant comes nearest. The roots, though stringy, dry, and tough, and containing but little farinaceous matter, are gathered and eaten by the Cree Indians raw, or sometimes roasted.

**Brachiate Petalostem.** Pl. 1 to 1½ foot.

19 **GLYCINE INVOLUCRATA** (Wall. pl. rar. asiat. 3. p. 22. t. 241.) branches filiform, long, twining, pilose; leaflets oval, ciliated; racemes dense, axillary; peduncles usually with 2 whorls of 3 roundish bracteas at the base. As. G. Native of Nipal, also in Sirmore and Kamaon. Flowers white, tipped with pink.

**Involutarated**-racemmed Glycine. Shrub tw.

**Subtribe IV. Galèceae.** p. 222.

20 **PETALOSTÉMNON ORNATUM** (Dougl. mss. Hook, fl. bor. amer. p. 138.) spikes of flowers oblong-cylindrical; bracteas longer than the calyx, which is very villous; leaves with 2-3 pairs of elliptic-oblong, glabrous leaflets. As. F. Native of North-west America, frequent in the arid prairies near the Blue Mountains, of Lewis's River. Bracteas subulate, hairy. Corolla rose-coloured. This species comes near to *P. cárneum*, Michx. p. 222. no. 2, of the present volume.

**Ornamented** Petalostemon. Pl. 1 foot.

21 **CARAGANÀ BWOEI** (Led. fl. ross. alt. ill. t. 464.) leaves with 2-3 pairs of broad-elliptic, distant leaflets, which are cuneated at the base, but rounded and truncate at the apex, ending in a spine-like mucrone, rather silky on both surfaces; stipules spreadingly recurved, spinescent, permanent; petioles pungent, deciduous; peduncles usually solitary, and are as well as the calyxes silky. As. H. Native of Altai, in the desert called *Kuriac*, and near the river Tschujda. Led. fl. alt. 3. p. 264. Corolla yellow. To follow *C. arborescens*, p. 243. no. 3. of the present volume.

Bunge’s *Caragana*. Fl. June. Shrub 3 to 5 feet.

**Subtribe V. Astraigææ.** p. 247.

22 **PHACA ABBREVIÁTA** (Led. fl. ross. alt. ill. t. 330. fl. alt. 3. p. 268.) plant pilose when young, but when in an adult state smooth; stems erect, simple; stipulas lanceolate-linear, reflexed, marcescent; leaves with 21-23 oblong, mucronate leaflets, which are rounded at both ends; peduncles longer than the leaves; flowers numerous, disposed in a short raceme; corolla hardly twice the length of the calyx; legumes stipitate, compressed, when young densely clothed with pili. As. H. Native of Altai, in subalpine places at the mouth of the river Abai. Flowers deep yellow. To follow *P. alpina*, Lin. p. 247. no. 3. of the present volume.

**Short-spined** Bastard-vetch. Fl. June, July. Pl. 2 feet.

23 **PHACA LONGATA** (Hook, fl. bor. amer. p. 140.) stem erect, angular, pubescent, sparingly branched; leaves with 8-10 pairs of oblong-cuneate, retuse leaflets, which are hoary beneath; stipulas small, acuminate, broad at the base, lower ones connected; peduncles much longer than the leaves; racemes elongated, loose; calyces silky; legumes coriaceous, cylindrical, curved, sessile, acute. As. H. Native of North-west America, on the plains of the Saskatchewan. Flowers small, white, or cream-coloured, having the carina tipped with purple. There is a smaller variety of this plant with flexuous stems. This species follows *P. arenaria*, Pall. p. 248. no. 7. of the present volume.

**Elongated** Bastard-vetch. Pl. 1 to 1½ foot.

24 **PHACA FLEXOSA** (Hook, fl. bor. amer. p. 141.) stem decumbent, flexuous, angular, sparingly branched; leaves with 6-9 pairs of linear-oblong, obtuse leaflets, which are glabrous above, but clothed with adpressed pili beneath; stipulas small, broad at the base, acuminate, lower ones connected; peduncles longer than the leaves; racemes elongated, loose; calyces rather silky; legumes coriaceous, cylindrical, straight, sessile, acute. As. H. Native of North-west America, abundant on elevated and dry fertile soils of the Red River and Assinaboin. *Astraigalus* flexuosus, Doug. mss. p. 256. no. 33. of the present volume. Flowers purple, very fragrant. This species follows *P. Lappónica*, p. 248. no. 14. of the present volume.

**Flexuous-stemmed** Bastard-vetch. Pl. 1 foot.

25 **PHACA COLÍNA** (Hook, fl. bor. amer. p. 141.). As. H. Native of North-west America, on the sub-alpine ranges of the Blue Mountains. *Astraigalus* collinus, Doug. mss. p. 256. no. 33. of the present volume. Corolla white, with a large purple spot on one of the petals. Stipulas oblong, leafy. This plant is remarkable for the linear leaflets.

**Hill** Bastard-vetch. Fl. June, July. Pl. 1 foot.

26 **PHACA PECTINÁTA** (Hook, fl. bor. amer. p. 141. t. 54.). As. H. Native of North-west America, in the pastures of the Saskatchewan, and on the Red Deer and Eagle hills, bordering on that river. Flowers large, white. *Astraigalus* pectinatus, Doug. mss. p. 257. no. 53. of the present volume.

**Pectinate-leaved** Bastard-vetch. Pl. decumbent.

27 **PHACA PODÓCARPA** (Hook, fl. bor. amer. p. 142.) plant canescent, much branched, diffuse; stems and branches striated; leaves with 6-9 pairs of broad-linear, obtuse leaflets; stipulas small, ovate, acuminate; peduncles longer than the leaves; racemes loose; legumes oblong, coriaceous, compressed, clothed with appressed hairs, acuminate, tapering into a long stipe at the base, with thickened sutures. As. H. Native of North America, on dry, sandy, and barren grounds, at the great falls of the Columbia. Flowers middle-sized, white. This plant should follow *P. arenaria*, p. 248. no. 7. of the present volume.

28 **PHACA NIGRESCENS** (Hook, fl. bor. Amer. p. 143.) clothed with obscure adpressed pili; stems erect and decumbent, branched, striated; leaves with 8-10 pairs of oblong, obtuse leaflets, which are cuneated at the base; racemes for the most part longer than the leaves; stipulas small, ovate, aechin, conuate at the base; teeth of calyx a little shorter than the tube; legumes stipitate, oblong, membranous, compressed, glabrous. As. H. Native of North America, along the Saskatchewan to the Rocky Mountains, and as far north as Fort Franklin on the Mackenzie River. Corolla white or cream-coloured. The present species should follow *Phaca caespitosa*, Nutt. p. 248. no. 6. of the present volume. The stems are usually purplish.

**Blackish** Bastard-vetch. Pl. erect or decumbent.

29 **PHACA ABORIGINORUM** (Hook, fl. bor. amer. p. 144.). As. H. Native of North America, from Lake Winnipeg to the Rocky Mountains, and as far north as Bear Lake in lat. 60°. *Astraigalus* aboriginorum, Richards, p. 258. no. 61. of the present volume.

**Aboriginal** Bastard-vetch. Pl. 1 foot.

30 **PHACA OLABRÍSCULĂ** (Hook, fl. bor. Amer. p. 144.) plant glabrous, or with a few scattered hairs; stem erect, nearly simple, striated; leaves with 5-6 pairs of linear-lanceolate, acute leaflets; stipulas ovate, acute, lower ones conate and larger; legume on a rather long stipe, lanceolate, falcate, compressed, membranous, glabrous. As. H. Native of North America, in the valleys of the Rocky Mountains. General aspect very similar to the preceding species, of which it may only be a variety. Corolla white or bluish, with the keel dark blue.
Smoothish Bastard-vetch. Pl. 1 foot.

31. **Pisaca elegans** (Hook, fl. bor. amer. p. 144.) plant nearly glabrous; stems branched, erect, or assurgent, angular; leaves with 5-7 pairs of oblong, obtuse leaflets, which are cuneate at the base, glabrous above, but clothed with minute adpressed pili beneath; stipulas ovate, acute, rather connate at the base; racemes compact, on long peduncles, exceeding the leaves, but when in fruit much more elongated; legumes sessile, elliptic, inflated, membranous, apiculate, clothed with black velvety down, 3-5-seeded. 3 H. Native of North America, in the prairies of the Rocky Mountains. There is a smaller ascending variety with shorter racemes, which inhabits the summits of the higher mountains. Leaves glaucous beneath. Flowers of a bright and deep purple. This species should follow *P. lapponiana*, p. 248. no. 14. of the present volume.

**Elegant Bastard-vetch.** Pl. 1 foot.

32. **Pisaca bisuca'ra** (Hook, fl. bor. amer. p. 145.) stems rather decumbent, smoothish; leaves nearly sessile, with 11-13 pairs of elliptic leaflets, which are clothed with adpressed hairs beneath; stipulas ovate, acute, free; racemes pedunculate, very much elongated; flowers nodding; legumes pendulous, stipitate, linear-cylindrical, bisulate, clothed with adpressed pubescence.

3 H. Native of North America, on the plains of the Saskatchewan. Flowers of a rich purple colour. This species should follow *P. brachytropis*, Stev. p. 248. no. 16. of the present volume.

Bisulate-podded Bastard-vetch. Pl. 1 to 2 feet.

\[ \text{§ 1. Acaules. p. 249.} \]

33. **Oxytropis foliolo'sa** (Hook, fl. bor. amer. p. 146.) stemless, and clothed with hoary villi; leaves numerous; leaflets approximate, ovate or ovate-oblong, scatich; scapes pilose, longer than the leaves; heads of flowers broadly ovate, small; flowers crowded, spreading, lower ones reflexed; bracteas linear-subulate, shorter than the calyx, which is beset with black hairs; legumes remotish, deflexed, cylindrical, acute, beset with black hairs. 3 H. Native of North America, from Carlton House to the Rocky Mountains. Petals bluish purple, their bases nearly white. This species is much nearly allied to *O. montana*, D. C. p. 249. no. 1 of the present volume.

Leafy Mountain Milk-vetch. Pl. \( \frac{1}{2} \) foot.

34. **Oxytropis argyrophy'lla** (Led. fl. ross. alt. ill. t. 54.) is *O. argyroce'a*, D. C. p. 249. no. 4. of the present volume.

**Siler-leaved Mountain Milk-vetch.**

35. **Oxytropis sulphure'a** (Led. fl. ross. alt. ill. t. 55. fl. alt. 3. p. 285.) nearly stemless; leaflets numerous, lanceolate, when young silky; petioles and scapes beset with spreading pili; scapes a little longer than the leaves; flowers horizontal, in dense spikes; bracteas bilaterally 2-linear, about equal in length to the villous calyx; legumes erectly spreading, oval-oblong, somewhat 2-celled, acuminate. 3 H. Native of Altai, near Ridders. Corolla sulphur-coloured, 3-flowered, of the present volume.

 Sulphur-coloured-flowered Mountain Milk-vetch. Pl. \( \frac{1}{2} \) foot.

36. **Oxytropis brevica'ulis** (Ledeb. fl. ross. alt. ill. t. 288. fl. alt. 3. p. 284.) plant caulescent, erect, rather silky; stem short; leaflets crowded; stipulas adnate to the petioles, lanceolate, acuminate, ciliate; leaflets ovate-oblong; peduncles twice the length of the leaves; racemes at length elongated; bracteas about half the length of the calyx; legumes cylindrical, erect, pubescent, 1-celled. 3 H. Native of Altai, in the Soongarian desert, between Mount Ku and Karkarala. Corolla violaceous. Plant tufted. To follow *O. songari'a*, D. C. p. 250. no. 17. of the present volume.

Short-stemmed Mountain Milk-vetch. Fl. Ju. Aug. Pl. \( \frac{1}{2} \) ft.

\[ \text{§ 2. Verticilles. p. 251.} \]

37. **Oxytropis physoca'ra** (Led. fl. ross. alt. ill. t. 381. fl. alt. 3. p. 272.) stem shaggy, branched; leaves impari-pinnate; leaflets verticillate in fours, oblong or linear, with ciliated margins, and bearded towards the apex; petioles usually persistent; peduncles axillary, usually 3-flowered, rather shorter than the leaves, but at length elongated; calyx rather vizcous; legumes inflated, mucrinate, ending in a curved beak. 3 H. Native of Altai, on the tops of the Alps at the river Tschuja. Corolla violaceous. To follow *O. muri'cata*, p. 232. no. 41. of the present volume.

38. **Oxytropis subverticill'a'ta** (Led. fl. ross. alt. ill. t. 292. fl. alt. 3. p. 275.) stem shaggy, branched, very short; leaves impari-pinnate; leaflets somewhat verticillate by pairs of fours, elliptic, silky on both surfaces; petioles hardened, permanent; peduncles axillary, 3-flowered, shorter than the calyx, which is beset with spreading villi; legumes pubescent.

3 H. Native of Altai, in the Soongarian desert, between the mountains Kent and Ku. Corolla violaceous. To follow *O. muri'cata*, D. C. p. 252. no. 41. of the present volume.

\[ \text{§ 3. Tragacanthoides, p. 252.} \]

39. **Oxytropis polypephy'lla** (Led. fl. ross. alt. ill. t. 277.) stem shaggy, much branched, short; leaves impari-pinnate; leaflets 11-17, ovate-oblong, silky on both surfaces; petioles hardened, permanent; spikes of flowers sub-capitate, axillary; peduncles elongated, about equal in length to the leaves; calyx clothed with white villi. 3 H. Native of Altai, on mountains near the river Tschuja. Corolla violaceous. To follow *O. tragacanthoides*, Fisch. p. 252. no. 42. of the present volume.

Many-leafletted Mountain Milk-vetch. Fl. May, Ju. Sh. \( \frac{1}{3} \) ft.

40. **Oxytropis leucor'onia** (Led. fl. ross. alt. ill. t. 282. fl. alt. 3. p. 279.) stem shaggy, much branched, short; leaves impari-pinnate; leaflets usually 15, oblong-linear, glabrous; petioles hardened, permanent; peduncles axillary, 2-flowered, very short; calyx covered with thick, elevated coruples; legumes rather inflated, glabrous, ending in an acuminate beak.

3 H. Native of Altai, on mountains near the river Tschuja. Vexillum and wings yellow. Keel bluish. To follow *O. tragacanthoides*, Fisch. p. 252. no. 42. of the present volume.

**White-petaled Mountain Milk-vetch.** Pl. Ju. Sh. 6 inches.

41. **Oxytropis acypi'lla** (Led. fl. ross. alt. ill. t. 281. fl. alt. 3. p. 279.) stem shaggy, much branched; leaves abruptly pinnate, with 2 or 3 pairs of oblong or oblong-linear, pungent leaflets, which are silky on both surfaces; petioles permanent, hardened into spines; peduncles axillary, 2-3-flowered, twice the length of the villous calyx; legumes oblong, acuminate, villous.

3 H. Native of Altai, on sandy hills at the river Irtysh. Corolla purplish violet. Shrub forming a dense tuft. To follow *O. tragacanthoides*, Fisch. p. 252. no. 42. of the present volume.

\[ \text{§ 4. Caulescentes.} \]

42. **Oxytropis diffu'sa** (Led. fl. ross. alt. ill. t. 451. fl. alt. 3. p. 281.) many stemmed, diffuse, beset with adpressed pili; stipulas opposite the leaves, somewhat concretes, ciliate; leaflets ovate-oblong; peduncles at length nearly twice the length of the leaves; flowers racemose; bracteas rather exceeding the pedicels; legumes depressed, mucrinate, deflexed, 1-celled.
472

LEGUMINOSE.

**clothed with adpressed pili.** 2. H. Native of Altaia, in humid places. O. glabra, D. C.? Corolla bluish violet. To follow O. pilosa, D. C. p. 232. no. 43. of the present volume. Var. a, elongata (Led. 1. c.) stem 1-2 feet high. Var. b, pyriformis (Led. 1. c.) stem 2-6 inches high. Diffuse Mountain Milk-vetch. Pl. ½ to 2 feet. 43. OXYTRONUS FLORENS (D. C. Prod. 2. p. 280.) According to Ledebour the following names belong to this species. O. terry, D. C. O. longistylis, Ledeç. O. Fischeri, D. C. O. vaginata, D. C. O. teveillu, D. C.

**Buddle-flowered Mountain Milk-vetch.** Pl. ½ to 1 foot.

44. ASTRA'GALUS PAUCIFLORUS (Hook, fl. bor. amer. p. 149.) plant decumbent and hoary, beset with adpressed pili; stipulas concrete, opposite the leaves, lower ones entire; leaves with 3-5 pairs of oblong acute leaflets; peduncles rather shorter than the leaves, 2-1-flowered; flowers small, loosely racemose; bracteas length of pedicels; calyx beset with white pili, having the teeth about equal in length to the tube. 2. H. Native of North America, among the rocks in the more elevated regions of the Rocky Mountains. Root long, descending, rather fusiform. Corolla blue. This species should follow A. hypoglotis, Linn. p. 253. no. 1. of the present volume.

**Few-flowered Milk-vetch.** Pl. decumbent.

45. ASTRAGALUS MULTICAUSUS (Led. fl. ross. alt. ill. t. 316. fl. alt. 3. p. 293.) caespitose, prostrate, or ascending, pubescent; stipulas membranous, concrete, opposite the leaves; leaflets oblong or obovate, ciliate, 5-6 pairs; racemes short; peduncles much longer than the leaves; bracteas longer than the pedicels; calyx beset with black or white pili; legumes erect, racemose, glabrous, ovate, triquetroius, short, half 2-seeded; cells 1-seeded. 2. H. Native of Altaia, in muddly salt places near the river Tschuja. Corolla pale purple. To follow A. hypoglotis, p. 253. no. 1. of the present volume.

**Many-stemmed Milk-vetch.** Fl. May, June. Pl. prostrate.

§ 3. **Onobyroidei**, p. 257.

49. ASTRAGALUS DIAPHANUS (Dougl. msx. Hook, fl. bor. amer. p. 151.) plant prostrate, diffuse, pilose; stipulas small, ovate, acuminate; leaves with 5-9 pairs of ovate leaflets; peduncles shorter than the leaves; flowers small, capitulate, loose; bracteas ovate, acuminate, minute, rather shorter than the pedicels; legumes rather reflexed, linear, compressed, falcate, somewhat diaphanous, smoothish, 2-seeded, many-seeded. 2. H. Native of North America, abundant on sandy soils near the great folks of the Columbia. Flowers small, purple. This species should follow A. lentiginosus, D. p. 257. no. 49. of the present volume.

**Diaphanous-podded Milk-vetch.** Pl. prostrate.

50. ASTRAGALUS COMPRISPUS (Led. fl. ross. alt. ill. t. 289. fl. alt. 3. p. 304.) plant prostrate, suffrutescent, siliccy, leaves oblong-linear, usually 3 pairs; flowers somewhat capitae; peduncles twice or thrice longer than the leaves; vexillum a little exceeding the wings; legumes racemose, erect, linear, compressed, much longer than the calyx, and clothed with adpressed pili. 2. H. Native of Altaia, at the river Irtysch. To follow A. arboreus, Pall. p. 258. no. 59. of the present volume.

**Compressed-podded Milk-vetch.** Fl. April, May. Pl. prostr.

51. ASTRAGALUS MELANOCAPSUS (Frass. cat. Richards. in Frankl. journ. ed. 2. append. p. 28. Hook, fl. bor. amer. p. 150.) plant clothed with silky hoary down; stems short, decumbent; stipulas ovate, acute; leaves with 8-10 pairs of ovate leaflets, which are acute at both ends, but sometimes obovate and obtuse; racemes capitace, loose, 6-8-flowered, longer than the leaves, on longish peduncules; flowers spreading; legumes spreading, elliptic-oblong, coriaceous, nearly 1-seeded; wrinkled, blackish-brown. 2. H. Native of North America, on the plains of the Saskatchewan, and on the Eagle and Red Deer Hills on the same river. Flowers dark purplish-blue, varied with white. Perhaps the same as the A. Missouriensis. P. 258. no. 69. of the present volume. Root fusiform.

**Black-fruited Milk-vetch.** Pl. decumbent.

N. B. ASTRAGALUS SUCCUMENS, Doyl. p. 263. no. 139., A. INFLETUS, Doyl. p. 256. no. 34. and A. glaucous, Doyl. p. 271. no. 241. should follow A. lentiginosus, Doyl. p. 257. no. 49. of the present volume; and A. Pürskii should follow A. Caro- linianus, p. 263. no. 130.

52. ASTRAGALUS LOTTIFLORUS (Hook, fl. bor. amer. p. 159.) plant hoary and clothed with adpressed pili; stems short, diffuse; stipulas ovate, acuminate; leaves on rather long petioles; leaflets rather remote, usually 1 pairs, oblong, obtuse; peduncles slender, shorter than the leaves; flowers 3-5, loose, capitae, usually yellow; bracteas subulate, shorter than the pedicels; calyx campanulate, clothed with white pili, with the teeth subulate and longer than the tube; petals about equal in length; legumes erethed spreading, ovate, acuminate, compressed, very villous from white hairs, 1-seeded, with the upper suture straight, and the lower one arched. 2. H. Native of North America, about Carlton House on the Saskatchewan. Perhaps a species of Phaca very near Phaca villosa. Astra'galus villousus of Michx. Lotus-flowered Milk-vetch. Pl. diffuse.

53. ASTRAGALUS CANDIDISSIMUS (Led. fl. ross. alt. t. 287. fl.
LEGUMINOSÆ.

alt. 3. p. 399.) root creeping; stems herbaceous, erect, clothed with white tomentum; stipulas ovate-lanceolate, acuminate, free, glabrous inside; leaves with 7-10 pairs of nearly orbicular, mucronate leaflets; peduncles about equal in length to the leaves; calyces woolly at length bladddy; legumes inflated, ovate, ending in a long reflexed acumen, glabrous, 2-celled, much larger than the calyx. Z. H. Native of Altaia, in sand on the river Irtysh. Corolla purplish-violet. To follow A. megalanthus, D.C. p. 259. no. 80. of the present volume.

54 Astra'galus orbicularis (Led. fl. ross. alt. t. 290. fl. alt. 3. p. 311.) plant villous and procumbent, or erectish; leaves with 6-11 pairs of nearly orbicular mucronate leaflets; stipulas ovate, acute; racemes usually 3-flowered, pedunculate; peduncles one-half the length of the leaves; bracteas and teeth of calyx lanceolate-linear; ovary oblong, densely clothed with pili, on a glabrous stipe. Z. H. Native of Altaia, in the Soongarian desert. Corolla white. To follow A. striatellus, Bieb. p. 260. no. 86. of the present volume.

55 Astra'galus raphi²rus (Led. fl. ross. alt. ill. t. 88. fl. alt. 3. p. 313.) plant ascending, suffrutescent, clothed with an apology pili; leaves with 5-11 oblong-linear leaflets; peduncles much longer than the leaves; flowers remote, on short pedicels, secund; legumes subulate, triquetrov, a little arched, horizontal, clothed with white villi, 3 or 4 times longer than the calyx. Z. H. Native of Altaia, in the Soongarian desert, in dry salt fields about the mountains of Tschingistan. Corolla cream-coloured. To follow A. microphyllus, Lin. p. 261. no. 108. Saccate-flowered Milk-Vetch. Fl. July, Aug. Pl. ascending.

56 Astra'galus orel'des (Meyer, verz. pfl. p. 141.) smoothish; stems diffuse; stipulas all concrete and sheath-formed; leaflets 8-12 pairs, all oblong-elliptic, rather retuse; peduncles shorter than the leaves; legumes crowded, erectish, inflated, nearly globose, mucronate, and pilose. Z. H. Native of Persia, on mount Kasbek, at the height of 3600 or 4200 feet. Nearly allied to A. microphyllus, Lin. p. 261. no. 108.

Oreades Milk-vetch. Fl. diffuse.

57 Astra'galus deapa'peratus (Led. fl. ross. alt. ill. t. 314.) plant erectish, suffrutescent, rather silky; leaflets 5-9, oblong, acute at both ends; peduncles exceeding the leaves; flowers few, in umbellate heads; legumes oblong, a little arched, compressed, villous, granular, villous, but at length almost glabrous, 2-celled. Z. H. Native of Altaia, in dry salt plains, near Loktewsk. Corolla cream-coloured. To follow A. microphyllus, Lin. p. 261. no. 108. of the present volume.

Depauperated Milk-vetch. Fl. Aug. Pl. 4 to 1 foot.

58 Astra'galus rytipo'capus (Led. fl. ross. alt. ill. t. 293. fl. alt. 3. p. 315.) plant ascending, rather hoary; stipulas ovate, mucronate or acuminate; leaves with 4 pairs of oblong-linear leaflets; peduncles about equal in length to the leaves; spikes capitata, few-flowered; legumes short, nearly globose, didymous, sessile, wrinkled, transversely 2-celled, rather villous, apiculated by the oblique style. Z. H. Native of Altaia, in islands in the river Tschuja. To follow A. glycyphylthus, Lin. p. 262. no. 116. of the present volume.

59 Astra'galus chlo'o stachyus (Linkl. hort. trans. vol. 7. vol. 134. of the present volume) stems erect, pubescent; stipulas distinct, separate from the petioles; leaves with 11-12 pairs of oblong pubescent leaflets; racemes pedunculate, many-flowered, longer than the leaves; legumes inflated, a little arched; racemes axillary at the tops of the shoots. Z. H. Native of Nipaul. Flowers greenish yellow.

60 Astra'galus rodoca'papus (Meyer, verz. pfl. p. 142.) plant clothed with adpressed, canescent down; stems branched, diffuse, or erect; stipulas free, lanceolate; leaflets 3-6 pairs, elongated, nearly linear, acute; peduncles very long; spikes dense-flowered, oblong; legumes stipitate, erect, oblong, clothed with pili, longer than the calyx. Z. H. Native of Persia, near Swant, on the mountains of Talesch, at the height of 2000 feet. Flowers yellowish. To follow A. galegifórmis, Lin. p. 263. no. 137. of the present volume.

Foot-fruiting Milk-vetch. Pl. 1 to 2 feet.

61 Astra'galus Sirin'iicus (Tenore, fl. neap. prol. 5. ex. Schlecht. Litr.æn. p. 102.) shrubby; petioles spinose; leaves with 14 pairs of elliptic-oblong bluntish leaflets, beset with adpressed pili on both surfaces; peduncles rather shorter than the leaves, from 2-10, disposed in a racemose spike; calyx clothed with black and white hairs; the teeth setaceous: corolla yellow, 3-times the length of the calyx; bracteas linear, setaceous, 3-times the length of the pedicels; legumes villous. Z. H. Native of Naples, on Mount Sirini, near Lagonegro in rocky meadows.

This species differs from A. retássis, Wall. p. 267. no. 185. of the present volume, in the flowers being disposed in racemose spikes, not capitate, in the setaceous teeth of the calyx, and in the linear bracteas. It differs from A. Massilianus, to the calycine teeth being subulate, not obtuse, and obliquely truncate, in the bracteas being longer than the pedicels, and in the racemose flowers.

Sirini-Goat-thorn. Shrub $\frac{1}{2}$ to 1 foot.

§ 15. Anthylloidei, p. 268.

62 Astra'galus ellipsóides (Led. fl. ross. alt. ill. t. 297. fl. alt. 3. p. 319.) nearly stemless and silky white; leaflets 11-23, broad-elliptic, acute at both ends; stipulas ovate, acuminate, silky outside; peduncles a little shorter than the leaves; spikes oblong or globose; calyces inflated, elliptic, clothed with white pili; legumes somewhat triquetrov, many-seeded, acute, very villous, shorter than the calyx. Z. H. Native of Altaia. Corolla sulphur-coloured. To follow A. cállyméus, Bieb. p. 268. no. 197. of the present volume.

Var. a, elongatá (Led. l. c.) caulescent; leaflets 11-19, remote; spikes oblong-cylindrical; calyx clothed with spreading pili. Z. H. Native on the mountains of Arkaul and Dolenka.

Var. b, intermédia (Led. l. c.) almost stemless; leaflets 11-23, large, crowded; spikes oblong, short; calyx clothed with adpressed pili. Z. H. Native on exposed hills, near Ústka'megorsk.

Var. γ, abbreviátus (Led. l. c.) smaller, stemless; leaflets 11-13; spikes subglobose, few-flowered; calyx clothed with spreading pili. Z. H. Native of dry fields about the mountains of Tschingistan and Dschigilen.

63 Astra'galus sabulétorum (Led. fl. ross. alt. ill. t. 298. fl. alt. 3. p. 321.) nearly stemless, silky white; leaflets 11-19, oblong, acute at both ends; stipulas ovate, acuminate, silky; peduncles about equal in length to the leaves; spikes ovate-globose; calyces inflated, ovate, clothed with white adpressed 5 P
LEGUMINOSÆ.

pili, and densely eiliated at the apex; legumes rather triquetrous, many-seeded, acute, villous, longer than the calyx. \( \zeta \). \( \Pi \). Native of Altaia, in sand on the river Irtysch, and Bekun. Corolla rose-coloured. To follow \( A. \) elongiflorus, Pall. p. 269. no. 215. of the present volume.

Rose-coloured-flowered Milk-vetch. Fl. May, June. Pl. \( \frac{1}{2} \) to \( \frac{1}{4} \) foot.

70 \( A. \) astrogalus lactiflorus (Led. fl. ros. alt. ill. t. 108. fl. alt. s. 3. p. 333.) plant caulescent, hairy; leaflets 19-23, elliptic; racemes very short, axillary; bracteas lanceolate-linear; calyces teeth lanceolate-linear, thrice the length of the tube, but shorter than the bracteas; corolla glabrous; legumes ovate, rather triquetrous, mucronate, 2-celled, many-seeded, densely clothed with wool. \( \zeta \). \( \Pi \). Native of Altaia, in dry fields and on rocks. \( A. \) testiculatus Alatticus, Pall. Corolla milk-coloured. To follow \( A. \) Schanginianus, Pall. p. 270. no. 229.

Milk-flowered Milk-vetch. Fl. June. Pl. \( \frac{1}{4} \) to \( \frac{1}{2} \) foot.

71 \( A. \) astrogalus breviflorus (Led. fl. ros. alt. ill. t. 307. fl. alt. s. 3. p. 334.) tufted, rather silky; leaflets 7 obl., petiolate; peduncles axillary, very short, 1-2-flowered; flowers longer than the leaves; teeth of calyx much longer than the tube; legume inclosed in the calyx, which is silky, membranous, and erect; cells 2-seeded. \( \zeta \). \( \Pi \). Native of Altaia, in sterile dry deserts, near the river Tshauja. Corolla sulphur-coloured. To follow \( A. \) Buchtorowensis, Pall. no. 228.

Short-leaved Milk-vetch. Fl. June. Pl. \( \frac{1}{4} \) foot.

\( \S 17. \) Incani, p. 270.

72 \( A. \) astrogalus rostratus (Meyer, verz. pIII. p. 144.) plant stemless, and densely clothed with hairs, which are fixed by their centre; scape rather shorter than the leaves; leaflets 15-17, nearly linear, acute; calycine teeth shorter than the tube; setaceous; legumes erect, very long, subulate, nearly terete, erectly, ending in a beak. \( \zeta \). \( \Pi \). Native of Persia, on the mountains of Tulusch near Swant, at the height of 2000 feet. Allied to \( A. \) Monspeussulatus, Linn. p. 270. no. 233.

Beaked-podded Milk-vetch. Pl. \( \frac{1}{2} \) to \( \frac{1}{4} \) foot.

73 \( A. \) rebafractus (Meyer, verz. pIII. p. 144.) plant caescent from ad pressed pili, which are fixed by their centre; scape erect, longer than the leaves; leaflets 19-23, oblong-lanceolate, acute; racemes elongated, loose; calycine teeth subulate, shorter than the tube; legumes deflexed, stipitate, rather trigonal, beaked, beaked with black and white hairs. \( \zeta \). \( \Pi \). Found along with \( A. \) rostratus. Flowers yellow. To follow \( A. \) sanginolentus, Bieb. p. 270. no. 234 of the present volume.

Refracted-podded Milk-vetch. Pl. \( \frac{1}{4} \) foot.

\( \S 18. \) Radiciflori, p. 271.

74 \( A. \) astrogalus physoscatérus (Led. fl. alt. s. 3. p. 335.) almost stemless; leaflets 17-27, elliptic, rounded at the base or cuneated, mucronate, glaucous, glabrous on both surfaces, but with a few adpressed hairs on the margin, which are fixed by their centre; peduncles about equal in length to the leaves; flowers in dense spikes; legumes inflated, membranous, subglobose, glabrous. \( \zeta \). \( \Pi \). Native of Altaia, about Lektewsk, &c. \( A. \) physodes Alatticus, Pall. p. 272. t. 58. Flowers violaceous or dirty yellow. To follow \( A. \) physodes, Linn. p. 271. no. 247.

Bladder-fruited Milk-vetch. Pl. \( \frac{1}{2} \) to \( \frac{1}{4} \) foot.

75 \( D. \) desmòdium purpur'æum (Hook, in Beech, voy. part. bot. p. 63.) stem erect, terete, nearly simple, clothed with adpressed
glabrous; stem compressed, somewhat quadangular; leaves with usually 6 pairs of rather alternate, petiolulate, reflexed, ovate-oblong, mucronate, ribbed, rather glaucous, somewhat coriaceous leaflets; peduncles 3-8-flowered, about equal in length to the leaves; stipules semi-sagittate or hastate; teeth of calyx nearly equal, lower one the longest, but one-half shorter than the tube; style bearded at the apex; legumes pendulous, glabrous, nearly cylindrical, 2-4-seeded. 2. H. Native of Altaia, on rocks at the river Katunja and Tschuja, and on the mountains of Dolen-Kara. Flowers whitish; the keel tipped with purple. To follow V. sylvatica, p. 316. no. 8.

81 Vicia lila'cina (Led. fl. ross. alt. itt. t. 386.) stem weak; leaflets 9-16, ovate-elliptic, alternate or opposite, mucronate, clothed with adpressed pili beneath, the veins anastomosing; stipulas oblong, acuminate, ciliated, entire or semi-sagittate; peduncles many-flowered, exceeding the leaves; vexillum exceeding the keel, but shorter than the wings; style pilose; legumes oblong, compressed, glabrous, usually 3-seeded. 2. H. Native of Altaia, on mountains near Aleandrowsk, at the river Itrysch. Flowers lilac, smaller than those of V. Cracca. To follow V. biennis, Lin. p. 319. no. 49. of the present volume.

82 Vicia megalo'tropis (Led. fl. ross. alt. itt. t. 368.) stems and tendrils branched; leaflets numerous, lanceolate-linear, alternate or opposite, mucronate; stipulas very narrow, ciliated, linear, or semi-sagittate; peduncles many-flowered, about equal in length to the leaves, or rather shorter; flowers numerous, imbricate; vexillum and wings about equal in length to the keel; style puberulous at the apex; legumes horizontal, oblong, glabrous, 3-4-seeded, compressed. 2. H. Native of Altaia, on mountains at the river Uba, Uba, Koskus, Tschanysh, &c. Flowers with an emarginate purple vexillum, and with the wings and keel white, tipped with bluish violet. To follow V. tenue-folia, Lin. p. 317. no. 28. of the present volume.

Large-keeled Vetch. Pl. cl.

83 Vicia multicau'lis (Led. fl. ross. alt. itt. t. 50. fl. alt. t. 346.) stems and tendrils nearly simple; leaves with 4-8 pairs of alternate, or opposite, oblong-elliptic, mucronate leaflets; stipulas sub-hastate; peduncles exceeding the leaves, 4-8-flowered; vexillum equal in length to the keel and wings; style puberulous at the apex; legumes horizontal, oblong, somewhat reticulated, 6-8-seeded, rather compressed. 2. H. Native of Altaia, on mountains. V. alpina, Pall. itin. 2. p. 568. Flowers almost the colour of the last species.

84 E'rvum A'gri genti'num (Gussone, in litt. D. C. prod. 2. p. 367.) leaflets 8-10, elliptic, mucronate; tendrils trifid; stipulas semi-sagittate, deeply toothed; peduncles 2-5-flowered, shorter than the leaves; calyceine segments linear, equal, longer than the tube; legumes ovate, compressed, puberulous, reticulately veined, 4-seeded. 2. H. Native of Sicily, about Agrigentum. Allied to E. tetrasperrum, but differs in the legumes being broader, puberulous, and in the stipulas being toothed.

Agrigentum Lentin. Pl. 1 foot.

85 Lathyrus altag'icus (Led. fl. ross. alt. itt. t. 53. fl. alt. 3. p. 355.) stem weak, pubescent, tetragonal, but not winged; leaves with 5-6 pairs of oblong or ovate mucronate leaflets, which are pilose beneath; stipulas semi-sagittate, ovate, acuminate, a little toothed; peduncles 2-4-flowered, longer than the leaves; legumes cylindrical, villously pubescent. 2. H. Native of Altaia, on the lower mountains. Root creeping. Corolla reddish-violet, changing to bluish. To follow L. palustris, Lin. p. 334. no. 30. of the present volume.

86 O'robus survel'sus (Led. fl. ross. alt. itt. t. 483. fl. alt. 3 p 2
3. p. 359.) plant clothed with hoary pubescence; root fibrous; stem branched at the base; leaflets 5-9, oblong-linear, mucronate, somewhat attenuated at the base; stipulas lunately-sagittate, profusely cut; peduncles axillary, 2-3-flowered, twice the length of the leaves; calyces teeth broad-lanceolate, upper one shorter. 2. H. Native of Altaia, in salt fields at the river Kurtschum. Flowers with a reddish vexillum, yellowish wings, and the keel tipped with blue. To follow O. lacetces, Bleib. p. 329. no. 14.

**Ratleri-sillos** Bitter-vetch. Fl. April, May. Fl. 1 foot.

97 O'BORES INTERMEDIES (Loud. f. ross. alt. ill. t. 484.) plant sparingly pilose; stem simple; leaves with 4 pairs of narrow, oblong, apiculate, nerved leaflets; stipulas semi-sagittate or hastate, toothed at the base or entire, much shorter than the leaflets; peduncles axillary, 4-8-flowered, longer than the leaves; calyceal teeth equal in length to the tube, upper ones the shortest. 2. H. Native of Altaia, about the metal mines of Nikolajewski. Intermediate between O. lacetces and O. litus. Flowers pale yellow or cream-coloured.

Intermediate Bitter-vetch. Fl. May, June. Fl. 1 to 1 1/2 foot.

**Tribe V. Phascolaceae. p. 341.**

98 CANAVALLA PSEDESEES (Gaud. ex Hook. in Beech. voy. part. bot. p. 81.) stem twining; branches and petioles pubescent; leaflets ovate, elliptic, ending in a very short acumen, rather oblique at the base, membranous, glabrous above, but pubescent beneath; peduncles axillary, 3-flowered. 2. C. S. Native of the Sandwich Islands. Nearly allied to Delichos galeatus, Gaud. p. 357. no. 4. of the present volume, which is also a species of Canavalla. To follow C. rattianus, p. 363. no. 7.

**Pubescent Canavalla.** Shrub tw.

99 MUCUNA ANGIUNA (Wall. pl. rar. asiat. 3. p. 19. t. 286.) flowers cyemose, dense; legumes roundish, transversely wrinkled, hispid, 1-seeded; leaflets glabrous above. 2. N. Native of Chittagong. Flowers large, dark purple, feathery.

100 LUPINUS MINMUS (Doug. miss. Hook. fl. bor. amer. p. 165.) plant small, herbaceous, and densely clothed with silky hairs; stem furnished with 1-2 leaves; leaflets 7-9, lanceolate, acute, tapering to the base; flowers alternate and verticillate; pedicels bractless; upper lip of calyx bifid at the apex, lower one entire; root small, rather fusiform. 0. H. Native of North-west America, in mountain valleys near the Kettle Falls, and very abundant towards the Rocky Mountains along the Columbia. To follow L. micranthus, Doug. p. 366. no. 15. of the present volume.

**Small Lupine.** Fl. 1/2 foot.

**Tribe VI. Dalbergieae. p. 373.**

91 PONGA'NIA ELIPTICA (Wall. pl. rar. asiat. 3. p. 20. t. 237.) leaves impari-pinnate, with 3-5 pairs of cuneate-oblong, pubescent leaflets; branchlets, peduncles, and calyces clothed with ferruginous villi; racemes in fascicles; legumes elliptic-lanceolate. 2. G. S. Native of Amboyna. Galedipa elliptica, Roxb. bot. beng. p. 58. Flowers rose-coloured.

**Elliptic Ponga.** Shrub tw.

**Tribe VIII. Mimoseae. p. 381.**

92 INGA'SPINDIFOLIA (Hamilt. prod. p. 61.) stem and branches prickly; leaves bipinnate, with 6 pairs of pinnae, each pinna bearing 3 pairs of ovate-oblong, reticulate, pubescent leaflets, ending each in a spine-like mucrone; legumes twisted, pubescent. 2. S. Native of the West Indies. Desv. journ. bot. vol. 3. This species should follow I. Martia, Spreng. p. 385. no. 126.

**Spine-leaved Inga.** Tree.

93 ACACA' STENOCA'NTYA (Desv. herb. Hamilt. prod. p. 59.) unarmed; branches angular, brownish, glabrous; leaves with about 10 pairs of pinnae, each pinna bearing about 20 pairs of linear-robhome, rather coriaceous, shining leaflets; racis com- planate, sulcate, pubescent; spikes twin, axillary, filiform, on very long peduncles, cyemose, papillose-flowered; flowers minute. 2. S. Native of Guiana. This species should follow A. Guianensis, Willd. p. 410. no. 155. of the present volume.

**Slender-spiked Acacia.** Tree.

94 ACACA' HAMILTONI (Desv. herb. Hamilt. prod. p. 59.) unarmed; young branches pubescent; leaves with 5 pairs of pinnae, each pinna bearing many pairs of rather remote, linear, obtuse, ciliated leaflets; peduncles elongated, and are as well as the racemid pilose; spikes subglobose. 2. S. Native of Jamaica. To follow A. formosa, Kunth, p. 417. no. 229.

**Hamiltoni's Acacia.** Tree.

95 ACACA LINENARS (Desv. herb. Hamilt. prod. p. 59.) unarmed, shrubby; branches nodose, striated, pubescent at the apex; bracteas rather hardened, permanent; leaves with usually 5 pairs of pinnae, each pinna bearing about 20 pairs of narrow, linear, crowded, rather ciliated leaflets; peduncles terminal, elongated, festigiate; spikes subglobose. 2. S. Native of Jamaica. This plant should follow the last species.

**Linear-leaffed Acacia.** Shrub.

96 ACACA MICROCA'NTHA (Desv. herb. Hamilt. prod. p. 60.) stem armed, arborescent; branches pubescent; leaves with usually 10 pairs of pinnae, each pinna bearing many pairs of minute pubescent leaflets; spikes stipitate, globose, axillary, solitary, on short peduncles, nodding; bracteas rather spinose.

2. S. Native of Guiana. This species should follow A. albicans, Kunth. p. 414. no. 185. of the present volume.

**Small-spined Acacia.** Tree.

97 ACACA' ALBICNSA (Lindl. bot. reg. 1317.) spines thin, short; branches, petioles, and peduncles pubescent; leaves with 5-7 pairs of pinnae, each pinna bearing 8-10 pairs of linear, acute leaflets; heads of flowers pedunculate, twin, axillary.

2. G. Native of Peru. Flowers yellow. This species should follow A. albicans, Kunth. p. 414. no. 185. of the present volume.

98 ACACA SELENOCARPA (Desv. herb. Hamilt. prod. 2. p. 60.) stem armed; branches whitish, glabrous, spiny; spines scattered; leaves with usually 6 pairs of pinnae, each pinna bearing about 15 pairs of linear-robhome, quite glabrous, glaucescent leaflets; spikes globose, twin, loose-flowered, pedunculate; legumes short, pubescent. 2. S. Native of Guiana. This species should follow A. macrocarpa, Kunth. p. 415. no. 192.

**Moon-podded Acacia.** Tree.

**Tribe X. Cassieae. p. 427.**

99 HUMBOLDTIA BRUNONIS (Wall. pl. rar. asiat. 3. p. 17. t. 233.) leaves with 2 pairs of leaflets; hind lobes of stipulas nearly equal-sided, rounded at both extremities; branches equal.

2. S. Native of the mountains of Malabar and the peninsula of India. A climbing shrub, with deep orange-coloured flowers.

**Brown's Humboldtia.** Shrub el.

Flowers more or less irregular (f. 59. a. f. 60. a. f. 61. b.). Sepals 5, joined together into a 5-lobed calyx (f. 59. a. f. 60. a. f. 61. a.), permanent. Petals equal in number to the lobes of the calyx (f. 60. b. f. 61. b.), and inserted in it, imbricate in vestigation. Stamens inserted in the calyx (f. 60. c.) along with
CHRYSOBALANEÆ. I. Chrysobalanus.

the petals, few (f. 61. c) or numerous (f. 59. c, f. 60. d), having the filaments incurved when the flower is in vitrification. Anthers 2-celled, bursting by a double chink. Ovary 1 (f. 61. c), free, having the style proceeding from its base (f. 61. d), and containing 2 erect ovula (f. 61. c). The pedicel of the ovary closely cohering to the calyx. Style simple, crowned by a more or less dilated stigma. Seed usually solitary from abortion, exalabuminous in all except Hirteilla, in which it is fleshy and the cotyledons foliaceous; in the rest of the genera the cotyledons are fleshly and thick.—This order is composed of trees and shrubs, natives within the tropics, with simple, entire, feather-nerved, glandless, petiole leaves, and axillary and terminal racemes or panicles of small flowers. The fruit of the greater part of the plants is edible, though by no means very palatable, being extremely dry and farinaceous: they generally go under the name of plums in the places of their natural growth. The principal distinguishing characters in the fructification of Chrysobalanaceae are the style proceeding from the base of the ovary (f. 61. d), the ovula (which in Amygdalaceae are 2 in number), as well as in the embryo being erect (f. 61. c). The greater part of the Chrysobalanaceae have their flowers more or less irregular, this irregularity consisting in the cohesion of the stipe of the ovary with one side of the calyx, and a greater number or greater perfection of stamens, on the same side of the flower.

Synopsis of the genera.

3 Courea. Calyx tubular, obtusely 5-lobed. Petals 5, nearly orbicular. Stamens about 20, inserted in the top of the calyx tube. Drupe egg-shaped, dry, covered with a thick, fibrous, coriaceous ind. Seed 1, inclosed in a fragile testa.

4 Acro's. Calyx tubular, bluntly 5-lobed. Petals 5, obovate, unequall. Stamens 10-12, projecting on one side of the flower, with the filaments joined to the middle. Drupe ovate, coriaceous, containing a 1-celled, 1-seeded nut.

6 Grand'ea. Calyx bluntly 5-cleft (f. 60. a.). Petals 5 (f. 60. b), soon falling off. Stamens 15 (f. 60. d), unequall. Ovary woolly. Drupe olive-formed, rather triquetrous (f. 60. c), containing a bony, triquetrous, 1-seeded nut.

7 Linc'nia. Calyx bifractulate on the outside, 5-cleft. Petals wanting. Stamens 5-10, when they are opposite the calycine lobes. Drupe olive-formed, fleshy, containing a 1-seeded nut.

8 Thely'ra. Calyx campanulate, ending in a tube, which is adnate to the peduncle, as in Pelargonium. Petals 5. Stamens

10, the 6 on one side fertile, the 4 on the other side sterile and tooth-formed. Ovary 2-ovulate. Berry? wrinkled, villous inside, 1-seeded.

† Genera apparently belonging to the present order.

10 Leucostomum. Calyx 5-parted; lobes acute, coloured, deciduous, with the lower one permanent, glandular, and staminate above. Petals wanting. Stamens about 20, inserted in a calycine disk. Ovary free, ovate, pubescent, 5-furrowed, ending in a filiform style. Fruit unknown.

11 Thalepium. Calyx 5-lobed, free from the ovary. Petals wanting. Stamens numerous, inserted in the tube of the calyx, and disposed in many series. Tube terminated by 3 liguule between the stamens and pistil. Ovary 1-seeded. Style bifid at the apex, crowned by a tomentose stigma.

I. CHRYSOBA'LANUS (from χρυσός, chryso, gold, and βαλανός, balanos, an aorn; in reference to the yellow fruit of some of the species). Lin. gen. 641. Lam. ill. t. 428. D. C. prod. 2. p. 525.—Ica'co, Plum. gen. 43. t. 5.

—LIN. SYST. Ica'co. Monogymia. Calyx campanulate, 5-cleft. Petals 5, unguiculate. Stamens about 20, nearly equal in length, disposed in one series. Drupe fleshy, plum-formed, containing an ovate, 5-furrowed, 1-seeded nut.—Trees with simple leaves, and racemes or panicles of insignificant flowers, Fruit of all edible.

1 C. Ica'co (Lin. spec. 513) leaves nearly orbicular, or obovate, emarginate; racemes axillary, dichotomious; stamens hairy. ß. S. Native of South America and the West Indies, by the sea-side, as well as of the southern parts of North America. Jacq. amer. 154. t. 94. Plum. ed. Burm. t. 138.—Catesb. car. 1. t. 25. Panicles axillary, dichotomous. Flowers white. Fruit about the size of a plum, ovate-roundish, varying much in colour, white, yellow, red, but most commonly purple, and usually covered with a kind of bloom; the skin is thin, and the pulp white, adhering firmly to the stone, the taste sweet, with some austerity, but not unpleasant, and is eaten both raw and preserved. The fruit is called Icaco or Cocoa plum, and is sold in the markets in the West Indies, under these names.

Var. ß. pellucidus (Meyer, prim. essq. 193) leaves roundish-ovate or obovate: fruit oval, brown. ß. S. Native of Guiana. C. purpureus, Mill. dict. no. 2. Brown. jam. 250. t. 17. f. 5. Perhaps a proper species.

Ica'co or Common Cocoa-plum, Clt. 1752. Sh. 3 to 6 feet. 2 C. ellip'ticus (Smeath. herb. Hort. trans. 5. p. 453) leaves elliptic, obtuse, or acute, never emarginate; racemes axillary, dichotomous; stamens hairy. ß. S. Native of Sierra Leone, on the sea-side. Racemes sometimes disposed in a bracteate panicle. Fruit the size of a damson plum, with a black thin skin, and the flesh like that of the last species. The fruit is edible.
CHRYSOBALANEÆ. I. CHrysobalanus. II. MOquilea. III. COuepia. IV. ACioa. V. PARINARIUM.

Oblong-leaved Cocoa-plum. Fl. May, Ju. Cvt. 1812. Sh. 1 ft. 4 C. ovafilolus (Schott, in Spreng. syst. append. p. 406.) leaves coriaceous, rather cotyledon, elliptic, obtusely pointed, clothed with silvery tomentum beneath; flowers hermaphrodite; stamens glabrous. t.S. Native of Brazil.

Oval-leaved Cocoa-plum. Shrub.

Cult. Sandy loam is the best soil for the species of Cocoa-plum. Large cuttings, taken off at a joint, without shortening any of their leaves, and planted thinly in a pot filled with sand, with a bell-glass placed over them, in a moist heat, will strike root readily. The best way of increasing the plants is by seeds, when they can be procured.

II. MOQUILEA (meaning not explained by the author).

Lin. syst. Icosandria, Monogynia. Calyx tubular or urceolate, acutely 5-parted or 5-toothed. Petals 5, rather unequal, roundish. Stamens about 40, longer than the petals, inserted in the tube of the calyx beneath the petals, distinct or polyadephous at the base. Ovary hairy. Style lateral, filiform, hairy below. Stigma obtuse. Drupe woody, egg-shaped, with a chinchy bark, 1-seeded. Seed amygdalaceous. Trees with simple leaves and axillary and terminal racemes of white flowers.

1 M. Guianaensis (Aubl. l. c.) leaves oval, acuminate, quite entire, glabrous; racemes loosely panicled. t.S. Native of Guiana, in woods. Stamens about 40, free.

Guiana Moquilea. Tree 30 feet.

2 M. Canomeësis (Mart. fl. bras. 2. p. 79. t. 166.) young branches, under side of the leaves, buds, and racemes beset with rusty hairs; leaves oblong, acute; berry globose; stamens in 5 bundles glabrous, and incomplete orb in the top of the tube of the calyx. t.S. Native of Brazil. Hirtella Canomensis, Spreng. syst. append. p. 407. Flowers white.

Canom Moquilea. Tree 20 to 30 feet.

Cult. For culture and propagation see Chrysobalanus.

III. COUEPIA (Coupi is the name of the tree in Guiana).

Lin. syst. Icosandria, Monogynia. Calyx tubular, bluntly 5-lobed at the apex. Petals 5, nearly orbicular, length of calyx. Stamens about 20, nearly equal, inserted in the top of the calyxine tube; filaments distinct. Ovary somewhat stipitate. Drupe egg-shaped, with a dry, thick, coriaceous, fibrous rind. Seed 1, large, inclosed in a thin testa. —Trees with oval, entire, feather-nerved leaves. Flowers few, nearly terminal.

1 C. Guianaensis (Aubl. l. c.) leaves with undulated margins; tube of calyx obconical, with rounded lobes. t.S. Native of Guiana. A'sia amara, Willd. spec. 3. p. 717. Petiole clothed with rufous hairs. Flowers small, white. Seed bitter. In Guiana the natives strip the bark from the tree and use it in baking their earthenware.

Guiana Couipi. Tree 60 feet.

2 C. Parillo (D. C. prod. 2. p. 526.) leaves flat; tube of calyx cylindrical, with oval-oblong, acuminate lobes. t.S. Native of Guiana, where it is called Parillo. Flowers small, white.

Parillo Couipi. Tree 20 to 30 feet.

Cult. For culture and propagation see Chrysobalanus.

Lin. syst. Monadélphia, Decandria. Calyx tubular, bluntly and unequally lobed at the apex. Petals 5, oblong, obtuse, unequal. Stamens 10-12, projecting only on one side of the flower; filaments joined to the middle into a flat ligula, but free at the apex. Ovary or stipe of ovary adnate to the calyx at the base. Drupe ovate, coriaceous, chinky at maturity, containing a 1-celled, 1-seeded nut. Seed large, with a brittle testa. —A tree, with oval, acute, entire leaves, caduceous stipulas, and terminal corymb of violaceous flowers.

1 A. Guianaensis (Aubl. l. c.). t.S. Native of Guiana, in woods. Acia litiru, Willd. spec. 3. p. 717. Petioles glabrous. Seed edible. Hardly distinct from Coupi. It is sometimes called Coupi by the inhabitants of Guiana. The fruit contains a sweet oil like that of the almond.

Guiana Acioa. Tree 60 feet.

Cult. For culture and propagation see Chrysobalanus.

Lin. syst. Icosandria, Monogynia. Calyx urceolate, 5-lobed. Petals 5. Stamens about 15, commonly 3 to each petal. Ovary villous, with the stipe adhering to the calyx. Style filiform, glabrous. Drupe ovate, thick, containing a 2-celled, 2-seeded, hard nut, which is rough on the outside. Seeds covered with wool. —Trees with villous branches, and with the leaves glabrous above, but white from pubescence beneath. Flowers small, white, disposed in panicles, corymbs, or racemes. Pulp of fruit edible, and sometimes the kernel of the nut.

Sect. 1. Petrocýra (from petra, a stone; and kárry, a nut; in reference to the hard nut contained in the fruit). D. C. prod. 2. p. 527. Flowers disposed in corymbose branched racemes. Stamens 7-8, sterile in one side, and 7 or 8 fertile at the opposite side. —Species native of Guiana.

1 P. montanum (Aubl. guian. 1. p. 514. t. 204 and 205). Leaves ovate, acuminate, clothed with white down beneath. t.S. Native of French Guiana, in woods. Petrocarýa montana, Willd. spec. 2. p. 287. —Petrocarýa Brasiliensis, Schott. The drupe is large, ovate, smooth, and fulvous, has a thick acid rind, and the nut or kernel of the tubercular putamen is sweet and edible.

Mountain Parinarium. Tree 60 to 80 feet.

2 P. campestris (Aubl. l. c. p. 516. t. 206.) leaves cordate, acuminate, clothed with white down beneath. t.S. Native of French Guiana, in woods. Drupe small, oval, yellow; putamen less echinated than in most of the species, and containing only one single, edible seed. Stipulas broad, many nerved.

Field Parinarium. Clt. 1824. Tree 80 to 40 feet.

Sect. II. Neocýra (Neow, the Senegal name of P. Setengálesis, and kárry, a nut; which signifies Neownut). D. C. prod. 2. p. 527. Flowers disposed in axillary and terminal panicled racemes. Stamens all fertile, disposed in one series, some of them rather concrete at the base. —Species native of Guinea.

3 P. Setengálesis (Perr. in litt. D. C. prod. 2. p. 527.) leaves oval, obtuse at both ends, clothed with white down be-
Native t. Seed small P. G. S. 2. prod. triquetrous, racemes panicked. H. S. Native of Sierra Leone, where the fruit is brought to the market at Freetown, under the name of Rough-skinned or Grey plum. They are eaten by the inhabitants. It is about the size of Imperatrice plum, with a coarse skin of a greyish colour; the pulp is dry and farinaceous, and owing to the size of the stone is small in bulk. The negroes are very fond of the fruit. Perhaps Mampita Senegalensis of Adanson mentioned by Bussew, in gen. pl. 342. is referrible to this species.

Tall Parinarium. Fl. Feb. Clt. 1822. Tree 50 to 60 feet, 5 P. MACROPHYLLUM (Hort. trans. 5. p. 452.) leaves large, ovate, sessile, and cordate, green above and downy beneath; stems thickly beset with brown hairs; racemes terminal; fruit oblong, twice the size of those of the preceding species. H. S. Native of Sierra Leone, by the sea-side about Cape Shilling, where the fruit is called Gingerbread-plum by the natives, who eat its pulp; it has much the flavour and appearance of that of the preceding species.

Cult. For culture and propagation see Chrysobalanus, p. 478.

1 G. BORBÓNICA (Lam. dict. 3. p. 21.) H. S. Native of the island of Bourbon. Drupe blood-coloured when young. C. buxifolia, Smith in Rees’ cyc. 16. no. 1. (f. 60.)

Bourbon Grangeria. Clt. 1823. Tree 40 to 50 feet.

Cult. For culture and propagation see Chrysobalanus, p. 478.

Lin. syst. Pentándria, Monogynia. Calyx bibracteolate on the outside, with a 5-cleft limb. Petals wanting. Stamens 5-10, opposite the calyceine lobes, or only 3 from abortion. Ovary 1, in the bottom of the calyx. Style incurved, lateral? Drupe olive-formed, fleshy, containing a 1-seeded nut. Seed thick.—Small trees, with oblong acuminate leaves, which are hoary beneath, and terminal spicate racemes of small white flowers.

Ha'y Lincanía. Shrub 4 to 5 feet.

2 L. hu'milis (Cham. in Linnaea. 2. p. 549.) stamens 10, exserted; style pilose; spikes nearly simple. H. S. Native of Brazil.

Dwarf Lincanía. Shrub.

3 L. Tur'iva (Cham. l. c. p. 550.) stamens 10, exserted; style smooth; spikes branched. H. S. Native of Para, in Brazil. Hirtella Octandria, Wild. rel. in Roem. et Schultes, syst. 5. p. 274.

Hirtella Lincanía. Shrub.

Cult. For culture and propagation see Chrysobalanus, p. 478.

Lin. syst. Decándria, Monogynia. Calyx campanulate at the base, ending in a small tube, which is adnate to the peduncle, as in Pelargonium. Petals 5. Stamens 10; the 6 on one side fertile, but the 4 on the other side are sterile and tooth-formed. Anthers fixed by the back, and bursting at the sides. Style lateral. Ovary 2-ovulate. Drupe? wrinkled, villous inside. Seed one, thick, exalbuminous. Cotyledons thick, unequal, plicate, the inner involving the other. Radical inferior.—Trees, natives of Madagascar, furnished with glandular bracteas.

1 T. Maga'da'sca'nis. H. S. Native of Madagascar. None of the species are described.

Madagascar Thelyra. Tree.

Cult. For culture and propagation see Chrysobalanus, p. 478.

IX. HIRTELLA (a diminutive of hirtus, having been so named from the hairyness of the branches). Lin. gen. no. 86. Lam. ill. t. 138. D. C. prod. 2. p. 528.—Ca'isa, Scop.—Cosminb'ena, Ruiz et Pav. fl. per. prod.

Lin. syst. Tri-Decándria, Monogynia. Calyx blunting 5-lobed (f. 61. a.), usually reflexed at length. Petals 5, small (f. 61. b.), deciduous. Stamens 3-5 (f. 61. c), many of which are abortive; filaments long, circuminately twisted inwards before the flowers expand. Style rising from the base of the ovary (f. 61. d), opposite the stamens. Drupe furrowed (f. 61. e), 1-celled. Seed stipitate, erect, with fleshy albumen, and a straight embryo, and leafy cotyledons (Gaertn. fruct. 3. p. 40. t. 185.)—American shrubs, with entire stipulaceous leaves, and axillary and terminal simple or compound racemes of flowers.

1 H. tri'andra (Swartz, fl. ind. occid. 1. p. 508.) flowers triandrous; petals ovate; racemes compound, loose, terminal; rachis pubescent; leaves oblong, acuminate, glabrous. H. S. Native of the West Indies and New Spain, in woods. H. Ame'ricana, Jacq. amer. p. 5. t. 8. H. paniculata, Lam. dict. 3. p. 89. Flowers white.

Cosminb'uen's Hirtella. Shrub 5 to 6 feet.

H. Mollé'cica (H. B. et Kunth, nov. gen. amer. 7. p. 263.) flowers triandrous; petals roundish-elliptic; panicles terminal and axillary, usually solitary, elongated, and pilose; leaves oblong, acuminate, somewhat coriaceous, acute at the base, glabrous above, and shining, but beset with soft fuscous pili beneath. H. S. Native of New Spain, near El Espinal at the river Magdalena. Flowers white.
Soft-haired Hirtella. Tree 20 feet.

4. H. pendula (Sol. ex Lam. dict. 3. p. 134.) flowers tetrandrous and pentandrous; racemes compound, loose, elongated, pubescent; leaves oblong-lanceolate, acuminate, cordate at the base, and rather seaboars beneath. \( \text{H.} \) S. Native of South America. Smith in Rees' cyc. 19. no. 3. Flowers white.

Pendulous-branched Hirtella. Shrub.

5. H. castanea (Moc. et Sesse, fl. mex. icon. ined. D. C. prodr. 2. p. 528.) flowers triandrous; petals ovate, length of the calyx; racemes terminal, and are, as well as the branches, very hairy; leaves hairy, oblong-lanceolate, rather cordate at the base, acuminate at the apex. \( \text{H.} \) S. Native of New Spain. Petals of a dirty whitish red colour. Stamens hardly twice the length of the petals.

Cheesnut-coloured-flowered Hirtella. Shrub or tree.

6. H. regosa (Pers. ench. 1. p. 230.) flowers triandrous; petals oblong, longer than the calyx; racemes terminal, and are, as well as the branches, very hairy; leaves ovate-lanceolate, acuminate, shining above, reticulated beneath, and pilose on the nerves. \( \text{H.} \) S. Native of Porto-Rico and St. Thomas. H. Portoriecensis, Willd. rel. in Rem. et Schultes, syst. 5. p. 274. Flowers white.

Wrinkled Hirtella. Shrub.

7. H. hirsuta (Lam. ill. no. 2754.) flowers tetrandrous or pentandrous; racemes aggregate, compound, axillary, and terminal, as well as the branches, hairy; leaves ovate, acute, pilose on the nerves beneath. \( \text{H.} \) S. Native of Cayenne. H. paniculata, Vahl. symb. 2. p. 43. t. 31. H. aggregata, Poir. suppl. 2. p. 53. Stamens constantly 6 according to Meyer, nov. act. bonn. 12. p. 802.

Hairy Hirtella. Shrub or tree.

8. H. glandulosa (Spreng. ank. t. 7. f. 1-4. neuv. entl. 1. p. 303.) flowers pentandrous; calyx and pedicels beset with stipitate glands; racemes compound, terminal; leaves ovate-oblong, acutish; the nerves beset with yellow hairs. \( \text{H.} \) S. Native of Brazil.

Glandular Hirtella. Shrub or tree.

9. H. corymbosa (Cham. in Linn. 9. p. 545.) flowers triandrous; corymbs compound, terminal, pubescent; leaves coriaceous, rather cordate, glabrous on both surfaces. \( \text{H.} \) S. Native of Brazil.

Corymbose-flowered Hirtella. Shrub.

10. H. floribunda (Cham. in Linn. 2. p. 548.) flowers octandrous or cuneandrous; racemes simple, terminal, and axillary, very hairy; leaves lanceolate-elliptic, coriaceous, glabrous above, except on the nerves, but hairy beneath. \( \text{H.} \) S. Native of Brazil.

Bundle-flowered Hirtella. Shrub or tree.

11. H. racemosa (Lam. dict. 3. p. 158.) flowers pentandrous; calyx glandless; racemes simple, axillary, solitary; rachis and branchlets villous; leaves oblong, acuminate, glabrous above, but rather pilose or glabrous on the nerves beneath. \( \text{H.} \) S. Native of Guiana and Cayenne. H. Americana, Aubl. guian. 1. p. 247. t. 98. Flowers purplish. (f. 61.)

Racemose-flowered Hirtella. Cfr. 1784. Tree 20 to 30 feet.

Oblong-leaved Hirtella. Shrub or tree.

13. H. heptandra (Willd. rel. in Rom. et Schultes, syst. 5. p. 274.) flowers hexandrous; racemes terminal, simple, hairy; leaves oblong, bluntish, glabrous but pubescent on the nerves beneath; pedioles and peduncles pubescent. \( \text{H.} \) S. Native of South America, at the river Orinoco. H. B. et Kunth, nov. gen. amer. 6. p. 245. Flowers white.

Hexandrous Hirtella. Shrub.

14. H. esculenta (Moric. ined. D. C. prodr. 2. p. 539.) flowers hexandrous; racemes terminal, simple; branches, pedioles, and nerves of leaves velvety; leaves oval, rather puberulous above, and rather hispid beneath. \( \text{H.} \) S. Native of Brazil, Raddi.

Hairy-branched Hirtella. Shrub.

15. H. tomentella (Schott, in Spreng. syst. append. p. 341.) flowers hexandrous and heptandrous; racemes terminal, clothed with ferruginous tomentum; leaves oblong, attenuated at both ends, glabrous above, but rather hairy beneath. \( \text{H.} \) S. Native of Brazil.

Tomentose Hirtella. Shrub.

16. H. angustifolia (Schott, in Spreng. syst. append. p. 341.) flowers heptantrous and octandrous; racemes simple, nodding, hairy; leaves cordate, linear-lanceolate, hairy on both surfaces. \( \text{H.} \) S. Native of Brazil.

Narrow-leaved Hirtella. Shrub.

17. H. apetala (Meyer. in nov. act. bonn. 12. p. 803.) flowers enneandrous, apetalous; calyx spreading; leaves ovate-oblong, acuminate, glabrous; racemes compound, terminal. \( \text{H.} \) S. Native of Surinam.

Apetalous Hirtella. Shrub.

18. H. polyandra (H. B. et Kunth, nov. gen. amer. 6. p. 245. t. 565.) flowers with 15-20 stamens, 5-petalled; panicles terminal, much branched, clothed with hoary tomentum; leaves oblong or obovate-oblong, ending in a short acumen, acute at the base, shining and glabrous above, but clothed with white tomentum beneath. \( \text{H.} \) S. Native on the shores of the Pacific ocean, near Acapulco. Flowers white.

Polyandrous Hirtella. Shrub 10 to 12 feet.

† Species not sufficiently known.

19. H. scadenens (Willd. rel. in Rem. et Schultes, syst. 5. p. 274.) flowers heptandrous; racemes axillary and terminal; leaves distinct, oblong, rounded at the base, acuminate at the apex, shining and glabrous; stems climbing. \( \text{H.} \) S. Native of Brazil.

Climbing Hirtella. Shrub cl.

20. H. nemorosa (Willd. rel. l. c.) flowers heptandrous; racemes terminal; leaves distich, oblong, rounded at the base, acuminate at the apex, shining and glabrous; stem erect. \( \text{H.} \) S. Native of Brazil. Petals yellow. Stamens violaceous.

Grose Hirtella. Shrub.

21. H. acayeensis (Moc. et Sesse, fl. mex. icon. ined. and mss. D. C. prodr. 2. p. 529.) flowers octandrous, 4-petalled; racemes simple, villous, axillary; leaves ovate, acuminate, glabrous. \( \text{H.} \) S. Native of Mexico, on the mountains of Acayaca. Flowers purple.

Acayaca Hirtella. Shrub or tree.

22. H. dodendon (Moc. et Sesse, l. c.) flowers with 12-15 stamens; racemes terminal, panicled; leaves oval-oblong, acute. \( \text{H.} \) S. Native of Mexico. Petals rose-coloured. Perhaps sufficiently distinct from \( \text{H.} \) polyandra.

Dodendron Hirtella. Shrub or tree.

23. H. nitida (Willd. rel. l. c.) flowers in terminal racemes,
pubescent; leaves oblong, acuminate, shining, narrow at the base. \( \text{f.} \). Native of Cuba. Skinning-leaved Hirtella. Shrub or tree.

Cult. For culture and propagation see Chrysobalanus, p. 478.

† Genera which are doubtful whether they belong to the present order.

X. LEUCOSTOMON (from \( \text{λύκος, leukos,} \) white, and \( \text{στόμα, stoma,} \) mouth). Mos. et Sesse, fl. mex. icon. ined. D. C. vol. 2, p. 639.

Lin. syst. Icosandria, Monogynia. Calyx 5-parted; lobes ovate-lanceolate, acute, spreading, coloured, deciduous, the lower part permanent, and bearing a circle of glands above, and stamens. Petals wanting. Stamens about 20, inserted in the calycine disk; filaments very short; anthers long, erect, fixed by the base. Ovary free, ovate, pubescent, 5-furrowed, ending in an acute filiform style. Fruit unknown.—A shrub, with oval, entire, feather-nerved leaves. Stipulas 2, subulate. Pedundes trifid, 3-flowered. Calyx brownish-purple.

1 L. terniflorum (Mos. et Sesse, 1. c.) \( \text{f.} \). Native of Mexico.

Tern-flowered Leucostomon. Shrub.

Cult. For culture and propagation see Chrysobalanus, p. 478.

XI. TRILEPISIUM (from \( \text{τρίς, três,} \) three, and \( \text{λεπίς, lepis,} \) a scale; in reference to the 3 scales situated in the calycine disk between the stamens and pistil). Pet. Th. gen. mad. no. 74. D. C. vol. 2, p. 639.

Lin. syst. Icosandria, Monogynia. Calyx thick, 5-cleft, not adhering to the ovary. Petals wanting. Stamens numerous, inserted by several series in the calyx; filaments filiform. Calycine tube terminating in 3 scales between the stamens and pistil. Ovary in the bottom of the calyx, 1-seeded. Style longer than the tube, bifid at the apex. Stigmas tomose. Fruit unknown.—A small tree, with alternate lanceolate leaves, when young wrapped round by the stipules, which are caducous.

1 T. Madagascariensis. \( \text{f.} \). Native of Madagascar. Madagascar Trilepisium. Tree.

Cult. For culture and propagation see Chrysobalanus, p. 478.

Order LXXX. AMYGDALACEAE (plants agreeing in important characters with Amygdalus, the almond).—Amygdalea, Juss. gen. 310. exclusive of some genera.—Drupaea, D. C. fl. fr. 4, p. 479.—Rosaceae, tribe II. Amygdalea, D. C. fl. prod. 2, p. 529.

Calyx 5-toothed (f. 62. a. f. 64. a.), deciduous, lined with a disk, the fifth lobe next the axis. Petals 5 (f. 62. a. f. 63. b.), perigynous. Stamens about 20 (f. 62. b. f. 63. b. f. 64. a.), inserted in the throat of the calyx, curved inwards in restoration. Anthers innate, 1-celled, bursting lengthwise. Ovary superior, solitary, simple, 1-celled. Ovula 2, suspended. Style terminal, with a furrow on one side, terminating in a reniform stigma. Seed usually solitary, suspended. Embryo straight, with the radicle pointing towards the hilum, with thick cotyledons. Alburnum none.—Trees or shrubs. Leaves simple, alternate, usually glandular towards the base. Stipulas simple, mostly glandular. Flowers white or pink.—This order is distinguished from Rosaceae and Poumaceae by its fruit being a drupe (f. 63. b. f. 64. d.), and by the presence of Prussic acid, from Leguminosa in the equal petals and stamens, and by the fruit.

The plants contained in this order are astringent and febrifugal, as the bark of Cerasus Virginiana is prescribed in the United States, and of the Cerasus Capullina in Mexico. They are, however, better known for yielding an abundance of prussic acid, a deadly principle residing in the leaves and kernels of the fruit, in consequence of which some of the species are poisonous to cattle which feed upon them, as for example Cerasus capricida, which kills the goats of Nipal, and the Cerasus Virginiana, which is known in North America to be dangerous. They all of them also yield a gum analogous to Tragacanth. Notwithstanding, however, the poisonous principle that is present in them, their fruit is in many cases a favourite food, as that of Amygdalus the almond, Armeniaca the apricot, Persica the peach and nectarine, Prunus the plum, and Cerasus the cherry. The principle in which they abound is the basis of laurel-water, which when taken in small doses acts either as a violent purgative or as an emetic, and in larger doses is said to destroy the irritability without exciting inflammation; these properties, however, although thus dangerous in the distilled water of the laurel and other similar plants, can scarcely be said to exist in any important quantity in the plants in a state of nature. The leaves of Prunus spinosa, and Cerasus avium have been employed as a substitute for tea. The bark of Cerasus Capullina is used in Mexico against dysentery. The prunes of the shops are chiefly prepared from those sorts of plums called St. Catharine and green-gage, and in Portugal from a sort that derives its name from the village of Guimaraens, where they are principally dried. They contain so large a quantity of sugar, that brandy is distilled from them when fermented. The kernel of Cerasus Brignatianca yields a fixed oil called Huiz des Marmottes, which is used instead of olive or almond oil. The Prunus Cocomiliea yields a bark the properties of which are spoken of very highly; according to Tenore it is a specific for the cure of the dangerous intermittent fevers of Calabria, where it grows. A variety of the Cerasus avium is used for the preparation in the Vosges and the Black Forest of the liqueur known under the name of Kirschenwaesser. The kernel of Cerasus occidentalis is used for flavouring the liqueur Noceau.

Synopsis of the Genera.

1 Amygdalus. Drupe clothed with velvety pubescence (f. 62. c.), with a fibrous dry rind, separating irregularly, having the putamen pitted or smooth.

2 Persica. Drupe fleshy (f. 63. b.), glabrous or clothed with velvety down, having the putamen irregularly furrowed (f. 63. c.).

3 Armeniaca. Drupe fleshy, clothed with velvety down, having the putamen obtuse at one end, and acute at the other, and surrounded by a furrow, the rest smooth, but never rugged.

4 Prunus. Drupe fleshy, quite glabrous, but covered with a kind of grey bloom, having a compressed putamen, which is acute at both ends, and slightly furrowed on the margin, the rest smooth.

5 Cerasus. Drupe globose (f. 64. d.), fleshy, quite glabrous, containing a smooth flattened putamen (f. 64. f.).

AMYGDALACEÆ. I. AMYGDALUS.

Lin. syst. Icosandra, Monogynia. Drupe clothed with velvety pubescence (f. 62. c.), having a dry rind, which separates irregularly, containing a pitted or smooth putamen or nut.—Trees. Leaves conduplicate when young. Flowers nearly sessile, usually pink or rose-coloured, rising either singly or by pairs from the scaly buds earlier than the leaves. Fruit woollly.

§ 1. Calyx cylindrically-campanulate.

1. A. Arborea (Oliv. voy. t. 47.) leaves oblong-linear, obust, crenated; petals short; fruit ovate-globose, solitary, ending in a short blunt acumen; putamen ovate. ½ H. Native of Arabia. Fruit the size of a filbert. 

Arabian Almond. Shrub 2 to 3 feet.

2. A. Nana (Lin. mant. 396.) leaves oblong-linear, attenuated at the base, serrated, quite glabrous; flowers solitary and rose-coloured. Fruit the form of those of A. communis, but much smaller. 

Root creeping.

Var. ß, Georgica (D. C. l. c.) calyce lobes lanceolate, length of the tube; style inclosed, hardly tomentose at the base. ½ S. Native of Georgia. A. Georgica, Desf. arbr. 2. p. 221.

Var. ß, campéstris (Ser. miss. in D. C. prod. 2. p. 530.) leaves broader; calyce lobes length of the tube; petals narrower, longer, and white; style hardly tomentose at the base. ½ H. Native of the south of Podolia. A. campéstris, Besser. Enum. p. 46. no. 1455. A. Besserianna, Schott, in cat. hort. vind. 1818. The form of the nut is different from the other varieties according to Besser.

4. A. Inca'na (Pall. ross. 1. p. 13. t. 7. Smith, fl. grace. t. 477.) leaves obovate, serrated, clothed with white tomentum beneath; flowers solitary; drupe compressed, pubescent. ½ H. Native of Caucasus, and of the Levant between Smyrna and Bursa. Flowers red. Shrub spinose.

§ 2. Calyx campanulate.

5. A. communis (Lin. spec. 677.) leaves oblong-lanceolate, serrulate; flowers solitary; calyx campanulate; fruit compressed, egg-shaped, tomentose. ½ H. Native of Mauritania, in hedges. Flowers white or rose-coloured.

Var. ß, amara (D. C. fl. fr. 4. p. 486.) style almost the length of the stamens, tomentose below; seeds bitter. Duham. ed. 2. p. 114. Flowers larger. Petals white, but rose-coloured at the base. There are varieties of this bitter almond, with hard and brittle shells to the nuts. 1 Bitter almond, with a tender shell. 2 Bitter almond, with a hard shell. Amandier amer (French).

Var. ß, dölcis (D. C. fl. fr. 4. p. 486.) leaves of a greyish green colour; flowers earlier; style much exceeding the stamens; fruit ovate, compressed, acuminated; seeds sweet; shell of putamen hard. Lam. ill. t. 430. f. 2.—Sweet almond, with a hard shell. Amandier à petits fruits, Amandier douce.

Var. ß, macrédé (D. C. prod. 2. p. 531.) leaves broader, acuminate, hardly cuneiform; peduncles shorter, turgescent; fruit larger, unibinate at the base, but acuminated at the apex; putamen hard. Flowers whitish rose-colour, large, rising before the leaves, with broadly obcordate undulated petals. —Sweet almond, with a large fruit. Amandier à gros fruits. Duham. arbr. ed. 2. vol. 4. p. 112. Nois. jard. fruit. p. 7. t. 3. There are two other varieties of this. 1 Sweet-almond, with a smaller fruit and tender shell. Amandier sultane. 2 Sweet-almond, with a smaller fruit. Amandier Pintaque.

Var. ß, persicoides (D. C. l. c.) leaves almost like those of the peach; fruit ovate, obtuse, with the sarcocarp hardly succulent; putamen dark yellow; seeds sweet. Peach-almond. Amandier pocher. Duham. arbr. ed. 2. vol. 4. p. 114. Nois. jard. fruit. p. 7. t. 3. f. 1. This variety is supposed by Duhamel to have been produced from the impregnation of the almond by the pollen of the peach.

Both the bitter and sweet-almond rise above 20 feet in height. The leaves resemble those of the peach, but the lower serratures are glandular, which has given rise to the conjecture that glandular leaved peaches have sprung more immediately from the almond than such as are without glands, as is generally the case with nectarines. Their flowers vary in colour from a fine blush to white snow. The chief distinction is in the fruit, which is flatter, with a coriaceous dry covering instead of the rich pulp of the peach and nectarine, opening spontaneously when the kernel is ripe. The tuberces of Pliny, Knight considers as swollen almonds, and the same with the peach-almond, having raised a similar variety from dusting the stigma of an almond with the pollen of a peach, which produced a tolerably good fruit. (Hort. trans. 3. p. 41. t. 1.) It is mentioned by Turner in 1548, and though hardly worth cultivating in England as a fruit tree for profit, yet it is a very satisfactory thing to produce almonds of one's own growing at the dessert. The tree forms an important article in the general culture of many parts of France, Italy, and Spain. In a forward spring the blossoms often appear in February, but in this case frost generally destroys them, and they bear little or no fruit, whereas when the trees do not flower till March they seldom fail to produce fruit in abundance. Use. The kernel of the nut is the only part used, which is tender and of a fine flavour. The sweet almonds and other varieties are brought to the dessert in a green or imperfectly ripe and also in a ripe state. They are also much used in cookery, confectionery, perfumery, and medicine. Sweet almonds used as food, Professor Martin observes, are difficult of digestion,
and afford very little nourishment unless extremely well com-
iminated.

Selection of sorts. The tender shelled is in the greatest
esteem, and next the sweet and Jordan.

Propagation. The almond is propagated like the peach, by
seed for varieties or stocks, and by budding on its own or on a
plum stock for continuing varieties. Plum stocks are pre-
ferred for strong moist soils, and peach and almond stocks for
dry situations.

Final planting. The trees are generally planted as standards in
shrubberies, and these will sometimes in good seasons ripen their
fruit, but when fruit is the object they should be trained against a
west or east wall like the peach.

Mode of bearing and pruning. The almond tree bears chiefly
on the young wood of the previous year like the apricot and
peach, and in part upon small spurs on the two year old and
three year old, and older branches; it is therefore pruned like
these trees.

Gathering and preserving the crop. A part may be gathered
when nearly ripe daily for some weeks before gathering the
whole crop. This operation generally falls to be performed in
September, when a part may be laid in the fruit room, and a
part thoroughly dried and bedded in sand in the fruit cellar for
keeping through the winter.

Medicinal properties. Almond-oil is obtained both from bitter
and sweet almonds by expression. Bitter almonds have been
found poisonous to dogs and smaller animals; and a distilled
water from them when made of a certain degree of strength has
had the same effects. The essential oil obtained by distillation
is one of the most virulent poisons known. Nevertheless bitter
almonds are every day used in cookery on account of their agree-
able flavour. Almond-oil is supposed to blunt aervosomous
humours, and to soften and relax the solids; hence its use inter-
nally in tickling coughs, pains, and inflammations, and externally
in tensions and rigidity of particular parts. On triturating
almonds with water, the oil and water unite together by the
mediation of the albuminous matter of the kernel, and form a
bland milky liquor called an emulsion, which may be given freely
in inflammatory disorders. The sweet almonds alone are em-
ployed in making emulsions, as the bitter almonds impart their
peculiar taste. Several astringent and resinsous substances, of
themselves not mixable with water, may by trituration with
almonds be easily mixed into the form of an emulsion; and are
thus excellently fitted for medicinal purposes. It is a singular
fact that the seeds of the bitter and sweet almonds should differ
so essentially in their chemical compositions; the bitter almonds
containing a deleterious principle which does not exist in the
sweet almond, although found in its bark, leaves, and flowers.

The existence of hydrocyanic or prussic acid, as a vegetable
principle, was discovered in 1802 by Bohm in the distilled water
of bitter almonds. It was also discovered in the leaves of the
cherry-laurel by Schrader in the same year; in peach blossoms
and leaves by Vanquelin; in cherry-water by Von Ittner, and in
the bark of the bird-cherry by Jahn. In all these, and many similar
substances, the acid is modified by its ultimate combination with
volatile oil. Laurel-water is prepared, according to the Prussian
pharmacopoeia, by drawing off three pounds of distilled water
from two pounds of the fresh leaves. Thomsen Von Thues-
sink observed it to produce immediately cheerfulness; a lower
pulse, and quiet sleep. It has hitherto been chiefly recommended
in melancholy with an attributable condition, and in obstruc-
tions of the liver, with a viscid state of the blood. Hydrocyanic
acid has recently been much used in pulmonary inflammation,
asmas, sympathetic coughs, &c. It is prepared by the apothe-
caries' company in London from cyanuret of mercury, hydro-
chloric acid, and water. Dr. Duncan, however, prefers the dis-
tilled water of bitter almonds or cherry-laurel water in these
diseases, as being more manageable and less liable to decomposi-
tion. Bitter almonds consist of 100 parts of fixed oil, 54 albu-
men, 2 fluid ounces sugar, 6 gum, 3 fibres, 4 pedicels, 5 water, and
a little acetic acid.

1548. Tree 10 to 30 feet.

6 A. Cochin-chinese (Laur. fl. cochin. p. 316.) leaves oval,
quite entire, scarcely small, subterminal; calyx campanulate;
fruit ovate, ventricose, acute at the apex. Š. G. Native of
Cochin-china, in woods. Corolla white. Kernel like the com-
mon almond in form and smell.

Cochin-China Almond. Tree 30 to 40 feet.

8 A. Microphylla (H. B. et Künth, nov. gen. amer. 6. p.
245. t. 506.) shrub much branched; leaves oblong, acute, mu-
cronate, crenately serrated, glabrous, small; stipulas twice
the length of the petioles; calyces lobes obtuse, mucronate,
reflexed; stigma peltate; fruit globose. Š. S. Native of Mexico
between Pachucha and Moran on arid hills at the height of
2390 feet. Flowers small, pink.

Small-leaved Almond. Shrub 3 feet.

Cult. All the kinds of almond are very ornamental when in
flower; the larger species are proper trees for the backs of large
shrubberies, or to stand singly, as they make a fine appearance
in spring, being in blossom before most other trees. The
dwarf kinds are well fitted for small shrubberies or the fronts of
large ones. All the species are increased by grafting on plum
stocks, or on the bitter almond, except some of the dwarfier kinds,
which may be easier increased by taking the suckers from the
plants at the roots.

II. PERSICA (so named from the peach coming originally from
p. 487.—Amygdalus species of Lin. and Juss.—Trichocarpus,
Neck. elem. no. 718.

L. persica. Drupe fleshy (f. 63. s.), with a glabrous or velvety epicarp, and having the putamen
wrinkled from irregular furrows (f. 63. c.).—Trees. Leaves
duplicate when young. Flowers almost sessile, solitary or twin,
rising from the scaly buds earlier than the leaves.

1 P. vulcanis (Mill. dict. no. 1. D. C. f. fr. 4. p. 487.) fruit
clotted with velvety tomentum.

Š. H. Native of Persia. Amyg-
Nois. jard. fruit. no. 1-16 and 22-
35. with figures. There is a very
elegant double flowered variety.
The peach tree in its natural state is
under the middle-size, with spreading
branches, lanceolate, glabrous, serrated leaves. The flowers are
sessile, with reddish calyxes, and pale
or dark-red corollas; the fruit
roundish, generally pointed, with a
longitudinal groove; the pulp or
sarcocarp large, fleshy, and succu-
lent, white or yellowish, sometimes reddish, abounding in a
grateful sweet acid juice; the stone hard, and irregularly fur-
rowed; and the kernel bitter. The tree of quick growth, and
not of long duration, blossoms in April, and ripens its fruit in
August and September. Dr. Sicker
considers Persia as the original
country of the peach, which in Media is esteemed un-
wholesome, but when planted in Egypt becomes pulpy, delicious,
and salubrious. The peach also, according to Columella, when

FIG. 63. 
first brought from Persia into the Roman empire possessed dele-
terior qualities, which T. A. Knight concludes to have arisen
from the fruits being only swollen almonds (the tuberc of Pliny,)
or imperfect peaches, and which are known to contain the
prussic acid, which operates unfavourably on many constit-
tutions. The tree has been cultivated time immemorial in most
parts of Asia; when it was introduced into Greece is uncertain;
the Romans seem to have brought it direct from Persia during
the reign of the emperor Claudius. It is first mentioned by Co-
lumella, and afterwards described by Pliny. The best peaches
in Europe are at present grown in Italy on standards, and next
may be cited those of Montreuil, near Paris, trained on lime-
white walls. (Mozard sur l’Education du Pecher, &c. 1814.)
In England there are but few sorts of peaches that come to
tolerable perfection in the open air in ordinary seasons. The
best adapted for this purpose are the free-stones, but all the sorts
ripen well by the aid of hot-walls or glass, and may be forced so
as to ripen in May and June. The tree is generally an abundant
bearer; one of the noblesse kind is at Yokefield in Suffolk, which
covers about 600 square feet of trellis under a glass case with-
out flies, and ripens annually from 60 to 70 dozen of peaches.
(Hort. trans. 3. p. 17.)
Use. The peach is a dessert fruit of the first order, and makes
a delicious preserve. In Maryland and Virginia a brandy is
made from the fruit. “The manufacture of this liquor, and the
feeding of pigs, being (as Braddock observes, Hort. trans. 2. p.
205.) the principal use to which the peach is applied in those
countries.” The leaves steeped in gin or whisky communicate
a flavour resembling that of noyau.
Criterion of a good peach. A good peach, Miller observes,
possesses these qualities, the flesh is firm, the skin is thin, of a
deep or bright-red colour next the sun, and yellowish green next
the wall, the pulp is of a yellowish colour, full of high flavoured
juice, the fleshy part thick, and the stone small.
Varieties. Linnaeus divides his Amygdalus Persica into two
varieties; that with downy fruit or the peach, and that with
smooth fruit or the nectarine, but in the present work the peach
and nectarine have been established into a genus called Persica,
and the peach and nectarine made distinct species. There are,
however, various instances on record (Hort. trans. 1. p. 103.)
of both fruits growing on the same tree, and even on the same
branch; and one case has occurred of a single fruit partaking of
the nature of both. The French consider them as one fruit,
arranging them in four divisions, the pêches or free-stone peaches,
the flesh of whose fruit separates readily from the stone and the
skin; the peches lisse or free-stone nectarines; the pêches or
clingstone peaches, whose flesh is firm, and adheres both to the
stone and the skin; and the Brugnons or cling-stone nectarines.
Knight (Hort. trans. 3. p. 1.), Robertson (Hort. trans. 3. p.
382.), and many other horticulturists, consider the peach and
almond as one species. We have, however, in this work fol-
lowed the established nomenclature, and treated them as distinct
fruits. There are many fine varieties of the peach. Tussser in
1573 mentions peaches white and red; Parkinson in 1629 enu-
merates 21 sorts; and Miller in 1750 31 varieties. In the gar-
den of Luxembourg at Paris are 70 varieties, and above double
that number of names are to be found in the catalogues of our
nurseries. Several attempts have been made to class the varieties
of peaches and nectarines by the leaf and flower, as well as the
fruit; the first is by M. Poitevin in the Bon Jardinier; the next
by Count Lelièvre in his Pomone Française; the next by John
Robertson, nurseryman of Kilkenney, whose arrangement is
founded on the glands of the leaves; and the fourth by George
Lindley (Hort. trans. vol. 5.), also founded on the glands of the
leaves; but none of these arrangements have been found suffi-
ciently perfect for the purpose of this work.

List of the varieties of peaches.
Var. a; flesh separating from the stone, called in English
free-stones, and in French pêches.
List of free-stone or melting peaches.
1 Abricottée, abricotée à noyaux partagé, admirable jaune,
grosse jaune, grosse pêche jaune tardive, d’abricot, de Burri,
D’Orange, Sautadie hermaphrodite, yellow admirable. Duham.
no. 13. Leaves with reniform glands. Flowers large. Fruit
large, yellow and red, ripening in the beginning or middle of
October. A second-rate sort.
2 Acton Scot. Hort. trans. 2. t. 10. Leaves with globose
glands. Flowers large. Fruit middle-sized, pale yellow, and
red, ripening about the end of August. A first-rate sort.
3 Late admirable, royal, la royale, pêche-royale, Bourdine,
Boudine, Bourdine, tétou de Yeu, belle hausse or belle haue of
some, Jud’s melting, Motteze’s. Leaves with globose glands.
Flowers small. Fruit large, pale yellow and red, ripening about
the end of August. This is one of the very best late peaches,
and ought to be in every collection; and is very proper for a
peach-house to succeed the early sorts.
4 Early admirable, admirable, l’admirable, (Duham. 29.) belle
de Vitry of Bon Jardinier. Flesh white, red at the stone, ripen-
ing end of August.
5 Yellow alberge, purple alberge, red alberge, golden mig-
nonne, gold-fleshed, alberge-jaune (Duham. no. 5. t. 5.), pêche-
jaune. Leaves with globose glands. Flowers small. Fruit
middle-sized, yellow and red; flesh yellow. Ripening about the
end of August. A second-rate sort.
6 Almond peach. Leaves without glands. Flowers large.
Fruit middle-sized, pale yellow and red, ripening about the
middle of September. A second-rate sort, raised from the almond.
7 Ansley’s colonel. Leaves with globose glands. Flowers
large. Fruit large, pale yellow and red, ripening in the middle
of September. A first-rate sort, resembling the Barrington.
8 Barrington, Buckingham mignonue. Leaves with globose
glands. Flowers large. Fruit large, pale yellow and red, ripening
in the middle of September. A first-rate sort, but sub-
ject to mildew.
9 Belle Chevereuse (Duham. t. 13.), Chevereuse, early Che-
reuse. Leaves with reniform glands. Fruit yellow and red.
Flesh yellow, excellent. Much confusion exists with regard to
this sort.
10 Belle de Vitry (Duham.), late admirable, bellis, admirable
tardive.
11 Bellegarde (Hook. t. 8.), galand, noire de Montreuil,
violette hâtie, early galand of some, Breuxford mignonue, French
royal George (Hook. t. 41.), smooth-leaved royal George of
some, French violette hâtie. Leaves with globose glands.
Flowers small. Fruit large, pale green and dark red, ripening
in the beginning and middle of September. A very handsome
and excellent peach, succeeds royal George and grosse mignon-
ne.
12 Swainson’s black. Leaves with globose glands. Flowers
small. Fruit dark red, middle-sized, ripening about the begin-
ing of September.
13 Braddock’s New York (Hort. trans. 2. t. 13.), Braddock’s
South American. Leaves with reniform glands. Flowers small,
Fruit middle-sized, pale green and red, ripening in the begin-
ing of September. A second-rate fruit.
14 Braddock’s red. Leaves without glands. Flowers large.
Fruit large, pale green and dark red, ripening end of August,
and beginning of September. A large handsome peach of good
quality.
15 Braddick's summer. Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of August. A second-rate sort.

16 Cambry. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the end of August. A first-rate sort, resembling the Malta.

17 Cardinal, le cardinal, cardinal de Furstenberg. Leaves without flowers. Flowers large. Fruit large, red, ripening in October. Flesh red, like beet-root, of little merit in this climate.

18 Green Catharine of the Americans. Leaves with globose glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the end of September. A worthless kind.

19 Chancelor, chancelier var. of Duham. late chancellor, Noisette. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening about the middle of September. A first-rate sort.

20 Yellow chevrette. Leaves with globose glands. Flowers small.

22 Double-blossomed, pêcher à fleurs doubles, pêcher nain à fleurs doubles, pêcher à fleurs semi-doubles. Leaves with reniform glands. Flowers large. Fruit small, pale yellow and red. A worthless sort as regards its fruit.

23 Double Montagne, Montagne, Montauban. Lang. t. 28. Leaves without glands. Flowers large. Fruit like that of the noblesse.

25 Dunnington beauty. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the beginning of September. A first-rate sort, very like the noblesse.

26 Early Anne (Duham. t. 10.), Anne, white avant of some. Leaves without glands. Flowers large. Fruit middle-sized, white, and red, ripening in the beginning and middle of August. Earliness is the chief recommendation of this sort.

28 Flat peach of China (Hort. trans. 4. t. 19.) Chinese peach, Peen-to peach, Java peach. Leaves with reniform glands. Flowers large. Fruit small, violet green and red, ripening in the beginning and middle of September, but may be forced in pots pretty early. A worthless sort.

29 Ford's seedling. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the end of August. Resembles much the noblesse.

30 Steward's late galande. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening about the middle of September. A first-rate sort, hardly differing from the chancellor.

31 George the Fourth. Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red, ripening about the middle of September. A first-rate sort.

36 White-blossomed incomparable, white-blossomed. Leaves with reniform glands. Flowers large. Fruit large, white, ripening about the end of August. Singular on account of its white blossoms and pale fruit.

37 Péche D'Ispahan, De Perse. Leaves without glands. Flowers large. Fruit small, greenish and red, ripening in the middle of September. A worthless kind.

39 Knapp castle seedling. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the end of August. A first-rate sort, very like the noblesse.

40 Knight's early, Knight's early seedling. Leaves with globose glands. Flowers large. Fruit middle-sized, pale green and dark red, ripening in the middle of August. A first-rate sort.

41 Lion's large melting. Leaves without glands. Flowers small. Fruit large, pale yellow greenish and red, ripening in the beginning of September. Allied to the royal George, larger, but not so good.

42 Madeleine de Bollmiller. Leaves without glands. Flowers large. Fruit middle-sized, pale green and dark red, ripening in the beginning and middle of September. A first-rate sort.

43 Madeleine de courson (Duham. t. 10.), red Madeleine of Miller, Madeleine rouge, rouge Poyanne, French Magdalene. Leaves without glands. Flowers large. Fruit middle-sized, pale yellow and red, ripening about the beginning of September. A first-rate sort, and a good bearer.

44 White Magdalen, Madeleine blanche (Duham. t. 6.), Montagne blanche. Leaves without glands. Flowers large. Fruit middle-sized, yellow white and red, ripening in the middle and end of August. A second-rate sort.

45 Malta, Italian, péche de Malte, belle de Paris, Malte de Normandie. Leaves without glands. Flowers large. Fruit middle-sized, pale greenish and red, ripening about the end of August. A first-rate sort, hardy, and keeps well after being gathered, and bears carriage.

46 American mignonette. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red, ripening in the end of September. A second-rate sort; comes near the chancellor.

48 Grosse mignonette (Duham. t. 10.), Grimwood's royal George, large French mignonette, mignonette Vineuse, royal sovereign, and 50 other names belong to this kind. Leaves with globose glands. Flowers large. Fruit large, yellow and red, ripening from the middle of August to the beginning of September. A first-rate sort, forces well, a good bearer, but does not bear carriage so well as many others.

49 Lord Fauconberg's mignonette. Leaves without glands. Flowers small. Fruit large, pale yellow green and red, ripening in the beginning and middle of September. A good peach, resembling the royal Charlotte.

50 Petit mignonette (Duham. t. 4.), small mignonette, early mignonette, mignonette, double de Troyes, péche de Troyes. Leaves with reniform glands. Flowers small. Fruit small, pale yellow and red, ripening in the beginning and middle of August. A first-rate sort, succeeds the brown nutmeg, and is larger than it.

51 Yellow mignonette. Leaves with reniform glands. Flowers
small. Fruit small, pale green and pale red. Flesh full yellow. A second-rate sort.

52 Morrisonia, Morrison's pound, Hoffmann's. Leaves with globose glands. Flowers small. Fruit large, pale green and red, ripening in the beginning and middle of September. One of the best of the American sorts.

53 Mountaineer. Leaves with globose glands. Flowers large. Fruit large, pale yellow and red, ripening in the beginning of September. A first-rate sort. Fruit sometimes partly smooth, in consequence of its having been raised between the red nutmeg peach and violette hâtive nectarine.

54 Nain pêcher, pêcher nain d'Orleans, dwarf Orleans, pot peach. Leaves without glands. Flowers large. Fruit pale green and yellow.

55 Nicette, nicette veloutée, veloutée tardive, Dorsetshire. Leaves with globose glands. Flowers small. Fruit large, pale green and red, ripening in the middle of September. A first-rate sort, very like the late admirable.

56 Noblesse (Hook, t. 2.), Mellish's favourite, vanguard. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening end of August and beginning of September. This is one of the very best peaches, either for forcing or the open wall.

57 Red nutmeg, brown nutmeg, early red nutmeg, avant rouge, avant pêche de Troyes (Duham. t. 3.), red avant. Leaves with reniform glands. Flowers large. Fruit small, pale yellow and dark red, ripening about the end of July. A second-rate sort.

58 White Nutmeg, early white nutmeg, avant blanche (Duham. t. 2.), white avant. Leaves without glands. Flowers large. Fruit small, white, ripening middle of July. Has little merit, except that of being the earliest.

59 Ord's peach. Leaves with reniform glands. Flowers small. Fruit large, yellow green and red, ripening beginning and middle of September. A second-rate sort, allied to the chancellor.

60 Purpure hâtive, early avant of some. Leaves with reniform glands. Flowers large. Fruit middle-sized yellow white, and red, ripening end of August. A good peach, as large as the grosse magnonne and earlier, but more tender.

61 President. Leaves with globular glands. Flowers small. Fruit large, pale yellow greenish and red, ripening middle and end of September. Though a good late peach, yet inferior to the late admirable.

64 Rosanne, petite Rosanne, alberge jaune (Duham. t. 5.), pêche jaune, Saint Laurent jaune. Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow and dark red, ripening middle of September. A second-rate sort.

66 Royal George (Hook, t. 41.) Millet's magnonne, red Magdalen, French chancellor, Lockyer's magnonne, early Royal George. Leaves without glands. Flowers small. Fruit pale green white and red, large, ripening about the end of August. A first-rate sort, well known and much cultivated, forces and bears well, but subject to mildew.

67 Royal George magnonne, new Royal George magnonne. Leaves without glands. Flowers small. Fruit large, pale yellow white and red. A first-rate sort, ripening about the beginning of September.

69 Pimenton sanguine. Leaves with reniform glands. Flowers large. Fruit dark red, small, ripening end of September.

70 Spring-grose. Leaves with globose glands. Flowers large. Fruit middle-sized, pale green and red. A first-rate sort, ripening about the beginning of September.

72 Southampton. Leaves without glands. Flowers large. Fruit large, pale green and red. A first-rate sort, very like the noblesse, ripening about the end of August.

73 Sweet water, early sweet water. Leaves without glands. Flowers large. Fruit middle-sized, pale green and red. A second-rate sort, ripening about the end of August.

74 Twyford's, Holmes's, Rickett's. Leaves without glands. Flowers large. Fruit large, pale green and red. A first-rate sort, ripening about the beginning of August. Resembles the noblesse and is probably a seedling from it.

75 Williams's early purple, Williams's seedling. Leaves without glands. Flowers small. Fruit pale green and dark red, large. A first-rate sort, ripening in the end of August.

Far, β; flesh adhering to the stone, called in English cling-stones, and in French peaches.

List of Cling-stone peaches.

1 Blood clingstone, claret cling-stone. Leaves without glands. Flowers large. Fruit middle-sized, dark red, ripening in October.

4 Catharine (Lang. t. 33.). Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of September. This is one of the best late clingstone peaches.

5 Williams's Catharine. Leaves with reniform glands. Flowers small. Fruit pale green and red, large, Very like the Catharine, but ripening later.

7 Congress. Leaves with reniform glands. Flowers small. Fruit large, pale yellow and red. A second-rate sort, ripening about the end of September. Resembles the Catharine.

8 Cooper's early. Leaves with globose glands. Flowers small. Fruit middle-sized, pale yellow and red. A worthless sort, ripening about the end of September.

10 Heath, fine heath, heath clingstone, red heath. Leaves with reniform glands. Flowers small. Fruit large, pale yellow.
and red, ripening in October. In a good season this is one of the very best late clingstone peaches.

11 *Incomparable*, *pavie admirable*. Leaves with reifenform glands. Flowers small. Fruit large, pale yellow and red, ripening about the beginning of October. It is a larger sort than the *Catherine*, but not so good.

12 *Lemon clingstone*. Leaves with reifenform glands. Flowers small. Fruit large, yellow and red. Flesh yellow, like that of the following; all three are esteemed in America for sweetmeats. All ripen about the end of September.

15 Old *Newington, Newington*. Leaves without glands. Flowers large. Fruit large, pale green and red, ripening about the middle of September. Very good as a *clingstone peach*.

18 *Pavie de Pomponne, pavie de Pomponne grosse, monstrous pavie of Pomponne, gro**s Perseque rouge, gro**s melecaton, pavie monontrleurs, pavie rouge de Pomponne, pavie rouge, pavie cannu*. Leaves with reifenform glands. Flowers large. Fruit large, yellow and dark red. A second-rate sort, ripening middle and end of October, but will not ripen, unless in a warm season and good situation.

+ *Peaches not well known, but none of them are probably worth notice.*

*Culture of the peach in the open air.*

Selection of sorts. Abercrombie says, "except the situation be completely favourable as to climate, aspect, and shelter, forbear to plant very early or extreme late fruit, for frost will almost invariably cut off the former, when blossoming and setting, and the latter will hardly ripen under the declining heat of autumn." The peaches proper for a small garden, according to Forsyth, are; the early avant, small mignonne, *Anne, Royal George, Royal Kensington, noblesse, early Newington, Glandare, early purple, chancellor, nivette, Catharine, and late Newington*. The peaches in the duke of Buccluecl's garden at Dalkeith, and which ripen in the order in which they are placed, are as follows; those marked † are planted against a hot wall. *Early nutmeg. 2 Early Anne. 3 Red Magdalene. 4 Royal George. 5 Grimwood's Royal George. 6 Noblesse. 7 Galande.† 8 Bellagard †. 9 Montauban †. 10 Miller's mignon †. 11 Smith's early Newington †. 12 Chancellor †. 13 White Magdalene.*

Propagating to procure new varieties.—The peach is raised from the stone; and this mode is pursued in North America, even for procuring trees for common purposes. The peaches called *Aston-Scot* and *Spring-groove* were thus originated; the parent trees were dwarfs planted in large pots; these being brought into a state of vigorous health, the pistils of the blossoms of one sort were impregnated with the pollen of another; only 3 peaches were suffered to remain on each tree; and from sowing the stones of these the above-mentioned peaches and other varieties were produced; the male parent of the latter was the large French mignon, and the female the little red nutmeg, which choice is consistent with the general principle,
that the most perfect and vigorous offspring will be obtained of plants as of animals, when the male and female parent are not too closely related to each other. Some excellent papers on this subject will be found in the Hort. Trans. vol. 1. by T. A. Knight.—The peach does not, like many other species of fruits, much exercise the patience of the gardener who raises it from the seed; for it may always be made to bear when 3 years old. In prosecuting such experiments, Mr. Knight recommends the seedling peach trees to be retained in pots, and buds from them only to be inserted in older trees; for their rapid and luxuriant growth is extremely troublesome on a wall, and pruning is death to them. Mr. Knight, by leaving on the lateral branches near the extremities of the shoots, and by exposing the leaves as much as possible to the sun, in order to promote the growth and ripening of the wood, procured blossom-buds the first year from seed.

**Propagata to perpetuate varieties.**—The peach is generally budded on Damask-plum, and some of the more delicate sorts on apricot stocks, or old apricot trees cut down, or on seedling peaches, almonds, or nectarines. Knight recommends growing almond stocks for the finer nectarines and apricots, as likely to prevent the mildew, and as being allied to the peach. He says, "almond stocks should be raised and retained in the nursery in pots, as they do not transplant well." Perform the budding in July and August, in the side of the stock, one bud in each; they should be inserted near the bottom for the principal wall-trees, and at the height of 3 or 4 or 5 feet for riders. The bud will shoot the following spring, and attain the length of 3 or 4 feet in the summer's growth. After the budded trees have ripened the first year's shoot, they may either be planted where they are to remain, or be trained in the nursery for 2, 3, or 4 years, till in a bearing state. Whether the plants be removed into the garden at a year old, or remain longer in the nursery, the first year's shoot from the budding must be headed down, either early in June the same year, to gain a season, or in March following, to 4, 5, or 6 eyes, to produce lateral shoots, with 1 upright leader to begin the formation of the head in a fan-like expansion; the second year's shoot should also be shortened to a few eyes at the return of June or March; and those also of the third year in such degree as may seem expedient.

**Soil.**—A good soil for peach trees, according to Abercrombie, "is composed of 3 parts mellow unexhausted loam, and 1 part drift sand, moderately enriched with vegetable mould. If the soil be lean and poor, and at the same time light, have the borders improved by decomposed dung and fertile mellow earth; if the ground be strong and heavy, add some light earth or dung; if very gravelly, remove the grossest part, excavating to the proper depth, and in the same proportion apply a compost as above. Let the soil be made good to the depth of 30 inches or 3 feet. The nectarine wants the warmer, richer, and deeper soil, if any difference be made. Bad soil ground or an exhausted mould, is often the cause of the trees gumming." Forsyth says, "Peaches require a lighter soil than pears and plums, and a light mellow loam is best."

**Choice of plants.**—Abercrombie, Forsyth, Nicol, and most authors agree in recommending the choice of trees, 2, 3, or 4 years trained. Forsyth says they should be procured in the latter end of October or beginning of November, as soon as the leaf begins to fall.

**Final planting.**—The peach is almost universally planted against walls in Britain; in some few warm situations they have been tried as dwarf standards or as low espaliers, covering with mats in spring to protect their blossoms. Early autumn planting is best on dry soils. Spring planting may be successfully performed in February and March, but the sooner the better, that the trees may take root immediately before the dry warm weather commences.

**Mode of bearing.**—"All the varieties of the peach and nectarine bear the fruit upon the young wood of a year old; the blossom-buds arise immediately from the eyes of the shoots. The same shoot seldom bears after the first year, except on some casual small spars on the two years wood, which is not to be counted upon. Hence the trees are to be pruned as bearing entirely on the shoots of the preceding year, and a full supply of every year's shoots must be trained in for successional bearers the following season."

**The summer pruning.**—In May and June, and occasionally in the succeeding months, is to regulate the shoots of the same year, and to prevent improper growths by rubbing off the buds. Pinch off fore-right buds or shoots, and pinch off or cut out, ill placed, very weakly, spongy or deformed shoots, and very strong luxuriant growths, retaining a plentiful supply of good lateral shoots in all parts of the tree, and leaving a leader to each branch. Let them mostly be trained in at full length all summer, about 3 inches asunder for next year's bearers, and divest them of any lateral twigs, to prevent a thicket-like intricacy, and to promote a healthy fruitful growth in the shoots left. In the course of the summer regulation, if any partial vacancy occurs, or should a young tree under training want an additional supply of wood, shorten some conveniently placed strong shoot in June to a few eyes, to furnish a supply of laterals the same season.

**The winter-pruning** may be performed at the fall of the leaf, and thence, according to some professional writers, at any time in mild weather until spring. It should be completed in February, or early in March, before the blossom-buds are considerably advanced, which are distinguishable by being round, plump, and prominent, while the leaf and shoot-buds are oblong and narrow. There is some advantage in pruning when the blossom-buds can be certainly known. Retain in all parts of the tree a competent supply of such regular grown shoots of last year as are apparently fruitful in blossom-buds. Most parts of these should be shortened, not indiscriminately, but according to their strength and situation; the very strong shoots should be left longest, being topped about one-fourth or one-third of their length; shoots of middling vigour reduce one-third or one-half, and prune the very weak to 2 or 3 buds. Always cut at a shoot-bud, to advance for a leader; sometimes a shoot-bud lies between a twin blossom-bud; cut half an inch above the bud. As many new shoots as will lay from 3 to 6 inches asunder may be deemed a competent supply for next year's bearers. Cut out quite close the redundant, irregular, and other improper shoots; remove or reduce some part of the former bearers of the two preceding years; cutting the most naked quite away, and others down to the most eligible younger branch or well-placed shoot. Also take out all diseased and dead wood, retaining young where necessary to fill a vacuity. In cold and late situations, T.A. Knight recommends a mode of pruning adapted to obtain fruit-bearing spurs on the peach, and these spurs he finds best calculated in such situations and late seasons to generate well organised and vigorous blossoms. "Instead of taking off so large a portion of the young shoots, and training in a few only, to a considerable length, as is usually done, and as I should myself do, to a great extent in the vicinity of London, and in every favorable situation, I preserve a large number of the young shoots, which are emitted in a proper direction, in early spring by the yearling wood, shortening each where necessary, by pinching off the minute succulent points, generally to the length of 1 or 2 inches. Spurs which lie close to the wall are thus made, upon which numerous blossom-buds form very early in the ensuing season. It is only in cold and late situa-
tions that the mode of management above suggested is recommended. The spurs must not be shortened in the winter or spring till it can be ascertained what parts of them are provided with leaf-buds." In a very cold and elevated situation, C. Harrison (Hort. trans. 2. p. 14.) prunes and nails his peach and nectarine trees in December and January, taking away two-thirds of the young shoots; and in two hand-dressings in May and July, he leaves the lowest and weakest shoots for a succession in the year following, pinching off the leading and other shoots. The chief rule which he follows, is never to allow the shoots that are left for bearing fruit to run to any length from the strong wood, for which reason, when the trees are pruned in autumn, the bearing branches for the next year are shortened, taking care not to leave more fruiting-buds than he thinks will come to perfection.

Training.—The peach is almost universally trained in the fan-manner, either straight-lined or wavy, though some allege that it bears better in rich soils, when two leading branches are encouraged, and the bearing shoots trained outwards from these, so as to form a sort of horizontal training.

Thinning the fruit.—"In favorable seasons the blossoms often set more fruit than the trees can support, or than have room to attain full growth, and if all were to remain it would hurt the trees in their future bearing, therefore they should be timely thinned, when of the size of large peas or half-grown gooseberries. There should be a preparatory thinning before the time of stoning, and a final thinning afterwards, because most plants, especially such as have overborne themselves, drop many fruit at that crisis. Finish the thinning with great regularity, leaving those retained at proper distances, 3, 4, or 5 on strong shoots, 2 or 3 on middling and 2 or 2 on the weaker shoots, and never leaving more than one peach at the same eye. The fruit on weakly trees thin more in proportion."—Abercrombie.

Renovating old decaying trees.—Head down, and renew the soil from an old upland pasture, and if the bottom of the border is moist, or if the roots have gone more than 2 feet downwards, pave the bottom, or otherwise render it dry, and impervious to roots at the depth of 20 inches or 2 feet from the surface. This plan will be found almost universally successful, in restoring sufficient vigour to resist insects and diseases; and produce abundance of fruit.

Protecting the blossoms.—This may be done by various modes. Forsyth recommends old netting as the best covering. C. Harrison protects his trees from the frost in the month of January by branches of broom; these are previously steeped in soapsuds mixed with one-third of urine for 48 hours, in order to clear them from insects, and when dry are disposed thinly over the whole tree, letting them remain on only until the trees begin to break into leaf. At the time of the blooming and setting of the fruit, he applies cold water in the following manner, viz. if, upon visiting the trees before the sun is up in the morning after a frosty night, he finds there is any appearance of frost on the bloom or young fruit, he waters the bloom or young fruit thoroughly with cold water from a garden-engine, and he affirms that even if the blossoms or young fruit are discoloured, this operation recovers them, provided it be done before the sun comes upon them. Dr. Noethden remarks, Hort. trans. vol. 2. "that this operation of watering before sun-rise, in counteracting the frost, seems to produce its effect in a manner analogous to the application of cold water to a frozen joint or limb, which is injured by the sudden application of warmth." J. Carr, of St. Ann's, near Leeds, protects his blossoms by retardation; and the means used are, detaching the branches of the trees from the walls in autumn, and not refixing them till late in the spring, when the blossoms are about to expand. In addition to unfastening the trees, a wedge is put in behind the main stem to throw it forward, in order that the tree may receive as little protection from the wall as possible. (Caled. mem. 3. p. 25.)

Ripening peaches on leafless branches.—Whenever the part of the bearing branch which extends beyond the fruit is without foliage, the fruit itself rarely acquires maturity, and never its proper flavour and excellence. This Knight conjectures to be owing to the want of the returning sap, which would have been furnished by the leaves, and he proved it experimentally by introducing a small branch immediately above the fruit. The fruit in consequence acquired the highest degree of maturity and perfection. (Hort. trans. 2. p. 25.)

Insects and diseases, &c.—The leaves of the peach tree are liable to the attacks of the acarus, its greatest enemy, and also to be devoured by the chermes, aphis, and even a much smaller insect, the thrips. These are to be kept under by the usual means of watering over the leaves, and fumigation with tobacco smoke. The honey-dew, mildew, gum, and canker are chiefly to be kept under by regimen; dusting with sulphur has been found to destroy the mildew, but the only certain way of remedying it is by a renewal of the soil, which will commonly be found old mould long in use and too rich, and by abundance of air. J. Kirk (Caled. hort. mem. 4. p. 150.) has tried renewing the soil for 50 years, and always found it an effectual remedy.

The young wood of the peach tree is liable to be covered with black spots or blotches, which Kemmerton proved to be produced by over rich soil (Caled. hort. mem. 2. p. 79 and 80.). The fruit, when ripe, is very liable to the attacks of the wasp, the large fly, and especially the earwig, &c., the two first may be excluded by nets, or enticed by honied bottles, and the latter caught by the beetle-trap, reeds or bean-stalks laid in behind the leaves, and examined every morning.

Gathering.—Use the peach-gatherer, and gather one day or two before the fruit is to be used, and before it be quite ripe, laying it on clean paper in a dry airy part of the fruit-room.

Use of hot walls.—The ripening of the peach may be accelerated in the open air, when planted against a hot wall, by the application of gentle fires in cold moist weather, in August and September. This will ripen the fruit and wood; but no attempt should be made to accelerate the blossom early in spring, as without the protection of glass they are almost certain of being cut off.

** Culture of the Peach-house.

Soil.—Abercrombie uses the same soil as for those grown in the open air. The border or bed to be 30 inches or 3 feet deep. The nectarine wants the warmer and richer and deeper soil, if any difference be made. The soil for peaches that are forced, McPhail recommends to be, "fine, loamy, well prepared earth, of a medium texture, neither very light nor of a strong binding quality, well mixed with some good manure. The border to be 4 feet deep and so broad that the roots cannot get into a bad soil" (Gard. Mem. 18.). The bottom of the border being made with gravel, if not naturally dry. Nicol directs the breadth of the border to be the width of the house within, and to the extent of 10 or 12 feet without. The average depth 30 inches at the least; but if a yard it would not be too much. The soil to be thus composed: three-fourths strong loam, one-eighth part of light sandy earth, and an eighth part of rotten stable-yard dung, with a competent quantity of lime and marl, all being properly mixed before planting.—Kal. p. 291.

Choice of sorts.—Select from the catalogue given, according to quality. The following list is given by Abercrombie as the most proper for forcing:—

3 R
* Cling-stones.

1 Late admirable. 2 Old Newington. 3 Portugal. 4 Golden. 5 Catharine. 6 Fanie de Pomponne.

* Free-stones.

7 White Nutmeg. 8 Grosse Mignonette. 9 Belle Chevreuse. 10 White Magnolia. 11 Red Magnolia. 12 Double Montagne. 13 Chancellor. 14 Early Admira. 15 Malta. 16 Royal George. 17 Noblesse. 18 Late Admira. 19 Late Purple.

McPhail says, "The names of the peach trees fit for forcing are the Magnolia, Double Montagne, Royal George, and Noblesse. Nicol recommends the following:—1 Red Magnolia. 2 White Magnolia. 3 Royal George. 4 Noblesse. 5 Double Montagne. 6 Early Admira. 7 Late Admira. 8 Late Purple. 9 Grosse Mignonette. 10 Smith's Newington. 11 Early purple, and orange.

Choice of plants. "Before a house for forcing peaches and nectarines be built," McPhail observes, "trees to plant in it had best be got in readiness, and if they be growing on the premises it will be an advantage. If it can be avoided, no tree should be planted in a forcing-house until the fruit of it has been seen and tasted. The trees should be well trained ones, 4 or 5 feet high; indeed, it is of no consequence what their age be, provided they are healthy, well rooted, and in a bearing state; and if they have been transplanted several times since they were budded, they will be the fitter for transplanting again; and if the work of taking them up and of planting them in the peachhouse be carefully and methodically done, the trees, by their removal, will be but little retarded in their growth. When every thing in the forcing-house is got in readiness for the reception of the trees, loosen them from the wall to which they were fastened with nails and shreds, and dig a wide semi-circular trench, 4 feet distant from the stem of each tree, and a little deeper than their spreading roots, then, by little and little, with a pointed stick, work the earth out among their roots, taking care to break as few of them as possible. In this manner the roots of the plants are to be divested of earth in a careful manner, so as to undermine the stem, that the tree may be lifted out of its place without straining the roots of it. Having holes previously prepared, about 8 or 10 inches deep and 4 feet wide, set the trees into them one after another, training their roots out in a regular horizontal manner at full length, and after let the ends of the roots be cut, so as to take the ruggedness off, cover them not deeper than about 6 inches at their extremities, and at the stem of the tree about 4 inches. Clean healthy dwarfs, that have been one or two years trained, Nicol prefers to older plants, and riders three and even four years trained; because, being temporary, it is desirable to have them produce fruit as soon as possible, for if the dwarfs thrive, the former will have to be removed in three or at most in four years. In a house 35 feet long, 3 dwarfs should be planted, and in a house 35 or 40 feet, 4 dwarfs; in both cases with riders between them."—Kal. 323.

Situation of the plants in the house.—Permanent occupants, intended to be forced early, Abercrombie plants in a front border, training them on a treillis just under the roof. In late forcing-houses, he trains them to an upright treillis near the back wall. McPhail plants so as to train under the glass, and Nicol's practice concurs with that recommended by Abercrombie. For a late peach-house, dwarfs should be planted in front, to be trained about half-way up the roof; and dwarfs, with riders between them, against the back wall, to be trained to the top. In this case, the trees on the back treillis would not be shaded by those in front, provided they are not trained to more than half way up the sloping-glass; and thus the greatest possible extent of unshaded surface, and the greatest quantity of unshaded fruit may be obtained. A house planted in this manner, about 40 or 45 feet in length, may have 4 dwarfs in front, and 4 dwarfs and 5 riders at back, and when in a full bearing state would produce a large quantity of nectarines and peaches. If only 30 or 34 feet in length, 3 dwarfs in front and 3 dwarfs and 4 riders at back, would be trees enough to fill it.—Pract. gard.

Season of planting.—Abercrombie recommends November and December as preferable, if not February and March; which practice is also agreeable to that of Nicol.

Training.—All seem agreed in recommending fan-training for peaches and nectarines, which being the simplest and most natural training, is always to be preferred.

Pruning.—This, according to Abercrombie, may be performed at the fall of the leaf, but should be completed before the blossom-buds are considerably advanced. McPhail says the best season is in the spring, when the blossom-buds can be distinguished. In the case of a newly-planted house, Nicol heads down the maiden plants, or cuts the trained trees about the end of March or beginning of April. With respect to the dwarfs, the shoots on the lower branches should be cut back to 2 or 3 buds, that the treillis may be furnished from the bottom with young wood. The shoots on the upper or further extended branches may be shortened back to half or one-third of their lengths, according to their strength, provided they have been well ripened, and are free from canker; but if the tree be anyways diseased, let them be cut so far back as to get rid of the cankered or mildewed part, but it would be advisable that no diseased tree should be planted, unless of a particular kind that cannot be easily obtained. The riders need not be headed so much in as the dwarfs, the object being rather to throw them into a bearing state than to cause them to push very strong shoots, which would not be fruitful. If they make moderately strong shoots, and if these be well ripened in autum, a good crop may be expected on them next year. Let the young shoots be laid in, as they advance, at the distance of about 9 inches from each other, that is of the dwarfs; those of the riders may be laid in considerably closer, it not being intended they should grow so vigorously as those of the dwarfs. In a bearing-house the winter pruning is supposed to take place in November, and if the summer shoots have been regularly trained and laid in at the distances of 9 inches in the dwarfs, and rather less in the riders, they will not require much pruning at this time. A few of the shoots may be shortened about the lower and middle parts of the tree, for the purpose of providing a supply of young wood in these parts, and thinning out such shoots here and there as have been left too thick; for others should not be shortened, but should be laid in at full length, that is, such as are short, stout, nearly of an equal thickness, and have a bold wood-bud at the extremity, as from these may be expected the best fruit next season. In some parts of the tree, perhaps, or in some particular trees, it may be expedient to cut out such old branches as have but few young shoots on them, provided there be neighbouring branches better furnished, whose shoots may be spread out so as to fill, or nearly to fill, the vacancy occasioned by such lopping. In this case, the shoots borrowed as it were for this purpose, must be shortened more or less, according to the size of the vacancy to be filled up, and according to their strengths, in order that the plant may appear complete in all parts as soon as possible. In summer Nicol pinches off foreright shoots as they appear, and all such as are ill-placed, weakly, watery, de-
year, and retaining a plentiful supply of good lateral shoots in all parts of the tree. If any blank is to be filled up, some conveniently-placed strong shoot is shortened in June to a few eyes, in order that it may throw out laterals. Sir Joseph Banks, in speaking of the culture of peaches at Montreuil, near Paris (Hort. trans. vol. 1. append.) says, "Much advantage is derived from the practice of rubbing off the leaf-buds from the fruit-bearing branches, leaving only as many as are wanted to produce wood for the succeeding year. The taille d'été does not only leave the remaining wood to grow stronger and to ripen sooner, but it naturally increases the size of the fruit. The fruit is thinned after the stoning and in the early days described for thinning of wall fruit." In a peach-house, in a state of bearing, when the fruit is swelling off, in order that it may attain a greater degree of perfection, such leaves and summer shoots as overhang and shade the fruit are taken off or thinned. The leaves of peach trees "may be dressed off," when the wood is ripened, by the use of a wisty or small cane, which is more necessary in a house than if the trees were growing in the open air, where the wind or frost may make them tumble down fast. In the newly-planted peach-house the dwarfs must be well cut in, in order to make them push shoots freely for furnishing the trellis next season. Those situated in the lower and middle parts of the tree should be cut back to half their lengths, or to a few buds, less or more according to their strength; and those of the extremities to the third or to about half their lengths, also according to their strength, and how well they have been ripened. They should be thinned so at this time, as that the shoots which are to issue from them next season may be laid in at the medium distance of about 6 inches. The riders need not be pruned near so much as the dwarfs, as they are wished to produce a crop of fruit the following season, shortening no shoots that are fully ripened, except a few of those at the extremities of the tree, in order to make them throw out others for its full extension upwards next year.

Stirring the soil.—The borders are to be pointed and forked up after pruning, and a little well-rotted dung or compost added where deemed necessary. That part of the border on the outside may in addition be covered with dung, and after forcing is commenced, those in the inside may be occasionally watered with the drainings of the dung-hill.—Kal. 524 and 438.

Time of beginning to force.—From the rise of the sap, according to Abercrombie, it occupies, in some sorts, about 4 months to make mature fruit; in the later varieties 5 months; and when much of winter is included in the course of forcing, the time is proportionally lengthened. To ripen moderately early kinds by the end of May, begin to force on the 21st of December. Little is gained by commencing sooner. But you may put on the glasses a week before, and make gentle fires, admitting a constant stream of fresh air, to get the house ready. M'Phail says, "Those who wish to have peaches and nectarines ripe in May, should begin to force them about the beginning or middle of December." For a general crop, Nicol, Weeks, and most gardeners recommend forcing to begin in the month of February. He says it is much better to force too slow than too fast.

Temperature.—Abercrombie directs to begin at 42° min. and 45° ½ max., from sun heat, and rise in a fortnight to 45° min. and 50° max. from sun heat; in the progress of the second fortnight augment the temperature from 3 to 8 degrees, so as to have it at the close up to 58° min. and 56° max. from sun heat, admitting air in some degree daily. When the trees are in blossom, let the heat be 55° min. and 60° max. Continue to aim at this till the fruit is set, then raise the minimum to 60° and the artificial maximum to 65°, in order to allow of giving air. When the sun shines do not let the maximum from collected heat pass 70°, rather employ the opportunity to admit a free circulation of air. M'Phail, beginning in February, keeps the thermometer to about 55°, increasing it as the days lengthen; when the fruit is set and swelling, raise it to 60° with fire heat; when the sun shines, let it rise to 65° or 70° with air. A short time before the fruit begins to ripen, from 55° to 70° is not too much with fire heat, and when the sun shines let it rise a little above 75°. In a house, begun to force on the 1st of February, Nicol begins with 45° for the first fortnight, and then increases the heat to 50° or 52°. The times of regulation are supposed to be at 6 or 7 o'clock in the morning and 8 or 9 o'clock at night. At the end of the month the temperature is to be kept as steadily as possible to 55°. In two months keep it to about 65°, seldom allowing it to pass 70°, which if it does, will have the effect of drawing the shoots up weak, and may cause the setting fruit to drop. He recommends 60° by fire heat, mornings and evenings, as proper after the fruit are fairly stoned. T. A. Knight finds that neither peaches nor nectarines acquire perfection either in richness or flavour, unless they be exposed to the full influence of the air and sun during their last swelling, without the intervention of the glass. In consequence, he says, some gardeners take off the lights wholly before the fruit begins to ripen, but he recommends taking them off only in bright sunshine, and putting them on during rain, and at night to protect the fruit from dew, &c.

Air.—A constant stream of fresh air is to be admitted before beginning to force, and plenty of air, when the sun shines, during the whole progress of forcing. M'Phail says, "when the fruit is set and swelling, give the house air every day, whether the sun shine or not. Give plenty of air, and keep the house dry when the fruit begins to ripen." When the intention is to begin to force on the first of February, Nicol shuts up the house from the middle of January, admitting plenty of free air through the day. During the first month of forcing, he admits air freely "every day, even in frosty weather, by the sashes, till the flowers begin to expand, after which time by the ventilators, except in fresh weather, till the season become mild." Air should be admitted all this month to such an extent as to keep down the temperature in sunshine to within 5° of the fire heat medium, and this in order to strengthen the buds as they break, and that the young shoots may spring in a vigorous manner.

Admit large portions of air every day when the fruit is swelling off, except in damp weather, from 7 or 8 o'clock in the morning to 5 or 6 o'clock in the evening, opening the sashes to their fullest extent, from 10 to 2 or 3 o'clock in the afternoon, giving and reducing gradually, &c.

Watering and steaming. "While the fruit is in blossom," Abercrombie observes, "steaming the flues must be substituted for watering over the leaves; at the same time you may water the roots now and then gently, avoiding such a copious supply as might risk the dropping of the fruit to be set. Let the water be warmed to the air of the house." M'Phail directs to keep the border moist by watering; and after the fruit are as big as nuts, sprinkle the flues now and then with water, to raise steam, and wash the trees about once a week with clean water, not too cold. It is better not to wash all over the top till the fruit are set. A sunny day is to be preferred, and the water may be about 65°. Do not water after the fruit begins to ripen, but recommence when it is all gathered (Gard. rem. p. 148. and 191.) Newly planted peach trees should be freely supplied with water. The roots at the branches of the season, in order to promote their growth; and the engine must be applied with force to the branches for the suppression of the red spider, and refreshing the foliage, generally once in two or three days (Gard. kal. p. 358). In a fruit-bearing house, after the fruit is set, water should be given pretty freely to the plants at the

3 and 2
AMYGDALACEÆ. II. PERSICA.

roots once in two or three days, increasing the quantity as the fruit begins to swell, and as the shoots advance in growth. Also continue the operation of the engine regularly, and do not be afraid to hurt the foliage if the red spider appear upon them, and more particularly towards the top of the house, as it is there the red spider is fostered by the extreme heat. Withhold water from the border, and cease to exercise the engine on the foliage when the fruit are swelling.—Gard. kal. p. 401.

Insects and diseases.—The red spider is the great enemy to peach and nectarine trees, but they are also attacked by blight, mildew, the aphis, thrips, and sometimes even the coccus. The blight, Abercrombie says, is caused by a small insect, very pernicious both to the trees and fruit in their growth; this is apparent by the leaves curling, and often by the ends of the shoots being bunched and clubby. In this case it is advisable to take off the distempered leaves, and cut off the diseased ends of the shoots. Further to check the mischief, if the weather be hot and dry, give the trees a smart watering all over the branches by a garden engine, and repeat it two or three times a week in the afternoon when the power of the sun is declining. These waterings will clear the leaves, branches, and fruit, refresh and revive the whole considerably, and conduct greatly to exterminate the vermin. When the plants have begun to expand their blossoms and leaves, the aphis or green-fly makes its appearance; in which case M’Phail directs to fill the house full of tobacco-smoke once a week or oftener. If there be any appearance of mildew, dust a little sulphur on the infected parts, and if the gum or canker be seen on the shoots, or on any parts of the trees, open the bark and cut out the dying wood. Inspect the trees in every part minutely, and if you perceive the bark dying or the gum exuding, take off the bark as far as it is dead or decaying, and if the branches be strong, that you cannot well effect it with your knife, take a chisel with a semicircular edge and a mallet and cut out the wood as far as you see it is affected; you need not be afraid of hurting the tree, even if the branches or stem are cut half way. This method exposes the old wood to the sun and air, by which it is dried, and the tree is thereby assisted in casting off the unwholesome juices, or those kept in it too long for want of a more dry genial climate (Gard. rem. 131.). J. Michell, of Montcrieff House, Perthshire, hangs on his peach trees, when the fruit are ripe, large white glass phials, with a little jam or jelly in them, in order to entice large black flies, which he finds very destructive to peaches. Wasp he destroys by finding out their nests in the day time, and going in the evening with a candle, he introduces a burning stick smeared with wet gunpowder, which stupifies the wasps, and causes them to fall nearly dead, when he crushes them (Caled. hort. mem. 1. p. 194.). Nicol strongly recommends watering for keeping down insects, especially the red spider. If the green fly or thrips make their appearance, recourse must be had to fumigation. Shut the house close at night, and fill it as full of tobacco-smoke as possible. If this be repeated the next evening they will be completely destroyed. Calm cloudy weather is the most favorable for this operation (Gard. kal. p. 340 and 356.).

The coccus and chermes, he says, are not so immediately hurtful, and unless very numerous need not be much minded at this season, but they must be more particularly attended to at the more critical times. In the month of May the leaves, if having wings and are active, will be dislodged by the operation of the engine, and the females, which are stationary and adhere to the shoots and branches, if very numerous, may readily be crushed by the finger, or by a small flattish stick. In November, the winter pruning being finished, the plants and trellis are to be anointed with the composition recommended for vines, see vol. 1. p. 708.

Gathering of the fruit. M’Phail advises laying moss or some soft material over the borders, to save those from being injured which drop of themselves. Sir Joseph Banks, quoting from a Mr. Dyer, states that peaches are never eaten in perfection if suffered to ripen on the tree; they should be gathered just before they are quite soft, and kept at least 24 hours in the fruit chamber. Hort. trans. vol. 1. append. John Williams of Pitmaston says, “should the season prove wet when the peaches are ripe, they should be gathered, and placed for about two days in a dry airy room before they are eaten.” Hort. trans. 2. p. 113.

Ripening of the wood. Abercrombie says, “on account of the fruit of most sort of peaches ripening somewhat earlier than grapes, and the growth of the shoots stopping sooner than the runner-wood of vines, it is not so often necessary to assist the plant in September or October by artificial heat; but in some of the late kinds, if, by the time the external air is down to 60°, the shoots have not taken a greenish-brown tint as high as several eyes from the origin, and if the blossom-buds on these, when full swelled, are not distinguishable from the oblong wood-buds, apply a little fire heat, and continue it till the leaves fall.” Nicol directs attention to be paid to the ripening of the wood of peach trees in September. “A little fire heat may be necessary fully to mature the shoots, especially of young trees. Fire heat should be continued till the growth of the smaller and middle-sized shoots stop, their bottom parts become greenish-brown, and the flower-buds upon them appear turgid, so as to be distinguishable from the wood-buds. The stronger, and more extreme shoots, of the dwarfs in particular, will continue to grow later than the above shoots, which as they are to be considerably shortened back in November for the production of wood to fill the trellis next season, is not very material, provided the bottom part be pretty well hardened.”

Resting of the wood. The management of the peach-house when at rest, Abercrombie says, “should be nearly the same as for the grape-house, except when there is but one set of frames to serve both an early peach-house and a late grape-house; in which case, as soon as the young wood of the vine is perfectly ripened, the glasses should be brought back to the peach-house; for although the fruit of the grape is to be set and ripened in a higher heat, the peach tree as a plant is more tender than the vine, and independently of forcing comes into blossom about two months sooner.” M’Phail keeps on the glasses from the time the fruit is gathered till he begins to force, in order to keep the wood dry; but give succour all day he can. Gard. rem. p. 367. Nicol exposes the house fully day and night, only shutting up in the time of heavy rains. Gard. kal. p. 420.

Forcing the peach tree in pots. “All the varieties of peaches and nectarines,” Abercrombie remarks, “are extremely well suited for forcing in large pots. Small plants intended to come in before or after those in the borders may be excited in the first stage in a distinct house, so as the temperature of that in which they are brought to finish fruiting be suited to their progress.” The pots or tubs should be such as not to contain less than a cubic foot of earth, the soil should be lighter and richer than that recommended for the borders, and liquid manure should be plentifully supplied to make up in some degree for the confinement of the roots. They are best forced in a peach-house, but succeed in a vineyard or on the mountains; best of all, however, in a pit or Dutch frame, where the temperature can be regulated at pleasure, and where they are near the glass. Great care must be taken to supply them regularly with water, for which purpose some place saucers under the pots, others cover their surface with moss, or what is better, fresh cow or rotten horse dung. Casing the pots with ropes made of moss is also a very good method, as it not only preserves an uniform degree of moisture,
but also of temperature. Of course the moss must be kept watered. Peach trees in pots are sometimes trained to small fan-trellises attached to the pot, but in general they are pruned as dwarf standards, in which form they bear rather better than when trained. When the fruit is nearly ripe, the pots should be removed from the hot-house or vine-house to a cooler and more airy situation, or if in the pots the sashes may be taken off a part of every fine day. In other respects the treatment of peach trees in pots is similar to that of the trees in the borders. With respect to the quality of fruit from peach trees in pots, J. Williams observes, “by far the best flavoured peaches I have ever tasted were from trees planted in large pots, and kept in a vineyard from February till the first week in June, when the trees were removed into the open air, and after being shaded a little from the sun for the first ten days, were placed in the most open part of the garden till the fruit became ripe. Treated in this way the peach is beautifully coloured on the outside, and of a most exquisite flavour.” Occasionally in very warm seasons peach trees in pots, when forced very early in the season, and afterwards plunged in the open air, will produce a second crop late in the autumn, but this is more a matter of curiosity than utility. It frequently happens with forced cherries and strawberries. Hort. trans. 3. p. 367.

Peach trees as standards. The peach bears remarkably well in the standard form, planted in the middle of the house, and the flavour of the fruit is universally acknowledged to be preferable to that grown on the trellis, from the comparatively free circulation of the air. The glass tent or moveable house might be most advantageously applied in this way, and when the fruit begins to ripen, the sashes could be removed, and applied to ripening a late crop of grapes against a common wall, or to cover pits or houses which had not been forced.

forcing peaches by dung heat. Sir Thomas Neave (Hort. trans. 5. p. 218.) forces peaches and nectarines principally by dung heat; about 3 feet and a half of the bottom of the front wall of his peach-house is open brick-work, with a flue on the inside, the top of which is covered with flat tiles. The inside of the house is filled with earth to within 2 feet of the bottom of the lights, and the trees planted as near as possible to the front wall, and trained under the lights or wires like vines; the back wall of the pine-pit is built of the same height as the front of the peach-house, and 3 feet distant from it; this of course forms a space 3 feet wide for the hot dung, and as soon as he wishes to begin forcing, this space is filled with hot dung. The roots being next the flue soon begin to feel the warmth of the dung. He finds great advantage from this method, and it is productive of no ill effects until the leaf buds begin to expand, and if the steam is not then perfectly sweet and moderate, the places left to admit it must be secured. The way in which this dung lining is placed is, that, while it is forcing the peaches and nectarines, it is assisting to work the pines in the pine-pit at the same time. By this means he has never failed in producing abundant crops of peaches and nectarines.

In medicine peach blossoms are recommended as an anthelmintic purgative. They are given in infusion; half an ounce of the fresh petals or a draught of the dry for a dose. A syrup made from peach blossoms is official in Wirttemberg.

Common Peach. Fl. April, May. Ctl. 1562. Tree 10 to 15 feet.

2 P. Lèvis (D. C. fl. fr. 4. p. 487.) fruit smooth, glabrous. H. Native of Persia. Amygdalus Pérsica, Lam. dict. 1. p. 100. no. 21-27. Amygdalus Pérsica nectarina, Ait. hort. kew. ed. 2. vol. 3. p. 104. Noisett. jard. fruct. p. 89-90. no. 17-22. t. 20. f. 29. t. 21. f. 8-4. The nectarine is distinguished from the peach by its smooth, and rather firmer, more plump fruit. In other respects the general history of the peach equally applies to the nectarine, as well as its culture and uses. Forsyth says, “the fruit is called nectarine from nectar, the poetical drink of the gods.” The varieties of the nectarine are as follow.

Var. a; flesh separating from the stone. Called in French brugnon, and in English free-stone nectarines.

A list of free-stone or melting nectarines.

1 Aromatic. Leaves with reniform glands. Flowers small. Fruit pale yellow, red on the exposed side, middle-sized, ripening about the beginning of September. Resembles the violette hátie.

3 Boston. Leaves with globose glands. Flowers small. Fruit middle-sized, orange, but dark red on the sunny side, ripening about the beginning of September. A second-rate kind.

4 Brinon. brugnon red at the stone, violet red at the stone. Leaves with reniform glands. Flowers small. Fruit large, pale yellow, red on the sunny side, ripening about the beginning of September. A first-rate sort.

5 Côte de pêche, cherry nectarine. Leaves with reniform glands. Flowers small. Fruit small, whitish, but red on the sunny side, ripening about the end of August. More a subject of curiosity than use.

6 Claremont. Leaves with reniform glands. Flowers small.

7 Desprès, Déprès. Leaves with reniform glands. Flowers large.

8 Du Tellier's, du Telly's. Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening in the beginning of September. A first-rate sort.

9 Downton. Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of August. A first-rate sort.

10 Elrige, common elrige, Claremont, Oatlands, Temple's of some. Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green and red, ripening about the beginning of September. Flesh almost white to the stone, excellent. A good bearer, and forces very well.

11 Elrige of Miller. Leaves without glands. Flowers small.

13 Genoa, late Genoa, Genoese. Leaves with reniform glands. Flowers small.

14 Greenshield's late. Leaves with reniform glands. Flowers small. Fruit middle-sized, greenish on one side, and red on the other, ripening about the end of September.

17 Murray, Murry (Forsyth), black Murray. Leaves with reniform glands. Flowers small. Fruit middle-sized, pale green on one side, and dark red on the other, ripening in the end of August. A first-rate sort.

18 Large melting. Leaves with reniform glands. Flowers small.

19 Ord's new. Leaves with reniform glands. Flowers small.

21 Pimnaston orange, Williams’s orange, Williams’s seedling. Leaves with globose glands. Flowers large. Fruit large, orange and dark red, ripening about the end of August. An excellent, hardy, and good bearer.

22 Scarlet of Forsyth. Leaves with reniform glands. Flowers small. Fruit small, fine scarlet and pale red, ripening about the end of August.

23 Hunt’s tawny, Hunt’s early tawny. Leaves without glands. Flowers small. Fruit middle-sized, orange and dark red, ripening from the middle to the end of August. A very distinct sort, worthy of cultivation for its earliness.

25 Vermash, true vermash. Leaves with reniform glands. Flowers large. Fruit middle-sized, green on one side, and red on the other, ripening about the end of August. A first-rate, but rare sort.

26 Violette grosse, grosse violette hâtive, violette de courson, le gros brugnon in some parts of the continent. Leaves with reniform glands. Flowers small. Fruit large, pale greenish and red, ripening in the beginning of September. A first-rate sort, having the flesh very red at the stone.

27 Violette hâtive (Hooker, t. 15.), violet, early violet, lord Selsey’s elruge, Hampton Court, large scarlet, new scarlet, ver- mash of some, petite violette hâtive. Leaves with reniform glands. Flowers small. Fruit large, pale green and red, ripening about the end of August. A first-rate sort, forces well.

29 New white, Neat’s white, white, Flanders (Hook. t. 30.), Emmerton’s new white, Cowdray white, large white. Leaves with reniform glands. Flowers large. Fruit large, white, ripening about the beginning of September. In a favourable soil and warm exposure both the new and old white acquire an excellent flavour; under other circumstances only indifferent.

30 Old white. Leaves with reniform glands. Flowers large. Fruit large, white, ripening in the beginning of August. A first-rate sort.

Var. β; flesh adhering to the stone. Called in French pêches-violettes, and in English cling-stone nectarines.

List of cling-stone nectarines.

1 Aiton’s seedling. Leaves with reniform glands. Flowers small. Fruit large, dark brown, red on the sunny side, ripening in the beginning and middle of September. A second-rate fruit.

3 Brugnon hâtif, early brugnon. Leaves with reniform glands. Flowers small.

4 Brugnon violet musqué, brugnon musqué (Duham. no. 26.), brugnon, red Roman. Leaves with reniform glands. Flowers large. Fruit middle-sized, pale yellow, but red on the exposed side. A second-rate fruit. Ripens in September.

5 Early pavie (Forsyth, 57.). Leaves without glands. Flowers large.

6 Golden (Lang. t. 29.), fine gold-fleshed, orange. Leaves with reniform glands. Flowers small. Fruit middle-sized, yellow, but red on the exposed side. Flesh orange-coloured. A second-rate fruit, ripening in the beginning or middle of September.

7 Prince’s golden. Leaves with reniform glands. Flowers large. Fruit large, orange, but dark red on the exposed side, ripening throughout September. As a cling-stone nectarine very good.

9 Newington, late Newington (Lang. t. 29.), scarlet New- ington, old Newington, Smith’s Newington, French Newington, brug- non de Newington de l’Angletére, rough Roman, red Roman of some, Sion-hill, Anderson’s, Anderson’s round. Leaves without glands. Flowers large. Fruit large, dark, ripening in September. A good bearer, excellent when beginning to shrivel.

10 Early Newington (Forsyth, 27.), early black Newington, black, early black, new early Newington, new dark Newington, Lacombe’s seedling, Lacombe’s black. Leaves without glands. Flowers large. Fruit large, dark red, ripening in the end of August. A first-rate sort, larger than the Newington.

12 West Dean Newington. Leaves without glands. Flowers large.

13 Roman, red Roman, old Roman, brugnon musqué (Duham. no. 26.), brugnon violet musqué of some. Leaves with reniform glands. Flowers large. Fruit large, green brown and red, ripening in the beginning and middle of August. A first-rate sort.

14 Royal Buckfast. Leaves without glands. Flowers large. Has much resemblance to the Newington.

15 Tawny, late tawny, Murrey of some. Leaves with reniform glands. Flowers small. Fruit middle-sized, brown, and red, ripening in the middle of September. A second-rate sort.

† Varieties of nectarines not well known.

1 Bright red alberge.

2 Argyle. Leaves with reniform glands. Flowers small.

3 Bonden. Leaves with reniform glands. Flowers large.

4 Brugnon tardif.

5 Ford’s seedling. Leaves with reniform glands.

6 Fox’s seedling.

7 Freeman’s.

8 Late French. Leaves with reniform glands. Flowers small.

9 Lyndoch. Leaves with reniform glands. Flowers small.

10 Pholia. Leaves with reniform glands. Flowers small.

11 Please’s seedling. Leaves with reniform glands. Flowers large.

12 Sand’s seedling. Leaves without glands. Flowers large.

13 Small orange. Leaves with globose glands.

14 Spring-grobe. Leaves with reniform glands. Flowers small.

15 Veitch’s. Leaves without glands. Selection of sorts. Forsyth recommends for a small garden; 1 Fairchild’s early, 2 Elrimge. 3 Scarlet. 4 Newington. 5 Red Roman. 6 Temple.—Those of the Dalekith garden are as follow. Such as are marked with a † are planted against a hot wall. 1 Roman †. 2 Du Tellier’s †. 3 Elrimge †. 4 Brug- non †. 5 Temple. 6 Murrey †. 7 Fairchild. 8 Scarlet †. 9 Claremont †. The surest way of having superior kinds is to select according to quality from the catalogue given.

Insects. “On account of the smoothness of the skin of the fruit,” Forsyth says, “it suffers more from the wood-louse, ear- wig, &c. than the peach; it will therefore be necessary to hang up a greater number of bundles of bean-stalks about these than about any other fruit trees. Wasps are also very destructive to nectarines, and the trees are very liable to be infested with the red spider.”
Culture, &c. This is in all respects the same as for the peach. Smooth-fruited Peach or Nectarine. Fl. April, May. Tree 10 to 15 feet.

Lin. syst. Icosandría, Monogénia. Drupe ovate-globose, flesh, covered with a velvety skin, containing a nut or stone, which is acute at one end, and blunt at the other, with a furrow on both sides; the rest smooth, not wrinkled. Small trees. Leaves when young convolute. Flowers rising before the leaves from scaly buds, solitary or few together, almost sessile.

1 A. vulgaris (Lam. dict. 1. p. 2.) flowers sessile; leaves ovate or cordate, glabrous. b. H. Native of Armenia. Prunus Armeniaca, Lin. spec. 679. Malus Armeniaca of the ancients, Abricot of the French, Abricosebanum of the Germans, and Altiboccio of the Italians. The apricot is a low tree, of rather crooked growth, with broad, roundish, cordate or ovate, glandularly-serrate leaves. The flowers are white, tinged with dusky red. The fruit round, yellow both within and without, firmer than plums and most peaches, inclosing a smooth compressed stone, like that of the plum. The flowers appear in April on the shoots of the preceding year, and on spurs of two or more years old, and the fruit ripens in September. It is supposed to have originated in Armenia, but Regnier and Sickler assign it a parallel between the Niger and the Atlas; and Pallas states it to be a native of the whole of the Caucasus, the mountains there to the top being covered with it. It appears from Turner’s herbal that the apricot was procured out of Italy by Wolfe, a French priest, gardener to Henry VIII. The apricot appears to have been known in Italy in the time of Dioscorides under the name of præcoce, probably as Regnier supposes from the Arabic bërkoh, whence the Tuscan baccòco or albacciaco, and the English apricot, or as professor Martin observes, a tree, when first introduced, might have been called a precoce or early fruit, and gardeners taking the article a for the first syllable of the word, might easily have corrupted it to apricocks. The orthography seems to have been finally changed to apricot about the end of the last century, as Justice in 1764 writes aprick, and Kyle and Moredon in 1782 apricot.

Use. The fruit is used in a raw state at the dessert, and is esteemed next to the peach and nectarine; it is also made into marmalades, jellies, and preserves. Grossier says, that lozenges are made by the Chinese from the clarified juice, which, dissolved by water, yield a cool refreshing beverage; oil may be extracted from the nut, and the young shoots yield a fine golden cinnamon colour to wool.

Varieties. Parkinson in 1629 enumerates six; Rea in 1720 seven; the Luxembourg garden catalogue in 1800 fifteen; but the catalogue published by the Horticultural Society in the present year enumerates 41. They are as follow:

1. Kernels bitter.

* Fruit small, round, early. Flowers small.

1 Red masculine apricot (Forysth, treat. p. 2.), early red masculine (Hort. soc. cat. no. 9.), brown masculine of some collections, apricot précoce or abricotis (Nois. man. 493.), fraie muscateller apricotis (Reyn. & tash. p. 389), abricot gratifié (Duham. fruit. 1. p. 133), Mayer, nom. no. 1. t. 2. f. 1. Nois. jard. fr. t. 1)., nusqué hatif, Hort. Leaves roundish, cordate. Fruit small. Skin dull, honey yellow. Flesh pale yellow, juicy, and tender, parting from the stone. An early and excellent fruit.

2 White masculine (Hort. trans. 2. ser. 1. p. 59), early white masculine (Hort. soc. cat. no. 8.), abricot blanc (Duham. arb. fr. 1. p. 134), abricot pêche (Mayer, pom. fr. 1. p. 30, &c.), white Algiers of some gardens. The chief recommendation of this and the former kind is their early time of ripening.

** Fruit large.

† Channel of the stone closed up.

‡ Flesh parting from the stone.

3 Large early apricot (Hort. trans. 2. ser. 1. p. 66. Hort. soc. cat. no. 47. Pom. mag. t. 142.), abricot gros précoce, and abricot de Joan (Aud. cat.), abricot de St. Joan rouge in Languedoc, abricot gros d’Alexandrie in Provence, die grosse frahe apricecos, (Sickler, teutsche 12. t. 12.) Leaves large, broad, oval, tapering to the petiole. Fruit large, oblong, the back nearly straight. Skin downy, bright orange, red next the sun, pale orange on the other side. Flesh orange-coloured, juicy, rich. An excellent early sort, ripening about the middle of July.

4 Roman apricot (Langl. pom. p. 89. t. 15. f. 4. Pom. mag. t. 13. Hort. trans. 2. ser. 1. p. 61.), Roman or common (Switzer, fruit. gard. p. 100.), common (Forysth), abricot commun (Duham. arb. fr. 1. p. 135. t. 2. Nois. jard. fr. 2. t. 1.), germane apricose (Kraft, pom. austr. 1. p. 31. &c.), grosse germane apricose (Mayer, pom. fr. 1. p. 31. t. 3.), Brussels apricot and Turkey apricot of some collections. Leaves broad, cordate. Fruit middle-sized, dull straw-coloured, with a little dotting on the sunny side, of an orange red, inclining to oval. Flesh of a dull pale straw-colour, soft, soon becoming mealy, and requiring to be eaten rather before its maturity. This sort bears abundantly, and ripens about the beginning of August; but it is more fit for preserving than for the dessert, the juice being much less highly flavoured than that of many sorts.

5 Blotched-leaved Roman apricot (Hort. trans. 2. ser. 1. p. 62.), blotched Turkey, variegated Turkey, striped Turkey (Hort. soc. cat. no. 27.), macule of the French, abricotier à feuilles panachées (Duham. arb. fr. 1. p. 145.), abricot commun à feuilles panachées de Jaune (Noisett. jard. fr. p. 2.), abricot bunte oder geflektete apricose, (Mayer, pom. fr. 1. p. 34. t. 4.). Leaves blotched with a pale yellow or golden colour. Fruit much like that of the Roman or common apricot.

6 Royal apricot (Pom. mag. t. 1. t. 2. Hort. trans. 2. ser. 1. p. 63.), abricot royale, (Bouin. jard. 1857. p. 288. Nois. man. 2. p. 490.) Leaves large, roundish cordate or ovate. Fruit about the size of that of the moorpark, rather oval, of a dull yellow colour, slightly coloured with red in a small space. Flesh pale orange, very firm, juicy, sweet, and highly flavoured, with a slight degree of acidity. This is a very valuable sort, and ripens about 10 days sooner than the moorpark.

7 Brussels apricot, (Hort. trans. 2. ser. 1. p. 64.) Fruit oval, compressed, of a pale orange colour, acquiring a brown tinge, with deep blood red specks next the sun. The flesh is juicy, rather crisp, and the fruit is most excellent for preserving.

8 Shipley’s apricot (Hort. soc. cat. no. 24. trans. 2. ser. 1. p. 64.) Blenheim, Shipley’s large, Miss Shipley’s, of various collections. A fine looking fruit, very like the Roman, but larger, oval, compressed. Skin clear, yellow, minutely speckled with brown. Flesh of a very bright deep orange, juicy, with a pleasant sweetish acid flavour, without much scent. The fruit is rather more downy than the Roman, which it resembles. It ripens about the last week in July.

9 Almond apricot (Hort. trans. 2. ser. 1. p. 65.), abricot amandier, (Hort. soc. cat. no. 34.) In form like the Roman. Skin pale straw coloured, blotched with pinkish spots next the sun. Flesh pale yellow, dry, with very little flavour. This sort has little or no merit. It ripens about the end of July.
Flesh adhering to the stone.

10 *Montpommet apricot* (Hort. trans. 2. ser. 1. p. 65.), *alberger de Montpommet* (Hort. soc. cat. no. 81.) Leaves broad and rounded at the base, and acuminate at the apex. Fruit small, about half as large as the *white masculine*, which it resembles outwardly. Skin pale clear yellow, slightly tinged with red next the sun. Flesh firm, watery, juicy, but without much flavour. This sort is not much esteemed, and is chiefly used for preserving. It ripens at the end of July.

† † Channel of the stone impervious.

11 *Moarpark apricot* (Nicol, gard. kal. p. 167. Brookshaw, pom. brit. t. 23.), *Anson's, Dunmore's, Dunmore's Breda, Temple's, imperialis Angoumois, Oldaker's moarpark, Sudlow's moarpark* (Hort. soc. cat.). *peach apricot* (Forsyth, treat. 1. p. 4.), *abricot de Nancy* (Duham. arb. fr. 1. p. 144. t. 6. &c.), *abricot pêche* (Duham. arb. fr. 1. p. 144.), *abricot de Tours* (Hort. soc. cat. no. 51.), *abricot pêche, abricot de Nuremberg or de Wirttemberg*, *abricot de Piemont*, Aud. cat. Leaves large, roundish, acuminate. Fruit large, roundish, compressed. Skin of a brownish orange colour. Flesh dull reddish-orange, juicy, and of a high and excellent flavour, peculiar to this sort, never liable to become mealy. This is one of the best of the kinds.

12 *Hennemans apricot* (Hort. soc. cat. no. 4. Pom. mag. t. 11.), *Hort. trans. 2. ser. 1. p. 69.). Leaves broad, much like those of the *moarpark*. Fruit rather large, roundish, slightly compressed, very like the *moarpark*. Flesh very bright, deep, clear orange, tender, and juicy, with a particular rich delicate flavour. This sort comes next to *moarpark* for its excellence.

II. Kernels sweet.

* Flesh parting from the stone.

13 *Breda apricot* (Hort. soc. cat. no. 2. Pom. mag. t. 146.), *Brussels or Breda* (Langley, pom. p. 89.), *abricot de Hollande ou Amande Aréline* (Duham. arb. fr. 1. p. 198. t. 4. &c.), *Holländische Breda'sche oder Ananas apriçoce* (Baumann, tasch. p. 389.), *Holland* (Forsyth, treat. p. 5.). *abricot de Nancy* (Sickler, teutsche, p. 299.). Leaves broadly cordate, acuminate. Fruit rather small, roundish. Skin of a deep brownish colour where exposed to the sun. Flesh deep orange, juicy, rich and high flavoured. Kernel sweet, like a hazel-nut. Ripens from the beginning to the middle of August on walls, and its perfection is considerably prolonged on standards.

14 *Anpognins apricot* (Duham. arb. fr. p. 137. t. 3. Hort. trans. 2. ser. 1. p. 71.), *abricoce ans dcm Angpognins die abricoce* (Mayer, pom. fr. p. 32.), *rothe Angpognins* (Baumann, tasch. p. 388.). Leaves rather small, oval, tapering to both extremities. Fruit about the size of the *Breda*, and like it in shape. Skin yellow where shaded, but of a very deep reddish brown on the exposed side. Flesh reddish orange, juicy, sweet, mixed with a slight acidity, very agreeable. Kernel sweet, like a nut. This sort ripens rather earlier than the *Breda*.

15 *Musch-musch apricot* (Nois. man. p. 410. Hort. trans. 2. ser. 1. p. 73. t. 1.). *Abriço de Alexandrie* (Kraft, pom. austral. p. 29. t. 58. f. 1.). Leaves roundish, subcordate, acuminate, doubly serrated. Fruit about the size of the *masculine*, roundish, compressed. Skin straw coloured next the wall, deep orange in the sun, slightly downy. Flesh tender, very sweet, semi-transparent. Kernel very sweet, like a nut. It appears to be a native of the cases of Upper Egypt, where the fruit is gathered and dried in large quantities for sale. It is not sufficiently known to judge how far it may become a valuable variety in this country.

16 *Turkey apricot* (Mill. dict. no. 5. Hort. trans. 2. ser. 1. p. 78.). *Large Turkey* of some nurseries. *Abriço de Nancy, La Brettonerie* (Nois. jard. fr. p. 3.). Leaves middle-sized, roundish, acuminate. Fruit rather large, very handsome, deep yellow, with a number of orange red spots and blotches next the sun, nearly spherical, not compressed. Flesh pale yellow, firm, juicy, sweet, with a little acid, very rich and excellent. Kernel sweet, like that of the almond. Ripens on a south wall about the middle of August, and in other situations may be prolonged to the end of the month. It is an excellent sort.

* * Flesh adhering to the stone.

17 *Orange apricot* (Switzer, fruit gard. p. 100. Hort. trans. 2. ser. 1. p. 74.), *early orange, royal-orange, royal George, royal Persian* (Hort. soc. cat.), *D'orange* (Knoop, pom. p. 65.), leaves flat, pendulous, tapering. Fruit almost spherical, downy, of a more intense orange colour than other apricots, interspersed with some minute specks. Flesh tender, bright orange, in some seasons juicy, but not highly flavoured. Kernel sweet. Generally an abundant bearer, and is chiefly useful for preserving.

The remaining sorts are described in books, upon which no sufficient information has been procured, but none of these are of any importance.

† List of apricots not sufficiently known, but the greater part of them are not worth notice in this country.

Choice of sorts. Those grown in the Dalkeith gardens are as follows:—1 *Moarpark*. 2 *Breda early*. 3 *Masculine, early*. 4 *Brussels*. 5 *Orange, early*. The list given should be examined, and the sorts chosen according to their quality.

Propagation.—New varieties are procured from the seed as in the peach, and approved sorts are perpetuated by budding, generally on muscule or plum stocks. The *Brussels and Breda*, when intended for standards, are budded on the St. Julian plum, which produces a strong clean stem, but for the rest any stock will do, provided it be free and thriving. *Knight* (hort. trans. 2. p. 19.) recommends budding the *moarpark* on an *apricot* stock, which he has found prevents the trees from becoming diseased and debilitated, which they generally do on plum stocks. *Budding apricots* is generally performed early in the season, from the middle of June to the end of July. For dwarfs, the bud is inserted 6 or 8 inches from the ground; and the sorts are sometimes twice budded, or one variety budded on another, which is said to keep the trees in a more dwarf state. For riders or standards they are budded on plum stocks, 4 or 5 feet from the ground. Miller prefers half standards, budded 3 or 4 feet from the ground; the trees so produced being less liable to suffer from high winds.

Choice of plants.—Abercrombic prefers trees of 2 or 3 years' growth from the bud, and fit for immediate bearing. Forsthy makes choice of those plants which have the strongest and cleanest stems; and if he can such as have been headed down of 2 or 3 years' growth, as they will bear and fill the walls much sooner than those which have not been so treated. He says,
"make choice of trees with one stem, or if they have two, one of them should be cut off; for by planting those with two stems, the middle of the tree is left naked, and, of course, one third of the wall remains uncovered."

Season of planting.—Abercrombie says the best season is from the fall of the leaf until February or March. Forsyth says the best time is in August, when the leaf begins to fall.

Final planting.—The Breda and Brussel are occasionally planted as standards or espaliers in warm situations; and in these states, in fine seasons, produce more highly flavoured fruit than on walls. The other varieties are generally planted against walls, which Miller and Forsyth say should have an east or west aspect, for if they are planted full south, the heat causes them to be mealy before they are estable. The borders should not be less than 6 or 8 feet wide, and 2 or 2½ feet deep. The soil a light rich loam, perfectly dry below. Standard apricots, according to Abercrombie, do not come into bearing under a considerable number of years, sometimes 10 or 12; but then the fruit, in a congenial situation, is abundant, and of the finest flavour. The training of the plant to a trellis, almost touching the south wall, will improve the flavour of the apricot, and render it more succulent than if trained against the wall.

Mode of bearing. The varieties of the apricot in general bear upon the young shoots of last year, and casually upon small spurs, rising on the two or three years' old fruit branches. The Moordark bears chiefly on last year's shoots, and on close spurs formed on the two years' old wood. The bearing shoots emit the blossom-buds immediately from the eyes along the sides; and the buds have a round and swelling appearance.

Pruning wall trees.—The general culture of wall apricots comprehends a summer and winter course of regulation by pruning and training.

Summer pruning.—Begin the summer pruning in May, or early in June, and continue it occasionally in July and August, &c. This pruning is principally to regulate the young shoots of the same year. In the first place take off close all the fore- right shoots, and others that are ill-placed or irregular, or too luxuriant in growth, taking care to retain a competent supply of choice, well-placed, moderately growing side shoots, with a good leader to each mother branch. Continue these mostly at their full length all the summer, regularly trained in close to the wall, to procure a sufficiency to choose from in the general winter pruning for new bearers next year. If the summer regulation commence early, while the shoots are quite young, and, as it were, herbaceous, 1, 2, 3, or 4 inches long, those improper to retain may be detached with the finger and thumb; but when of firmer growth they must be removed with the knife. If any very strong shoot rise in any casually vacant part, it may be topped in June, which will cause it to produce several laterals the same year of more moderate growth, eligible for training in to supply the vacancy.

Thinning the fruit.—Sometimes the fruit are much too numerous, often growing in clusters, in which case thin them in May and the beginning of June in their young green state, leaving the most promising singly at 3 or 4 inches’ distance, or from about 3 to 6 on the respective shoots, according to their strength. The apricots so thinned off, and the first principal green crop are esteemed very fine for tarts.

Winter pruning.—This may be performed either at the fall of the leaf, or in mild intervals from that time until the beginning of March. When it is deferred until the buds begin to swell, the promising shoots can be the better distinguished. It comprehends a general regulation, both of the last year's shoots and the older branches. A general supply of the most regular placed young shoots must be every where retained for successive bearers the ensuing year. Cut out some of the most

Naked part of the two last years' bearers, and naked old branches not furnished with competent supplies of young wood or with fruit-spurs, either to their origin, or to some well-directed lateral, as most expedient, to make room for training a general supply of the new bearers retained, and cut away all the decayed wood and old stumps. Generally observe in this pruning to retain one leading shoot at the end of each branch, either a naturally-placed terminal, or one formed by cutting, where a vacancy is to be furnished with a proper leader. Let the shoots retained for bearers be moderately shortened; strong shoots reduced in the least proportion, cutting off one-fourth or less of their length; from weak shoots take away the third, and sometimes half. This shortening will converge to the production of a competency of lateral shoots the ensuing summer from the lower and middle placed eyes; whereas without it, the new shoots would proceed mostly from the top, and leave the under part of the mother branches naked, and the lower and middle part of the tree unfurnished with proper supplies of bearing wood. Never prune below all the blossom-buds, except to provide wood, in which case, cut nearer to the origin of the branch, as in these trees, small fruit-spurs, an inch or two long, often appear on some of the two or three years' branches, furnished with blossom- buds; these spurs should generally be retained for bearing; but when any project foreign from the wall, cut them in accordingly, for the spurs projecting above 3 inches, though they may set their fruit, seldom ripen it, unless the season and situation are both favorable. The thick clusters of spurs, which are apt to form on aged trees, ought also to be thinned. As each tree is pruned, nail it, laying in the branches and shoots from 3 to 6 inches' distance, straight, and close to the wall.

Pruning espaliers.—As directed for wall trees.

Pruning standards.—Half standards will require only occasional pruning, to regulate any branches which are too numerous, too extended, or cross placed, and to remove any casually unfruitful parts, and dead wood. At the same time the regular branches forming the head of the tree should not be generally shortened, but permitted to advance in free growth.—Abercrombie.

Training the apricot tree.—This is generally done in the fan manner, which is the method of training not only for the apricot, but for wall trees generally. Forsyth recommends a mode between the fan and horizontal manner.

Renovating old decaying trees.—Forsyth had the greatest success in this department of fruit tree culture, by cutting down to within a foot or 18 inches, or more occasionally, of the ground, and then renewing the soil of the border.

Gathering.—The apricot is apt to become mealy if left on the tree till over ripe. It should be gathered with the peach-gatherer while moderately firm.

Insects, diseases, &c.—As the fruit ripens early, it is very liable to be attacked by wasps and large flies, which should be kept off by a net, stretched a foot or more apart from the wall or trellis. The other insects, and the diseases of the tree are the same as in the peach tree; but it is not nearly so obnoxious to their attacks, probably owing to the comparatively hard nature of its bark and wood, and coriaceous leaves.

Forcing the apricot.—The apricot does not force well; but a few are sometimes tried in pots, and placed in a peach-house and forced in the same manner as peaches and nectarines, see p. 492.

Prunus Armeniaca nigra, Desf. cat. ed. 2. p. 206. In a specimen that flowered in the Botanical Garden at Geneva, the calyx was purple and 6-lobed, the petals 6 in number, and the stamens 24. This species is called Abricot noir in French gardens, the fruit of which turns the same color. It is supposed to be a native of the Levant. The flowers are white.

3 A. Persicifolia (Lois. in Duham. ed. nov. 5. p. 172. t. 552 f. 1.) leaves ovate, short, or lanceolate, lobulate; petals glandular; flowers pedicellate. h. H. Native country unknown. Flesh of fruit variegated with yellow and red, edible. Called in France Abricot noir à feuilles de pécher, or peach-leaved black apricot. Corolla white.

4 A. Sibrica (Pers. ench. 2. p. 36.) leaves ovate, acuminate; petiole glandless. h. H. Native of the ulterior mountains of Siberia. Amm. ruth. 272. t. 29. Prunus Sibrica, Lin. sp. p. 679. Pall. ross. 1. p. 15. 18. This tree is much like the common apricot in appearance, but smaller in all its parts; the petals are longer and destitute of any gland; the leaves are of the form of those of the birch tree; the fruit is small, juicy, and sour or acid, and contains a bitter kernel. In transalpine Dauria, the north side of the mountains in May are clothed with the purple flowers of Rhododendron Dauricum and the south side with the rose-coloured blossoms of this tree.

5 A. Brigantica (Pers. ench. 2. p. 36.) leaves somewhat coriaceous, acuminate, sharply toothed; the teeth numerous, and lapping over each other; flowers glomerate, almost sessile. f. H. Native of Dalmatia, near (Brigantia) Brinzen. Prunus Brigantica, Vill. dauph. 3. p. 555. Lois. in Duham. ed. nov. 5. t. 59. Flowers white or pink. From the seeds of this tree a fixed oil, commonly called huile de marmotte is obtained by expression. It is used instead of olive or almond oil. Perhaps sufficiently distinct from A. Sibrica.

Briancon Apricot. Fl. Mar. April. Clt. 1819. Sh. 6 to 8 ft. Cult. The species are all increased by budding on the same kind of stocks recommended for the common apricot. They grow in any kind of soil, and are very ornamental for shrubbery in spring.

IV. PRUNUS (said to be a word of Asiatic origin, the wild plant, according to Galen, being called πρυνν, in Asia, from the Greek προφύτ, which occurs in Theophrastus). Tourn. inst. t. 398. Juss. gen. 341. D. C. fl. fr. 4. p. 483. prod. 2. p. 532.—Prunusphora, Neck. elem. no. 719. Prunus, species of Lin. and others.

Lin. syst. Icosandra, Monogyna. Drupe ovate, or oblong, fleshy, quite glabrous, covered with a kind of glaucous bloom, containing a compressed nut or putamen, which is acute at both ends, and a little furrowed on the margin, the rest smooth. Trees or shrubs. Leaves convolute when young. Flowers usually disposed in umbellate fascicles, solitary on the pedicels, rising either after or before the leaves.

1 P. spinosa (Lin. spec. 683.) branches spiny; peduncles solitary; calyx campanulate, with obtuse lobes, which are longer than the tube; leaves obovate-elliptic, or ovate, smooth except where connate and doubly serrated; fruit globose. h. H. Native of Europe and America; plentiful in Britain, in hedges and thickets. Vahl. fl. dan. t. 926. Smith, engl. bot. 842. Woodv. med. bot. t. 84. Blackw. icon. t. 494. P. sylvestris, Bauh. pin. 444. Στριούς, Theophrastus. Spinus, Virgil. Flowers white, rising before or with the leaves. Fruit sour or acid, black, roundish, covered with bluish bloom. The black thorn is not so good as the white thorn for hedges, because it spreads its roots wide and encroaches upon the pastures; but it is excellent for dead fences, and to lay in covered drains. The fruit, when ripe, makes an excellent preserve; unripe the insipid juice is used for the German water, and affords an almost indellible ink, used to mark linens. It is used in home-made wines, to communicate the colour and roughness of red port. The tender leaves, dried, are sometimes used as a substitute for tea, and is the best substitute that has been yet tried, and it is said they have been used in mixing with the Chinese tea. Knight and others consider the sloe as the parent of the bullace plum (P. insititia) and the varieties of the common plum (P. domestica). Sloes have been employed as a styptic medicine from the time of Dioscorides. They have been recommended in diarrhoeas and hemorrhages, and as galls in the swellings of the tonsils and uvula. Dr. Cullen considers them as the most powerful of aercb fruits, and as agreeable and useful astringents. The flowers with their calyces, are moderately purgative: the dose is an ounce infused in water. As a shrubbery plant the sloe is most ornamental, blossoming before all others of the Prunus tribe.

Var. a, vulgaris (Ser. mss. in D. C. prod. 2. p. 523.) leaves ovate-oblong-elliptic; fruit dark purple. P. spinosa, Lois. in Duham. ed. nov. 5. p. 182. t. 54. f. 1. There is a variegated-leaved kind of this.

Var. β, microcarpa (Wallr. exsic. cent. 1. no. 45.) leaves elliptic, narrow, blunting; fruit smaller.

Var. γ, macrocarpa (Wallr. exsic. cent. 1. no. 45.) leaves ovate, blunting; fruit large, dark purple. Native of Germany. Perhaps this is P. domestica, var. γ, Juliana.

Var. e, ova1 (Ser. mss. in D. C. prod. 2. p. 523.) leaves ovate-oblong. P. spinosa, Blackw. herb. t. 494.

2 P. insititia (Lin. spec. 680.) branches spiny at the apex; peduncles twin; leaves ovate or ovate-lanceolate, convolute, downy beneath; fruit roundish. h. H. Native of Germany and France, as well as of Britain, in hedges. Smith, engl. bot. 841.—Duham. arb. 2. t. 41. Black Bullace tree, Mill.dict. no. 31. The stipulas are fringed. The flowers are white. The fruit is globular, black, or white, of an acid taste, but so tempered by sweetness and roughness as not to be unpleasing, especially after it is mollowed by frost. A conserve is prepared by mixing its pulp with thrice its weight of sugar. The bark of the roots and branches is considerably starchy. An infusion of the flowers, sweetened with sugar, is a mild cathartic. It varies with black and white or wax-coloured fruit.

3 P. canescens (Bulb. cat. taur. 1813. p. 63.) peduncles short, twin, or tern, and are as well as the branches pubescent; leaves broadly ovate, white beneath; stipulas very narrow, deeply toothed, length of pedioles; calyx campanulate. h. H. Native country unknown. Willd. enum. suppl. p. 32. Lindl. bot. reg. 1135. Flowers white.

4 P. Cocomilla (Tenore, prod. suppl. 2. p. 67. cat. 1810. p. 46.) peduncles short, twin; leaves obovate, glabrous on both surfaces, crenulated, with the crenatures glandular; drupe ovate-oblong, mucronulate. h. H. Native of Calabria, in hedges. Fruit white, sweet. Fruit yellow, bitter, or sour. The bark of this shrub is febrifugal, and is spoken very highly of by Tenore: it is a specific for the cure of the dangerous fevers of Calabria, where it grows.

Cocomilla or Calabrian Plum. Fl. April. Clt. 1824. Sh. 2 to 3 feet.

5 P. Tomentosa (Thumb. fl. jap. 203.) branches unarmed;
AMYGDALACEÆ. IV. Pruæus.

peduncles solitary; leaves ovate, acute, serrated, villous above, tomentose beneath as well as the peduncles. ʃ. ʃ. F. Native of Japan. Flowers white. Drupe the size of a pea.

_Sea-side_ Plum. Fl. Apr. May. Cl. 1818. Sh. 5 to 8 feet. 7 _P. acuminata_ (Michx. fl. bor. amer. 234.) flowers? calyx glabrous; leaves oblong-oval, ending in a long, acute acumen; drupe ovate, acuminate, on a long peduncle. ʃ. ʃ. H. Native of Virginia. Perhaps the same as _P. maritima._

_Acuminated-leaved_ Plum. Shrub 6 to 10 feet. 8 _P. pubescens_ (Poir. suppl. 4. p. 584. but not of Pursh) flowers usually solitary, almost sessile; leaves ovate, thickish, and roundish, or ending in a short acumen, hardly pubescent, unequally toothed; petioles pubescent, short; fruit oval. ʃ. ʃ. H. Native country unknown. Flowers white.

_Pubescent_ Plum. Fl. May. Cl. 1818. Shrub 2 to 3 feet. 9 _P. domestica_ (Lin. spec. 680.) flowers usually solitary; leaves ovate-lanceolate, convolute; branches unarmed. ʃ. ʃ. H. Native of the south of Europe, in elevated places. Smith, engl. bot. 1783. Flowers white. Fruit variable, both in shape and colour. All the varieties of garden plums belong to this species. The _plum_ is called _prune_, in French, _prugne_ in Italian, and _pfauen-zam-baum_ in German. It rises usually to the height of 15 feet, branching into a moderately spreading head. The natural colour of the fruit is generally considered to be black, but the varieties in cultivation, yellow, blue, and green, and of different shapes and flours. It is a native of or naturalized in Britain, very frequently found in hedges; but its original country is supposed to be Asia Minor; and according to Pliny it was brought from Syria into Greece, and thence into Italy.

_Use._—The best varieties are esteemed a delicious dessert fruit, and the others are used in pies, tarts, conserves, and sweetmeats. A wholesome wine is also occasionally made from them, with or without other fruits or ingredients. Plums, Professor Martin observes, when sufficiently ripe and taken in moderate quantity, are not unwholesome, but in an immature state they are more liable to produce diarrhoea and similar diseases than any other fruit of the class. Considered medicinally, they are emollient, cooling, and laxative, especially the French prunes, which are peculiarly useful in costive habits. The wood of the _plum_ is used in turnery, cabinet work, and in making musical instruments.

Varieties.—_Tusser_ enumerates 10, Parkinson 60. In the Luxembourg Catalogue are 68, but in the Horticultural Catalogue for the present year there are 274, which are here disposed according to the colour and shape of the fruit.

Var. _a._ _Armenioides_ (Ser. ex D. C. prod. 2. p. 583.) fruit oval or roundish, yellow or greenish yellow; stone blunt. To this belong the following varieties of _plum._

1 _Apricot, abricotée_ (Duham. arb. fr. 2. p. 93. n. 20. t. 13.). Wood smooth. Fruit yellow, oval, middle-sized; flesh adhering to the stone. A bad kitchen fruit, ripening in the end of August.

2 _A. hâtée_, Lois. in Duham. ed. nov. 5. p. 195. no. 23. _Bonne deux fois l'an._ Wood downy. Fruit small, greenish-yellow, oblong; flesh adhering to the stone. An useless fruit, ripening in August and September.

3 _Bryanton-gage._ Wood smooth. Fruit roundish, greenish-yellow, middle-sized; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of October.

4 _White bullace._ Wood downy. Fruit round, yellow, small; flesh adhering to the stone. A kitchen and preserving fruit, ripening in October. An abundant bearer.

5 _Yellow Roman bullace._

6 _Coe's golden drop._ _Coe's imperial golden._ Golden drop, new golden drop, Barry seedling, Fair's golden drop, golden gage. Wood smooth. Fruit oval, large; flesh adhering to the stone. One of the most valuable plums either for the table or for preserving, and a good bearer. Ripens in the end of September.

7 _White damson, small round damson._ Wood downy. Fruit oval, yellow; flesh adhering to the stone. A second-rate kitchen fruit, ripening about the end of September.

8 _Dennison's Albany._ Fruit yellow.

9 _Dennison's late._ Fruit oval, yellow, middle-sized. A good preserving fruit, ripening in October.

10 _Dennison's late._ Fruit oval, yellow, middle-sized; flesh separating from the stone. An excellent dessert fruit, precedes the _green-gage_ in ripening, and resembles it in quality.

11 _Drap d'Or, mirabelle double_ (Duham. arb. fr. 2. p. 96.). _Mirabelle grosse, abricotée hâtée_ (Lois. in Duham. ed. nov. 5. p. 195. no. 23.). Fruit downy. Fruit small, round, yellow; flesh separating from the stone. A second-rate kitchen fruit, ripening in the middle of August. A great bearer.

13 _Gibson's, Gibson's early, Peter's._ Fruit downy. Fruit oblong, middle-sized, yellow; flesh separating from the stone. A second-rate kitchen fruit, ripening in the middle of September.

14 _Gambinaea._ Wood downy. Fruit middle-sized; flesh adhering to the stone. A first-rate preserving fruit, ripening in the beginning of September.

15 _Mirabelle, mirabelle petite, mirabelle jaune._ Fruit downy. Fruit small, roundish-ovate, yellow; flesh separating from the stone. A first-rate dessert fruit, and good for preserving. Ripens in the middle of August.

16 _Yellow Orleans._

17 _Peter's large yellow._ Wood downy. Fruit middle-sized, oval; flesh adhering to the stone. A good dessert fruit, ripening in August. Bears considerable resemblance to the green-gage, but is not so good.

Var. _β._ _Claudivia_ (Pers. ench. 2. p. 35.) fruit roundish, rather depressed, green, and usually spotted with purple, rarely purple; flesh greenish yellow, more or less sugary; umbilicus hardly depressed; putamen or stone ending in a short mucrone. To this variety belong the following sorts of plums.

1 _Green-gage, brunon green-gage._ _Reine Claude, abricot vert, vert bonne, Daphnine, Reine Claude blanche, grosse reine, grosse reine Claude_ (Duham. arb. fr. 2. p. 89. no. 25. t. 11.). _Damas vert, Sucrin vert, Drap d'Or._ Frame. Wood smooth. Fruit middle-sized, round, greenish yellow; flesh separating from the stone, ripening about the middle of August. Allowed by all to be one of the best plums both for the dessert and for preserving.

2 _Astur green-gage._

3 _Conforler's green-gage._

4 _Derbyshire green-gage._

5 _Gonne's green-gage._

6 _Hoo green-gage._

7 _Isleworth green-gage, Wilmot's green-gage, Wilmot's new green-gage, Wilmot's late green-gage._
AMYGDALACEÆ. IV. PRUNUS.

8 Late greengage.
9 New greengage.
10 Isle vert, de Savoye, Grisé insculpflaume.
11 Luscombe's munsach. Wood smooth. Fruit large, greenish-yellow, round; flesh adhering to the stone. A second-rate dessert fruit, ripening in the end of August.
12 White Orleans. Wood smooth. Fruit round, greenish white; flesh adhering to the stone. A kitchen fruit, ripening in the middle and end of August.
14 Reine Claude à fleur semi-doublée, Reine Claude à fleurs semi-doublées. Flowers semi-doublé.
15 Reine Claude violette (Lois. in Duliam. ed. nov. vol. 5. p. 195. no. 22. t. 57. f. 2.), purple gage. Wood smooth. Fruit middle-sized, yellow; flesh separating from the stone. A first-rate dessert fruit, ripening in October. Succeeds as a standard, and is a good bearer.

Var. γ, Catherinea (Ser. mss. in D. C. prod. 2. p. 534.) fruit roundish-obovate or roundish, wax-coloured or yellow; umbilicus exerted; flesh sweet, hardly sapid; stone blanish, usually rather prominent at the base, and truncate. Prunus domestica cësca, Lin. spec. 680. To this variety belong the following sorts of plums.
1 Abricotée blanche. Lois. in Duliam. ed. nov. 5. p. 205. t. 60. f. 16.
2 Abricotée blanche à longue queue grosse.
3 Bingham's. Wood downy. Fruit large, yellow, oblong; flesh adhering to the stone. A second-rate dessert kind, ripening in September.
4 Briquette. Duliam. arb. fr. 2. p. 97. no. 31. t. 29. t. 5.
5 Dames ambre.
6 Dames ballon.
7 Dames ballon jaune et vert.
8 Dames ballon rouge et jaune.
9 Gros damas blanc kâtif, damas blanc très kâtîf. Wood smooth. Fruit yellow, oval, middle-sized; flesh separating from the stone. A second-rate kitchen fruit, ripening in the middle of September.
10 Petit damas blanc (Duliam. arb. fr. 2. p. 71. no. 6. t. 3.), fruit small, yellow, oval. Wood smooth. Flesh separating from the stone. A second-rate kitchen fruit, ripening in the beginning and middle of September.
11 Dames dronet. Wood smooth. Fruit oval, middle-sized, yellow; flesh separating from the stone. Ripens in August.
12 Dames d'Espagne.
13 White damask.
14 Douton impératrice. Wood smooth. Fruit obovate, middle-sized; flesh separating from the stone. A first-rate dessert and preserving fruit, ripening in October.
15 White impératrice, impératrice blanche (Duliam. arb. fr. 2. p. 106. t. 18. f. 2.), wood smooth. Fruit white, obovate, middle-sized; flesh separating from the stone. A second-rate dessert and preserving fruit, ripening in the beginning and middle of August.
16 Jaune hâtive (Duliam. arb. fr. 2. p. 66. f. 1.), jaune de Catalogne, Catalanian, white primordian, amber primordian, St. Barnabé, D'Acqin. Wood downy. Fruit oval, yellow, middle-sized; flesh separating from the stone. A dessert fruit, ripening in the end of July. Only to be recommended for its earliness.
17 Mirabelle tardive. Fruit oval, purple and yellow, small; flesh separating from the stone. A preserving fruit, ripening in the beginning of September.

18 White perdrigon, perdrigon blanche (Duliam. arb. fr. 2. p. 84. no. 2. t. 8.), brinigole (Calv. pep. 2. p. 187.). Wood downy. Fruit middle-sized, yellow, oval; flesh adhering to the stone. A first-rate preserving fruit, ripening in the end of August. This and the blue perdrigon furnish the brinigole plums of the shops.
19 Yellow perdrigon.
20 Gros perdrigon de brinigole.
21 Saint Catherine (Duliam. arb. fr. 2. p. 109. t. 19.). Wood smooth. Fruit oblong, middle-sized, yellow; flesh adhering to the stone. A first-rate dessert and preserving fruit, ripening in the middle of September. It is a good bearer.
22 Saint Julien. Like the last. Used chiefly for stocks for peaches.

Var. ε, Aubertiïana (Ser. mss. in D. C. prod. 2. p. 534.) fruit ovate, obtuse, yellow on all sides; umbilicus depressed; stone hardly prominent at the base. To this variety belong the following kinds of plums.
1 White magnus bonum, yellow magnus bonum, dame Aubert (Duliam. arbr. 2. p. 107. no. 41. t. 2.), dame Aubert blanche, dame Aubert jaune, grosse luisante, impératrice blanche (Nois. jard. fr. 143. no. 37. t. 57. and t. 58. f. 4.), impératrice jaune (Calv. pep. 2. p. 196. ex Lois. l. c.). Egg plum, Wentworth, white Holland, white Mogul. Wood smooth. Fruit large, oval, yellow, and white; flesh adhering to the stone. A second-rate kitchen fruit, ripening in September.
2 New magnus bonum.

Var. ζ, Myrobdalana (Lin. spec. 680.) fruit globose, depressed at the base, red; umbilicus depressed; stone mucronulate; sepals narrow. Prunus cerasifera, Ehrh. beitr. 4. p. 17. Prunus Myrobdalana, Lois. l. c. 5. p. 184. t. 57. f. 11. To this variety belong the following garden plums.
1 Cerisette. Lois. l. c. p. 190. no. 58. t. 5.
2 Cherry plum, Virginian cherry, Myrobdalan (Duliam. arb. fr. 2. p. 111. no. 46. t. 2. f. 15.), De Virginie, early scarlet, D'Amérique rouge. Wood smooth. Fruit middle-sized, cordate, red. A second-rate dessert and kitchen fruit, ripening in the beginning and middle of August.

Var. η, Damascenæa (Lin. spec. 680.) fruit globose, depressed, violaceous; stone short; keel prominent, blunt at the apex. To this variety belong the following garden plums.
1 Asure hâtive. Wood downy. Fruit round, purple, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the beginning of August.
2 De chypre (Duliam. arb. fr. 2. p. 82. no. 18.). Wood smooth. Fruit middle-sized, round, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the end of August.
3 Choy's fine late red. Wood downy. Fruit middle-sized, purple, round; flesh separating from the stone. A first-rate dessert fruit, ripening in October. Valuable for its lateness.
4 Damas de Mangeron (Duliam. arb. fr. 2. p. 76. no. 13. t.
AMYGDALACEE. IV. PRUNUS.

5. Wood smooth. Fruit middle-sized; flesh adhering to the stone. A worthless fruit.

9. Cooper's large, Cooper's large red, Cooper's large American, La délicieuse. Wood smooth. Fruit oval, purple, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the end of September.

10. Fotheringham. Wood smooth. Fruit middle-sized, oblong, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the middle and end of August.

12. Gwalsh. Wood smooth. Fruit large, oval, purple; a second-rate dessert fruit, ripening in September, resembling the red magnum bonum.  

15. Cold Orleans.

16. Early Orleans, Grimwood's early Orleans, monsieur hâtie, monsieur hâtif de Montmorency, new early Orleans, new Orleans, Hampton Court. Wood downy. Fruit middle-sized, round, purple; flesh separating from the stone. A second-rate kitchen and table fruit, ripening in the beginning and middle of August.

17. Late or black Orleans.

18. Knevet's late Orleans.

20. Wilmot's new early Orleans, Wilmot's Orleans, Wilmot's early Orleans, Wilmot's large Orleans. Wood downy. Fruit middle-sized, round, purple; flesh separating from the stone. A dessert and kitchen fruit, very like the early Orleans.

22. Blue perdrigon, perdrigon violette (Duham. arb. fr. 2. p. 82. no. 21. t. 9.), perdrigon de brignole. Wood downy. Fruit oval, middle-sized, purple; flesh adhering to the stone. A first-rate dessert and preserving fruit, furnishing the brignole prunes of the shops.

24. Perdrigon rouge (Duham. arb. fr. 2. p. 86. no. 22. t. 20. f. 6.2.). Wood downy. Fruit middle-sized, purple, oval; flesh separating from the stone. A second-rate dessert fruit, ripening in the beginning and middle of September.

25. Perdrigon tardif.

27. Perdrigon violette hâtif.

29. Précéde de Tours, Noître hâtice, early violet, perdrigon violet of some, blue perdrigon. Wood downy. Fruit middle-sized, oval, purple; flesh adhering to the stone. A second-rate dessert and kitchen fruit, ripening in the beginning of August.

30. Rodney, Rodney gage. Wood downy. Fruit large, purple, oval; flesh adhering to the stone. A second-rate dessert fruit, ripening in August.

32. Royle de Tours (Duham. arb. fr. 2. p. 81. no. 17. t. 20. f. 8.). Wood downy. Fruit large, round, purple; flesh adhering to the stone. A first-rate dessert and kitchen fruit, equal to the Orleans, if not better.

33. Saint Martin rouge, Saint Martin (Lois. l. c. 5. p. 193. no. 12. t. 58. f. 7.). Wood downy. Fruit middle-sized, purple, oval; flesh adhering to the stone, ripening in October. A very good kind, considering its lateness.

34. Sharp's emperor. Wood downy. Fruit oblong, purple, large; flesh adhering to the stone. A second-rate dessert fruit, ripening in the end of September.

35. Valance, Saint Loo. Wood smooth. Fruit oblong, large, purple; flesh adhering to the stone, ripening in the middle and end of September. Seems only fit for drying.
AMYGDALACEÆ. IV. PRUNUS.

36 Suisse, prunier Suisse (Duham. arb. fr. 2. p. 82. no. 19. t. 20. f. 7.), Aletsche, monsieur tardire, Simiana.

37 Gros damas de Tours (Duham. arb. fr. 2. p. 69. no. 4.). Wood downy. Fruit middle-sized, oval, purple; flesh adhering to the stone. A second-rate table fruit, ripening in the beginning of August.

38 Damas de Tours.

40 Jerusalem, prunier de Jerusalem (Lois. 1. c. 5. p. 194. no. 16. t. 56. f. 2.), Œil de Beauf, de Bordeaux. Wood downy. Fruit large, purple, round; flesh adhering to the stone. A second-rate table fruit, ripening in the middle of September.

41 Tardive de châlons. Lois. 1. c. 5. p. 193. no. 13. t. 58. f. 6.

Var. 2. Juliana (Lin. spec. 580.) fruit ovate-globose, round, obovate or oval, small, blue or purple; umbilicus not depressed, the suture hardly evident; stone mucronulate. Prunus damas-cena, Black. herb. t. 905. 1 To this variety belong the following garden plums.

1. Aston. Fruit small, round, purple; flesh adhering to the stone. A second-rate preserving fruit, ripening in September.

3. Black bullace. Wood downy. Fruit small, round, purple; flesh adhering to the stone. A worthless fruit, ripening in October.

4. New large bullace.

5. Damas d'Espagne. Lois. 1. c. 5. p. 196. no. 25. t. 56. f. 4.

7. Damas noir tardif (Duham. arb. fr. 2. p. 79. no. 9. t. 20. f. 4.). Wood downy. Fruit middle-sized, purple, roundish; flesh adhering to the stone. A second-rate dessert fruit, ripening in the beginning of September.

9. Damas de Provence.

10. Damas de Provence hâtif. Lois. 1. c. 5. p. 197. no. 27.

11. Damas Quinté.

14. Damas violet (Duham. arb. fr. 2. p. 192. no. 11. t. 56. f. 5.). Wood downy. Fruit small, oval, purple; flesh separating from the stone. A second-rate dessert fruit, ripening in the end of August.

15. Damas violet tardif.

16. Blue damask.

22. Perdrigon hâtif. Wood downy. Fruit round, purple, middle-sized; flesh separating from the stone. A second-rate dessert fruit, ripening in the middle and end of August.

23. Saint Julien (Lois. in Duham. ed. nov. 5. p. 158. t. 54. f. 2. and 56. f. 9.). Used chiefly for stocks for peaches.

25. Gros Saint Julien. Lois. 1. c. 190. no. 2. t. 58. f. 3.

27. Virgin, prunier de Virginie (Duham. arb. fr. 2. p. 111. no. 45.). Wood smooth. Fruit roundish, middle-sized, purple; flesh separating from the stone. A first-rate dessert fruit, resembling the reine Claude violette, ripening in the beginning of September.

28. Virginal verde. Lois. 1. c. 192. no. 11. t. 56. f. 5.

29. Prunier noir de Montreuil. Duham. arb. fr. 2. p. 65. no. 3.

30. Gros noir de Montreuil.

Var. i., prunus meloide (Ser. in D. C. prod. 2. p. 534.) branches pyramidal; fruit ovate, more or less obtuse or elongated, violaceous, rarely green; umbilicus exserted; nut very much compressed, elongated, prominent at the base, more or less acute at the apex. Prunus pyramidalis, D. C. fl. 4. p. 485. Perhaps not distinct from var. Juliana. To this variety belong the following garden plums.

1. Abricoté terre. Lois. 1. c. 196. no. 24. t. 46. f. 11.

2. Asdrigde black.

3. D'Amérique noire.

4. Black ball, black hill.

5. Bonne rouge.

6. Damas rouge.

7. Damaire rouge.

8. Damson, common damson, round damson, small round damson. Wood downy. Fruit small, purple, roundish, obovate; flesh separating from the stone. A kitchen fruit, ripening in September. Damsos are all raised from the stone.

11. Early damson.

12. Long damson.

13. Shelder's white damson.

15. Sweet damson.

16. Violet damson.

17. White damson.

19. Dianthræ blanche longue.

22. French prune.

23. Elfreth's prune.

24. Hungarian prune. Fruit oblong, purple, middle-sized; flesh adhering to the stone. A preserving fruit, ripening in the end of September. A sort of quetsche.
AMYGDALACEÆ. IV. PRUNUS.

25 Horse plum, Irish horse plum.
26 Impériale de Milan.
27 Impériale Ottoman.
28 Impériale violette. Duham. arb. fr. 2, p. 98. no. 32. t. 15.
30 Isabella. Wood downy. Fruit oval, red, middle-sized; flesh adhering to the stone. A first-rate dessert and kitchen fruit, ripening in the end of August.
31 Jacinthe. Duham. arb. fr. 2, p. 100, no. 34. t. 16.
32 Prunallier.
33 Prunallier petit.
36 Quetsche de Bréno. Wood smooth. Fruit oblong, middle-sized, purple; flesh separating from the stone. A first-rate preserving fruit, ripening in September.
37 Hungarian quetsche. Wood smooth. Fruit purple, oblong, middle-sized; flesh separating from the stone. A preserving fruit, ripening in September.
38 Quetsche d'Italie.
39 Early Leipzig quetsche. Wood smooth. Fruit middle-sized, oblong, purple; flesh separating from the stone. A preserving fruit, ripening in the beginning of September.
40 Long green quetsche.
41 Saint James's quetsche. Fruit oblong, purple; flesh adhering to the stone. A preserving fruit, ripening in September.
42 Saint Martin's quetsche.
43 Quetsche précoce.
44 Quetsche Rognon de Coq.
45 Turkish quetsche.
46 Quetsche riche.
47 Wetherell's sweet. Fruit round, purple, small; flesh separating from the stone. A preserving fruit, ripening in the end of September. A sort of damson.
48 Wheat, wheaten, whitton, great whitton, nutmeg. Wood smooth. Fruit roundish-oblong, middle-sized, red; flesh adhering to the stone. A second-rate dessert fruit, ripening in the middle and end of August. Remarkable for its bright fiery red-colour.
49 Wine sour, Rotherham. Wood downy. Fruit small, purple, roundish-oblong; flesh adhering to the stone. A first-rate preserving fruit, ripening in the middle of September.
50 New wine sour.
51 Prunier haricot. Ser. ined.

† A list of plums not sufficiently known, but none of them are probably worth notice.

1 Belle de Riom. 2 Brompton. 3 Brussels. 4 Buchanan. 5 Burnet. 6 De Canada. 7 Court royal. 8 Cydmarine. 9 Dame Aubert rouge. 10 Dame Aubert violette. 11 Winter miracle. 12 Davies's seedling. 13 Deron's. 14 Dittisham. 15 Double blossomed, à fleurs doubles. 16 Duke of Devonshire. 17 Dunkerline. 18 Elsy's. 19 Elton. 20 Emperor. 21 Prunier à fleur semidouble. 22 Fall copper. 23 French copper.
24 Blucher's gage. 25 Bauker's gage. 26 Flushing gage. 27 Schuyler's gage. 28 White gage. 29 Garlick's early. 30 Goldsmith's Vienna. 31 Green plum of Tours. 32 Grove-house purple. 33 Honey Julic. 34 Horse jarg. 35 Joan morceau. 36 Julien gros à feuilles panachées. 37 Kenellan. 38 Lannans. 39 Large green drying. 40 Luscombe's seedling. 41 Maitre Claude. 42 Mignonette. 43 Mirabelle of Lorgy. 44 Mirabelle rouge. 45 Mirivian. 46 Monsieur d'Agen. 47 Wild Oakley park. 48 Oddy's. 49 Orange. 50 Panachée. 51 Blue primordian. 52 Pseudo Mirabelle. 53 Queen mother. 54 Raisin. 55 Roi d'Agen. 56 Saint Antoine. 57 Saint Maurin. 58 Saint Remy. 59 Scabbiatella. 60 Scabbiatone. 61 Small green drying. 62 Steer's emperor. 63 Seckes Ungersk. 64 Tidlig Leipzig Secksk. 65 Sweet prune. 66 Trianon. 67 La Vitoriane. 68 Violet gage. 69 Violet de Tours. 70 White corn. 71 Yellow gage. 72 Yellow Jack.

Cultivation of the plums in orchards appears to be deserving of more encouragement than it generally meets with. Not only does the fruit make excellent pies and tarts, but it may be kept in large quantities, so as to be ready for that purpose at any period of the year. They also make a good wine, and with other fruits and ingredients form one of the substitutes for port. The damson, bullace, and some other kinds will grow and bear high flavoured fruit in hedges, where the soil is dry below, and not too thin. The fruit of the sōc is for wine-making superior to that of the plum, and nearly as good for tarts.

Selection of sorts. The following are recommended by Forsyth for a small garden: 1. Jamie hâtrie. 2. Morocco. 3. Orleans. 4. Royal. 5. Green-gage, different sorts. 6. Drop d'Or. 7. Saint Catharine and imperatrice. 8. Magnum bounon, for baking. 9. Wine-sour, for preserving.—The table fruit in the Daleke garden are as under, placed in the order of their ripening, all of them being planted against walls. 1. Violet de hâtive. 2. Early hâtive. 3. New Orleans. 4. Early Morocco. 5. Green-gage. 6. Blue-gage. 7. Blue perdigon. 8. Apricot plum. 9. Fothergillia. 10. White magnum bourn. 11. Imperial.

Propagation. Most of the varieties are propagated by grafting or budding on the muscle, S. Julien, magnum bourn, or any free growing plums, raised from seed or from suckers, but seedlings are preferable to stocks for a permanent plantation. The common baking plums, as the damson, bullace, Wentworth, &c. are generally propagated by suckers, without being either budded or grafted. Plum grafting is performed in February or March; budding in July or August. Miller prefers budding, because plums are very apt to gum wherever large wounds are made on them. New varieties are procured by propagating from seed on the general principles already stated. T. A. Knight (Hort. trans. 3, p. 214.) in an attempt to combine the bulk of the yellow magnum bourn with the richness and flavour of the green-gage, produced a fruit which partook of both parents; and a good variety of the Orleans plum has been raised from seed by J. Wilmot, Hort. trans. 3, p. 392.

Soil. Plums, according to Miller, should have a middling soil, neither too wet and heavy, nor over light and dry, in either of which extremes they seldom do well. Abercombie recommends any mellow fertile garden or orchard ground; and where a soil is to be made, "one-half fresh loam, one-fourth sharp sand, one-sixth road stuff, and one-twelfth vegetable remains or decomposed dung, or animal matter."

Site. The plum is cultivated like other indigenous fruit-trees, the hardier sorts as standards, and the finer varieties against walls. It is sometimes forced; but the blossom, like that of the cherry, is difficult to set, and on the whole it is a fruit not well adapted for forcing. The finer varieties are almost always planted against walls, which, Miller says, should have an east south-east aspect, which is more kindly to these fruits than a
full south aspect, on which they are subject to shrivel and be very dry, and many sorts will be extremely mealy if exposed too much to the heat of the sun; but most sorts will ripen extremely well as espaliers if rightly managed. Some, he adds, produce fruit for standard trees, in which method some of the ordinary sorts will bear very well, but then the fruit will not be near so fair as those produced on espaliers, and will be more in danger of being bruised or blown down by strong winds. Abercrombie says, "they have some choice sorts against south walls for earlier and superior fruit; others on east and west walls, and espaliers to ripen in succession, with full and half standards in the orchard."

Choice of plants. Miller recommends trees of not more than one year's growth from the bud, for if they are older they are very subject to canker, or if they take well to the ground commonly produce only two or three luxuriant branches. Abercrombie and Nicol take plants from one to five years old. Forsyth chooses "clean, straight plants, with single stems, and of two or three years' growth."

Neat planting. Miller says it is common to see plum trees planted at the distance of 14 or 16 feet, so that the walls are in a few years covered with branches, and then all the shoots are cut and mangled with the knife, so as to appear like a stumped hedge, and produce little fruit; therefore the only way to have plum trees in good order is to give them room, and extend their branches at full length. Abercrombie directs full and half standards to be planted at 40, 30, 25, and 20 feet distance; dwarfs generally 20 feet apart, and wall trees or espaliers 15, 20, or 25 feet from stem to stem. Forsyth says plums and cherries thrive best by themselves, and he prefers a wall for each, placing plums on walls 10 feet high, 8 yards apart, and at 7 yards distance on 12 feet walls.

Mode of bearing. All the sorts produce their fruit on small natural spurs, rising at the ends and along the sides of the bearing shoots, on one, two, or three years' growth. In most sorts new fruit branches are 2 years old before the spurs bear. The same branches and spurs continue fruitful in proportion to the time which they take to come into bearing. After the formation of the head is begun, it takes from 2 to 6 years before the different sorts come into bearing. Miller trains horizontally, and is against shortening the branches of plum trees, since the more these trees are pruned, the more luxuriant they grow, until the strength of them is exhausted, and then they gum and spoil; therefore the safest method to manage these trees, is to lay in their shoots horizontally, as they are produced at equal distances, in proportion to the length of their leaves, pinching off the points of young shoots, where lateral branches are desired, and displacing forright and irregular shoots, or such as shade the fruit. With thus carefully going over these trees in the growing season, there will be but little work to do to them in the winter. Abercrombie agrees with Miller in not shortening the fruitful branches. Standards, he says, must be allowed to "expand in free growth, occasionally pruning, long, rambling, and cross-placed or other irregular branches. Thin crowded parts, cut away, worn bearers, also decayed and cankered wood."

Forsyth says, "never cut the stems of young plum trees when first planted, but leave them till the buds begin to break, then you may head them down to 3 or more eyes, always observing to leave an odd one for the leading shoot; remember to cut sloping towards the wall, and as near to an eye as possible; thus managed, the shoots will soon fill the wall with fine wood. If you find that some of the shoots are too luxuriant, you may pinch the tops off with your finger and thumb about the beginning of June, in the first year after planting; by doing which you will obtain plenty of wood to fill the bottom of the wall. A great deal depends on the first and second years' management of your trees."

Renovating decaying trees.—Proceed as directed for the peach, but observe that the plum tree, when cut down, is very apt to run to wood, therefore the new soil must neither be very rich nor laid on in a very deep stratum.

Pruning blossoms.—This is sometimes done with the tenderer sorts, in the same way as for peaches and apricots.

Taking the crop.—The different sorts of the plum ripen in succession for about 3 months in summer and autumn. Some early sorts begin to ripen in July; the main varieties reach full maturity in August and September; late sorts continue ripening till the end of October or beginning of November. Each kind should be brought to table presently after being gathered, as they will not keep long in a natural state.

Insects and diseases.—See peach. The gum and canker are the most common diseases, and, as in almost every other case, the acarus is the most noxious insect. As a remedy for the former, Abercrombie directs to head down. The insects are destroyed by the common means. The gages, or reine Claudes, when nearly ripe are very apt to be eaten by wasps.

Forcing plums. Mr. J. Aiton (Hort. trans. 4. p. 531) says, when an early crop of plums is desired, they are best forced in large tubs or pots, as this method admits of their being removed at pleasure into different temperatures; but for a general crop to ripen at the end of May or beginning of June, he prefers having the trees planted in the forcing house. The temperature required for cherries answers well for plums, and plenty of air must be admitted. He prefers, for forcing, the Précocé de Tours, green gage, azure hâve, white perdrigon, Orleans, n© Orleans, and Morocco.

Domestic or Garden-plum. Fl. April, May. Britain. Tree 10 to 20 feet.

1 P. microcarpa (Led. fl. ros. alt. ill. t. 13 fl. alt. 2. p. 211) branches unarmed; petioles glandless; leaves oblong-apiculate, attenuated at both ends, convolute, serrated, glabrous, having the middle rib beneath bearded longitudinally; peduncles solitary; calyx reflexed; fruit elliptic, yellow. F. H. Native of Caucasus. Flowers white, very numerous.

2 P. micronera (Mayer, verz. p. 166) unarmed; leaves quite glabrous, conduplicate, ovate-elliptic, or oblong, obtuse, sharply serrated; serratures immarginate and glandless; umbels many-flowered; calyx tubular; drupe and nut oblong. F. H. Native of Caucasus, on mount Bechvarmak.

Small-fruited Plum. Shrub

12 P. Chinensis (Bl. bijdr. p. 1104) leaves oblong, acuminate, furnished with 2 glands at the base, and unequaly and glandularly serrated, glabrous, except in the axils of the veins beneath, where they are pubescent; flowers rising from the buds in umbellate fascicles; sepals glandularly serrated; fruit round, yellowish red. F. G. Native of China.

China Plum. Tree.

 Cult. All the species grow in any kind of soil, and are either increased by seeds, by suckers from the roots, or by grafting or budding for to continue rare sorts.

V. CE'ERASUS (said to have been first brought from Cerasus, a town in Pontus, in Asia). Jussain, gen. 540. D. C. fl. fr. 4. p. 479. D. C. prod. 2. p. 535. —Cerasus and Lauro-cerasus, Tournefort. Pristis species of Lin. Lax. svr. laevigata, Monogynia. Drupe globose or umbilicate at the base (f. 64. d.), fleshy, quite glabrous, destitute of bloom, containing a smooth, rather globose, compressed stone (f. 64. f.).—Trees. Leaves when young conduplicate. Flowers white. Pedicels 1-flowered, rising before the leaves in fascicled umbels (f. 64.) from scaly buds, but sometimes rising after the evolution of the leaves in racemes from the tops of the branches.
AMYGDALACEÆ. V. CERASUS.

SEC. I. Cerasophora (κερασω, kerasos, the cherry, and φωκος, phavor, to bear; bearing cherries). D. C. prod. 2. p. 535. Cerasopora, Neck. elem. no. 730.—Cerasus, Tourn. 451. exclusive of the species wherein the flowers are disposed in racemes. Flowers umbellate (f. 63). Pedicels 1-flowered, rising from the buds (f. 64.).

1. C. Prunifolia (Hamilt. ex. D. Don, fl. nep. p. 239.) leaves elliptic-oblong, acuminate, doubly serrated, pilose beneath; stipulas pectinated, bearing glands; umbels few-flowered, sessile. 4 H. Native of Nipal, at Narainhettv. Prunus cerasoides, D. Don, prod. fl. nep. 289. Flowers of a pale rose colour. Phosasia is the name of the tree in Nipal.

Phosasia, Cherry. Tree 15 to 20 feet.

2. C. Aénum (Moench. meth. 672. D. C. fl. 4. p. 482.) Flowers rising with the leaves; fruit roundish-ovate, depressed; peduncles slender; flesh of fruit very succulent and sugary, with the juice usually coloured; epicarp adhering to the flesh; leaves white beneath, rather pubescent; branches strong, divergatc; flower-bud oblong, acute. 4 H. Native of Europe, in woods. Prunus Cerasus avium. Lin. spec. 679. Prunus nigra, Mill. dict. no. 2. but not of Alton. Fruit black.

Var. a, syylectaris (Ser. in D. C. prod. 2. p. 535.) fruit small, blackish-purple, having the suture hardly depressed; flesh tender, hardly sweet. Prunus avium, a and b. Willd. baum. ed. 2. p. 50. Prunus nigricans, and P. varia, Ehrh. beitr. 7. pp. 126. and 127. Merisier à petits fruits, Duh. arb. fr. 1. p. 156. To this variety belong the small Merisier cherries, which are not better than the wild cherries.

1. Merisie petite roue.
2. Merisie petite rouge.
3. Black Mazzard; wild black-fruited; small wild black; Whiskey's black. Merisier à petit fruit noir. Very like the Black heart cherry.

Var. b, macrocórpa (Ser. in D. C. prod. 2. p. 535.) tree middle-sized; nerves of leaves red; peduncles longer; fruit large, blackish-purple, containing a red stone. This kind is cultivated in Switzerland, under the name of Kirschwasser, where the inhabitants distill a spirit from the fruit. To this variety belong the cherries known under the following names:

2. Merisie rouge.
3. Merisier grosse noire.
4. Merisier grosse rose oblongue.

Var. γ, pullida (Ser. ms. in D. C. prod. 2. p. 535.) fruit of a pale wax colour; leaves bearing twin glands at the base. To this variety belong the following sorts of cherry:

1. Merisier à fruit blanc. Lois. in Duham. abr. fr. ed. nov. 5. p. 12. no. 3. t. 4. f. B.
2. Merisier à fruit jaune. Lois. l. c. 5. p. 12. no. 4. t. 4. f. A.

Var. ε, multiplex (Ser. l. c.) smaller; leaves ovate, small, bearing 2 or 3 glands at the base. This variety is frequently cultivated in gardens, under the names of double-flowering cherry, merisier à fleurs doubles, merisie à fleur double. Only fit for ornament.

Bird's Corone, Merise, or Merisier Cherry. Fl. April, May. Britain. Tree 20 to 40 feet.

3. C. Duraéına (D. C. fl. fr. 4. p. 483.) tree large; branches ascending when young, but in the adult state hardly spreading; flowers rising with the leaves; fruit heart-shaped; peduncles long, slender; suture of the fruit much depressed, rarely almost obsolete; flesh hard and brittle; epicarp adhering firmly to the flesh; stone of fruit ovate. 4 H. Native of the south of Europe. Prunus Cerasus, var. bigarreaux and duraéina. Lin. spec. 679. Flowers white. To this species the bigarreauxiers, bigarreau, and heart cherries belong.

Var. a, cordigera (Ser. in D. C. prod. 2. p. 535.) fruit ovate, more or less heart-shaped or 2-lobed at the apex, with the suture much depressed. To this variety belong the cherries known under the following names:

1. Bigarreau belle de Rockmond, cœur de pigeon (Lois in Duham. arb. fr. ed. nov. 5. p. 15. no. 20. t. 18.), bigarreau commun.
2. Black bigarreau, black heart.
5. Bigarreau couleur de chair (Lois. in Duham. ed. nov. 5. p. 16. no. 24.), fruit pale yellow and red, large, ripening in the beginning of July. A second-rate table fruit. Does best as a standard.

7. Bigarreau dur.
8. Bigarreau à fruit jaune.
11. Bigarreau à gros fruit blanc (Duham.). Fruit pale yellow and red, tender, ripening in July. A first-rate table fruit, having the flesh more tender than that of the bigarreau. Does best as a standard.
12. Bigarreau à gros fruit rouge, Duham. 1. t. 2.
13. Bigarreau à gros fruit rouge tardif.
15. Knevet's late bigarreau.
16. Bigarreau de Mai.
17. Bigarreau monstrosus.
21. Turkey bigarreau.
22. White bigarreau.
24. Black bud of Buckinghamshire.
25. Beller's black heart.
26. Black heart of Buckinghamshire.
27. Goldsmith's black heart.
28. Jenkins's black heart.
29. Black Tartarian, Ronald's black heart, black Russian.
30. Spanish black heart.
31. Amber heart.
32. Early amber heart.
33. American heart.
34. Travers's black heart, Elthorn.
36. Taversham heart.
37. Florence. Fruit pale yellow and red, large, ripening about

41 Kruger's Herz Kersche zu Frankfort. Fruit red and pale yellow; flesh firm. Ripening in July. Does best against a south wall.

43 Large heart cherry.

44 Late or Spanish heart.

46 Maple heart. Fruit red. Flesh firm. A bad fruit.

48 Remington heart.

50 Guigne gousse blanche, guigne à gros fruit blanche (Duh. arbl. fr. 1 p. 161. t. 1. f. 3.). Fruit pale yellow and red, heart-shaped. Flesh firm. A worthless fruit, ripening middle of July.

Var. β, obtusata (Ser. mss.) fruit ovate, obtuse, or 2-lobed at the apex, with the suture hardly depressed. To this variety belong the following kinds of cherries:

1 Bigarreau, graffion, bigarreau gros, bigarreau d'Hollande, Italian heart, Harrison's heart, West's white heart. Fruit pale yellow and red, obtuse, heart-shaped, large, ripening in July and August. Flesh firm. A first-rate table fruit. Does best as a standard.

3 Bigarreau rouge. Fruit large, pale yellow and red, obtuse, heart-shaped. Flesh firm. Hardly different from the bigarreau. A good dessert fruit.

4 Guigne gousse noir hâtane. Fruit middle-sized, blood-coloured, obtuse, heart-shaped. Flesh firm. A second-rate dessert fruit, ripening in the beginning of July. Does well as a standard; the branches are pendulous. A good bearer.

5 Black Tartarian, Tartarian, Fraser's black, Fraser's Tartarian, Fraser's black heart, Ronald's black heart, Cerasian, black Russian. Fruit blood-coloured, large, obtuse, heart-shaped. Flesh half tender. A first-rate table fruit, ripening about the end of June. In appearance it is the finest. Does best against a wall.

6 White Tartarian, Fraser's white Tartarian, Fraser's white transparent. Fruit middle-sized, pale yellow, obtuse, heart-shaped. Flesh half tender. A second-rate dessert fruit, ripening in the beginning of July. Does well as a standard.

7 Bigarreau noir, cerise de Norvège, Lois. in Duham. ed. nov. 5 p. 17. no. 36. t. 13. f. B.

8 Bigarreau noir tardif, Lois. in Duham. ed. nov. p. 17. no. 27. t. 18. f. A.

Var. γ, mamillaris (Ser. mss.) fruit ovate, ending in a drop-like process at end, with the suture more profound at the base. To this variety belong the following sorts of cherries:

1 Four to the pound, bigarreau à grandes feuilles (Nois. jard. fr. p. 17. no. 6.), ceriser de quatre à la liere, guigne à feuilles de tabale, Prunus macrophylla (Poir. suppl. 5. p. 584.). Cerasus nicotianae (flolia (Hortul.), Cerasus decumana (Delany). Leaves large. Fruit 'middle-sized, heart-shaped. Flesh firm. A worthless fruit, ripening about the end of July.

2 Gascoigne's heart, red heart of some, bleeding heart, Herefordshire heart, guigne rouge hâtive. Fruit middle-sized, dark red, heart-shaped, the apex terminating in the form of a drop. Flesh half tender. A second-rate fruit, ripening in July.

3 Bigarreau piquant, guigne piquante, guigne à pigeon. Duham. ed. nov. 5. p. 13. no. 12. t. 16. f. A.

Hard or Bigarreau Cherry. Fl. April, May. Tr. 10 to 20 ft.

4 C. Juliana (D. C. fl. fr. 4. p. 482.) branches ascending when young, but when in an adult state hardly spreading; flowers rising with the leaves; fruit ovate, depressed, heart-formed; flesh of fruit sweet, rather soft, epicarp adhering to the flesh; leaves glabrous.

$^{b}$ H. Native of Europe. The varieties of this species of cherrv are commonly called guigniers, geans, or haumiers. The sorts are as follow:

1 Black eagle. Fruit middle-sized, black, obtuse, heart-shaped; flesh tender. A first-rate dessert fruit, ripening beginning of July. A good bearer. Does either as a standard or wall tree.

4 Black gean. Useless fruit.

5 Black caroon gean.

6 Early gean.

11 Late gean. Fruit black, heart-shaped, small. A worthless fruit, ripening about the end of July.

12 Large black gean. Fruit black, middle-sized, heart-shaped. Flesh firm. A worthless kind, ripening end of July.

13 Lundie gean. Fruit black, heart-shaped, middle-sized.
A second-rate dessert fruit, ripening in July. Does well as a standard.

15. White gean.
18. Guigné blanche, Lois, in Duham. ed. nov. 5. p. 13. no. 7.
20. Guigné rose hâtive.
22. Guigné grosse noire.
25. Guigné noir. Resembles the black heart.
27. Guigné petite rouge. Worthless.
28. Guigné de Russie à fruit blanc.
29. Guigné précocé, guigné de l’entocé, Lois. in Duham. ed. nov. 5. p. 12. no. 5. f. 15.
Lois. l. c.
33. Guigné ou cerise cœur de poule, Calv. pepin. 2. p. 139. ex.
Lois. l. c.
34. Hertfordshire black. Fruit black, obtuse, heart-shaped.

Flesh tender. A second-rate dessert fruit, ripening about the middle of July. Does well as a standard.

Var. β? Heuviâna (Ser. mss.) taller trees; leaves thin, large, elongated, finely serrulated; flesh of fruit not brittle. To this variety belong the following sorts of cherry:
1. Heuviâner blanco, Lois. in Duham. ed. nov. 5. p. 17. no. 28.
2. Heuviâner rouge, Lois. l. c. p. 17. no. 29. t. 19. B.
3. Heuviâner noir, Lois. l. c. p. 17. no. 30. t. 19. f. A.

Var. γ, péudhula (Ser. mss. in D.C. prod. 2. p. 586.) branches pendulous.—Altsaants, weeping cherry, cerise de la Tout-taint, cerise tardière, cerise St. Martin, guignier à rameaux pendus (Lois. in Duham. ed. nov. 5. p. 15. no. 16.). Fruit round, red, small, watery, ripening in July and October. This sort is of little value as a fruit, being more curious than useful.

St. Julian, Guigniers, or Jean-cherry. Tree 20 to 40 feet.
5. C. cåproniià (D.C. fl. fr. 4. p. 482.) small trees, with spreading branches; flowers rising with the leaves; calyx large, campanulate; pedicels usually thick, stiffer, not long; fruit globose, depressed, with the suture highly depressed; flesh soft, more or less acid and styptic; epicarp not adhering to the flesh; stone roundish. F.H. Native of Europe. C. vulgaris, Mill. dict. no. 1. Lois. in Duham. ed. nov. 5. p. 18. var. 1-3. Prunus austèra and P. acida, Ehrh. beitr. 7. p. 129. Commonly called round cherries, Morells, May-dukes, and in France cerises de Paris, cerises à fruits ronds, and grittières. In consequence of this species containing a greater number of the best cherries than any of the other species, we have given the history and cultivation of all kinds of cherries under it. The cherry is a middle-sized tree, with ash-coloured, shining, roundish branches, ovate, serrated leaves, and white flowers, produced in umbellate fascicles, and succeeded by a red drupe with an acid pulp. The leaf and flower-buds are distinct, the former terminal, the latter produced from the sides of the 2 or more years’ old branches. The cultivated cherry was brought to Italy by the Roman general Lucullus in 73 A.C. from a town in Pontus in Asia, called Cerasus, whence the generic name, and was introduced to Britain 120 years afterwards. Many suppose that the cherries introduced by the Romans into Britain were lost, and that they were re-introduced in the time of Henry VIII. by Richard Haines, the fruiterer to that king. But though we have no proof that cherries were in England at the time of the Norman Conquest, or for some centuries after it, yet Warton has proved by a quotation from Lidgate, a poet who wrote about or before 1415, that the hawkers in London were wont to expose cherries for sale, in the same manner as is now done, early in the season. The tree is now very generally cultivated, both as a wall and standard fruit, and has been forced for upwards of two centuries.

Use.—The cherry is a refreshing summer fruit, highly grateful at the dessert, and affording pies, tarts, and other useful and elegant preparations in cookery and confectionery. Steering cherries in brandy qualifies and improves its strength and flavour; a fine wine is made from the juice, and a spirit is distilled from the fermented pulp. The gum which exudes from the tree is equal to gum arabic; and Hasselquist relates, that more than 100 men, during a siege, were kept alive for nearly two months without any other sustenance than a little of this gum taken sometimes into the mouth and suffered gradually to dissolve. Cherry wood is hard and tough, and is used by the turner, flute-maker, and cabinet-maker.

Varieties.—The Romans had 8 sorts: red, black, tender fleshed, hard fleshed, small, bitter flavoured, and a dwarf sort. Tusser, in 1573, mentions cherries red and black. Parkinson mentions 34 sorts, Ray 24, and Miller has 18 sorts, to which he says others are continually adding, differing little from those he has described. The catalogue of the Luxembourg contains 42, and the catalogue of the London Horticultural Society, published last February, 210 sorts, the greater part of which are not well known.

The French divide their cherries into grittières, or those belonging to the present species; bigarreau, or hard-fruited cherries, the Cerasus durècina; Meristers, or wild cherries; the Cerasus avium, and guignes or geans, the Cerasus Juliana.

The varieties of the present species are as follows:

Var. α, Montmorencyâna (Ser. mss. in D.C. prod. 2. p. 536.) fruit globose, depressed, pale red, generally hardly depressed at the suture; flesh white, more or less acid; pedicels rather long; leaves ovate, acuminated. To this variety appertain the following sorts of cherry:
1. Adam’s crown. Fruit pale red, round, heart-shaped, middle-sized. Flesh tender. A first-rate dessert fruit, worthy of cultivation for its earliness, being ripe about the beginning of July.

Flesh tender. A first-rate dessert fruit, ripening beginning of July, allied to the May-duke. Does either as a wall or wall fruit.
4. Belle de Choisy, ambîée de Choisy, cerise de La Palemere, cerise doucette, grittière de Palemere (Lois. in Duham. ed. nov. p. 25. no. 20. t. 11.). Fruit very handsome and good, large, red, round. Flesh tender and sweet. A first-rate dessert fruit, ripening beginning and middle of August. Answers well either as a wall or standard fruit.
5. Carnation, English bearer of some, cerise nouvelle d’Angleterre, cerise de Portugal, grittière de Villènes, Guignardou rouge (Lois. in Duham. ed. nov. 5. p. 25. no. 14. t. 7.), grosse cerise rouge pale (Nois. jard. fr. p. 20. no. 17. t. 5.), grittière rouge pale, cerise à gros fruit pale (Duham. arbr. fr. 1. p. 182. t. 9.). Fruit large, round, pale red; flesh tender. A first-rate sort, ripening in July.
6. English bearer. Fruit large, dark red, round. Flesh
tender. A first-rate kitchen fruit, ripening in July. Does well as a standard. It is a variety of the Kentish cherry.

7 English cherry, cerise d'Angleterre. Fruit middle-sized, round, red. Flesh tender. A first-rate kitchen fruit, ripening in July. It is a variety of the Kentish. Does well as a standard.

8 English preserve. Fruit round, red, middle-sized. Flesh tender. A first-rate kitchen fruit, ripening about the beginning of July. It is a sort of Kentish, and good for drying.

9 Large honey cherry. Fruit roundish, red, small. Flesh sweet. A second-rate table fruit, but too small for cultivation.

10 Jeffries' duke. Fruit middle-sized, round, red. Flesh tender. A first-rate dessert fruit, ripening about the beginning of July. Answers either as a wall or standard fruit.

14 May-duke, early duke, early May-duke, large May-duke, Morris's duke, Benham's fine early duke, Thomson's duke, Portuguese duke, Buchanan's early duke, Angleisa, royale látine, De Hollande, Courlande, De Hollande à larges feuilles, d'Espagne, griotte d'Espagne, griotte précocé of some, cerise nain à fruit rond précocé (Duham. arb. fr. 1. p. 168. t. 3.). Fruit middle-sized, obtuse, heart-shaped. Flesh tender. This is certainly one of the best dessert cherries, when all its properties are taken into consideration. It answers either as a wall or standard fruit.

15 Cerise griot maraquin, Lois. in Duham. 5. p. 21. no. 7.

16 Cerise à crochet, Duham. arb. fr. 1. p. 175.

17 Cerise à noveau tendre, Duham. l. c. p. 174.

18 Cerise d'Italie, cerise du pape goix, Lois. in Duham. ed. nov. 5. p. 27. no. 55.

Var. β, palléscens (Ser. in D. C. prod. 2. p. 536.) fruit globose, depressed, or ovato-globose, amber-coloured. To this variety belong the following cherries:

1 Blanche, cerise à fruit blanc, cerise ambre (Duham. arb. fr. 1. p. 185. no. 18. t. 11.). Fruit small, pale yellow. Flesh tender. Not worthy of cultivation.

2 Downton. Fruit roundish, heart-shaped, pale yellow and red. Flesh tender. A good bearing and excellent dessert cherry, ripening about the beginning of July. Does well either as a wall or standard fruit.

Var. γ, gobbêta (Ser. in D. C. prod. 2. p. 536.) fruit red, depressed, the suture also depressed; flesh white; peduncles short; leaves tapering to both ends. To this variety belong the following sorts of cherry:

1 Early May, griotte naîné précocé. Fruit red, round, small. Flesh watery. A poor fruit, owing to its smallness and acidity, ripening in the middle of June.

2 Flemish, Kentish of many, yellow Ramoncè, cerise de Kent (Lois. in Duham. 5. t. 12.), cerise de Montmorency à gros fruit (Duham. arb. f. 1. p. 180. t. 8.), Montmorency à courte queue, cerise à courte queue, gros gobet, gobet à courte queue, double volgers of the Dutch. Fruit round, red, middle-sized. Flesh watery. A first-rate kitchen fruit, ripening in July. Does best as a standard.

3 Kentish, common red, Flemish of many, Virginian May, early Richmond, Kentish red or pie cherry, Sussex, de Montmorency, Montmorency à longue queue, commune à Trochet of some fruit middle-sized, round, red. Flesh watery. A good bearer and a first-rate kitchen fruit, ripening end of July. Does best as a standard.

5 Wild Rosshire. Fruit small, red, round. Flesh watery. A wild cherry, allied to the Kentish.

Var. ε, polycléna (Ser. miss. in D. C. prod. 2. p. 537.) flowers numerous, usually polygynous; fruit numerous, on the same peduncle; flesh white; leaves glandular at the base. C. polycléna, D. C. herb.—Cerise à bouquet, Duham. arb. fr. 1. p. 173. t. 53.—Cluster cherry, cherreuse. Fruit round, red, small. Flesh watery. A cluster of fruit is formed from several styles in the same flower. A kitchen fruit. Does best as a standard.

Var. ρ, multiplex (Ser. in D. C. prod. 2. p. 537.) flowers semi-double or double; pistils simple, fertile, or petaloid; fruit pale red; flesh thin and very acid.—Double-flowering cherry, cerise à fleurs doubles, semi-double-flowering cherry, cerise à fleurs semi-doubles. Only cultivated for ornament.

Var. φ, persifolia (Ser. in D. C. prod. 2. p. 537.) flowers double or red.—Cerise à fleur de pêcher, pêche-flowered cherry.

Var. ω, persicifolia; leaves narrow, like those of the peach or willow.—Willow-leaved May-duke cherry, forment-leaved cherry, cerise à feuilles de pêcher, cerise à feuilles de sant de balsamine (Lois. in Duham. ed. nov. 5. p. 25.), cerise de Hollande à feuilles de sant. This kind of cherry bears but an inferior fruit.

Var. ϑ, variegáta (Ser. l. c.) leaves variegated with white. —Cerise à feuilles panachées (Lois. in Duham. ed. nov. 5. p. 20. no. 4.); variegated-leaved cherry.

Var. ι, griottá (Ser. l. c.) fruit globose, depressed, dark purple; flesh red. To this variety belong the following sorts of cherries:

1 Griotte de chaux, griotte d'Allemagne (Duham. arb. fr. 1. p. 102. t. 141.), grosse cerise de M. le Comte de Mau.

3 Early purple griotte. Fruit dark red, heart-shaped, middle-sized. Flesh tender. A first-rate dessert fruit, ripening about the beginning of June. A valuable cherry, particularly on account of its earliness. Does well either as a standard or wall fruit.

5 Griotte à petit fruit, griotte à petit fruit noir, Duham. abr. fr. 1. p. 190.

6 Griotte de Portugal (Duham. arb. fr. 1. p. 190. no. 18. t. 13.), arch-duke of some. A kind of May-duke.

7 Griotte de Ratafa, griotte à Ratafa, cerise à tres petit fruit noir (Duham. arb. fr. 1. p. 189. no. 16.), cerise ou griotte du nord tardive, de St. Martin, wild Russian, bruise de Bruxelles, gros griotte noire tardive (Lois. in Duham. ed. nov. 5. p. 20. no. 21. t. 14.), cerise du nord (Lois. l. c. p. 26. no. 22. t. 5.). Fruit roundish, dark red. Flesh watery. A good boner, but inferior in size to the Morello, which it closely resembles; ripens in August. It is a kitchen fruit.

8 Griotte de Turquie. Fruit round, red, large. Flesh tender. A first-rate dessert fruit, ripening end of July. Like the belle de Choisy. Does well either as a wall or standard fruit.

9 Griotte or cerise de Prusse, Lois. in Duham. ed. nov. 5. p. 29. t. 33. t. 13. f. A.

10 Griotte ou guindouz de Poiton, Le Berr. trait. jard. 1. p. 252. ex. Lois. l. c. p. 27. no. 29. t. 12. f. C.

11 Morella extra noir.

12 Moreller dobbeete.
15 Sweet Morello.
14 Langusthede sode Morelter.
15 Morello, small Morello of some, Dutch Morello, large Morello, black Morello, late Morello, Ronald's large Morello, du nord, griotte ordinaire du nord. Fruit dark red, round, heart-shaped, large. Flesh tender. A first-rate kitchen fruit, ripening in July and August. For north walls and for preserving the Morello is well known to be most valuable.

16 Wild Morello.

Var. c, cordigera (Ser. in D. C. prod. 2. p. 537.) fruit ovate-globose; flesh red. To this variety belong the following sorts of cherry:

2 Giotte guigne, cerise d'Angleterre, Lois. in Duham. ed. nov. 5. p. 28. no. 32. t. 14. f. B.
3 Grotte ou cerise cœur, Le Berr. trait. jard. 1. p. 257. ex Lois. l. c.

4 Plantes Morello. Fruit red, round, heart-shaped. Flesh watery, inferior to the Morello.

† Names of cherries not so well known as to be placed in either species or varieties.

1 Adlington. 2 Affine. 3 Ambrée à gros fruit. 4 Ambrée à petit fruit. 5 American heart. 6 Ansell's fine black. 7 Belle Bosc. 8 Black American. 9 Black Orleans. 10 Black Spanish. 11 Broughton's early black duke. 12 Bown's Duntic cherry. 13 Buttners' herz kirsche. 14 Buttners' October zucker weichel. 15 Buttners'schwarze. 16 Denner's black. 17 Double Natte. 18 Franche. 19 Grosse blanche carrée. 20 Grosse blanche. 21 Horthub. 22 Hâtive ou précoce. 23 Hâtive de St. Jean. 24 De Jacap. 25 Leder kirscher. 26 Lamarre's knorpel-kirschen. 27 Millet's late heart-duke. 28 Monstruosa Hennequin. 29 Muscat de Prague. 30 New Royal. 31 Nouvelle d'Angleterre, cerise guigne. 32 Noguy tendre. 33 Cerise à petit fruit blanc. 34 Précoce. 35 Prince's duke. 36 Black proflic. 37 De Prusse. 38 Rainer's French cherry. 39 Remington heart. 40 Rothmelrit Bernstein kirsche.

11 Rouge pale tardive. 42 Royal tardive, duke cherry. 43 Russe à fruit blanc. 44 Thramer's Muscateller aus Minorca. 45 Tüger's Weisse herz kirsche. 46 Robertson's Tradescant's. 47 Turkeine. 48 Transparent. 49 White transparent. 50 Cerise à trochet, commune. 51 Trochet, très fertile. 52 Unique nouvelle, early unique nouvelle. 53 De Varenne.

54 Wellington. 55 White Spanish. 56 Winter's schwarze knorpel kirsche.

Selection of sorts.— Forsyth recommends for a small garden: 1 May-duke. 2 Morello. 3 Archduke. 4 Black heart. 5 Bigarreau. 6 Graffon. 7 Turkey heart. 8 Kensington duke cherry.

Those in the Dalketh garden are: —1 May-duke, two sorts. 2 Harrison's heart. 3 Black heart. 4 White heart. 5 Amber heart. 6 Morello. All against walls.

Miller says the best sorts for an orchard are: the common red or Kentish, the duke cherry, and the Lukeward's heart; all of which are plentiful bearers.

Propagation.—Varieties of the cherry are continued by grafting or budding on stocks of the black or wild red cherries, which are strongly growers and of a longer duration than any of the garden kinds. The hearts, which are all ill bearers, are sometimes grafted on bird cherry stocks, which are said to have the same effect on the cherry that the paradise stock has on the apple, that of dwarfing the tree and rendering it more prolific. Some graft on the Morello for the same purpose. The stones of the cultivated cherries are sometimes, but improperly, substituted for those of the wild sort, as being more easily procured. New varieties are produced by propagating from seed.

The cherry, Mr. T. A. Knight observes, (Hort. trans. 2. p. 38.) "sports more extensively in variety when propagated from seeds, than any other fruit which I have hitherto subjected to experiments; and this species is therefore probably capable of acquiring a higher state of perfection than it has ever yet attained. New varieties are also much wanted; for the trees of the best old kinds are everywhere in a state of decay in the cherry orchards; and I am quite confident that neither healthy nor productive trees will ever be obtained from grafts of old and expended varieties of this or any other species of fruit tree."

Cherry stones, whether for stocks or new varieties, are sown in light sandy earth in autumn, or are preserved in sand till spring and then sown. They will come up the same season, and should not be removed till the second summer after sowing. They may then be planted out in rows, 3 feet apart, and the plants about 1 foot in the rows. The succeeding summer they will be fit to bud, if intended for dwarfs; but it is usual to use standards which will require to stand one or more seasons, generally till four years old. They should be budded or grafted near 6 feet from the ground; the usual way is to bud in summer, and graft those which do not succeed the following spring.

Soil.—The cherry delights in dry sandy soil and elevated situations; but some sorts, as the May-duke, will thrive in all soils and aspects, and the varieties may be planted in a common mellow garden or orchard ground. In Kent, this tree prosper in the deep loam lying on rock. Miller says, the soil which cherries thrive best in, is a fresh hazel loam; if it be a dry gravel they will not live many years, and will be perpetually blighted in the spring.

Site.—To obtain fruit early, some sorts, as the May-duke, are planted against walls; but all the varieties will do well as dwarfs or espaliers in general situations, and most of them as standards. The May-duke, Nicol observes, does well as a standard; but against a south wall the fruit becomes considerably larger, and contrary to what happens in other fruits, it seems to acquire flavour. The Morello is much improved in flavour when planted against a wall of good aspect. Abercrombie says, "allot to the finest of the early kinds south walls for fruit in May and June, train others against west and east walls, for supplies in succession, and some on north walls for the latest ripeners, particularly the Morello, which, so situated, will continue in perfection till September and October; but it is also proper to plant some trees of this sort on south walls, to have the fruit ripen earlier, with an improved flavour."

Final planting.—Plant full standards from 20 to 30 feet apart; small standards 15, 18, or 20 feet apart. The proper season for planting is from the middle of end of October, or any time in November or December, if open weather, till February or March. Miller says, never plant standard or rider cherry trees over other fruits; for there is no sort of fruit that will prosper under the drip of cherries. He allows 40 feet square for standards in orchards for the same reason.

Mode of bearing.—Cherry trees in general produce the fruit upon small spurs or studs, from half an inch to 2 inches in length, which proceed from the side and ends of the two year or 3 year and older branches; and as new spurs continue shooting from the extreme parts, it is a maxin in pruning both standard and wall trees, not to shorten the bearing branches where there is room for their regular extension. The Morello is, in some degree, an exception.

Pruning cherry trees in general. To standards give only an occasional pruning to reform or remove any casual irregularity from cross-placed or very crowded branches, and take away all cankery and decayed wood. To wall trees a summer pruning
should commence in May or June, in order to regulate the shoots of the same year. Disbud the superfluous or forlorn shoots, or if they have been suffered to spring, pinch or cut them off with such as are disorderly. Retain a competent supply of the best well placed side and terminal shoots, to remain for selection at the winter pruning. Nail or lay in the reserve close to the wall at their full length, and so train them all summer. The winter pruning may be performed at the fall of the leaf, or at any time in moderate weather till February or March. It comprises a regulation both of the old and young wood. Carefully preserve the sound and productive branches and bearers in their full expansion, and reduce or remove such only as are irregular in growth, too crowded, unfruitful, decayed, or cankered. Any branches extending out of bounds prune into some good lateral shoot or fruit-bud. According to the time the bearers have already lasted, look to some promising shoots for successors to those which may first wear out. To fill immediate vacancies retain select shoots of the last year and the year before, with uniformly a leader to the advancing branch where there is room, and with lateral shoots in any open or unproductive space nearer the origin of the branches, to be trained as bearers between the main branches. Some cut superfluous fruit-shoots clean away; others leave a sprinkling of short stubs cut very short if forward. The new laterals and terminals are to be trained in full length as far as room will permit. They will come into bearing the first and second year. In pruning cherry trees in general be careful to preserve the small clustering fruit spurs, except where on wall trees any old spurs project considerably, and assume a rugged disorderly appearance; cut such clean out smoothly.

Pruning the Morello cherry. "The Morello cherry bears principally on the shoots of last year, the fruit proceeding immediately from the eyes of the shoots, and bears but casually, and in a small degree, on close spurs formed on the two year old wood, and hardly ever on wood of the third year. Therefore both in the summer and winter pruning leave a supply of last year's shoots on all the branches, from the origin to the extremity of the tree, for next year's bearers, cutting out past bearers to make room. It is plain that the Morello ought to have no stubs left with a view to spurs, and all forlorn shoots ought to be disbudded while young. To leave a convenient space for young wood train the present bearers 6 inches apart; lay in between each of these one young shoot for bearing next year, which will make the promiscuous distance 3 inches." Underwood (Caled. hort. misc. 1. p. 427.) has often observed, when the branches of cherry trees are laid in too near to one another, or are crossed by branches of the same kind, or by plum-tree branches, as is sometimes the case, that although there be abundance of blossom, yet there is no crop even in good seasons. On examining the blossoms produced on such crowded shoots he found that in 50 flowers there were not above two styles, of course no fruit could be expected. By not laying in the branches so close, and by removing all superfluous summer shoots, more light and air was admitted, and he had in consequence plentiful crops.

Renewing old or decayed trees. Proceed as in the renovating the plum, see p. 504.

Growing cherry trees in orchards. Near large towns cherries might be cultivated in orchards to a certain extent. In Kent and Hertfordshire are the cherry orchards which afford the chief supply for the London market. The sorts are chiefly the caroam, small black or Kentish, the May-duke, and the Morello; but Hobman's duke, the black heart, and large black gean will do well in orchards.

Protecting from birds. "As cherries in the ripening state are frequently attacked by birds, it is advisable to have choice wall-trees or espaliers defended with large nets in due time. Old fishing nets may also be spread over the branches of dwarf standards. To protect other standard trees let scare-crows and clap-boards be put up."

Gathering the fruit. Use the hand, taking hold of the fruit-stalk in gathering from the wall, and the cherry gatherer, in gathering from the distant branches of high standards.

Insects and diseases, &c. Wall cherry trees are often infested with the red-spider, but standards are generally not much injured by insects. Nasmith says, "our cherry trees both in the open air, and on the natural walls, particularly the tops of young shoots, are much attacked with a small black insect, provincially called the black beetle. The remedy I have found most effectual for their destruction is a mixture of pitch with one-sixteenth part of powdered ophthalm, one-sixteenth part of sulphur, dissolved over a slow fire in an earthen pipkin, until they be well incorporated; when cold, divide it into small pieces about the size of a hen's egg, and burn it under the trees with damp straw, directing the smoke as much as possible where the insects are most numerous. In an hour afterwards, if the state of the fruit will admit, give the trees a good washing with a garden engine, which generally clears off the half dead beetles, and prevents the spreading of the red-spider." Caled. hort. misc. 2. p. 90.

Of the culture of the cherry-house.

Though the cherry be a native of Britain no fruit is more difficult to force. M'Phail observes, "no tree forced for obtaining fruit early is more liable to fail of a good crop than the cherry; the blossoms are apt to fall off before the fruit is set, and the fruit will keep falling off before and after they are as large as peas. This is occasioned by a kind of stagnation of air about them, which affects the tender blossoms and young shoots."

Soil. M'Phail says, "take light, sandy, rich, mealy earth, and make a border of it the whole width of the house, and 4 feet deep." According to Nicol, "the border should be from 24 to 30 inches deep; the bottom, if not naturally mild and dry, to be drained and paved. The soil should be a sandy loam or light hale garden earth, made moderately rich with stable-yard dung well reduced, or with other light compost. If a small portion of lime, or a moderate quantity of marl, were mixed with it so much the better. The soil for cherries to be forced in pots or tubs should be considerably richer than the above." Torbron (Hort. trans. 4. p. 116.) uses fresh virgin soil and rotten dung.

Choice of sorts. M'Phail, Nicol, and all gardeners agree in giving the preference to the May-duke. Nicol says, "none of the other kinds set so well, except the Morello, which I do not hesitate to say well deserves a place; it is a good bearer, and the fruit when forced acquires superior size and flavour." Nicol, kal. p. 295.

Choice of plants. M'Phail takes standards of different heights in a bearing state; Nicol clean, healthy, young plants, that have been one or two years in training against a wall; Torbron trees 8 or 10 years from the bud, and selected of such various heights as best suits the size of the house.

Choice of situation. M'Phail and Torbron plant in rows, beginning with the tallest in the back side, reserving the shortest for the front, letting them slope to the south gradually, somewhat in the form in which plants are set in the green-house." (Gard. remem. 146. and Hort. trans. 4. p. 110.) Nicol has a trellis against the back wall for wall-trained trees, and a border in front in which he plants dwarf standards. The dwarfs against the back trellis he plants 8 or 10 feet apart. Riders that have been 3 or 4 years trained, and are well furnished with fruit-spurs, may be planted between the dwarfs. They may probably yield a few fruit the first season, and will hardly fail to produce plentifully in that following. In the border may be
planted, as dwarf standards, to be kept under 5 feet in height, some well furnished plants that have been kept in large pots or tubs for a year or two; such being more fruitful, and less apt to go to wood, than plants that have grown in the open ground. In planting these the ball of earth should not be much reduced, only a few of the under roots should be spread out, for if the ball were reduced, and the whole roots spread out as in the ordinary way of planting, when it is wished that the plant may push freely, the intention here would be thwarted, which is to have the plant dwarf and fruitful, growing little to wood. Along with these may be planted in the same way an apricot or two, or figs, or both, that have been dwarfed in pots or tubs as above. If they succeed it would give a pleasant variety, of which there need be little doubt, as the temperature, soil, and general treatment for cherries will suit apricots, and not far disagree with figs. These little standards may be allowed a space of about 4 feet square each, which is sufficient, as they must not be suffered to rise high or spread far, on account of shading the trees on the trellis. In planting of the principal dwarfs and riders, let the work be carefully performed. They should be raised with as good roots, and be kept as short time out of the ground as possible, planting them just as deep as they have been before, spreading out their roots and fibres, and filling in with fine earth. The whole should have a moderate quantity of water, and have air freely admitted every day, defending them, however, from snow or much rain. The house should not be forced the first year; and it will be better to defer heading in the plants till the middle or end of March than to prune them now. I shall, therefore, take no further notice of them till then, supposing they are to be attended to with respect to air and moderate waterings. It is necessary, however, to remark, that the plants should be carefully anointed with the liquor recommended for vines, see vol. 1. p. 708. either just now or sometime in the course of the month.

**Time of planting.** According to Nicol and M'Phail January and February; to Torbron early in the autumn.

**Pruning.** Trees planted in January may be pruned about the middle or end of March. The dwarfs planted against the trellis should be well cut in, that is, each shoot of last year should be shortened back to three or four buds, that the plants may throw out a sufficiency of young shoots to fill the rail from the bottom. The dwarfs planted in the border as little standards need not be headed in so much, as the intention is to have the fruit full, and that they may grow little to wood from the beginning. Their short shrubby shoots need not be touched, unless bruised or hurt in transplanting, shortening back the longer and weaker ones a few inches, according to their strength. The riders planted against the back trellis may be treated very much in the same manner, the sole intention being to obtain a few crops of them while the dwarfs are making wood, and filling their spaces. In November following the trees may be pruned for the succeeding season. In order to produce wood to fill the trellis as soon as possible, the dwarfs should be pretty much headed in. The shoots may be pruned very much in the manner of the trees in the early house, shortening no shoots that are fully ripened, except a few of those at the extremities of the tree, in order to make them throw out others for its full extension upwards next year. November is also the proper time for pruning an established cherry-house preparatory to forcing for the next year. As cherry trees which have been forced make very little wood, the pruning required is probably nothing further than moderately to thin out the spurs, and to prune off any accidental breast-wood or water-shoots that may have risen since the crop was gathered. "The leading shoots, except for the purpose of producing wood to fill up any blank or vacancy, need not be shortened; nor need those in the lower parts of the tree, except for the same reason. But if it be necessary to shorten these, let them be cut pretty well in, as otherwise they will push very weakly. Shoots on the extremities of the tree that should be shortened for the above purpose, need not however be cut so closely in. If they be headed back one-third or to half their lengths, it will generally be found sufficient." "Summer pruning. Very little of this is requisite, such water-shoots or breast-wood as arise among the spurs are to be pinched off as they appear, laying in such shoots only of this description as may be wanted to fill an occasional vacancy. Train in the summer shoots of the dwarfs as they advance at the distance of about 8 or 9 inches from each other; and otherwise observe the general rules for pruning cherries on walls and espaliers.

**Stirring the soil.** After pruning, the borders are to be forked up, and a little well-rotted dung mixed with sand worked in if thought necessary. In summer they may be slightly stirred on the surface, and weeded to keep them fresh, clean, and neat, and where a part of the border is outside the house cover with horse-dung or litter in the early part of the season.

**The time of beginning to force** is sometimes December, but more generally January and February. "Newly planted trees," Nicol observes, "will bear gentle forcing next spring, from the first or middle of March, which ought to be considered merely as preparatory to forcing them fully, till about the first of February the third year." Torbron, if the trees have been removed with good balls, admits of gentle forcing the first spring, but prefers deferring it till the third year. He says, "I have had an abundant crop of fine cherries from trees which had been planted only a few months before forcing, but would not recommend the risking of a whole crop, unless the trees have been longer established." Where cherries are to be ripened early in the season he "shuts in about the beginning of December, and lights the fires about the third or last week of that month." Hort. trans. 4. p. 116.

**Temperature.** Abercrombie begins at 40°, and throughout the first week lets the minimum be 40°, and the maximum 42°, giving plenty of air. By gradual advances in the second, third, and fourth week, raise the course to 42° min. and 45° max. In strong sunshine admit air freely rather than have the temperature above 52°, by collecting the warm air. In the fifth and sixth week the artificial minimum may be gradually elevated to 45°, but the maximum should be restrained to 48° from fire heat, and to 55° from sun heat, until the plants are in flower. After the blossoms are shown, and until the fruit is set, aim to have the heat from the flues at 48° min. and 52° max. At this stage maintain as free an interchange of air as the weather will permit, and when the sun heat is strong do not let the temperature within exceed 60°. As the fruit is to be swelled and ripened, the requisite heat is 60° min. and 65° max." In January M'Phail does not let the cherry-house rise higher than 50°. In February "if the thermometer in the morning is as low as 35° there is no danger, but it should rise in the course of the day to imitate nature as near as possible. In the month of March the thermometer in the open air in the shade seldom rises above 55°. In the month of April it seldom rises above 65°. But it is observed that when the sun shines on a cherry tree or other trees in the open air, the heat on them is higher than in the shade. The cherry tree is of such a delicate nature to force, that it is impossible for any person to write down the exact temperature of the air, which would insure a crop from it in the forcing way." When the fruit is beginning to colour and swell off for ripening, the temperature may be raised 4 or 5 degrees. Torbron (Hort. trans. 4 p. 119.) says, "for the first three, four, or five weeks of lighting fires, if the weather be so severe as to depress the thermometer in the open air from 22° to 12° degrees; then let the thermometer inside the house be kept from 35° to 40°, or just sufficient to exclude the frost. If the weather be not severe
during the above period the thermometer may be kept to 45° inside the house. As the season advances and becomes more mild, and the days longer, probably about the first or middle of February, the thermometer may be raised to 50°, and then it is expedient to give gentle sprinklings by an engine or syringe two or three times a week in the evening. Whilst the trees are in blossom no sprinkling must be used, but the flies when only moderately hot are to be steamed morning and evening, and every day and hour of sunshine, and in calm and mild weather fresh air must be copiously admitted. When the petals begin to drop, and when the fruit is set, the temperature may be raised to 65°, the house being engined three or four times a week in the evening, but never till the bloom is all down. When the cherries are completely stoned the thermometer may be raised to 60° by fire heat, sprinkling every evening by the engine till the fruit is nearly ripe; the house may be kept higher by day as well as by night after stoning.

**Watering.** M'Phail waters occasionally at the root and over the top till the trees are in blossom; but when the stones in the fruit are become hard, the trees may be washed all over occasionally with clean water, not too cold. Let this be done in a fine sunny morning. In April, when the cherries are grown large, give the border a good watering now and then, which will enable the trees to swell their fruit to a good size; by keeping them in a healthy growing state the fruit will be fine flavoured, and the trees will make strong flower-buds for the ensuing season. If the fruit is not ripening, wash the trees occasionally, in a sunny morning, with sweet clean water. According to Torbrón, "from the time the flower begins to open till the fruit is completely stoned, the soil should be but sparingly watered; but when the stoning is effected water may be applied to the roots freely till the fruit is nearly ripe, when he desists." (Hort. trans. 4. p. 119.) Before the fruit begins to colour the engine should be exercised with force, and often for a week or two, to subdue the red spider. After the crop is gathered the watering must be resumed, and continued till the foliage begins to drop. The border may be kept in a moderately moist state until the leaves begin to fall, or till the house be exposed or be uncovered.

**Air.** In forcing the cherry it is essential to continue a free circulation of air; always sustaining the minimum heat in the different stages. The blossoms will sometimes fall abortive, or the young fruit drop off after setting, from no other cause than a stagnant atmosphere. At first beginning to force M'Phail gives plenty of air night and day. In February, when the trees are in blossom, "let the house have air day and night, and as much as you can when the fruit are swelling off." Nicol says, "the airing of the cherry-house may be performed by the sashes with every safety till the buds begin to expand, and after that in frosty or bad weather air may be admitted by the ventilators. In February nothing is more conducive to the health of the plants, and the setting of the fruit, than a regular and free circulation of air. A day should never pass without less or more air being admitted. As the fruit begins to ripen give as large and regular portions of air as possible, opening the sashes by 8 or 9 o'clock in the morning, giving full air about 10 o'clock, reducing about 2 or 3, and shutting up about 4 or 5, sooner or later according to the state of the atmosphere. In conducting this matter, however, regard must be had to the temperature, but air may be admitted in sunshine to such an extent as to keep down the mercury or spirits in the thermometer to 65°, and at other times to 60°." Gard. cal. p. 359. Torbrón says, "the cherry in forcing requiring more fresh air than most other fruits, particular attention must be paid to its admission, by the gardener having it in his power occasionally to make as many inlets or openings as convenient. It will be conducive to this end that the roof and the upright or front sashes, if any, be movable, and all with little difficulty, because in changeable weather the current of air may be required to be augmented or reduced many times in one day. Air must be admitted freely and copiously when the weather is mild and calm, and accompanied with sunshine, during the time the cherries are in blossom, and also near the time of their ripening." Hort. trans. 4. p. 119.

**Insects and diseases.** "The cherry is liable to be infested by a small grub-worm, which rolls itself up in the leaves, and extends its ravages to the fruit. As soon as the insect is perceived the trees should be searched daily, that it may be destroyed by the hand, and prevented from spreading. It usually shows itself first about the time of flowering." Prac. gard. p. 661. The cherry-house, as the season advances, may be smoked once a week or ten days, which will prevent the trees from being infested with a blackish kind of insect, frequently very pernicious. Birds are apt to get into the house and eat the fruit, therefore narrow nets should be employed, which will prevent birds as well as wasps and flies from getting to the fruit. Torbron fumigates for the black fly, and picks off the grub.

**Gathering and keeping the fruit.** If it be found necessary cherries will keep some time on the trees, provided the birds can be kept from them. Keep the house for the purpose dry, cool, and well aired. Gard. rem. p. 246.

**Exposing the wood.** This, according to all the authors quoted, may be done from the fruit to the gathered till with a week or ten days of the recommencement of forcing. The glass should be entirely taken off, unless the cherry-house is in part used for some other purpose, to which this practice would be injurious.

**Forcing cherry trees in pots.** M'Phail and Nicol concur in approving the very general practice of planting cherry trees in pots; in which, or in tubs of a foot or 15 inches in diameter, they may be successfully forced. Three or four dozen good plants managed in this way would give a great deal of fruit, which might be had in succession for a considerable length of time by dividing the plants into 3 or 4 classes or divisions, and shifting them from one compartment to another. In January the first 12 trees may be placed in the green-house or conservatory, if there be one, or in a peach-house now at work, placing them in the coolest part of the house, but in the full light, and where they may have plenty of air. They must be duly attended to with water at the roots, and be frequently syringed at top, generally once in two days. The pots being occasionally watered with the drainings of the dung-hill would add much to the vigour of the plants; there is no method of manuring more effectual or so readily accomplished. The plants may remain here till the fruit be fairly set, the stoning over, and all danger of dropping past. They may then be placed in a winery or stove to ripen off, where they would come in early, and be very high flavoured, if placed near the light, and so as that they may have free air daily. In February a second and third dozen should be taken in, and a fourth in the beginning of March, and each similarly treated. Gard. kal. It is very common with early forced cherry trees to bear a second crop late in the same season. Hort. trans. 3. p. 367. Mr. B. Law (Hort. trans. series 2, vol. 1.) finds the following method of forcing cherries attended with greater success than any other he is acquainted with. He puts the cherry trees into his houses, giving them but very little water at the close of the year, by which he finds them better prepared for blooming in the spring. Their pots have a capacity of from two quarts to two gallons, according to the size of the plants, but the soil in which they are planted is by no means rich, for he finds that highly manured soil makes the shoots too luxuriant, and causes them to gum. When he begins to force he waters but sparingly, and admits air both by night and by day as much as
leaves ovate, lanceolate, acuminate, sharply serrated; flowers umbellate; umbels on short peduncles; bracteas ciliat.; calyx tubular, length of the peduncle; limb of calyx reflexed; fruit roundish, red. H. Native of Nipaul, between Hurdwar and Siranaghar. Flowers rose-coloured. The wood is reckoned very useful in Nipaul. The fruit is like that of a common cherry; it is refreshing, but not very sweet. The tree is found in the south of Hindostan, Nipaul, Kamaon, Deyra, Sirmore, and elsewhere in great abundance. Puddum is the vernacular name of the tree.

10 C. *vulgaris* (Michx. fl. bor. amer. 2. p. 286.) striated; branches twiggy; flowers subumbellate, pedunculate; calyx short, ciliate; leaves obovate-oblong, erect, glaucous beneath, glabrous, hardly serrated; fruit ovate, red. H. Native of Canada. Prunus *vulgaris*, Lind. Fl. 75. Mill. fig. t. 89. f. 2. Cerasus glauca, Moench. Meth. 673. Stature of Amygadus nana. In Canada it is commonly called *Ragoumainier*. Flowers white. Fruit red acid.

**Dwarf Canadian-cherry.** Fl. May. Clt. 1756. Sh. 3 to 4 ft.

11 C. *pygeae* (Lois. in Duham. ed. nov. 5. p. 32. no. 21.) unarmed; umbels sessile, few-flowered; leaves ovate-elliptic, acutish, glabrous on both surfaces, tapering to the base, sharply serrated, bearing 2 glands at the base; fruit black, hardly succulent, about the size of a large pea. H. Native of North America. Prunus *pygeae*, Wild. spec. 2. p. 393. Flowers white, size of those of *Prunus spinosa*.

**Pigny Cherry.** Fl. May. Clt. 1823. Shrub 3 to 4 feet.

**Black Canadian-cherry.** Fl. April, May. Clt. 1773. Shrub.

13 C. *borealis* (Michx. fl. bor. amer. 1. p. 286. Lois. l. c. p. 32. no. 20.) flowers sub-corymbous; pedicels longish; leaves oval-oblong, acuminate, membranous, glabrous, corymbose, deltiform; fruit small, egg-shaped, red, with sweet flesh. H. Native of North America, on the high mountains of New England. Prunus *borealis*, Poir. dict. 5. p. 674. Leaves like those of the common almond, with the serratures inflamed, and tipped by glands at the apex.

**Northern Cherry or Cherokee.** Fl. May. Clt. 1822. Sh.

14 C. *glandulosa* (Lois. in Duham. ed. nov. 5. p. 33. no. 26.) flowers solitary; peduncles pendulous; leaves oblong, acute, with glandular serratures, glabrous, of the same colour on both surfaces; branches unarmed. H. Native of Japan. Prunus *glandulosa*, Thunb. fl. jap. 203. Corolla flesh-coloured.

**Glandular-leaved Cherry.** Shrub 5 to 8 feet.

15 C. *aspera* (Lois. l. c. p. 33. no. 24.) branches dotted; flowers solitary, terminal, pedunculate; leaves ovate, acuminate, serrated, scabrous on both surfaces. H. Native of Japan. Prunus *aspera*, Thunb. fl. jap. 201. Poir. dict. 5. p. 675. Drupe the size of pepper, blue, glabrous, edible, containing a hard acutish stone. The upper surface of the leaf is so hard that it is used for polishing in Japan.

**Rough-leaved Cherry.** Shrub 5 to 6 feet.

16 C. *incisa* (Lois. l. c. p. 33. no. 27.) branches unarmed; flowers solitary; peduncles capillary, twice the length of the leaves; leaves ovate, deeply serrated, villous; calyx cylindrical, ferruginous. H. Native of Japan. Prunus *incisa*, Thunb. fl. jap. 202. Petals rose-coloured.
Cut-leaved Cherry. Shrub 6 feet.

18 C. hypera (Michx. fl. bor. amer. 1. p. 284.) umbels sessile, aggregate; segments of the calyx lanceolate; leaves oval-oblong or obovate, abruptly acuminate; fruit subovate. ♂. H. Native of Canada, Virginia, in the shady woods of Carolina. Lois. in Duham. ed. nov. 5. p. 194. Flowers white. Fruit black and astringent, eatable only in the winter.

Prunus coriacea (Ser. in D. C. prod. 2. p. 538.) document; flowers usually solitary, almost sessile; calyx tubular; leaves ovate, deeply-serrate, glandless, clothed with hoary tomentum beneath; fruit ovate, red, with tender flesh, and with the sutures of the stone very blunt. ♂. H. Native of the mountains of Candia, and on mount Lebanon, and of Siberia. Prunus prostrata, Labill. syn. sec. 1. p. 15. Lois. in Duham. ed. nov. 5. p. 182. t. 53. f. 2. good. Curt. bot. mag. 136. Prunus incana, Steven in mem. soc. mosq. 3. p. 263. Petals ovate, retuse, rose-coloured.

20 C. numilis (Moris, elench. sard. 17.) stems depressed; flowers usually solitary, pedicellate; calyx tubular; leaves oblong or ovate, unequally serrated, glabrous, and green on both surfaces, reticulately veined beneath; fruit ovate. ♂. H. Native of Sardinia. Habit of C. prostrata, but differs from it in the nerves being hoary. Petals ovate, of a pale rose colour.

21 C. chica (Michx. fl. bor. amer. 1. p. 284.) branches rather spinous, quite glabrous; flowers usually twin; pedicels very short; calyx glabrous, with very short segments; leaves oval-oblong, acute or acuminate; fruit nearly globoso, small, yellow. ♂. H. Native of Carolina, to which country it has been introduced by the Indians, and by them called Chicasaw. Chicasaw Cherry or Plum. Fl. April. May. Clt. 1806. Shrub 6 feet.

23 C. japonica (Lois. in Duham. ed. nov. 5. p. 33.) leaves ovate, acuminate, glabrous, shining; peduncles solitary; lobes of calyx shorter than the tube. ♂. G. Native of Japan. Prunus japonica, Thum. fl. jap. p. 201. Prunus Sinensis, Pers. ench. 2. p. 36. Flowers red. Drupe the size of a pea.

Var. ♂. multiformes (Ser.) flowers semi-double, with the petals white on the upper side, and red on the under. Prunus Japonica, Ker. bot. reg. 27.

25 C. serrulata (G. Don, in Loud. hort. brit. p. 480.) leaves obovate, acuminate, setexously serrated, quite glabrous; petiolo glandular; flowers in fascicles. ♂. G. Native of China, where it is called Yung-to. Prunus serrulata, Lindl. hort. trans. 7. p. 238. This species is generally known by the name of double Chinese-cherry. The flowers are pale white, and very ornamental.

26 C. salicina (G. Don, in Loud. hort. brit. p. 480.) flowers usually solitary, shorter than the leaves; leaves obovate, acuminate, glandularly serrated, glabrous; staminal subulate, glandular, length of the pediole; petiole glandless. ♂. F. Native of China, where it is called Ching-chow-lee or Tung-chow-lee plum. Prunus salicina, Lindl. hort. trans. Flowers small, white. Fruit about the size of those of the Myrobolan plum. It seems to come nearest to C. glandulosa.

Sect. II. Laurocerasus (the name indicates it is a cherry in fruit, and laurel in leaves). Laurocerasus and Cerasus species, Tourn. inst. t. 493. Flowers disposed in racemes, rising from the branches.

1 Prunus (from πυκες, pudes, a name given by Theophrastus to a tree analogous to the cherry). Leaves caducous.

27 C. Pennsylvania (Lois. in Duham. ed. nov. 5. p. 9.) umbels almost sessile, aggregate, sometimes in the form of panicles; leaves oblong-lanceolate, acuminate, glabrous, biglandular at the base. ♂. H. Native of North America, Canada as far as the Saskatchewan, and from Newfoundland to the Rocky Mountains. Prunus Pennsylvanica, Lin. fl. suppl. 252. Prunus lanata, Willd. arb. 240. t. 3. f. 3. Flowers white. Fruit smaller than those of the cherry, agreeable to eat.

28 C. paniculata (Lois. l. c. p. 5. 9. Ker. bot. reg. t. 80.) flowers panicled, spreading; leaves ovate. ♂. G. Native of Japan. Prunus paniculata, Thunb. fl. jap. 200. Flowers large, white. Very like C. Mahaleb, but differs in the panicle of flowers being larger and more spreading, in the flowers being smaller, in the leaves being more oblong and attenuated at the base, and acutely serrated.

29 C. pseudo-cherasus (G. Don, in Loud. hort. brit. 200.) leaves obovato-acuminate, flat, serrated; flowers racemose; branches and peduncles pubescent; fruit small, pale red, of a pleasant subacid flavour, with a small smooth stone. ♂. H. Native of China, where it is called Yung-to. Prunus pseudo-cherasus, Lindl. hort. trans. 6. p. 90. Prunus paniculata, Ker. bot. reg. 800, but not of Thunb. Flowers white. This species of cherry forces well.

False-cherry. Fl. April, May. Clt. 1821. Sh. 6 to 10 feet.

30 C. mahaleeb (Mill. dict. not. 4. D. C. fl. fr. 4. p. 480.) racemes somewhat corymbose, leafy; leaves broad, roundish-cordate, denticulate, glandular, folded together; fruit ovaet-roundish, black. ♂. H. Native of the south of Europe. Lois. in Duham. ed. nov. 5. p. 6. t. 2. Prunus Mahaleb, Lin. spec. 978. Jacq. fl. austr. t. 227. Resembling the apricot in foliage. Flowers white. The wood is red, very hard, and sweet-scented, and on that account is greatly esteemed by the French for making cabinets and other furniture, under the name of bois de Santoine.
Amygdalaceae. V. Cerasus.

Lucir. The fruit is black, yielding a bitter purple juice, the
taining of which is not easily effaced. A fragrant and pleasant
distilled water is made from both leaves and flowers.

31 C. Pauus (D. C. fl. fr. 4, p. 580.) racemes elongated,
leafy, drooping; petals obovate; leaves ovate-lanceolate, rather
acuminated; fruit round, black, astringent. $\gamma$. H. Native of
Europe and Siberia, in hedges and in woods; plentiful in some
parts of Britain. Prunus Paus, Lin. spec. 677. Smith, engl. bot.
t. 1383. Flowers white. Fruit black, called bird-cherry, fruit-cherry,
cluster-cherry, and in Scotland hag-berry. A strong decoction
of the bark is used by the Finns to cure venereal complaints.
The fruit is nauseous to most palates, but infused in gin or
whiskey it greatly improves these spirits, and is only surpassed
by an infusion of peach leaves.

Var. a, vulgaris (Ser. in D. C. prod. 2. p. 539.) flowers large,
loose, on long peduncles; fruit black. Prunus pads a, D. C.
Var. B, pareflora (Ser. 1. c.) flowers smaller; peduncles
shorter and denser; fruit black. Oed. fl. dan. t. 205.

Var. $\gamma$, rubra (Ser. in D. C. prod. 2. p. 539.) fruit red. C.
rubra, Willd. arbr. 237. t. 4. f. 2. ex Ait. hort. kew. ed. 2. p.
299. This is the Cornish or red bird-cherry.

Var. $\delta$, bracteosa (Ser. mss. in D. C. prod. 2. p. 539.) flowers
very numerous; pedicles furnished with long bracteas. C. Pads
$\delta$, D. C. herb.

Common Pads or Bird-cherry. Fl. April, May, Britain.
Tree to 10 to 30 feet.

32 C. Amygdalæa (Wall. pl. rar. asiat. 2. p. 78. t. 181.) leaves
cuneate, acuminate, rather serrated, and are, as well as
the flowers, glabrous, sometimes with a few glands and are
racemes axillary, solitary, or in fascicules, a little shorter than the
leaves. $\gamma$. G. Native of the mountains of Nipal. Flowers
white. Racemes nodding. Aroa is the Nipal name of the
tree.

Acuminated-leaved Bird-cherry. Tree 20 to 30 feet.
33 C. Virginiana (Michx. fl. bor. amer. 1. p. 285.) racemes
erect, elongated; petals orbicular; leaves oblong, acuminate,
doubly-toothed, smooth; petals usually bearing about 4 glands;
fruit red. $\gamma$. H. Native of Virginia, Carolina, and Canada.
238. t. 5. f. 1. Prunus arguta, Bigelow in litt.—Catesbe. car. 2. t. 19.
—Park. for. 595. t. 597. f. 6. Flowers white. Fruit glabrous.

Wood beautifully veined with black and white. The tree retains
its foliage late in autumn.

Virginian Bird-cherry. Fl. May, June. Clt. 1724. Tree
20 to 80 feet.
34 C. Canadeensis (Lois. in Duham. ed. nov. 5. p. 3.) leaves
without glands, broad-lanceolate, wrinkled, pubescent on both
surfaces, and green, drawn down into the petiole. $\gamma$. H. Naive
of Canada. Prunus Canadensis, Willd. spec. 2. p. 936.—
Plum. alm. t. 158. f. 4. Flowers white.

Canada Bird-cherry. Fl. May, June. Clt. 1820. Tree 20
to 30 feet.
35 C. Molleis (Dough. mss. Hook. fl. bor. amer. 169.) 
racemes short, pubescently tomentose, as well as the calyxes;
calyx segments reflexed; leaves obovate-oblong, crenated, pubescent
beneath; fruit ovate. $\gamma$. H. Native of the north-west coast of
America, near the mouth of the Columbia, and on subalpine hills
near the source of the river. Like C. pubescens in habit. Young
branches dark brown and downy. Flowers white.

Soft Bird-cherry. Tree 12 to 24 feet.
36 C. Emariginata (Dough. mss. Hook. fl. bor. amer. p. 169.)
racemes corymbose; pedicles elongated, glabrous; calyx glabrous,
with ovate, obtuse, reflexed segments; leaves oval, dense-
tically serrated, glabrous, acute at the base, and bigna-
dular, but obtuse at the apex, and usually emarginate; fruit glo-
bose. $\gamma$. H. Native of north-west America, on the upper
part of the Columbia river, especially about the Kettle Falls.
Flowers white. Fruit astringent. Wood red spotted with white.
Leaves 2 inches long.

Emarginate-leaved Bird-cherry. Shrub 4 to 8 feet.
37 C. Capoline (D. C. prod. 2. p. 539.) racemes rather com-
 pound, lateral, and terminal; leaves lanceolate, serrated, gla-
 brous; fruit glabrose. $\gamma$. G. Native of Mexico, in cold and
temperate places. Prunus Virginiána, Moc. et Sesse, fl. mex.
icon. ined. Prunus Canadensis, pl. mex. ined.—Hern. mex. 95.
with a figure. The leaves are about the size and form of those of
Sälfä frágilis. The fruit is the colour and form of that of
C. aúsum. The bark of this tree is employed in Mexico as a
ferriage.

Capollia Bird-cherry. Shrub.
38 C. Nipaulensis (Ser. in D. C. prod. 2. p. 540.) leaves
long, lanceolate, acuminate, bluntly serrated, glabrous, conspi-
cuously and reticulately veined beneath, and whitish, plose in
the axis of the nerves; peduncles short, rather villous, as well
as the rachis; calyx glabrous; fruit? $\gamma$. H. Native of Nipal.
The leaves are almost the form of those of Sälfä frágilis.

39 C. Capricéna; leaves elliptic, acuminate, coriaceous, glau-
 brous, quite entire, with undulate curved margins; petioles
ovoid; racemes either solitary or aggregate by threes, many-
flowered, glabrous, shorter than the leaves. $\gamma$. G. Native
of Nipal, at Naninhetty. Prunus capricida, Wall. in litt. Prunus
undulata, Hamilt. ed. D. Don, prod. p. 299. Cerasus undulata,
Ser. in D. C. prod. 2. p. 540. The leaves of this shrub con-
tain so large a quantity of prussic-acid as to kill the goats of
Nipal. This shrub is probably evergreen.

Gout-killing Bird-cherry. Sh.
40 C. Elíptica (Lois. in Duham. ed. nov. 5. p. 4.) leaves
elliptic, serrated, bluntish, veinous, glabrous. $\gamma$. H. Native of
Japan. Prunus elliptica, Thumb. fl. jap. 199. Drupe oblong,
about the size of a small grape.

Elliptic-leaved Bird-cherry. Tree.
41 C. Serótila (Lois. in Duham. ed. nov. 5. p. 3.) racemes
loose, at length pendulous; leaves oval or obovate, acuminate,
simply serrated, opaque, shining above, naked on both surfaces,
bearded in the axis of the veins beneath; pedioles biglandular;
fruit dark purple, glabrose. $\gamma$. H. Native of North America,
in Canada and Newfoundland. Prunus serótina, Willd. arbr.
239. t. 5. f. 2. Prunus Virginiana, Mill. dict. no. 2. Leaves
rather coriaceous, shining, the floral ones very narrow at the
base, Flowers white. This is the Tawnoy-men-ahitik of the
Cree Indians. Its fruit is termed Tawnoy-men-ora or Choke-
cherry; it is not very edible in a fresh state, but when dried
and bruised it forms an esteemed addition to pemican. Dr.
Richardson says it is the C. Virginína.

Var. $\beta$, retusa (Ser. mss. in D. C. prod. 2. p. 540.) leaves
roundish, obovate, rather villous beneath, very blunt, and rather
retuse at the apex; the middle nerve pilose on both sides. $\gamma$. S.
Native of South America.

Late Bird-cherry, or Choke-cherry. Fl. May, June. Clt.
1629. Tree 20 feet.

$\gamma$. 2. Lawrooféras (lauros, the laurel, and crasus, the cherry;
the trees are cherries in fruit but laurels in the leaves). Leaves
coriaceus, permanent, evergreen.

42 C. Occidentalis (Lois. in Duham. ed. nov. 5. p. 4.) 
racemes lateral; leaves glabrous, oblong, acuminate, quite en-
tire, glabrous on both surfaces. $\gamma$. S. Native of the West
3 and 2.
Indies. Prunus occidentalis, Swartz, fl. ind. occ. 2. p. 925.—Catesb. car. 2. p. 94. t. 94. ? Flowers white.

Occidental Bird-cherry. Fl. year. Clt. 1784. Tree 20 ft. 43 C. Luísitânea (Lois. in Duham. ed. nov. 5. p. 5.) racemes erect, axillary, longer than the leaves; leaves ovate-lanceolate, serrated, glandless. ? H. Native of Portugal and Pennsylvania. Prunus Luisitânea, Lin. spec. 678. Mill. fig. 131. t. 196. f. 1.—Dill. Hort. elth. 193. t. 159. f. 193. Fruit ovate, red when ripe. The Portugal laurel is one of the most elegant shrubs which we have in our plantations, especially when planted in a proper situation and soil. The evergreen shining leaves and the long racemes of white flowers make altogether a very striking appearance. It was brought to England from Portugal, but whether it is a native of that country is doubtful. Var. H. Hixa (Ser. in D. C. prod. 2. p. 540.) leaves larger; racemes more elongated; flowers looser. ? H. Native of Teneriffe, the Grand Canary, and Palma. Prunus Hixa, Bouss. ex Willd. enum. 517. Prunus multiglandulosa, Cav. ann. sci. nat. 5. p. 55. The lower serratures of the leaves are glandular, according to Wildenow.

Portugal Laurel. Fl. June. Clt. 1648. Tree 10 to 20 feet. 44 C. lauro-cerasus (Lois. in Duham. ed. nov. 5. p. 6.) racemes shorter than the leaves; leaves ovate-lanceolate, remotely serrated, furnished with 2 or 4 glands beneath; fruit ovate, acute. ? H. Native of the Levant, Caucasus, the mountains of Persia, and the Crimea. Prunus Lanocerasus, Lin. spec. 678. Chelius received it in 1576 from David Ungand, then ambassador from the Emperor of Germany at Constantinople, with some other rare trees and shrubs, all of which perished except the common laurel and horse-chestnut. It was sent by the name of Trabison Cannus or Date of Trebison. The leaves have a bitter styptic taste, accompanied with a flavour resembling that of the bitter almond; this flavour has caused them to be used for culinary purposes in custards, puddings, blanc-mange, &c., and as the proportion of the sapid matter of the leaf to the quantity of milk is inconsiderable, no bad effects are produced. Laurel-water is prepared, according to the Prussian pharmacopoeia, by drawing off 3 pounds of distilled water from 2 pounds of the fresh leaves. See Amygdalus.

Cherry-laurel or Common Laurel. Fl. April, May. Clt. 1629. Shrub 6 to 10 feet. 45 C. spilero-carpa (Lois. l. c. 5. p. 4.) racemes axillary, erect, small, shorter than the leaves; leaves glandless, quite entire, shining; flowers distant; fruit nearly globose. ? H. Native of Jamaica, St. Domingo, Hispaniola, and Brazil, in woods. Prunus spilero-carpa, Swartz. fl. ind. occ. 2. p. 927. but not of Michx.—Sloane. hist. 2. p. 9. t. 193. f. 1. Wood very hard and white. Leaves 2 inches long and about an inch and a half broad, nearly round. Fruit purple when ripe. Round-fruited Evergreen Bird-cherry. Fl. June, July. Clt. 1820. Tree 10 to 12 feet. 46 C. Brasilie-siss (Cham. et Schlecht. Linnaea. 2. p. 542.) racemes axillary, shorter than the leaves, erect; leaves elliptic, acuminate at both ends, quite entire, with revolute edges, furnished with a gland on both sides of the middle nerve at the base beneath. ? H. Native of Brazil. Drupe black.

Brasilian Evergreen Bird-cherry. Tree. 47 C. Caroliniana (Michx. fl. bor. Amer. 1. p. 285.) leaves on short petioles, oblong-lanceolate, mucronate, smooth, rather coriaceous, almost entire; racemes axillary, dense, shorter than the leaves; flowers rather large; fruit nearly globose, mucronate, sessile. Native of North America, from Carolina to Florida. Lois. in Duham. ed. nov. 5. p. 5. Prunus Caroliniana, Ait. hort. kew. 2. p. 163. Leaves about 2 inches long, ¾ of an inch broad, with a few indents on their edges. Flowers white.

Willow-leaved Evergreen Bird-cherry. Tree 20 to 30 feet. 49 C. fermentínea (D. C. prod. 2. p. 540.) leaves ovate, permanent, on short petioles, retuse; petals and branches clothed with rusty velvet down; racemes length of leaves. ? H. Native of Mexico. Fruit unknown.

Capuli Evergreen Bird-cherry. Tree.

Cult. All the hardy kinds of this genus are well adapted for shrubberies; they are generally increased by cuttings or layers, which should be planted in September, in as sheltered a border as possible; some of them are raised more readily by seeds, as the Portugal laurel. Ripened cuttings of the stowe and greenhouse kinds root freely if planted in a pot of sand, with a hand-glass placed over them; those of the stowe require bottom heat to make them strike root.

VI. POLYDON'TIA (from πολύς, poly, many, and οὖς oivos, odous odontos, a tooth; calyx having more teeth than other genera in the order). Blum. bijdr. 1104.

Lix. syst. Iexsâdría, Monogyx. Calyx inferior, campanulate, with a 6-cleft deciduous limb. Petals 6, very minute, inserted in the limb of the calyx. Stamens 12-18, nearly equal, inserted with the petals. Ovary free, 1-celled. Stigma peltate. Drupes kidney-shaped, dry, 1-seeded. Embryo exalbuminous, inverted.—A tree 30 to 50 feet high, with alternate, oblong, quite entire, exstipulate leaves, for the most part biglandular at the base. Racemes axillary and lateral, solitary or crowded, tomentose. Flowers small, furnished with 1 bractea each. This genus is hardly distinct from Amygdalus.

1 P. arboëra (Blum. bijdr. p. 1105). ? S. Native of Java, in mountain woods.

Tree Polydontia. Tree 30 to 50 feet.

Cult. A mixture of loam, peat, and sand will suit this tree; and ripened cuttings will strike root, if planted in sand, under a hard-glass, in heat.

Calyx 5-cleft (f. 65. a. f. 66. a. f. 67. a.), imbricate in aestivation, with a disk either lining the tube (f. 67. b.), or surrounding the orifice, the fifth lobe next the axis. Petals 5 (f. 65. b. f. 66. b. f. 67. c.), perigynous, equal. Stamens from 20-50, arising from the calyx or the disk, with the petals curved inwards in aestivation; anthers innate, 2-celled, bursting lengthwise. Ovaries superior, several together (f. 65. d.), free from the calyx. Follicles or carpels several (f. 65. d.), distinct, disposed in a whorl, around an imaginary axis of the flower, usually 5 (f. 65. d.) in number, but sometimes fewer from abortion, apiculate by the styles, they at length become capsular, and open
I. PURSHIA. Lobes of calyx all obtuse. Stamens about 25, rising from the calyx. Carpels 1-2, ovate, oblong, containing 1 seed, which is inserted at the base of the carpel. Leaves cuneate, deeply toothed at the apex.

2. KERRIA. Lobes of calyx 5, 3 of which are obtuse, and the other 2 mucronate. Stamens about 20, arising from the calyx. Carpels 5-8, globose, containing 1 seed each, which adheres to the side.

3. SPIREA. Calyx 5-cleft (f. 65. a. f. 66. a.). Stamens 20-50, inserted with the petals in the torus, which adheres to the calyx. Carpels 2-5 (f. 65. d.), rarely solitary, free, rarely joined, containing 2-6 seeds in each, fixed to the inner suture.

4. GILLÉNIA. Calyx 5-cleft (f. 67. a.). Petals linear, contracted at the base (f. 67. c.), rising from the top of the tube. Stamens 10-15, inclosed (f. 67. b.). Carpels 5, somewhat conuate into a 5-celled fruit; cells 2-seeded.

† A genus doubtful whether it belongs to the present order.

Cult. A dry light sandy soil will answer this shrub best. Cuttings may be rooted under a hand-glass, but the shrub is easier increased by seeds.

Linn. syst. Icosandria, Pentagynia. Calyx 5-cleft; lobes ovato, of which are obtuse, and the other 2 completely mucronate at the apex, imbricate in aestivation. Petals 5, orbicular. Stamens about 20, arising from the calyx with the petals, exserted. Carpels 5-8, globose, free, glabrous, each ending in a filiform style. Seed solitary in the carpels, adhering laterally. —An evergreen shrub, with smooth green bark, twiggy branches, ovate-lanceolate, coarsely and unequally serrated, feather-nerved, conduplicate leaves, linear-subulate stipulas, and large yellow flowers, which are usually double in the gardens.

The single-flowered Kerria has not yet been introduced to the gardens, but the double-flowering variety is very common.

Japonica Kerria. Fl. all the year. Ch. 1700, Sh. 4 to 10 ft.

Cult. Kerria is an elegant shrub when in blossom, being clothed with double yellow flowers all the summer. It is hardly enough to stand the winter in the open air, if planted against a south wall. Cuttings, taken off at a joint when in a young state, root readily, if planted under a hand-glass.

III. SPIREA (said to be from σπείρα, speira, to become spiral; in allusion to the fitness of the plants to be twisted into garlands). Linn. gen. 620. Geirn. fruct. 1. p. 337. t. 69. D. C. prod. 2. p. 541.—Spirea, Ulmário, and Filipendula, Tourn. inst.—Spirea species, Cambess. mon. sp. in ann. sc. nat. 1. p. 227.

Linn. syst. Icosandria, Di-Pentagynia. Calyx 5-cleft (f. 65. a. f. 66. a.), permanent. Stamens 10-50, inserted in the torus, lining the calyx along with the petals. Carpels solitary, or several together (f. 65. d.), rarely connected at the base, ending in short points, sessile, rarely stipitate. Seeds 2-6, fixed to the inner suture of the carpel. Embryo inverted. Cotyledons thickish.

—Unarmed shrubs or perennual herbs, with alternate branches. Leaves usually simple, but sometimes pinnately cut, as in Section Ulmária, having pinnate or palmately nervate leaves. Flowers white or reddish, never yellow.

1 S. OPHELÍFOLIA (Lin. spec. 702.) leaves cordate, 3-lobed, biserated, stalked; calyces pedunculate, hemispherical; flowers numerous; pedicels slender, glabrous; sepals spreading; carpels large, diverging; seeds ovalate, shining, yellow. H. Native of North America, from Canada to Carolina, on the mountains. Cambess. in ann. sc. nat. 1. p. 386. Lois. in Duham. ed. nov. 6. p. 61. t. 14.—Comm. hort. 1. p. 169. t. 37. Flowers white. Carpels 3.

Var. β, tomentella (Ser. in D. C. prod. 2. p. 542.) peduncles and calyxes tomentose. Native at the grand rapids of the Columbia river.
Guilder-rose-leaved Spiraea. Fl. June, July. Ct. 1690. Sh. 5 to 6 feet.

2 S. moxo'gya (Torrey, in ann. lyc. 2. p. 194.) leaves broad-ovate, slightly 3-lobed, deeply serrated, glabrous; corymbs umbellate; flowers monogenous; lobes of calyx crenately spreading; ovaries villous. 之星 H. Native of North America, on the Rocky Mountains. Flowers white. Carpel solitary.

Monogynous Spiraea. Shrub 3 to 4 feet.

3 S. cap'itä (Pursh, fl. Amer. sept. 1. p. 342.) leaves ovate, a little lobed, doubly serrated, tomentose, and reticulately, corymbs terminal, crowded, somewhat capitulate, on long peduncles. 之星 H. Native of North America, on the eastern coast, and at the river Columbia. Cambess. l. c. 1. p. 365. Flowers white. Carpels 2, said by Hooker to be a variety of S. opulifolia.

Capitate-flowered Spiraea. Shrub 3 to 4 feet.

SECTION II. Chamædrys (Chamaedrys, the name of the germen; form of leaves). Ser. mss. in D. C. prod. 2. p. 542.

Spiraea species. Cambess. mon. sp. in Ann. ser. nat. 1. p. 384. Ovaries free. Torus free at the apex, but adhering to the calycine tube at the base. Shrub, with hermaphrodite flowers, disposed in umbels or corymbs; pedicels undivided, 1-flowered. Leaves entire or toothed, exstipulate.

Var. β, phyllitha (Ser. mss. in D. C. prod. 2. p. 542.) sepals distinct, stipitate, transformed into verticillate, lanceolate, sharply serrated leaves; petals and stamens wanting, or if present more or less deformed. S. foliifora, Poir. dict. 7. p. 353.

Emarginate Spiraea. Fl. June, Jul. Ct. 1790. Sh. 3 to 5 feet.

5 S. flexu'osa (Fisch. in litt. and Cambess. l. c. p. 365. t. 26.) leaves lanceolate, glabrous, dentately serrated from the apex to the middle; flowers disposed in corymbs. 之星 H. Native country unknown. S. alpina, Hort. terminal, ex Cambess. and Fisch. in litt. Perhaps only a variety of S. ulmi'folia. Flowers white.

Flowers white.

6 S. crata'egifolia (Link. enum. 2. p. 40.) leaves obovate, obtuse, doubly serrated in front, glabrous; corymbs terminal, compound, subcapitate. 之星 H. Native country unknown. Flowers white.

Hemlock-leaved Spiraea. Fl. June, July. Ct. 1823. Sh. 4 to 6 feet.

7 S. be'ella (Sims, bot. mag. 2426.) stems glabrous, rough; leaves ovate, glabrous, serrated, petiolate, glaucous beneath; lobes of calyx deflexed; cymes terminal, spreading, and are as well as the branches pubescent. 之星 H. Native of Nipaul. Shrub erect, branched, with the habit of S. chamadriofila. Flowers beautiful red. Carpels 5, shining.

8 S. chamadriofila (Linn. spec. 701.) leaves ovate, deeply serrated at the apex, pubescent; flowers disposed in hemispherical corymbs; pedicels slender, elongated; sepals veiny, reflexed. 之星 H. Native of Siberia, Kamatschatka, Dauria, and north-west coast of America. Cambess. l. c. 1. p. 362. Pall. fl. ros. 1. p. 32. t. 15. Flowers white.

9 S. blu'mei; leaves obovate, obtuse, deeply toothed at the apex, smoothish; cymes pendunculate, terminal, and are as well as the calyces glabrous. 之星 G. Native of Java and Japan. S. chamadriofila Japanica, Blum. bijdr. 1114. Flowers white.

Blume's Spiraea. Shrub 3 to 6 feet.

11 S. oblongifólia (Walst. et Kit. pl. hungr. 8. p. 261. t. 235.) leaves oblong-lanceolate, narrowed at the base, deeply serrated at the apex, or entire, pubescent, ciliolate; corymbs pendunculated. 之星 H. Native of Hungary. Flowers white. Like S. chamadriofila in the form of the leaves, but sufficiently distinct.

Oblong-leaved Spiraea. Fl. May, Ju. Ct. 1816. Sh. 3 to 6 feet.

12 S. lance'olata (Poir. dict. 7. p. 354.) leaves lanceolate, deeply serrated, glabrous, paler beneath; umbels few-flowered, axillary, pendunculate. 之星 G. Native of the Mauritius and China. S. Cantonensis, Lour. cocc. p. 322. ex Cambess. l. c. p. 366. t. 25. Leaves like those of S. salicifolia. Flowers white. Leaves deeply serrated only at the apex.

Lanceolate-leaved Spiraea. Shrub 2 to 4 feet.

13 S. ca'na (Walst. et Kit. pl. hungr. 3. p. 252. t. 227.) leaves ovate, acute, quite entire, or a little toothed, clothed with hoary villi; corymbs somewhat spicate, lateral, pendunculate, few-flowered, loose; sepals spreading; styles thick; carpels diverging, and rather villous. 之星 H. Native of Croatia on high rocks. Cambess. l. c. 1. p. 364. Leaves about the size of those of Sälix répens, var. argentea. Flowers white.

Hoary Spiraea. Fl. June, July. Ct. 1825. Sh. 1 to 2 feet.

14 S. vaccinifólia (D. Don, prod. fl. nep. p. 227.) leaves elliptic, acute, glabrous, glaucous beneath, serrated at the apex; branches hairy; cymes terminal, few-flowered, tomentose. 之星 H. Native of Nipaul. Lodl. bot. cab. 1403. Shrub small, erect. Flowers white.

15 S. incí'ba (Thunb. fl. jap. 213.) leaves ovate, deeply 5-parted, serrated, pale and villous beneath; cymes terminal. 之星 H. Native of Japan. Cambess. l. c. p. 262. Flowers small, white.

Cut-leaved Spiraea. Shrub 2 to 3 feet.

Three-lobed-leaved Spiraea. Fl. May, Ct. 1801. Sh. 2 to 4 feet.

17 S. alp'ína (Pall. fl. ros. 1. p. 35. t. 20.) leaves lanceolate, sessile, serrulated, glabrous, with the middle nerve pinnate; corymbs terminal, pendunculate, nearly leafless; sepals ascending. 之星 H. Native on the alps of Siberia, in woods. Flowers white.

18 S. thalictroides (Pall. fl. ros. 1. pp. 34. and 78. t. 18.) leaves obovate, obtuse, somewhat 3-lobed; umbels lateral, sessile. 之星 H. Native of Dahuria, on the alps. S. aquile'gifolia, Pall. itin. 3. append. 734. no. 94. t. f. 3. Leaves glaucescent beneath, finely 3-nerved. Flowers white.

Medea-suce-like Spiraea. Fl. May, June. Ct. 1814. Sh. 2 to 2 feet.

19 S. argé'etia (Muts., in Lin. fl. suppl. 261.) plant clothed with silky silvery down; leaves crowded, obovate, or oblong, serrated towards the apex, fan-nerved; racemes axillary and terminal, panicked; ovaries silky, biovulate. 之星 S. Native
SPIRÆCEÆ. III. SPIREA.

Silvery Spiraea. Shrub 4 to 6 feet.

20 S. pikowianus (Besser, enum. pl. pod. p. 46. no. 1428.) leaves lanceolate-cuneate, obtuse, rarely cuspidate, triple-nerved, unequally serrated at the apex; corymbs pedunculate. H. Native of Podolia, about Pikow. Flowers white.

Thunberg's Spiraea. Shrub 3 to 6 feet.

26 S. canescens (D. Don, fl. nep. p. 227.) leaves oval or obovate, obtuse, stalked, quite entire, villous; corymbs crowded, and are as well as the branches tomentose. H. G. Native of Sirimangur. S. cuneata, Wall. Shrub erect, branched, canescent, with the habit of S. hypericifolia. Flowers apparently red. Carpels 5, connivent.

Canescent Spiraea. Shrub.

27 S. canastrophilla (Horn. Hort. hainf. 2. p. 406.) leaves ovate, rounded at the base, sharply and unequally serrated from the middle to the apex; corymb terminal, on short peduncles. H. H. Native country unknown. Flowers white.

Corynabon Spiraea. Fl. June, July. Clt. 1819. Sh. 2 to 3 ft.

29 S. betulifolia (Pall. fl. ross. 1. p. 33. t. 16.) leaves broadly oval, serrated, on short petioles, glabrous; flowers disposed in fastigate panicles; carpels 5, erect, glabrous. H. S. Native of Siberia and North-west America, and in valleys of the Rocky Mountains. Camb. l. c. p. 368. t. 27. Flowers pink.

Wats. dend. brit. 67. Perhaps the same as S. crataegifolia of Link. enum. 2. p. 40.? 

31 S. Magellanica (Poir. dict. 7. p. 350.) leaves petiolate, lanceolate, unequally serrated, nerved; racemes terminal, almost simple. H. G. Native of Japan. Said to be like S. Magellânica.

Japan Spiraea. Shrub.

32 S. salicifolia (Lin. spec. 700.) stem and peduncles glabrous; leaves lanceolate, glabrous, somewhat doubly serrated; racemes rather spicate; calyce lobes triangular, spreading; carpels 5, glabrous. H. Native of Siberia, Tartary, Bohemia, and Silesia. It is to be found in England, although perhaps not truly indigenous; in many parts of Westmoreland; and also between Poolbridge and Colthouse, near Hakshead, Cumberland, and in a wood at Hafod, Cardiganshire. Smith, engl. bot. 1468. Gmel. fl. sib. 3. t. 49. Pall. fl. ros. 1. p. 36. t. 21. Duhum. arb. 2. t. 75. Flowers red or rose-coloured, disposed in thyrsoid racemes.

---

FIG. 65.
SPIRÆACEÆ. III. SPIRÆA.

35 S. Paniculata (Wildl. spec. 2. p. 1053.) leaves lanceolate, acute, sharply serrated; racemes panicked, divaricate; bracteoles ovate, sessile; H. Native of North America, Canada, and Newfoundland. S. alba, Ehrh. beitr. 7. p. 137. S. salicifolia, var. γ, paniculata, D. C. prod. 2. p. 544.—Mill. fig. 171. t. 257. f. 2. Flowers white, disposed in terminal thyrsoid panicles.

36 S. Tomentosa (Lin. spec. p. 701.) stem and peduncles clothed with rufous tomentum; leaves ovate, somewhat doubly serrated, densely clothed with tomentum beneath; calyceine lobes on the outside, triangular, deflexed; carpels 5, tomentose, divaricate. H. Native of Canada, and in many places of North-west America on mountains. Camb. l. c. p. 573.—Mill. fig. 257. f. 1. Schmidt, arb. 1. t. 51.—Pluck. phys. t. 321. f. 5. Flowers small, of a beautiful red colour, disposed in dense compound, terminal racemes.

37 S. Menziesii (Hook, fl. bor. amer. p. 173.) branches pubescent at the apex; leaves, as well as the peduncles and calyces; sepals reflexed; leaves elliptic, coarsely and unevenly serrated towards the apex, glabrous, the same colour on both surfaces; panicle crowded with flowers, oblong, obtuse; flowers small, stamens twice the length of the corolla; ovaries 5, glabrous. H. Native of North America, on the west coast. Flowers rose-coloured.

Menzies' Spiræa. Shrub.

38 S. Douglasi (Hook, fl. bor. amer. p. 172.) branches and peduncles pubescent; leaves elliptic, coarsely and unevenly serrated towards the apex, clothed with hoary tomentum beneath; panicle crowded with flowers, oblong, obtuse; flowers small; stamens twice the length of the corolla; calyceine lobes triangular, reflexed; carpels 5, glabrous, shining. H. Native of the north-west coast of America, about the Columbia and the Straits of Fuca.

Douglas' Spiræa. Shrub 4 to 5 feet.

40 S. Leucophila (Smith, in Rees' cycl. vol. 35.) leaves elliptic-oblong, toothed, pale, somewhat lobed, villous beneath; panicle large, branched, villous; pedicels bracteate; lobes of calyx acute, spreading; carpels 5, compressed, hairy. H. Native of North America, principally on the north-west coast. Flowers rose-coloured.

Aria-leaved Spiræa. Shrub.

41 S. Callosa (Thunb. fl. jap. 209.) leaves lanceolate, acutely serrated, tapering to both ends, glaucous, smoothish beneath; corymb terminal, compound, fastigate, and are as well as the calyces villous; stem and peduncules villous. H. Native of Japan and Nepal. S. expansa, Wall. Differs from S. salicifolia, in the leaves being stalked. Flowers red.

Callous-leaved Spiræa. Shrub 4 feet.

42 S. Erythreescens (Poir. dict. t. 3. p. 350.) leaves almost sessile; long-elliptic-oblong, entire, bluish; papillae and villous beneath; sepals obtuse, shorter than the corolla. H. Native of India. Cambess. l. c. p. 374. Flowers white.

Bluish-leaved Spiræa. Shrub.

43 S. Discolor (Pursh, fl. amer. sept. 1. p. 342.) leaves ovate, lobed; lobules toothed, and somewhat plicate, clothed with white tomentum beneath; panicle pedunculate, much branched. H. Native of North America, on the banks of the river Kooskoy.

Discoloured-leaved Spiræa. Shrub.

44 S. Sorbifolia (Lin. spec. 702.) leaves pinnate; leaflets sessile, lanceolate, opposite, doubly and sharply serrated; panicles thyrsoid. H. Native of Siberia, in bogs. Pall. fl. ross. 1. t. 88. t. 24.—Gmel. fl. sib. 3. p. 190. t. 40. Flowers white, sweet scented. The hollow shoots are used for tobacco-pipes in Siberia. S. pinnata, Monch. meth. 663.

45 S. Pallasi (leaves pinnate; leaflets sessile, ovate-lanceolate, deeply serrated, almost pinnatifid, opposite; flowers corymbous. H. Native of Siberia, on the high mountains about Lake Baikle. S. sorbifolia, var. β, alpina, Pall. fl. ross. 1. p. 34. t. 25. Flowers white, larger than those of the preceding species.

Sect. V. Aruncus (from aporege, aroges, a goat's beard). Ser. in D. C. prod. 2. p. 545. Spiræa species, Cambess. l. c. 1. p. 376. Carpels 5, free, pendulous. Torus very thick, free at the apex.—Herbs, with tripinnate leaves, without stipules, and oblong-carpellate flowers.

Var. β, Americana (Michx. fl. bor. amer. 1. p. 292.) leaves more shining; flowers more loose on the spikes. H. Native of North America.

Sect. VI. Ulmaria (from ulmus, the elm; form of leaflets of most of the species). Cambess. l. c. 1. p. 378.—Ulmaria, Mœnch. meth. p. 663. Torus obsolete. Style clavate, retroflexum. Ovula 2, about the middle of each ovary, fixed to the suture, and pendulous. Carpels hardly double the size of the ovaries, erect, rarely twisted.—Herbs with pinnate, stipulate leaves and cymose umbels of hermaphrodite flowers.

47 S. Ulmariæa (Lin. spec. 702.) leaves interruptedly pinnate, white from tomentum beneath; leaflets coarsely serrated, terminal one the largest and 3-lobed; sepals reflexed; styles elongated; carpels glabrous, twisted. H. Native of Europe and Siberia, in meadows and bogs; plentiful in Britain. Smth. engl. bot. 960. Curt. fl. lond. 5. t. 33. Ulmària palustris, Mœnch. meth. 663. Stem and peduncules puberulous. Stipulas roundish, joined to the petiole. Flowers white, in large compound cymes. The Meadow-sweet abounds in moist meadows, about the banks of rivers, brooks, and ditches, perfuming the air with the sweet hawthorn-like scent of its numerous blossoms, from June to August. The green parts of the herb partake of a similar aromatic flavour when rubbed or chewed. The flowers, infused in boiling water give it a very fine flavour, which rises in distillation. The leaves and tops have been used in medicine. Var. a, variegata; leaves variegated with white or yellow.

Var. β, multiceps; flowers double. Cultivated in gardens.
49. S. denudata (Presl. fl. ccc. 101.) leaves interruptedly pinnate, green, and glabrous on both surfaces; leaflets coarsely serrated, terminal one the largest and 3-lobed; sepals reflexed; carpels glabrous, twisted. 2. H. Native of Sicily and the south of Europe. S. ulmarioides, Bory, voy. sout. p. 121. S. ulmaria, Schwein. p. 380. Stem and peduncles smoothish. Flowers white, sweet scented, disposed in compound cymes.

Naked-leaved Meadow-sweet. Fl. June, Aug. Clt. 7 Pl. 2 to 5 feet.

51. S. palmata (Thunb. fl. jap. 212. but not of Lindl. nor Pall.) leaves 5-7-lobed; lobes obtuse, acuminate, acutely and doubly serrated. 2. H. Native of Japan. S. pallida, C. & P. p. 384. Flowers white or red. Panicle cymose, decompound. It comes nearest to S. opulifolia, according to Thunberg.

52. S. kamtschatica (Pall. fl. ross. 1. p. 41. t. 28.) leaves palmately lobed, upper stem leaves somewhat hastate or lanceolate; petioles appendiculate; flowers corymbose; sepals pilose, reflexed; carpels very hairy, parallel; styles subcapitate. 2. H. Native of Kamtschatka and Behring’s Island. Cam- bess. l. c. 385. Root leaves often a foot wide and 8 inches long, white, with hairs beneath, 5-lobed; lobes acute, doubly serrated, lower stem leaves 3-lobed. Flowers white, sweet-scented, larger than those of S. ulmaria, disposed in branched cymes.

Kamtschatka Meadow-sweet. Pl. 6 to 9 feet.
53. S. vestita (Wall. mss.) leaves cordate, 5-lobed, t shoot beneath, sharply and unequally serrated; petioles furnished with numerous unequal leaflets, generally the 2 in the centre very large; flowers corymbose, terminal. 2. H. Native of Kamaon. Flowers white. Like S. kamtschatica and S. ulmaria.

Cladophyll Meadow-sweet. Pl. 2 to 3 feet.
54. S. quinquemora (Baunl. ex Spreng. syst. 2. p. 503.) leaves pinnately ternate, clothed with white tomentum beneath; lateral leaflets 3-3, outer one 7-8; segments acute, serrated; panicule corymbose. 2. H. Native of Transylvania.

Five-lobed-leaved Meadow-sweet. Pl. 1 to 2 feet.
55. S. dioica (Willd. spec. 2. p. 1061.) leaves pinnate, clothed with tomentum beneath; terminal leaflet largest and 7-lobed, lateral ones 5-lobed; corymbs branched, contracted; carpels parallel, villous; styles thickish, capitate. 2. H. Native of Eastern Siberia, in meadows and moist valleys in the subalpine regions beyond the Balkal, especially in Dauria. S. palmata, Pall. fl. ross. 1. p. 40. t. 27. itin. 3. append. 735. no. 95. t. 2. f. 1. but not of Thunberg nor Lin. Flowers white. Allied to S. lobata.

56. S. Filipendula (Lin. spec. 702.) root tuberous; leaves interruptedly pinnate; leaflets uniform, oblong-linear, acutely toothed; stipules somewhat reniform, clasping the stem, toothed; corymbs loose; sepals reflexed; carpels parallel, villous, numerous; stigmas thick. 2. H. Native of Europe, in meadows, and very common in high pastures on a calcareous soil. Smith, engl. bot. 284. Oed. fl. dan. 635.—Black herb. 647. Root consisting of tubers hanging by threads, hence called Filipenda or Dropwort. Flowers white inside and red on the outside, sweet-scented, disposed in loose terminal corymbs. The whole herb is astringent, and was formerly used in medicine, but it is now altogether neglected.

Var. a, vulgaria (Cambess. l. c. p. 370.) stems tall, and as well as the leaves glabrous; leaves with scabrous margins; teeth usually piliferous at the apex.

Var. β, multiplex (Ser. in D. C. prod. 2. p. 546.) flowers double. Cultivated in gardens.

Var. γ, minor (Cambess. l. c. p. 380.) stem humble; leaves much smaller.

Cult. The hardy shrubby species of Spiraea are very pretty when in flower, and are therefore well adapted for shrubberies; they thrive well in any soil, and are easily increased by cuttings or layers. The greenhouse species are also of easy cultivation. The hardy herbaceous kinds will grow in any kind of soil, but prefer a moist situation; they are well fitted for border borders, and are increased by dividing the plants at the root.

Lin. Syst. Isosandra, Pentagynia. Calyx tubularly campanulate, 5-cleft. Petals 5, linear-lanceolate (f. 67. c.), contracted near the claws, rather unequal, rising from the top of the calyx tube. Stamens 10-15, inclosed (f. 67. b.). Carpels 5, terminated by a filiform erect style (f. 67. d.), which is capitate at the apex, somewhat connate into a 5-celled capsule, with 2 seeds in each cell.—Perennial herbs, with trifoliolate leaves and stalked serrated leaflets. Flowers from white to red, axillary and terminal, on very long peduncles. Roots emetic and cathartic.

1. G. trifoliata (Monch. suppl. p. 286.) stipulas linear, acuminate, entire. 2. H. Native of North America, in shady humid woods, from Florida to Canada. Gillenia trifoliata, Lin. spec. 702. Curt. bot. mag. 486. Digel. med. bot. t. 41. Mill. fig. 171. t. 556. Flowers in panicles. The roots of this plant possess properties analogous to Lippia. It requires, however, a larger dose, and then it is not so certain in its effects. Some authors have attributed a tonic power to the roots of Gillenia in small doses.

Trifoliata Gillenia. (Fl. June, Jul. Clt. 1713. Pl. 1½ foot.)
2. G. stipulacea (Nutt. gen. Amer. 1. p. 307.) stipulas foliaceous, ovate, deeply cut. 2. H. Native of North America, in humid woods from Tennessee to Kentucky. Gillenia stipu-

FIG. 67.

Stipulaceae Gillenia. Fl. Ju. Aug. Clut. 1805. Pl. 1 to 1 ½ ft. Cult. The species of Gillenia are elegant plants, and therefore are worth cultivating in every collection of hardy herbaceous plants. They grow best in a peat border, and are readily increased by dividing the plants at the root, in spring.

† A genus doubtful whether it belongs to the present order.

V. ADENILEMA (from αερ, aer, a gland, and ἄλημι, hilemi, to be near; glands on calyx). Blum. bijdr. 1129.

Lin. syst. Iocosandria, Monagynia. Calyx campanulate, 5-cleft, clothed with glandular pilis on the outside. Petals 5, small, inserted in the calyx. Stamens numerous, inserted with the petals. Ovary 1. Style 1, crowned by a subpelate stigma. Capsule inclosed in the calyx, beaked by the permanent style, 1-celled, opening at the side, containing 8–12 seeds, which are 1-ribbed, and fixed in a twin order on the sides of the opening suture. Spermatema testaceae. Embryo albuminous, with leafy cotyledons and a short centripetal radicle.—A sarmentose, unarmed shrub, with the habit of Rábus, with alternate, cordate, acuminated, 3-lobed, deeply serrated, bistipulate leaves. Flowers unbracteate, disposed in terminal racemose panicles. This genus apparently approaches the Nettíllia.

1 A. fállax (Blum. l.c. 1121.). Π. S. Native of Java, on mount Gede. Filaceae Adenilema. Shrub rambling. Cult. For culture and propagation, see Kagenecia.

Order LXXXII. QuillaJeæ. (plants agreeing with Quillaja in important characters). D. Don, in edinb. phil. journ. for Jan. 1831.

Calyx 5-cleft (f. 68. a.), valvate in aestivation (f. 68. d.). Petals 5 (f. 68. b.), alternating with the calycine segments, but sometimes wanting. Stamens definite in number from 10-15, inserted in the calyx; anthers bilocular. Ovaries 5 (f. 68. e.), connate at the base, 1-celled, containing numerous erect ovula. Styles 5 (f. 68. f.), disposed in a circle, connate at the base. Seeds disposed in 2 rows, inserted on the inner surface of the follicles, ascending, winged at the apex, with the umbilicus at the base; the testa simple and membranous. Albumen wanting. Embryo erect, with foliaceous convolute cotyledons, and a terete radicle, which is shorter than the cotyledons, pointing to the umbilicus. —South American trees, with alternate undivided leaves, small caducous stipules, and terminal dioecious flowers. This order differs essentially both from Rosiceae and Spiriceae in the erect ovula, and from the latter also in the valvate aestivation of the calyx. The habit of the plants composing this order is likewise abnormally different.

Synopsis of the genera.

1 Kagenecia. Calyx saucer-shaped, furnished with a ring a little elevated on the inside, girding the ovaries. Petals wanting? Stamens 15, 5 of which alternate with the lobes of the calyx, the rest by pairs opposite the lobes.

2 Quillaja. Calyx 5-cleft (f. 68. a.), Diask 5-lobed (f. 68. c.), stellate, fleshy. Petals 5 (f. 68. b.), spathulate, unguiculate. Stamens 10, disposed in 2 series, 5 of which are inserted in the middle of the calycine lobes, and the other 5 in the throat of the calyx.

3 Vaucellinia. Calyx 5-cleft. Petals 5. Stamens 15-20, exerted with the petals from the throat of the calyx.

Lin. syst. Iocosandria, Pentagyínia. Calyx saucer-shaped, 10-ribbed on the outside, permanent; limb 5-cleft, furnished on the inside with an elevated hardly membranous ring girding the ovaries; lobes recurved, acuminated or obtuse. Petals wanting? or δ, orbicular? Stamens 15, 5 of which alternate with the calycine lobes; the rest by pairs opposite the calycine lobes; filaments dilated at the base. Anthers cordate, oblong. Stigmas with cucullate disks. Carpels 5, follicular.—Trees, with dotless, glandularly serrated leaves. Stipules small, gland-formed. Flowers terminal, polygamous.

1 K. oblonga (Ruiz et Pav. fl. per. syst. 1. p. 289.) leaves oblong, obtuse, coriaceous, serrulatus; glands of teeth deciduous; flowers solitary. Π. G. Native of Chili, on mountains about Concepción. Lydén’s Lydyes, Mol. chil. ed. 2. p. 500. In its native country it is commonly called guayo colorado, but according to Molino, Lydyes. The wood is used to build houses in Chili. The leaves being very bitter are used by the inhabitants of Chili to cure intermittent fevers, as also those of the following species.

2 K. lanceolata (Ruiz et Pav. fl. per. syst. 2. p. 290. gen. p. 145. t. 37.) leaves lanceolate or ovobate, membranous, serrulatus; glands of teeth permanent; flowers corymbose. Π. G. Native of Peru, on hills in the province of Canta.

3 K. quitúinésa (H. B. et Kunth, nov. gen. amer. 6. p. 257.) leaves oblong and oblong-lanceolate, acuminate at the base, sharply crenately serrated; branches clamy, Π. G. Native of South America, on the Andes in the province of Juan de Bracamoros.

Clammy-branched Kagenecia. Tree 12 to 20 ft. Cult. These trees will grow well in a mixture of loam, peat, and sand, and ripened cuttings will probably root if planted in a pot of sand, with a hand-glass placed over them in a little bottom heat.

Lin. syst. Decandria, Pentagyínia. Calyx 5-cleft (f. 68. a.), segments ovate, bluntish, thick, tenementous, with truncate margins. Disk concretes, with the calyx 5-lobed (f. 68. c.), stellate, fleshy, smooth, nectariferous; lobes elevated from the calyx, roundish, emarginate. Petals 5 (f. 68. b.), spathulate, unguiculate, alternating with the segments of the calyx. Stamens 10 (f. 68. d.), disposed in a double order, 5 of which are inserted in the middle of the calycine lobes, rising from the notches of the lobes of the disk (f. 68. a.), the other 5 inserted in the throat of the calyx, and opposite the petals (f. 68. b.); filaments subulate. Carpels 5 (f. 68. c.), connate, spreading. Styles 5 (f. 68. f.),

III. VAUQUELINIA (in honour of M. Vauquelin, the celebrated French chemist, whose discoveries have been extended to the vegetable kingdom). Corr. in Humb. et Bonpl. pl. aquin. 1. p. 146. t. 40. D. C. prod. 2. p. 547.

1 L. mespilodes (H. B. et Kunth, nov. gen. amer. 6. p. 239. t. 562.) G. Native of Mexico, very common about the village of Magdalena. Habit of Pyrus malus, or the apple-tree. Mespilus-like Lindleya. Tree 20 to 30 feet. Cult. See Kagenzéchia for culture and propagation, p. 522.

Order LXXXIII. ROSACEÆ (plants agreeing with Rosa in important characters). Juss. gen. 534. part.

Calyx 4–5-lobed, valvate in aestivation, with the disk surrounding the orifice (f. 74. g. f. 75. e.), having the fifth lobe next the axis. Petals 5 (f. 71. b. f. 72. b. f. 75. c., &c.), perigynous, equal. Stamens indefinite (f. 69. c. f. 71. c.), arising from the calyx, just within the petals; they are curved inwards in aestivation; anthers innate, 2-celled, bursting lengthwise. Ovaries superior (f. 71. d.), several, 1-celled, 1-seeded. Ovula usually suspended, rarely erect. Styles lateral, near the apex of the ovaries. Stigmas simple and emarginate on one side. Fruit either 1-seeded nuts or akenia (f. 71. d. f. 72. c.). Seeds erect or inverted. Embryo straight, with a taper short radicle, pointing to the hylum, and flat cotyledons. Albumen wanting. — This order is composed of herbaceous plants or shrubs, but never trees. Leaves simple or compound, with 2 stipulas at the base. Rosaceous are distinguished from Pomaceae by their superior fruit, and usually suspended seeds; from Leguminosae by their regular petals and stamens, and especially by the odd segment of the 5-lobed calyx of that order, which is anterior, not posterior, as in Rosaceae; from Chrysobalanaceae in their styles proceeding from the side of the ovary near the apex, and from not the base, as in that order, by their more regular petals and stamens, and by their fruit not being a drupe; Amygdalaceae differ from Rosaceae by their terminal styles, drupaceous fruit, and presence of prussie-acid, along with the formation of gum; Sangivisorbeae differ from Rosaceae in their apetalous flowers and definite stamens, alternating with the segments of the calyx; Spiræaceae and Quillajæae differ from Rosaceae by their follicular fruit, and in the aestivation of the calyx.

Rosaceous plants are always wholesome; they are chiefly remarkable from the presence of an astringent principle, which has caused several of them to be reckoned febrifugal. The root of Tormentilla repens is used for tanning in the Feroe Islands; Potentilla anserina has been used by tanners; Potentilla repens as a febrifuge. Gèum urbànum and rivèlde have been compared for efficacy to Chinehòna. The fruit of many species of Fragaria or strawberry, and Rúbus or raspberry and cloudberry, are valuable articles for the dessert. The leaves of Rúbus arcticius and Rúosa rubiginòsa have been employed as a substitute for tea. Agra mìnàida, cipàtiòria yields a decoction useful as a gargle. The root of Rúbus villòsus is a popular astringent in North America in cholera infantum. One of the most powerful anthelmintics in the world belongs to this family, an Abyssinian plant, Brayera anthelmíntica. Upon the authority of Dr. Brayer two or three doses of the infusion are sufficient to cure the most obstinate case of tenia. The various species of roses form some of the greatest beauties of the garden. The fruit of Rúosa canìna, and other allied species, is astringent, and is employed against chronic diarrhoea and other maladies. The petals of Rúosa damascína yield a highly fragrant essential oil, called attar of roses; those of Rúosa gállica are astringent when dried with rapidity, and are sometimes found useful in cases of debility, such as leucorrhœa and diarrhoea, &c.

Synopsis of the genera.

Tribe I.

DRAY'æx. Calyx 8–10-cleft (f. 70. b.), rarely many parted 3 x 2
(f. 69. a.), valvate in aestivation, the outer lobes accessory (f. 70. b.), and alternating with the inner lobes. Petals 4-5, rarely more (f. 69. b. f. 70. c.). Carpels numerous (f. 70. d.), free, inserted in a dry or fleshy polyphore, dry (f. 70. d.) or baccate (f. 71. d.), 1-seeded. Herbs or shrubs, usually with compound leaves, with 2 stipules adnate to the sides of the petiole.

Drynas. Calyx 8-9-parted (f. 69. a.). Petals 8-9 (f. 69. b.). Stamens numerous (f. 69. c.). Carpels dry, numerous, each ending in the feathery style (f. 69. c.). Seed dehiscent.

Geum. Calyx 10-cleft, the 5 outer segments accessory. Petals 5. Stamens numerous. Carpels numerous, dry, ending each in a knob style.

Sieversia. All as in Geum, but differs in the carpels ending in a feathery (f. 70. d.) jointless style or awn.

Comarum. Calyx 10-parted, the 5 outer segments accessory. Petals 5, small. Stamens numerous. Akenia numerous, seated on an elevated spongy receptacle.

Horneilia. Calyx 10-cleft, the outer segments accessory. Petals 5. Stamens 10. Akenia inserted on a conical receptacle, inclosed in the calyx.

Siebaldia. All as in Potentilla, but the petals are very minute, and the carpels and stamens are usually 5. Seed inverted. Polyphore dry.

Brayera. Calyx double, both 5-cleft; lobes of the outer large and oblong, of the inner spatulate and shorter. Petals 5, small, linear. Stamens 15-20. Carpels 2, ending in exserted styles. Seed pendulous.

TRIBE II.

Neuradea. Calyx 5-cleft (f. 76. b.), with a short tube adhering to the corolla, valvate in aestivation. Petals 5. Carpels 10, connected into a 10-celled capsule (f. 76. c.), which is depressed at the apex. Seed bony, obliquely pendulous.—A dentatus suffrutescent herb.

TRIBE III.

Roses. Tube of calyx contracted at the mouth (f. 76. a. e.), with a 5-parted limb (f. 76. d. f. 75. b.); lobes somewhat spirally imbricated in aestivation, usually pinnatifid (f. 75. b. f. 76. d.). Petals 5 (f. 75. e. f. 76. c.). Stamens numerous. Carpels numerous, inserted inside the tube of the calyx, which at length becomes bacate and incloses them (f. 75. f. f. 76. a.). Seeds inverted.—Shrubs, with impari-pinnate leaves, serrated leaflets, and with the stipulas adnate to the petiole.

Rosa. Character the same as that of the tribe.

TRIBE I.

Dryadeae (plants agreeing in important characters with Dryas). Vent. tabl. 2. p. 349.—Fragaraceae, Rich. in Nesl. pot. p. 14. Calyx 10-cleft, rarely 8-cleft or many parted, valvate in aestivation, the outer segments accessory, and alternating with the inner ones. Petals 4-5, rarely more, alternating with the inner segments of the calyx. Stamens numerous, rarely few, inserted in the apex of the calyceine tube. Carpels or akenia numerous, rarely few, crowded, inserted in the torus, distinct from each other, and free from the calyx, bearing the styles at the side near the apex. Styles with a furrow on the inside, and expanded into an oblique stigma at the apex. Akenia 1-ovulate, free from each other, dry or bacate. Seeds solitary, erect or inverted, exalbunious. Embryo cret, with flatish cotyledons.—Herbs or shrubs, with usually compound bistipulate leaves, the stipulas adnate to the sides of the petioles.

Dryas (so named by Linnaeus from the dryades or nymphs of the oaks, in consequence of the leaves bearing some resemblance to those of the oak). Lin. gen. no. 637. Lam. ill. t. 443. Nestl. pot. 16. D. C. prod. 2. p. 549.

Lin. syst. Icosandra, Polygynia. Calyx 8-9-parted (f. 69. a.), with a somewhat concave tube (f. 79. a.). Petals 8-9 (f. 69. b.). Stamens numerous. Carpels numerous, each termin-
ated by a style, which at length becomes a feathery tail (f. 69. e.). Seed ascending.—Humble suffruticose herbs, with simple permanent leaves, which are clothed with white tomentum beneath. Flowers white, or yellow.

1 D. octopétala (Lin. spec. 717.) leaves ovate or subcordate, crenately serrated. Pole. H. Native of Europe on the Alps, and of Siberia. In Scotland, as in Breadalbane, Isle of Sky, Perthshire, Rossshire, Sutherland, and Argyshire; in Ireland, between Gort and Galloway, and near Sligo; in England, on Amidfowler, in Littendale, and near Settle in Yorkshire. Smith, eng. bot. 461. Oed. fl. dan. t. 51. This delicate evergreen plant, with its white flowers and germander-like leaves, is a great ornament to alpine heights.

Cult. Dryas is a genus of elegant little evergreen, prostrate plants; they thrive best in a border of peat soil, and sometimes they are grown in pots in the same kind of soil, and placed among other alpine plants. They are usually increased by dividing the plants at the root, and sometimes by seed.

Lin. syst. Icônia, Polygynia. Calyx with a concave tube, and a 10-cleft segment, the 5 outer segments accessory. Stamens numerous. Carpels dry, disposed in a head, ending each in a style, which at length becomes knobby. Seed ascending.—Herbs, with variously dissected leaves, the terminal lobe or leaflet always large. Flowers usually yellow or copper-coloured, red or white.

Sect. I. Caryophylla strum (Caryophyllus, the name of the clove pink; the roots of G. urbânum have a taste like cloves). Ser. in mem. soc. gen. 2. p. 138. D. C. prod. 2. p. 550. Flowers ascending. Calyx reflexed. Styles deflexed, knedd. Appendages for the most part shorter than the styles.

FIG. 69.

1 G. Canad'ense (Mut. comm. geôv. 5. p. 35. t. 4. but not of Jacq.) stem erect, rough, dichotomous; radical leaves interruptedly pinnate, the terminal leaflet large, nearly orbicular, 3-5-lobed, and serrated; cauleine leaves quinately and ternately pinnate, with the leaflets lobulate and toothed; stipules ovate, 3-5-lobed; peduncles elongated; petals orbicular, reflex, length of the calyx; head of carpels obovate-ovary pise, very numerous; styles glabrous, but with the appendages pise. Pole. H. Native of North America. G. stricatum, Ait. hort. kew. ed. 1. vol. 2. p. 217. Petals yellow.

2 G. stricatum (Pursh, fl. amer. sept. 1. p. 351.) hairy; leaves all interruptedly pinnate, the terminal leaflet the largest; leaflets ovate, toothed; stipula cut; the 5 outer calycine segments linear and long; petals nearly orbicular, longer than the calyx; awns of carpel naked and hooked. Pole. H. Native of North America, from Canada to New York, in dry wet meadows and bogs. G. Alliplicium, Jacq. icon. rar. 1. t. 93. Flowers large, yellow and striped.

3 G. macrophyllum (Willd. enum. 557.) stem erect, rough, pise, dichotomous; radical leaves interruptedly pinnate; leaflets nearly orbicular, terminal one cordate, large, and biserrated; cauleine leaves bluntly 3-lobed and serrated; stipula ovate, 3-5-toothed or nearly entire; peduncles when bearing the flowers very short, but when bearing the fruit they are much elongated; petals obcordate, longer than the calyx; heads of carpels ovate-ovariable; ovaries very pise; styles smoothish, but with the appendages pise at the base. Pole. H. Native of Kamtschatka. Flowers yellow.

4 G. heterophyllum (Desf. hort. par. D. C. prod. 2. p. 550.) stem erect, flexuous, beset with spreading pili, dichotomous; radical leaves bluntly 3-lobed; cauleine ones somewhat pinnate; the leaflets cuneiform, lobulate, and toothed; stipulas ovate, deeply toothed; peduncles short and stiff; petals ovate, about equal in length to the calyx; heads of carpels spherical, quite glabrous; styles with short appendages. Pole. H. Native country unknown. Flowers white?

Var. b. elongatum (Ser. in D. C. prod. 2. p. 550.) peduncles elongated; appendages of styles longer and rather pise; lobes of leaves more acute.

5 G. intermediate (Besser, cat. hort. crem. ex D. C. prod. 2. p. 550. but not of Wild.) stem erect, beset with spreading pili; radical leaves interruptedly pinnate; leaflets ovate-oblong, coarsely biserrated, terminal one large and 3-5-lobed; cauleine leaves somewhat interruptedly pinnate or ternate; leaflets of the upper leaves rhomboid-lanceolate, and coarsely toothed; stipula ovate, deeply toothed; peduncles when bearing the fruit much elongated; petals orbicular, length of the calyx; heads of carpels obovate-globose; ovaries very pise; styles glabrous, but with the appendages pise. Pole. H. Native of Volhynia and Altaia, in shady places. Flowers yellow.

6 G. virginianum (Lin. spec. 716.) stem branched, pise; radical leaves quinately pinnate, cauleine ones ternate; leaflets lanceolate-cuneiform, toothed, the uppermost leaves 1-lobed, and very acute; stipula ovate, toothed; peduncles when in fruit much elongated, filiform, and divaricate; petals obovate, shorter than the calyx; heads of carpels spherical; carpels few, pise; styles elongated, and are, as well as the appendages, pise. Pole. H. Native of Virginia and Carolina. This species comes very near G. urbânum, and differs from it principally in the small white flowers, and in the leaflets and stipulas being narrower.

7 G. Alatum (Gmel. syst. nat. 2. p. 861. Wildl. enum. 556.) radical leaves pinnate, cauline ones ternate, uppermost cauline ones simple, and somewhat trifid; petals about equal in length to the calyx; styles glabrous, with pilose appendages. 2 H. Native of Canada and Pennsylvania. G. Canadense, Jacq. hort. vind. 2. t. 175. ex Willd. i. c. Flowers small, white.

8 G. Portenschlagia'num (Tratt. ros. 3. p. 116.) stem erect, pubescent; branches straight, dichotomous; radical leaves pinnate, middle cauline ones dilately 3-lobed, but the upper cauline ones are lanceolate and coarsely toothed, pubescent; peduncles elongated, erect; petals about equal to the calyx; ovaries hispid; awns of carpels glabrous, gladiolate at the apex. 2 H. Native country unknown. According to Trattinckx it is allied to G. Album. Flowers smaller than those of G. urbìnum.

9 G. rubi'folium (Lejeune, rev. fl. sp. 103.) flowers erect; petals length of the calyx; radical leaves lyrate-pinnate; leaflets of upper leaves cuneiform, acute, auricled at the base; awns of carpels at first geniculately twisted, but at length hooked. 2 H. Native about Spa. Flowers yellow.

Bramble-leaved Avens. Pl. ½ foot.

10 G. ur'bìnum (Lin. spec. 716.) stem erect, branched, pilose; radical leaves pinnate, with 5 leaflets, cauline leaves ternate, 3-lobed or 3-parted; leaflets ovate, broad, dentately crenate; upper cauline leaves ovate, 1-lobed; stipulas large, nearly orbicular; petals obovate, length of the calyx; heads of carpels spherical; ovaries pilose, numerous; styles glabrous, with pilose appendages. 2 H. Native of Europe, in woods and hedges; plentiful in all parts of Britain. Smith, engl. bot. 1400. Sturm, deutsch. fl. fasc. 5. Woodv. med. bot. 5. p. 33. t. 4. A. Fl. dan. 672. Flowers erect, small, yellow. The roots have a mildly aromatic astrangent taste, somewhat like clove, whence this plant has the name of Caryophyllâta. They have much more virtue in a dry warm situation. Gathered in the spring, and put fresh into ale, they give it a pleasant flavour, and prevent its turning sour. Infused in wine it is esteemed a good stomachic.

Var. p. spicatum (Ser. in D. C. prod. 2. p. 551.) cauline leaves sparsely 3-lobed, ovate at the apex, small, toothed; stipulas ovate-ornicular. Native about Bern and Geneva.

City or Common Avens or Herb Bennet. Fl. May, Aug. Britain. Pl. 1 to 2 feet.

11 G. cocc'ïnum (Smith, fl. græc. t. 485.) leaves lyrate-pinnate; lower leaflets small, terminal one very large, roundish, cordate, all deeply crenated; cauline leaves 3-lobed, cut; stipulas deeply toothed; flowers panicled, erect; plant villous or pilose. 2 H. Native of Bithynia, on Mount Olympus. Flowers large, scarlet.

Scarlet-flowered Avens. Pl. ½ to 1 foot.

12 G. chïlo'ëse (Balb. in litt. Loud. hort. brit. p. 214.) plant villous; stem glandular; radical leaves interruptedly pinnate; leaflets crenate-serrate, the terminal one large, roundish, cordate, lobed, and crenated; cauline leaves 3-parted, deeply cut; stipulas large, roundish, toothed; flowers panicled, erect. 2 H. Native of Chile. G. cœciminnium, Lindl. bot. reg. 1088. G. Quel'yron, Sweet, fl. gard. 2. ser. vol. 2. with a figure. Flowers scarlet, sometimes copper-coloured.

Childe Avens. Fl. May, July. Ch. 1826. Pl. 1 to 2 feet.

13 G. heder'æfolium (Gmel. fl. bad. 2. p. 460.) leaves simple, somewhat 3-lobed, clothed with pilose tomentum; stem erect; carpels pilose, with feathery awns. 2 H. Native country unknown. Caryophyllâta folis hederæ terresaris. Bauh. pin. 322. Perhaps a variety of G. urbìnum.

Ivy-leaved Avens. Pl. 1 to 2 feet.

---

**II. Geum.**

14 G. elà'tum (Wall. cat. 711.) stem erect, pubescent; 1-2-flowered; leaves interruptedly pinnate; leaflets obtuse, crenately lobed, outer ones the largest, rather hairy and ciliated; cauline leaves pinnatifid; flowers large, erect; stipulas large, deeply lobed. 2 H. Native of the Himalaya.

Tall Avens. Pl. 2 to 3 feet.

15 G. ránunculoides (Ser. in mem. soc. phys. gen. 2. p. 108.) stem erect, branched; radical leaves interruptedly pinnate; leaflets bifid, dentate; cauline leaves somewhat interruptedly pinnate, or palmate; leaflets obovate-cuneated, toothed; stipulas ovate, large, lobed, or coarsely serrated; peduncles very long, filiform; petals roundish, nearly twice the length of the calyx; heads of carpels spherical; carpels numerous, pilose; styles glabrous, with the appendages ascending and glabrous, nearly the length of the styles. 2 H. Native country unknown. G. heterophyllum, Hortul. but not of Desf. Flowers golden yellow, about the size of those of Ranunculus áëris.

**Sect. II. Caryophyllâta (the same as last section).** Ser. in mem. soc. gen. 2. p. 139. D. C. prod. 2. p. 531.—Caryophyllum, Tourn. inst. t. 151. Flowers erect or drooping. Calyces erect. Styles deflexed, jointed, with the appendages about equal in length to the style.

16 G. rivâ'le (Lin. spec. 717.) plant pilose; stems erect, simple, 1-4-flowered; leaves interruptedly and lyrate-pinnate; leaflets obovate, biserrate; cauline leaves 3-lobed; lobes acute; stipulas ovate, toothed; peduncles pilose, elongated; flowers nodding; petals obcordate, on long claws, length of calyx; heads of carpels spherical, at length stipitate; ovaries very pilose; styles elongated, bent, pilose. 2 H. Native of Europe, Siberia, and North America, in moist pastures and woods, indicating, according to Linæus, a barren soil, not fit for corn; plentiful in many parts of Britain. Smith, engl. bot. 106. Sturm, deutsch. fl. fasc. 8. with a figure. Oed. fl. dan. 732. Caryophyllâta nánium, Mench. meth. 601. G. nánium, Rafin. in litt. Flowers nodding, of a coppery red colour. The powder is beneficial in diarrhoeas and hemorrhages, and is much used by the Canadians in tertian agues.

17 G. hyb'redium (Jacq. pl. rar. t. 94.) pilose; stems few-flowered; radical leaves interruptedly pinnate; terminal leaflets broad, round, and cordate, lobed and serrated; cauline leaves 3-lobed; lobes rounded; stipulas large, lobed; flowers erect; petals obcordate; carpels pilose, with hooked, pilose awns. 2 H. Native of Europe, in woods. G. rivâle, var. b. luxbriæns, Tratt. ros. 3. p. 121. Flowers erect, reddish.

Hybrid Avens. Fl. June, July. Ch. 2 ft.

18 G. pyrë'neæcum (Ram. bull. phil. no. 42. t. 10. f. 3.) plant pilose; stems erect, simple, 1-4-flowered; leaves interruptedly pinnate; lower leaflets ovate, dentate, small, terminal one large, cordate-reiniform, biserrate; stipulas ovate, bluntly toothed; flowers nodding; petals roundish, obcordate, on short claws, longer than the calyx; heads of carpels spherical, depressed; styles deflexed, stiff, length of carpels; carpels very pilose, with the appendages also pilose. 2 H. Native of the Pyrenees. D. C. fl. fr. 4. no. 3765. G. Tournefortii, Lepeyr. abreg. p. 292. G. inclinátum, Schleich. cat. 1815. Flowers yellow.
20 G. Brachypetalum (Ser. in mem. soc. phys. gen. 2, p. 129.) plant rather pilose; stems erect, simple, 1-3-flowered; lower leaves interruptedly pinnate, ultimate ones approximate, 1-lobed, lanceolate, all biserrate; lower stipules large, and nearly orbicular, coarsely serrate; flowers axillary, drooping; petals obvate, loose, much shorter than the calyx; heads of carpels roundish. 2. H. Native country unknown, but cultivated in the garden at Geneva. Flowers pale yellow, marked with rose-coloured lines.

20 G. Thomasianum (Ser. in mem. soc. phys. gen. 2, p. 146.) plant pilose; stems erect, 1-3-flowered; radical leaves somewhat interruptedly pinnate; leaflets nearly equal, obovate, somewhat doubly serrate; cauline leaves ternate; the terminal leaflets 1-lobed or lanceolate; stipules ovate, doubly serrate; flowers ascending; calycine lobes ovate, short; petals obvate, hardly longer than the calyx; heads of carpels nearly spherical; styles appendiculate. 2. H. Native of the eastern Pyrenees, about Mount Louis. Flowers small, yellow.

21 G. parviflorum (Commers, ex Smith in Rees's cyc. vol. 16, no. 12.) stem few-flowered, tormentose; radical leaves pilose, crenated, longer than the stem; stipulas dissected; flowers almost sessile, nodding; calycine segments longer than the corolla; carpels villous. 2. H. Native of the Straits of Magellan. Flowers small, white. Allied to G. rivale, according to Smith.

Small-flowered Avens. Pl. 1/4 ft.
22 G. Calthifolium (Menzies, ex Smith, in Rees's cyc. vol. 16.) stem erect, few-flowered; radical leaves pinnate; leaflets acutely toothed, pilose, terminal one large, roundish-reiniform; cauline leaves round, profoundly-toothed; calyx erect; petals ovate-roundish, about equal in length to the calyx; carpels pilose; styles straight? 2. H. Native of north-west America. Flowers yellow. Perhaps the same as Sieversia radiata.

Caltha-leaved Avens. Pl. 1/8 ft.
23 G. Magellanicum (Comm. ex Pers. ench. 2, p. 57.) scape elongated; leaves interruptedly pinnate; terminal leaflet large and lobed, lower ones small. 2. H. Native of the Straits of Magellan. Probably a species of Sieversia.

Magellan Avens. Pl. 1/8 ft.
24 G. involucratum (Juss. herb. ex Pers. ench. 2, p. 57.) stem 5-flowered; leaves pinnate; terminal leaflet roundish and crenated, by the leaves; petals white, smaller than the calyx. 2. H. Native of the Straits of Magellan. Perhaps the same as G. parviflorum.

Involucrated-flowered Avens. Pl. 1 ft.
25 G. hispidum (Fries, fl. hall. p. 90. ex Chatt. ros. 3, p. 140.) plant hairy; flowers erect; petals longer than the calyx; awns of carpels naked above the middle, hispid, glabrous above; stigma clavate; radical leaves almost equally pinnate; cauline leaves pinnatifid. 2. H. Native of Sweden. Reichb. icon. rar. cent. 5. t. 3. ex Chatt. Flowers yellow, 2 terminal on long peduncles.

26 G. Capeense (Thunb. prod. fl. cap. p. 91.) stem erect; radical leaves pinnate; terminal leaflet large; cauline leaves tripartite or pinnatifid; petals roundish, obovate, longer than the calyx; awns of carpels naked, twisted and knotted in the middle. 2. G. Native of the Cape of Good Hope. Wicks in acad. handl. 1822.

Cape Avens. Pl. 1 foot.
27 G. japonicum (Thunb. fl. jap. 212.) stem flexuous, hairy; leaves 3-5-lobed, hairy; stipules ovate, cut; flowers erect; petals length of calyx; fruit hairy, ending in naked recurved awns. 2. H. Native of Japan. Flowers yellow.

Japan Avens. Pl. 1 foot.
† A species not well known.
28 G. obliform (Steud. nom. phan. 366.) stem oblong, simple, hairy; radical leaves pinnate; outer leaflet very large, ovate, 5-parted, crenated; cauline leaves 3-lobed; stipulas oblong, toothed; carpels awless. 2. H. Native country unknown. Caryophyllata obliqua, Meech, suppl. 280. Waldsteinia Mae'shii, Tratt. ros. 3, p. 106. Perhaps a true species of Waldsteinia on account of the want of awns to the carpels.

Oblique Avens. Pl. 1/4 to 1 foot.

Cult. The plants will grow in any common soil, and are easily increased by dividing the plants at the root or by seeds.

LIN. SYST. Icon. Scandin. Polygynia. Calyx 10-cleft (f. 70. b.), the outer alternate segments accessory. Petals 5 (f. 70. c.). Stamens numerous. Ovaries indefinite; ovula ascending. Styles terminal, continuous. Carpels or akeinia awned by the whole style (f. 70. d.). Anus feathery (f. 70. d.), articulated. Embryo erect. Habit nearly of Geum, but differs in the styles being jointed, the superior joint dissimilar to the lower joint, and usually deciduous. Flowers and calyxes erect, never reflexed.

1 S. ATLAN'TICA: plant pilose; stems erect, simple; leaves interruptedly pinnate; lower leaflets ovate, toothed, terminal one large, somewhat cordate, biserrate, cauline leaves simple, deeply toothed; stipulas lanceolate, a little toothed; flowers ascending; petals obcordate, longer than the calyx; heads of carpels spherical, depressed; styles deflexed, stiff, length of ovaries, which are pilose; tails villous. 2. H. Native of the south of Europe and north of Africa, in woods. Géum Atlanticum, Desf. fl. atl. 1. p. 401. G. sylvaticum, Pouret. act. toul. ex D. C. fl. fr. 5. p. 544. G. bifórum, Brot. fl. lus. 2. p. 533. Flowers large, yellow.

2 S. repte's (Spreng. syst. 2. p. 553.) sterile stems creeping, but the flowering ones are erect, and undivided; radical leaves interruptedly pinnatifid, larger lobes obovate, profoundly toothed at the apex, smaller ones ovate, entire or tridentate at the apex; cauline leaves 5-lobed; flower large, solitary on the top of the stem; calycine segments elongated, usually trifid; calyxes ovate, longer than the calyx; styles spreading, very pilose. 2. H. Native on the higher Alps of France, Switzerland, and Germany. Géum réptans, Lin. spec. mag. 42. Jacq. austr. 5. append. t. 22. Adámia réptans, Fisch. Mor. hist. 2. p. 431. sect. 4. t. 26. f. 5.—Barrel. icon. t. 400.—Boeck. mus. t. 128. Flowers large, yellow.

Var. β, macrophylla (Ser. in D. C. prod. 2. p. 553.) leaves and stolons large; leaflets coarsely and doubly serrated. 2. H. Native of Vallais, at Gallenstock.

3 S. anemoneoides (Willd. berl. mag. 5. p. 398.) stems 1-flowered; stolons creeping; leaves pinnate, glabrous; leaflets cuneiform, toothed at the apex; stipulas filiform; petals longer than the calyx; styles bearded. 2. H. Native of Siberia and Kamtschatka. Dryas pentapétala, Linn. amenc. 2. p. 555. Caryophyllata, Kamtschatka, Lam. dict. 1. p. 400. Géum anemoneoides, Willd. spec. 2. p. 1117.—Pall. itin. 3. p. 738. t. E. c. f. 4. Flowers large, white.

4 S. adnata; stem 1-flowered, downy; radical leaves long, interruptedly pinnate; leaflets crenately lobed, villous above, and glabrous beneath, ciliated; cauline leaves small, lower ones rather
pinnatifid, uppermost ones triquid. 2. H. Native of Gosnaig-than. Geum adnatum, Wall. cat. no. 712. Like S. réptans.

Adnate Sieversia. Pl. 3/4 foot.

5 S. Rösssi (B. Br. in chl. melv. p. 18. t. C.) radical leaves interruptedly pinnate, glabrous; leaflets 3-lobed, but the accessory and lower ones are small and undivided; stem 1-flowered, usually 2-leafed; awns of carpels naked. 2. H. Native of Melville Island. Geum Rössii, Ser. in D. C. prod. 2. p. 553. Flowers large, yellow; distinctly veined.

Roselli Sieversia. Pl. 3/4 foot.

6 S. Glacialis (Spreng. syst. 2. p. 543.) whole plant densely clothed with yellowish villi; leaves interruptedly pinnate; leaflets ovate-oblong, upper and lower ones small, middle ones large and usually undividate; flowers large, terminal, solitary. 7. H. Native of Siberia, on the Alps at the mouth of the river Lena. Adânia glaciers, Fisch. ex Steud. nom. Geum glacialis, Adams, act. mosk. 5. p. 96. Flowers large, yellow. Allied to S. réptans according to Adam.

7 S. montana (Spreng. syst. 2. p. 543.) stem erect, 1-flowered; stolons none; radical leaves interruptedly pinnatifid, terminal leaflet ovate, large, oblong, obtuse, and bluntly biserrate, lateral leaflets small and tomentose; cauline leaves 1-lobed, and arnose as well as the stipulas deeply toothed; calyx segments undivided; petals obcordate, longer than the calyx; styles spreading, very pilose. 7. H. Native of the Alps of Europe, Switzerland, Austria, Siberia, Dauphiny, &c. Geum montanum, Lin. spec. 717. The leaflets becoming gradually smaller from the apex. Flowers large, yellow. Jacq. austr. 4. t. 373. Sturm. deutsch. fl. fasc. 14. with a figure.

Par. β. minus (Pers. ench. 2. p. 57.) stems and leaves smaller than those of the species. 7. H. Native on the higher Alps of Europe. G. alpinum, Mill. dict. no. 5.—Barr. icon. t. 299.

8 S. Trifólia (R. Br. in chl. melv. p. 18.) plant pilose; stems simple, usually 3-flowered; radical leaves interruptedly pinnate, leaflets cuneate, and deeply toothed; petals oblone, length of the calyx; awns of carpels long, and villous. 2. H. Native of Upper Louisiana. Hook. bot. mag. t. 2858. Geum triflorum, Pursh. fl. amer. sept. 2. p. 736. Leaves connate at the base. Stipulas divaricate, adnate to the petiole. Petals reddish.

9 S. Pécchi (R. Br. in chl. melv. p. 18.) plant smooth; stem 1-5-flowered; radical leaves pinnate; lateral leaflets small, ovate, and toothed, terminal one reniform-cordate, lobed, large, doubly toothed; cauline leaves almost wanting; petals obovate, longer than the calyx. 2. H. Native of North America. Hook. on the white hills in New Hampshire. Hook. bot. mag. t. 2863. Geum Pécki, Purs. fl. amer. sept. 2. p. 554.

10 S. Ciliata; plant pubescent; stems simple; leaves smoothish, pinnate, with ciliated margins; upper leaves palmate, with linear-cut leaflets; flowers corymbose. 2. H. Native of North America, on the banks of the river Kooskiosity. Geum ciliatum, Pursh. fl. amer. sept. 1. p. 559. Flowers yellow.

Ciliated-leaffletted Sieversia. Fl. Ju. July. Clt. 1818. Pl. 1 ft. 11 S. Radia'ta; plant very hairy; stem simple; radical leaves pinnate; the terminal leaflet very large, radiantly nerved; cauline leaves stem-clasping, and deeply jagged; petals orbiculate, cuneate; awns of carpels glabrous. 2. H. Native of the high mountains of Carolina, and on the west coast of America. Geum radiatum, Michx. fl. bor. amer. 1. p. 300. Flowers yellow.

12 S. Caroliniana; stems decumbent, a little branched; radical leaves obtuse, serrated, sub-pinnate; terminal lobe large, lateral ones small; cauline leaves ovate-lanceolate, serrated, hairy, on short petioles; flowers erect; petals ovate. 7. H. Native of Carolina. Geum Carolinianum, Walt. fl. carl. 150. Flowers white.

13 S. paradoxa (D. Don, in Lin. trans. 14. p. 576. t. 82. f. 2.) leaves in fascicles, linear, obtuse, sessile, entire or 3 or 5 cleft; flowers sub-corymbose; styles plumose; stem shaggy. 7. G. Native of Mexico. Geum cerco-papoides, D. C. prod. 2. p. 554. A branched stiff shrub, with large yellow flowers. (f. 70.)

Paradoxic Sieversia. Shrubs 1 to 3 feet.

Cult. For culture and propagation see Geum. S. paradoxa should be treated in the way recommended for Covania.

IV. COLU'RIA (from κολύμβω, κολύμβος, deprived of a tail; the seed is without the tail so conspicuous in the three preceding genera). R. Brown, chl. melv. 1. p. 392. Led. fl. alt. 2. p. 262.

Linn. syst. Icosándria, Polygynía. Calyx campanulate, 10-cleft, the 5 outer segments accessory. Petals 5, cardate, orbicular. Filaments inserted in the throat of the calyx, permanent. Ovaries numerous. Styles straight, thickened at the base, and articulated with the ovary. Carpals tall, scrobiculately wrinkled, inclosed in the calyx.—A small plant, with interruptedly pinnate leaves, the terminal leaflets large, the lateral ones unequal in size and shape, all lanceolate below, cauline leaves trifid or entire. Stipulas connate, entire. Stem 1-3-flowered. Flowers yellow.

Cult. A light soil suits this plant best, and it is easily propagated by dividing at the root, or by seed.

V. COWA'NIA (in honour of James Cowan, who, as a merchant, had several times visited Mexico and Peru, from whence he has introduced a great many plants, now common in our gardens). D. Don, in Lin. trans. 14. p. 574.

Linn. syst. Icosándria, Polygynía. Calyx 5-cleft. Petals 5. Stamens indefinite. Ovaries 5-11, densely villous, adnate to the bottom of the calyx. Ovula erect. Styles terminal, continuous. Carpels or akenia awned by the plumose permanent styles. Embryo erect.—A much branched shrub, with alternate small linear coriaceous leaves, with entire revolute edges, glandular above, and clothed with white wool beneath, dilated and tripartite at the apex; segments linear, blunt, with revolute edges. Stipulas twin, membranous, dilated, entire, silky, adnate by the base to the petiole, but free and acuminate at the apex. Flowers yellow, numerous, sessile, solitary on the tops of the branches, about the size of those of Potentilla fruticosa.

1 C. MEXICANA (D. Don, l. c. 22. f. 1.) 7. G. Native of Mexico. Geum dryadoïdes, D. C. prod. 2. p. 554. Mexican Cowania. Shrub 1 to 2 feet.
Cult. This shrub will do well in a mixture of sand, peat, and a little loam; and cuttings will root if planted in a pot of sand with a bell-glass placed over them, or the plant may be increased by seeds.

1 W. geórdés (Willd. l.c. p. 105. t. 4. f. 1.) 2. H. Native of Hungary, in shady woods. Leaves petiolate, palmately 5-lobed, having the lobes acutely toothed. Flowers yellow, smaller than those of Potentilla verna. Waldst. et Kiti. pl. rar. hung. 1. t. 77. Loddd. bot. cab. 492.

Lin. syst. Icosändria, Polýgíunia. Calyx with a turbinate tube and a 5-cleft limb, destitute of bracteae. Petals 5, unguiculate. Stamens numerous. Carpels few, ending each in the filiform elongated style. Akenia dry, not coarctate at the base. Seed erect.—Herbs, with the habit of Waldsteinia, but differs from it in the calyx being without bracteae. Leaves trifoliate.

* Lobes of calyx entire.

4 C. radícans (D.C. prod. 2. p. 555.) carpels glabrous; peduncles simple, pilose, bracteate, 1-flowered; stems prickly, rooting. 2. G. Native of Chile, in woods. Rubus radicans, Cav. icon. 5. p. 7. t. 415. Spreng. grand. p. 514. Leaves petiolate, trifoliolate; terminal leaflet large; lateral ones undivided. Flowers pale red.

Footing Comaropsis. Pl. creeping.

Cult. See Gewm for culture for culture and propagation, p. 527.

Lin. syst. Icosändria, Polýgíunia. Calyx flatish at the bottom, 5-cleft. Petals 5. Stamens numerous, inserted in the calyx along with the petals. Carpels or akenia numerous, fleshy, disposed in a head upon an elevated torus. Styles lateral, near the apex of the carpels. Seeds inserted.—Shrubs, rarely herbs, with the stems sometimes unarmed, but usually prickly. Leaves stalked, pinnate or palmate, with the leaflets usually stalked, sometimes the leaves are simple lobed or undivided. Fruit of all edible.

§ 1. Leaves pinnate or ternately pinnate.

* Leaflets glabrous beneath.

1 R. roseśfólius (Smith, ícon. íned. 3. p. 60. 60.) stems rather terete, pilose, prickles spreading, a little recurved; leaves pinnate, rather pilose; leaflets ovate-lanceolate, somewhat doubly serrated, full of glandular dots; stipulas linear-setaceous; peduncles usually 1-flowered; calyx segments lanceolate, acuminate, hardly longer than the corolla; carpels glabrous, very numerous, small, wrinkled from lacunae when dry. 2. G. Native of the Mauritius. Flowers white. Fruit size of those of the common raspberry.

Var. 3. coronários (Sims, bot. mag. 1783.) petals very numerous, much longer than the calyx. R. Comerssoni, Poir. dict. 6. p. 240. R. Sinénsis, Hort. Flowers large, semidouble, white.

Var. 4. trilábos (D.C. prod. 2. p. 556.) petals numerous, much longer than the calyx; leaves 3-lobed, large, glabrous. Flowers large, semidouble, white.

2 R. egłantěria (Tratt. ros. 3. p. 9.) stems shrubby, terete, glabrous, prickly; leaves pinnate; leaflets cordate-oblong, doubly serrated, glabrous, subentire; flowers solitary, axillary. 2. G. Native of New Holland. Like R. roseśfólius, but differs in the leaflets being cordate-oblong, and in the flowers being axillary. Flowers white.

3 R. fraxínifólius (Poir. dict. 6. p. 242.) branches glabrous, rather terete; prickles few, straightish; lower leaves with 3-5 pairs of leaflets, upper ones ternate, rarely simple; leaflets ovate-lanceolate, nearly sessile, glabrous, doubly serrated; flowers panicled, numerous; branches of panicle filiform; bracteae subulate, cut; calyce segments oval, acuminate, glabrous on the outside, hardly shorter than the petals; fruit large, globose; carpels numerous. 2. S. Native of Java. Flowers white.

Ash-leaved Bramble. Shrub 2 to 4 feet.

4 R. pinńátor (Willd. spec. 2. p. 1081.) branches villous; prickles hooked, obtuse; leaves pinnate; leaflets ovate-lanceolate, glabrous on both surfaces, sharply and doubly serrated, wrinkling from veins, having the middle nerve prickly; flowers
**Leaflets clothed with white tomentum or pubescence beneath.**

7. **R. nigydus** (Smith in Rees's cyclop. vol. 30.) stem villous; prickles slender, numerous; leaves of sterile branches pinnate, of the fertile ones trifoliate; leaflets ovate, doubly and unequally serrated, rather villous beneath, and on the petioles; stipulas lanceolate; flowers racemose, terminal, numerous, small; calyce segments ending in a short acumen; petals very narrow; fruit small. h. G. Native of the Cape of Good Hope.

**Stiff Bramble.** Shrub.

8. **R. Taolius** (Cham. et Schlecht. in Linn. 2. p. 9.) shrubby; branches terete, tomentose; prickles hooked, scattered; leaflets pinnate, with 2-3 pairs of doubly serrated leaflets, which are pubescent on both surfaces, and glandless; stipulas setaceous; flowers usually solitary, terminal on the branches; calyce segments lanceolate, acuminated, equal in length to the petals, reflexed when in fruit. h. G. Native of the Island of Lucon, on the burning mount called Taal. Fruit eatable, red.

**Taal Bramble.** Shrub.

9. **R. Curtsoa'rus** (Mundt in litt. Cham. et Schlecht. in Linn. 2. p. 17.) branches tomentose and glandular; prickles hooked, small; leaves of fertile branches trifoliate and pinnate; leaflets ovate, densely crenate-toothed, and curled on the margins, glabrous above, but clothed with yellowish tomentum beneath and on the petioles, and glandular; stipulas lanceolate-linear; panicle terminal, short, coarctate; calyce segments lanceolate; petals obovate, equal in length to the calyx. h. G. Native of the Cape of Good Hope, at Hex river. Resembles *R. rigidus* of Smith.

**Golden-fruited Bramble.** Shrub.

10. **R. Mu'ndhi** (Cham. et Schlecht. in Linn. 2. p. 18.) branches tomentose; prickles hooked, strong, numerous; leaves of fertile branches trifoliate and pinnate; leaflets ovate, unequally and doubly serrated, pilose above, but clothed with hairy tomentum beneath, and glandless; stipulas lanceolate-linear; panicle terminal, short, coarctate; calyce segments lanceolate; petals obovate, equal in length to the calyx. h. G. Native of the Cape of Good Hope, at Hanglip.

**Mundt's Bramble.** Shrub.

11. **R. Cele'bus** (Blum. bijdr. 1107.) lower leaves with 3-5 pairs of leaflets, floral ones simple; leaflets ovate-elliptic, acute, doubly serrated, smooth above, prickly on the middle nerve beneath, and pubescent on the veins; rameal prickles scattered, straight; stipulas wedge-shaped, jagged; panicle racemose; calyce segments ovate, cuspidate. h. S. Native of Java.

**Cebes Bramble.** Shrub.
VIII. Rubus.

351

terete, pubescent; prickles scattered; leaves pinnate, with usually 7 oval serrated leaflets, which are white beneath from tomentum; racemes axillary; flowers apetalous; calycine segments nearly linear, acute; carpels few. — R. S. Native of the Isle of France.

Apetalus Bramble. Fl. June, July. Cst. 1823. Sh. 6 feet.

**R. macrourus** (Ser. in D. C. prod. 2. p. 537.) branches tomentose; prickles numerous on the peduncles, slender, and recurved; leaves of the fertile branches pinnately trifoliate, clothed with hoary tomentum beneath, and rather ploose above; leaflets cleft, terminal one large and deeply 3-lobed; flowers axillary, solitary; peduncles longer than the leaves; calycine segments linear-lanceolate, 5-nerved, acuminate, rather woolly, prickly, rather foliaceous at the apex, twice the length of the corolla. — G. Native of New South Wales.

Long-petioled Bramble. Shrub.

**R. strigosus** (Michx. fl. bor. amer. 1. p. 297.) stem terete, very hispid; leaves of the sterile branches quinquefasciate, of the fertile branches 3-loped; leaflets ovate or elliptic, unequally serrated, obtuse at the base, lined beneath, and clothed with white tomentum, the terminal lobe or leaflet usually subcordate; peduncles usually 5-flowered, and are as well the calyces hispid. — H. Native of Pennsylvania and Canada, on the mountains. R. pennsylvanicus, Poir. dict. 6. p. 246. Petals white, longer than the calyx.

Strigose Bramble. Shrub.

**R. rhei** (Hamilt. ex Smith in Rees’ cycl. vol. 30.) stem prickly at the base; leaves of the sterile branches with 5 leaflets, of the fertile branches trifoliate; leaflets ovate or elliptic, unequally serrated, cuneate at the base, clothed with white tomentum beneath, but villous above; petioles and branches tomentose and prickly; stipulae linear; peduncles elongated, long or entire; calycine segments broad, oval, acuminate, length of the petals. — H. Native of Upper Nipaul, on the banks of rivers, and in the vicinity of Chitlong. R. pedunculosus, D. Don, prod. fl. nep. 254. where the stem is said to be unarmed.

Two-flowered Bramble. Fl. April, June. Shrub 4 to 6 feet.

**R. occidentalis** (Lin. spec. 706.) stems terete, pruinose; prickles recurved; leaves of the sterile branches pinnate, of the fertile ones trifoliate; leaflets ovate, deeply serrated, clothed with white tomentum beneath; stipulae very narrow, setaceus; peduncles umbellate, prickly; calycine segments lanceolate-linear, tomentose, pointed at the apex; petals obovate-cuneate, 2-lobed, spreading, shorter than the calyx; carpels numerous, smoothish, when dry wrinkled from lacuna. — H. Native of Canada and the West Indies.—Sloan, Jam. t. 213. f. 1.—Dill. hort. elth. t. 287. f. 319. Stems covered with bloom. Fruit black, resembling that of the common raspberry.

Western Bramble or Virginian Raspberry. Fl. May, June. Cst. 186. Shrub 4 to 6 feet.

**R. asper** (D. Don, prod. fl. nep. p. 234.) leaves pinnate, with usually 7 elliptic, acuminate, sharply serrated leaflets, which are green above, and rather ploose beneath; petioles and branches beset with gland-bearing bristles and prickles; stipulae lanceolate, cuspitate; peduncles terminal, usually tern. — H. Native of Nipaul. Flowers white.

Rough Bramble. Fl. May, June. Cst. 1821. Sh. 4 to 6 feet.

**R. lasiodiaphus** (Smith in Rees’ cycl. vol. 30.) stems smooth; prickles strong, recurved; leaves pinnate, with 7 leaflets, clothed with white tomentum beneath, the terminal leaflet usually 3-lobed; nerves ploose; stipulas setaceous; flowers racemose, terminal; carpels tomentose, reticulated. — S. Native of Mysore.

Woolly-fruiting Bramble. Shrub.

**R. idaeus** (Lin. spec. 706.) villous; stems terete; prickles slender, straight; leaves of the sterile branches pinnate, of the fertile ones trifoliate; leaflets ovate, deeply serrated, clothed with white tomentum beneath; stipulas setaceous; peduncles sub-corymbous; calyx clothed with white tomentum, with ovate-lanceolate segments; petals obovate, cuneate, entire, conviverted, shorter than the calyx; carpels numerous, pubescent. — H. Native of Europe, in woods and hedges; plentiful in some parts of Wales and Scotland. Smith, Engl. bot. 2442. Woody. med. bot. t. 198. Oed. fl. dne. 758.—Blackw. herbs. 289. R. framboisius, Lam. fl. fr. 3. p. 135.—Framboisier, Duham. arbr. fr. 2. t. 255. f. 290. The raspberry is called framboisier in French, himbeerstrauch in German, and rove idee in Italian. The stems of the raspberry are biennial, upright, but the root is perennial. The flowers come out in panicles from the extremity of the year’s shoots; they are white, and appear in May and June. It is a native of Britain, and not uncommon in woods in low situations.

Use. The fruit is grateful to most palates as nature presents it, but sugar improves the flavour; accordingly it is much esteemed when made into sweetmeats, and for jams, tarts, and sauces. It is fragrant, subacid, and cooling, allays heat and thirst. It is much used in distilling, to make the cordial spirituous liquor, from which it has its name. Raspberry syrup is next to the strawberry in dissolving the tart of the teeth, as like that fruit it does not undergo the acetic fermentation in the stomach; it is recommended to gouty and rheumatic patients.

The varieties of raspberry are as follow.

* Red raspberries.

1 Red Antwerp, Burley, late-bearing Antwerp, Knevet’s Antwerp, framboisier rouge à gros fruit. A red fruit of the first quality.

2 Barnet, Cornwall’s prolific, Cornwall’s seedling, Cornwall’s red, large red, lord Exmouth’s. A very fine large red fruit, of the first quality, but does not bear carriage so well as the red Antwerp.

3 Bramley-hill. A red fruit of the first quality.

4 Brentford cane. A second-rate red fruit.

5 Red cane. A red fruit, of a second-rate quality.

6 Rough cane. A second-rate red fruit.

7 Smooth cane. A second-rate red fruit.

8 Common red, old red, wild red. A worthless red fruit.

9 Cornish. A red fruit, of the first-rate quality.

10 Double bearing, red double bearing, perpetual bearing, Siberian, late cane. A red fruit, having the merit of bearing late in the season.

11 Williams’s double bearing red. Resembles the preceding, but seems rather more tender.

12 Jilliard’s seedling. A second-rate red fruit.

13 Early prolific. A second-rate red kind.

14 Red malta.

15 Spring-grove. A second-rate red sort, but an abundant bearer.

16 Superb. A second-rate red kind.

17 Taylor’s paragon, scarlet paragon. A second-rate red fruit.

18 Wilmot’s early red. A second-rate red fruit.

19 Woodward’s red globe. A second-rate red kind.

** White and yellow raspberries.

20 Yellow Antwerp, white Antwerp, double bearing yellow. A pale yellow fruit, of the first-rate quality.

21 Old white. A white fruit, of very inferior quality.

22 Large white.

Estimate of sorts. The red and yellow Antwerp may be said to hold the similar rank in this class of fruits as the red and the
white Dutch among currants; and although some may be found nearly to equal them, yet it is doubtful whether they are yet exceeded by any.

Propagation. The varieties can be perpetuated by the young suckers, which spring from the root in spring and summer; when these have completed one year's growth they are proper to detach with roots for planting, either in the autumn or the next spring in February or March, but never later than the middle of April. These new plants will bear some fruit the same year, and furnish a succession of strong bottom shoots for full bearing the second season. New varieties are easily raised from seed, and seed will come to bearing the second year.

Soil and site. All the varieties will succeed in any common mould, trenched about 2 feet deep, and sufficiently manured; but the soil in which the raspberry bushprosper must and bears the finest fruit, is in a light rich loam. Allot the main crop a free exposure to the sun, that the berries may ripen in perfection. Be careful to favour the double bearers with a dry soil, and a sheltered sunny situation, to give the second crop every aid in coming to maturity. When raspberries are cultivated on a large scale it is best to keep them in plantations by themselves. Set them in rows from 4 to 6 feet asunder, as the bushes are of the smaller or larger kinds, and by 3 or 4 feet in the row. Scattered bushes may either occupy a small row lengthwise along the back part of a border, or stand in detached stools, at 10 or 15 feet distance. Select sorts are frequently trained against walls, stakes, or espaliers, from the most sunny to the most shady aspect, for early and late fruit of improved growth and flavour. Nell says "the raspberry bush grows freely in any good garden soil; but it is the better for being slightly moist. Although the place be inclosed by trees, and even slightly shaded, the plant succeeds. In an inclosed and well sheltered quarter, with rather a damp soil, containing a proportion of peat moss, we have seen very great crops of large and well flavoured berries produced; for example at Melvillehouse, the seat of the earl of Leven, in Fifeshire." Haynes also recommends well manured bog-earth, and a situation naturally or artificially shaded.

New plantations. Raspberry bushes are in their prime about the third and fourth year; and, if well managed, continue in perfection 5 or 6 years; after which they are apt to decline in growth, and the fruit to become small, so that a successive plantation should be provided in time. Select new plants from vigorous shoots, in full perfection as to bearing.

Summer culture. Keep them free from weeds during the summer by hoeing between the rows, at the same time loosen the earth about the plants; under this management the plants, if tolerably strong, will both yield a moderate crop the first season, and supply young stems for bearing in greater plenty and perfection the following season, and so from year to year the summer culture should be repeated. As the plants get established let all straggling suckers between the rows, or from the extreme roots of single shoots, be cleared out by hoeing, or twisted off to admit the air and sun freely to the fruit. The fruit of the raspberry may be obtained of a very large size, other circumstances being favourable, by destroying all the suckers; but in this way, the plant being destroyed, a double plantation is wanted, one to grow only suckers, and the other fruit.

Pruning and winter dressing. It is requisite every winter or spring to cut out the dead stems, and to thin and regulate the successional young shoots. This annual pruning may be performed any time during open weather from November till the beginning of April. When kitchen garden crops are cultivated between the rows it is most convenient to do this as soon as the old bearers begin to decay. As to pruning indiscriminately in the open weather of winter, it sometimes happens that severe frosts immediately follow, and partially kill the plants; therefore it is safer to shorten the tender young shoots early in the spring, but let it not be deferred till the buds are making new shoots, as that would weaken the root. Cut out all the old dead stems close to the bottom, and having selected from the strongest young shoots on each main stool 3-4 or 5 to be preserved for a succession of bearers, cut away the superabundant shoots close to the ground. Let each of the shoots retained be pruned at the top below the weak bending part, cutting them in smaller plants to about 3 or 4 feet in length, and in the large sorts to the length of 5 or 6 feet. If any of the stems diverge irregularly, or struggle much asunder, they may be tied together at the top, and thus the strong ones will support the weaker, or the taller varieties may have the support of stakes. Prune plants against a wall or trellis in the same manner as directed above, and train the shoots to rise a little diagonally. After pruning, having cleared away the cuttings, dig the ground between and about the plants. To turn in a little rich compost will conduct to plentiful and fine returns; lay it at the extremities of the roots, and deeper as the plantation gets older. Eradicate all straggling suckers.

Taking the crop. "The fruit of the different varieties comes in from the end of June or July till October or later. As it ripens it should be timely gathered for immediate use, because when fully ripe it will not keep above 2 or 3 days before it moulds or becomes maggoty, and unfit to be used." Abercrombie.

Var. ? microphyllus (Wallr. sched. p. 220.) leaves all ternate; stems suffrutescous, bushy, humble.

27 R. Menzie's (Hook. fl. bor. amer. p. 179.) stems procumbent, terete, prickly, glabrous; branches short, pubescently tomentose, prickly; leaves pinately trifoliate; leaflets broad, ovate, slightly lobed, unequally serrated, on short petioles, hairy above, paler and very hairy beneath; panicule terminal, few-flowered; pedicels and calyces prickly; calyx segments ovate, acute, mucronate, tomentose, shorter than the corolla.

H. Native of North-west America. Flowers red.

Menzie's Bramble. Shrub procumbent.

28 R. Macropetalus (Doug. mss. in Hook, fl. bor. amer. p. 175. t. 59.) hairy; stem tall, shrubby; branches angular, slender, elongated; petioles, peduncles, calyces, and ribs of leaves beneath beset with bristly prickles; leaflets 3, ovate, acute, deeply lobed, serrated, membranous, terminal one on a long petiole, but the lateral ones are on short petioles; stipulas lanceolate; peduncles 2-flowered; calyces segments long-acuminated, about equal in length to the petals, which are oblong and white.

H. Native of North-west America, on the banks of rivers and in low woods in the valley of the Columbia. Flowers white.

Habit of R. spectabilis.

Var. R. myricaedatus (Doug. mss.) leaflets obtuse.

Long-petalled Bramble. Shrub.

§ 2. Leaves with 3-5 leaflets, disposed in a palmate manner.

* Shrubby. Stipulas petiolar, linear.

29 R. laciniatus (Willd. hort. berol. t. 82.) stem nearly terete; prickles dilated at the base, compressed, recurved, strong; leaves with 3-5 leaflets; leaflets dissected and sharply serrated, puberulous beneath; flowers in loose panicles; calyce segments lanceolate, tomentose, and prickly, somewhat foliaceous and reflexed at the apex; petals obovate-cuneated, 3-lobed at the apex; achenes roundish, black. 2. H. Native country unknown. Wats. dend. brit. 69. Flowers white or rose-coloured.

30. R. cinéus (Linn. spec. 706.) stems prostrate, terete, usually covered with glaucous, pruinose bloom; prickles slender, a little recurved; leaves with 3-5 ovate, doubly serrated leaflets, which are downy beneath; panicle simple; calycine segments ovate, acuminate; akenia thick, few, greyish. H. Native of Europe, about way sides and on the hedges of fields; plentiful in Britain. Smith, englt. bot. 826. and Weih. ex Ern. Meyer. Fl. dan. 1813. Panicle corymbose; petals blush-coloured. Fruit sweet, black, with a few tinge or bloom. 

31. R. DÉMÉTÆUS (Weih. et Nees, rub. germ. ex Lindl. syn. brit. fl. p. 95.) stem procumbent, rather angular, rather hairy, with a slight coat of bloom; bristles and glands very few; prickles unequal, recurved; leaflets generally 5, the lateral ones sessile; flowers in corymbs; fruit black. H. Native of Germany and Britain, in hedges. R. démétæus, Wild.

32. R. HÉRÆS (Waldst. et Kit. pl. hung. 2. p. 150. t. 141.) stem procumbent, tapering, densely hairy, covered with purple glands and setae; prickles long, numerous, straight, spreading; leaflets 3-5, pedate, cordate, ovate, covered with shining hairs beneath; stipulas leafy; panicle corymbose, with red setae; bracteas long, trifid. H. Native of Hungary and Britain, in hedges and woods.

**Grey Bramble or Dutywick.** Fl. June, July. Britain. Sh. prostrate.

33. R. **ELLÉTIEUS** (Smith in Rees' cycl. vol. 30.) leaves tri foliate; leaflets oval, serrated, tomentose beneath; petioles and branches tomentose, covered with numerous bristles and prickles intermixed; stipulas linear-setaceous; flowers glomerate, racemously corymbose. H. Native of Nipal, at Hethauna, where it is called by the natives tiki swa. R. élitieus, Hamilt. ex D. Don, prod. fl. nup. p. 234. Flowers white. Fruit yellow.

34. R. **SULCATUS** (Vest, ex Trav. ros. 3. p. 42.) runners and stems costately furrowed and ringed, acute-angled, glabrous, branches pubescent, flatfish on the sides; leaflets glabrous above, and pubescent beneath, the lower and larger ones ciliate-ovate, of the flagella 5, ovate and acuminate, and of the floriferous branches obovate; prickles scattered, recurved, flowers racemose; sepals clothed with hoary tomentum on both surfaces, as well as the peduncles. H. Native of Styria. Fruit black, shining, composed of many akenia.

**Furrowed-stemmed Bramble.** Shrub. Shrub straggling.

35. R. **FOLIOLATUS** (D. Don, prod. fl. nup. p. 266.) leaves with 3-5 leaflets; leaflets cuneate-ovate, serrated, clothed with white tomentum beneath; peduncles 3-flowered, and are as well as the petioles tomentose and prickly; calyx unarmed, densely tomentose; bracteoles simple; stems procumbent; prickles recurved. H. Native of Nipal. R. microphyllus, D. Don, prod. fl. nup. p. 234. Very nearly allied to R. parviséus, but differs in the leaves of that plant being twice the size, more rounded and more profoundly serrated, in the peduncles being 1-flowered, in the calyxes being prickly, in the bracteoles being triplicate, and in the stem being erect.

**Leafy Bramble.** Fl. June, July. Fl. 1818. Sh. proc.

36. R. **PUBESCENS** (Vest, ex Trav. ros. 3. p. 34.) branches furrowed, pubescent, prickly; leaves with 8-5 leaflets; leaflets obovate, acuminate, sharply and unequally serrated, clothed with white tomentum beneath; racemes simple; lower flowers solitary among the leaves. H. Native of Styria, among bushes on mount Plabutsch above Egggenberg.

**Pubescent Bramble.** Shrub. Shrub straggling.

37. R. **FLAGELLÆUS** (Willd. enum. 549.) stems terete, procumbent; prickles scattered, hooked, short; branches terete, glabrous; leaves tri foliate; leaflets glabrous, unequally serrated, intermediate one ovate and cuneate at the base, lateral ones rhomboidal, with yellowish nerves. H. Native of North America. Flowers white.

38. R. **CORYLÓLUS** (Smith, fl. brit. p. 542. englt. bot. t. 827.) stem shrubby, angular; prickles straightish; leaves with 3-5 leaflets; leaflets roundish, cordate, firm, doubly serrated, pilose beneath; panicule nearly simple; calycine segments ovate, acuminate, at length reflexed. H. Native of Europe, in hedges and woods; plentiful in some parts of Britain. Flowers white. Akenia purplish blue, large. R. corylólus, Heyne Spreng. ex Golth.

**Var.** B. **caudus** (Wallr. sched. p. 231.) leaflets all about the same size, same, and clothed with hoary tomentum on both surfaces.

39. R. **AGRÉSTIS** (Waldst. et Kit. pl. rar. hæg. 3. p. 297. t. 266.) stems suffruticos, procumbent, rather angular; prickles straight, setaceous; leaflets 3-5, roundish, lobed, tomented, teeth; and with hoary tomentum beneath; calyx clothed with hoary tomentum, and beset with glandular bristles. H. Native of Hungary and Transylvania, in neglected parts of fields. Flowers white. Perhaps only a variety of R. corylólus. 

**Field Bramble.** Fl. June, July. Ct. 1830. Sh. trailing.

40. R. **SPECTÁBILIS** (Parsh. fl. amer. sept. 1. p. 348. t. 16.) stem shrubby, glabrous, unarmed; leaflets 3, ovate, acute, unequal and doubly serrated; pubescent beneath; peduncles terminal, 1-flowered, solitary; calycine segments oblong, acuminate, shorter than the corolla. H. Native of North America, on the banks of the Columbia river, and on the shore of the western coast. R. ribifólius, Wildl. herb. ex Stev. Flowers of a beautiful purple colour.

**Shemy Bramble.** Shrub.

41. R. **BOGOSTHÉNE** (H. B. et Kunth, nov. gen. amer. 6. p. 220.) branches and petioles beset with glandular hairs and prickles, as well as the nerves of the leaves; leaflets 3, ovate, acute, deeply cordate at the base, serrated, pubescent above, and cuneate beneath; peduncles axillary, few-flowered, panicled. H. G. Native of South America, near Santa Fe de Bogota, at the height of 4200 feet above the level of the sea. Fruit blackish purple, like those of R. fruticósus.

**Bogota Bramble.** Shrub.

42. R. **PULCÁTUS** (Weih. et Nees. rub. germ. p. 15. t. 1.) stem erectish, angular, and prickly, glabrous; prickles rather conical, recurved, and rather compressed at the base; leaflets 5, smoothish above, and pubescent beneath; panicule nearly simple, corymbose; calycine segments ovate, acuminate, naked at the base, and at length reflexed; bracteas jagged. H. Native of Germany and Britain, in hedges and woods. Engl. bot. suppl. t. 2714. Flowers white. Akenia large, dark, shining. 

**Var.** B. **glabréscens** (D. C. prod. 2. p. 560.) R. plicatus
ROSACEÆ. VIII. Rubus.

γ, Weih. et Nees. l. c. R. corylifolius, Hell. fl. wurdcb. suppl. p. 46.

43 R. nitrone (Vest. ex Tratt. ros. 3. p. 28.) stem obso-
letely angled, flat, glabrous; flowering branches beset with
villous pubescence; lower leaves with 5 or 6 ovate, coarsely toothed
leaflets, upper ones with 3 roundish leaflets, all glabrous above,
and clothed with white tomentum beneath; panicule cyanose;
apals clothed with hoary tomentum on both surfaces. H. Native of Syria. Fruit black, usually large.

Two-fronded Bramble. Shrub trailing.
44 R. affinis (Weih. et Nees. rub. germ. p. 22. t. 3. and
36.) stems recurved, angular, prickly, and glabrous; prickles
strong, recurved; leaves with 3 or 5 leaflets; leaflets ovate,
cordate, cuspidate, sharply serrated, flat at the base, but some-
what undulated towards the apex, clothed with tomentum be-
neth; panicule compound, with the branches cyanose; calyce
columns ovate, acuminated, naked on the outside, reflexed.
H. Native of Germany and Britain, in hedges. Flowers white.
Akenia thick, bluish black.

Var. β, bracteosus (D. C. prod. 2. p. 560.) bracteas broad,
undivided. R. affinis γ et ε, Weih. et Nees. l. c. t. 36.

45 R. florihusdus (H. B. et Kunth, nov. gen. amer. 6.
p. 219. t. 557.) branches and petioloals villous tomentose, and
are as well as the nerves prickly beneath; upper leaves with 3
leaflets, and the lower ones with 5 leaflets; leaflets on long
tertholes, elliptic-oblong, sharply serrated, clothed with ad-
pressed pubescence on both surfaces; panicule terminal, branched.
G. Native of South America, on the Andes about Loza
in Quito, at the height of 2400 or 5400 feet above the level of
the sea. Petals white or rose-coloured, exceeding the calyx.
Fruit like that of R. fruticosus.

Bundle-flowered Bramble. Shrub strangling.
46 R. umilifolius (Schott. in isis. 1818. fasc. 5. p. 821.
and Link. enum. 2. p. 61.) stems decumbent, very prickly;
leaves with 3 or 5 leaflets; leaflets ovate, rather cordate, acutely
and doubly crenated, tomentose beneath and unarmed.
H. Native of Gibraltar, on the mountains. Branches red. Flowers
delicate rose-coloured.

47 R. Linkiaus (Scrib. in D. C. prod. 2. p. 560.) stems
prickly; leaves with 3 or 5 leaflets; leaflets unequal, ovate,
acuminated, serrated, clothed with hoary tomentum beneath;
flowers panicled. H. Native country unknown. R. punic-
ulatus, Schlecht. ex Link. enum. 2. p. 61. and Tratt. ros. 3.
p. 92. but not of Smith. Flowers double, white.

48 R. Albus (Kit. ex Tratt. ros. 3. p. 92.) leaflets 5,
ovate, cordate, lateral ones almost sessile, all clothed with white
tomentum beneath; stems angular, prickly; prickles recurved;
petioles and peduncles scabrous from glands. H. Native of Hungary, in bushy places. Allied to R. fruticosus or R. tomentosus.

Flowers white.

Whitish-leaved Bramble. Shrub trailing.
49 R. nubigenus (H. B. et Kunth, nov. gen. amer. 6.
p. 220.) branches and petioloals villous, and are prickly as well as the
nerves of the leaves; leaflets beset with adpressed pile above,
but clothed with canescent pubescence beneath; panicules ter-
inal, nearly simple; calyces prickly; fruit clothed with silky
pil. H. Native of the Andes, about Quito, at Paramo
de Puntas, at the height of 5100 feet above the level of
the sea.

Cloud-born Bramble. Shrub strangling.
50 R. fruticosus (Lin. spec. 707.) stems strangling, arch-
el, angular, and rather tomentose; prickles recurved; leaves
with 3 or 5 leaflets; leaflets petiolate, ovate-oblong, acute,
glabrous above, greyish tomentose beneath; panicule decompouned,
narrow, and straight; calyce columns reflexed and un-
armed. H. Native of Europe, in hedges and woods and by
way-sides and in commons; plentiful in Britain. Smith,
engl. bot. 826. Weih. et Nees, rub. germ. p. 25. t. 7. Flowers
pinkish or white. Fruit dark purple, with a mawkish taste. The
bramble may be useful in thickening hedges of white-thorn
or briars, being of very quick growth. The green twigs will
dye wool and silk black. Silk worms will eat the leaves; they
are astringent, and a decoction of them may be used in
garments.

Var. β, pomponius (D. C. prod. 2. p. 561.) flowers semi-
double; leaves pale green; leaflets oblate. R. fruticosus,
var. ε, Weih. et Nees. l. c.

Var. γ, leucocarpus. Fruit white.

Var. ε, inermis: stem unarmed.

Var. ς, concolor (Wallr. sched. p. 233.) leaves pubescent
beneath, the same colour on both surfaces. Native of Germany.

Var. ζ, glandulosus (Wallr. sched. p. 233.) stems, petioles,
and peduncles glandular. Native of Germany.

Shrub strangling.
51 R. faigfolius (Schlecht. et Cham. in LINN. vol. 5.
p. 571.) floral branches unarmed, angular, pubescent; leaflets 3-5,
elliptic, acuminated, obtuse at the base, glabrous and shining
above, but opaque beneath and puberulous on the nerves,
sharply serrated; panicule large, terminal, clothed with silky to-
mentum. G. Native of Mexico, among bushes at Pas-
santa. Flowers small, white.

Beech-leaved Bramble. Shrub.
52 R. abruptus (Lindl. syn. brit. fl. p. 92.) stems arched,
strong, angular, very glaucous, with very broad, equal, hooked
prickles; leaflets 3 to 5, small, distant, undulated, shining, obo-
late, truncate, with an inflexed, cuspidate point, simply serrated,
veiny, hoary beneath; panicles long, downy, armed with strong
hooked prickles; the branches spreading and corymbose. H.
Native of Scotland.

53 R. tomentosus (Weih. et Nees. rub. germ. p. 27. t. 8.)
stems erect, angular, prickly, glabrous; leaves with 3 or 5
leaflets; leaflets on short petioloals, obovate-cuneated, clothed
with hoary pubescence above and white tomentum beneath;
panicule compound, narrow, spreading; calyce segments nearly
unarmed, reflexed. H. Native of Europe, in dry places.
R. Thuiliéri, Poir. dict. suppl. 4. p. 694. Flowers white or
pink.

Var. α, acuï-cârrtitus (D. C. prod. 2. p. 561.) serratures of leaves serrated, approximate, and acute. R. tomentosus, var. α, Weih. et Nees. l. c.

Var. β, late-cârrtitus (D. C. l. c.) serratures of leaves remote and coarse, nearly simple. R. tomentosus, var. β. Weih. et Nees. l. c.

54 R. suberecitus (Anders. ex Lin. trans. 11. p. 218. t. 16.
Smith, fl. engl. bot. 2572.) smoothish; stem angular, ascend-
ing; branches terete; prickles deflexed; leaves with usually
3-5 or 7 ovate, cordate, pointed leaflets, which are minutely
hairy beneath; upper leaves with only 3 leaflets; flowers in
loose panicles; calyce segments ovate, lanceolate, acum-
nated, slightly hairy, at length reflexed. H. Native of Scotland,
on the banks of Lochness, Highlands of Aberdeen and Perthsire; hills of Forfarshire; in England in Wales and
Yorkshire; also of North America, between Lake Superior and
Lake Winepeg, and of Newfoundland. Tratt. ros. 3. p. 90. Flowers white. Fruit pale purpl.

55 R. sâtâctus (Sehreb. dec. p. 15. t. 8.) stems rather angular, pubescent; prickles recurved; leaves with usually 3 leaflets, rarely undivided; leaflets ovate, obtuse, serrated, tomentose beneath; flowers subpanicled, lateral ones few; calyce segments ovate, tomentose, short, reflexed. 7. H. Native of the Levant. Desf. cor. 80. t. 61. R. obtusifolius, Willd. Enum. suppl. 38. ex Link. Enum. 2. p. 61. Flowers pink.

56 R. velutinus (Vest, ex Tratt. ros. 3. p. 47.) stem prickly; prickles rather large, compressed, and rather recurved; leaves trifoliate; lateral leaflets ovate, terminal one obovate, acuminated, and sharply, deeply, and doubly serrated; floral leaves glabrous above, but clothed with hoary tomentum beneath; racemes compound; petals orbicular, on long clavus. 7. H. Native of Styria.

Feolety Bramble. Shrub straggling.

57 R. holosericeus (Vest, ex Tratt. ros. 3. p. 48.) stem and branches terete and simple; leaflets for the most part obovate, sharply and unequally toothed, clothed with hoary tomentum beneath; peduncles very prickly; calyces prickly; petals roundish, on very short clavus. 7. H. Native of Styria, not far from Greece, according to Vest.

White-silky Bramble. Shrub.

58 R. appendiculatus (Tratt. ros. 3. p. 31.) stems decumbent, angular, glabrous; prickles scattered, rather recurved, strong; floriferous branches pubescent; leaves trifoliate and many simple; leaflets different in shape, sharply and unequally serrated, plicate, pubescent beneath; racemes simple; calyx appendiculat. 7. H. Native of Hungary. Said to be nearly related to R. pictus.

Appendiculate-calyx Bramble. Shrub decumbent.

59 R. Cochin-china (Tratt. ros. 3. p. 97.) stems procumbent, prickly; leaves with 5 leaflets, which are clothed with yellowish tomentum beneath; racemes terminal; akenia small. 7. G. Native of Cochin-china, in woods and in hedges. 7. fruticosus, Lour. cochin. p. 325. Flowers white or pink? Cochin-china Bramble. Shrub procumbent.

60 R. canescens (D. C. cat. hort. monsp. p. 139. and fl. fr. 5. 1845.) stem shaggy, tall; petioles and peduncles tomentose and prickly; leaves with 3 or 5 leaflets; leaflets ovate-oblong, coarsely but sparingly toothed, clothed with white velvety down on both surfaces; flowers pubescent; calyces tomentose. 7. H. Native of the Alps of Piedmont. Flowers white.

61 R. râuseus (Poir. dict. 6. p. 237.) branches flexuous, glabrous, prickly; leaves trifoliate; leaflets ovate-lanceolate, crenulated, large, glabrous on both surfaces; stipulae oval, obtuse, large; flowers usually solitary, on long peduncles; petals smaller than the glabrous calyx; calyce segments lanceolate, acuminated. 7. G. Native of Peru. Cordula rose-coloured.

Rose-coloured-flowered Bramble. Shrub.

62 R. glâbatâtus (H. B. et Kutch, nov. gen. amer. 6. p. 221. t. 555.) shrubby, glabrous; branches, petioles, and nerves of leaves prickly; leaves trifoliate; leaflets oblong, acute, crenately serrated; flowers solitary; calyxes pubescent and prickly.

7. G. Native of South America, in the high plains of De Los Pastos, near Guachueal, on the banks of Rio Blanco, at the height of 3000 feet. Petals fan-vined, red. Immature fruit pubescent.

Smoothish Bramble. Shrub.

63 R. Altëhedëolus (Host, ex Tratt. ros. 3. p. 37.) stems angular, glabrous, with a few prickles; branchlets, petioles, and peduncles villously pubescent; leaves with 3 or 5 leaflets; upper leaflets rhomboid or obovate, lower ones ovate-deltoid, clothed with soft pubescence beneath, but sparingly above, deeply toothed and ciliated; racemes terminal, few-flowered; calyx tomentose, mucronate; petals obvate, larger than the calyx. 7. H. Native of Austria, near Mauerbach.

Althea-leaved Bramble. Shrub straggling.

64 R. collinus (D. C. cat. hort. monsp. p. 139. and fl. fr. 5. 1845.) stems shaggy, and are as well as the petals prickly; leaves with usually 5 leaflets, rarely with 3 only; leaflets roundish, toothed, lateral ones almost sessile, white from tomentum beneath; flowers loosely panicked; panicle branched; calyce segments ovate, acuminated. 7. H. Native on sterile hills about Montpelier. Nocea ex Balb. ft. teic. t. 9.

Hill Bramble. Shrub straggling.

65 R. Fastigiatâs (Weih. et Nees. rub. germ. p. 16. t. 2.) stems recurved, angular, pubescent, furnished with a few prickles; leaves with 3 or 5 leaflets, rarely with 7; leaflets ovate, cordinate, lower ones ending in long points, sharply serrated, flat, glabrous above, but pubescent beneath; floriferous branches horizontal, simply panicked, fastigate; calyce segments lanceolate, acuminated, glabrous, and unarmed on the outside, when mature reflexed. 7. H. Native of Germany, Switzerland, and Britain. Frucht. Poll. p. 1. p. 68. Flowers white. Fruit middle-sized. Carpels almost black, shining.

66 R. Cordifolius (Weih. et Nees. rub. germ. p. 21. t. 5.) stems recurved, angular, furrowed, prickly and glabrous; leaves with 3-5 leaflets; leaflets cordinate-orbiculare, cuspidate, clothed with canescent shining tomentum beneath; panicule compound, diffuse at the base; calyce segments spreading, prickly at the base. 7. H. Native of Germany and Britain, in hedges. Flowers small, white. Fruit dark, covered with bloom.

67 R. Menkii (Weih. ex Spreng. syst. 2. p. 528.) leaves with 3 or 5 leaflets; leaves ovate, rather cordinate, clothed with tomentum beneath and on the calyces; calyce segments at length reflexed. 7. H. Native of Germany. R. velutinus, Vest, ex Spreng. l.c. Flowers white.

Var. β, fusco-atér (Weih. et Nees. rub. germ. p. 72. t. 26.).

69 R. echinateus (Linnd. synb. brit. fl. p. 84.) stems arched, angular, densely covered with glands and bristles, mixed with short, numerous, nearly straight prickles; leaflets 5, roundish, cordinate, coarsely and unequally serrated, taper-pointed, green and velvety beneath; panicule spreading, prickly, and glandelar, leafy at the base; the branches cornybose: bracteas 3-toothed and entire; prickles of the peduncle scattered, with very few setae. 7. H. Native of Britain, in hedges and woods.

70 R. Ru'vis (Weih. et Nees. rub. germ. ex. Linnd. p. 94.) stems somewhat arched, angular, slightly furrowed, without hairs, but with abundance of glands and bristles; prickles equal, recurved, scattered; leaflets 5, ovate or obovate, acuminated, coarsely and unequally serrated, between hoary and pubescent;
panicle open, rather downy, bristly, with coriumbous, racemose branches; bracteas lanceolate, trifid; prickles and setae of the peduncles not numerous.  ½. H. Native of Germany and Britain, in hedges.

71 R. Schlechtendalii (Weih. ex Spreng. syst. 2. p. 529.) leaves with 3 or 5 leaflets; leaflets oblong, acuminate, angular, serrated, pubescent beneath; prickles as well as branches deflexed; stems nearly terete, villous; racemes axillary, leafy; calyces unarmed, reflexed. ½. H. Native of Germany. Flowers white.

72 R. Tillei (Weih. ex Spreng. syst. 2. p. 529.) leaves with 5 leaflets, disposed in a pedate manner; leaflets ovate, rather cordate, acute, serrulrated, smoothish on both surfaces; prickles straightish; stems terete, glabrous; calyces tomentose, spreading. ½. H. Native of Germany. Flowers white.

73 R. Macrophyllus (Weih. et Nees, rub. germ. ex Lindl. syn. brit. fl. 93.) stem arched, angular, prickly, rather hairy; leaflets 5, elliptical or roundish, bluntly wedge-shaped or subcorporate at the base, pubescent beneath; panicle compound, spreading, few-flowered. ½. H. Native of Germany and of Britain, in North Wales in thickets, common.

75 R. Schlechteri (Weih. ex Spreng. syst. 2. p. 529. and Tratt. ros. 3. p. 22.) leaflets 5, oblong, acuminate, unequally serrated, hardly pubescent; stems angular, very prickly, and are as well as the branches villous; prickles recurved; panicle compound, with spreading branches, very prickly; calyces prickly, reflexed. ½. H. Native of Germany. Flowers white.

76 R. vulgaris (Weih. et Nees, rub. germ. ex Lindl. syn. brit. fl. 93.) leaflets 5, roundish, serrated, wrinkled, villous beneath; stems and branches rather angular, and very prickly, glandular; racemes axillary; calyx adpressed when in fruit. ½. H. Native of Germany. ¹. R. Ferox, Vest. et Tratt. ros. 3. p. 40. ex Spreng. ¹. c. Flowers white.

77 R. leucochassus (Schlech. ex Smith, eng. fl. 2. p. 403. Borr. engl. bot. suppl. 2631.) stems arched, rather angular, and furrowed, hairy, with horizontal or deflexed, straight, uniform prickles; leaves of 5 or 5 stalked, roundish or ovate, rather cordate, flashtill leaflets; panicle elongated, slender, its branches but little deflexed; calyx reflexed. ½. H. Native of England, in hedges; Hampshire and Essex. Flowers red. Fruit large, black.

78 R. diversifolius (Lindl. syn. brit. fl. p. 98.) stem arched, angular, hairy, as well as the scattered straight prickles; leaflets 3, orbicular, cordate, acute, wrinkled, equally serrated, velvety, and rather hoary beneath; panicle villous, contracted, with coriaceous branches and roundish entire or 3-lobed leaves at the base. ½. S. Native of Britain, in hedges and thickets.

VIII. RUBUS.
calycine segments ovate, acuminated, setaceously jagged. H. Native of Java, on the mountains.

_Alp_ Bramble. Shrub.

86 R. _lineatus_ (Herb. Reinw. ex Blum. bijdr. 1108.) leaflets 3-5, oblong-lanceolate, acuminated, setaceously serrated, lined from the veins, which are silico pubescent beneath; branches terete, tomentose; prickles scattered, minute; stipulas lanceolate, acuminated; flowers cymose, axillary, and terminal; calycine segments ovate, acuminated, clothed with white tomentum. H. Native of Java, on the higher mountains.

_Lined-leaved_ Bramble. Shrub.

87 R. _thunbergii_ (Blum. bijdr. 1109.) leaves trifoliate, terminal one a little 3-lobed; leaflets roundish, deeply toothed above the base, pubescent above, and clothed with white tomentum beneath; branches angular, subtomentose; prickles scattered, recurved; stipulas awl-shaped; pedicels axillary and terminal, prickly, 3-flowered at the apex; calycine segments ovate, acuminated, reflexed, densely clothed with tomentum, equal in length to the petals. H. Native of Japan. Like _R. tomentosus_, Willd.

_Thunberg's_ Bramble. Shrub.

88 R. _sellii_ (Cham. et Schlecht. in Linnaea. 2. p. 15.) sterile branches pentagonal, finely pubescent; fertile ones terete, and pubescent beneath; leaflets ovate, acute, and serrated, as well as the petioles and nerves of the leaves; prickles hooked; leaves of 5 leaflets, those of the fertile branches trifoliate, the same colour on both surfaces, rather pilose above, and somewhat velvety beneath; leaflets roundish-oval, cordate, ending in a short acumen; stipulas very narrow, short; pedicels elongated, raceme-formed, terminal; calycine segments ovate, acuminated, clothed with hoary tomentum on both surfaces, shorter than the petals. H. Native of Peru.

_Nettle-leaved_ Bramble. Shrub.

90 R. _imperialis_ (Cham. et Schlecht. in Linnaea. vol. 2. p. 13.) sterile branches pentagonal, glabrous, fertile ones pubescent at the apex, both prickly, as well as the petioles, peduncles, and nerves of leaves; prickles strong, hooked, but those on the racemes are minute; leaves of 3 or 5 leaflets; leaflets ovate, acuminated, pediote, finely serrated, green and puberulous on the under surface, but only on the nerves and veins above; stipulas lanceolate, mucronate, pubescent; calycine segments lanceolate, clothed with hoary tomentum on both surfaces, longer than the petals, when in fruit reflexed. H. Native of Brazil, on the Island of St. Catharine. Fruit edible.

_Imperial_ Bramble. Shrub.

91 R. _arcuatus_ (Link, enum. 2. p. 60.) stems prickly and hairy; prickles straight, small; leaves trifoliate, upper ones undivided, clothed with silky tomentum on both surfaces; leaves ovate, cordate, elongated; branches of panicle very hairy; calyx white, hardly shorter than the petals. H. Native of North America. Petals white, attenuated at the base.

_Variable-leaved_ Bramble. Shrub straggling.

foundland. R. procumbens, Muhl.? R. flagellaria, Wild.?

W. Flowers white.

100 R. ensé'ni (Tratt. ros. 3. p. 63.) stem slender, sarmento-
tose, procumbent, terete, prickly, glabrous; leaves trifoliate;
leaflets deeply and unequally toothed or serrated, acute, narrow
at the base, smoothish, and ciliate; flowers solitary, on long
peduncles; petals narrow, elliptic, unguiculate. η. H. Native
of North America.

Enslent's Bramble. Sh. prostrate.

101 R. lanu'gosus (Stev. obs. ined. in herb. Wild. D. C.
proc. 2. p. 564.) floriferous stems a foot high; pedioles and pe-
duncles tomentose; prickles few, straight; leaves trifoliate;
leaflets ovate, cordate, acuminate, sharply and mucronately
toothed, villous on both surfaces; pancreis terminal, many-flo-
ered; calyces segments erect, villous on the outside, and
clad with white tomentum inside, ending in a short awn each;
bracteas subulate. η. H. Native of Caucasus and Siberia.

102 R. far'volus (Lin. spec. 707. but not of Walt.) stems
terete, tomentose; prickles recurved, scattered; leaves trifoliate;
leaflets clad with white tomentum beneath; flowers racemose;
calyces segments tomentose, ovate, short; fruit globose. η. S.
Jap. 215. R. mollé'icus, Rumph. amb. 5. p. 88. t. 47. f. 1.
Flowers red. Fruit red.

to 3 feet.

103 R. canadé'nsis (Lin. spec. 707. exclusive of the
sy'onymy of Mill. fig.) stem purple, unarmed; leaflets 3-5-10,
lanceolate, sharply serrated, naked on both surfaces; stipulas linear.
η. H. Native from Canada to Virginia, among rocks in woods.

104 R. xu'tans (Wall. illt. ex herb. Lin. soc.) stem, pe-
dioles, and calyces beset with brown bristles; leaves trifoliate,
beset with bristles on the nerves beneath; leaflets cuneated,
slightly lobed, rather pilose, sharply serrated; stipulas broad,
membranous; sepals ovate, elliptic, cuspidate; peduncles 1-
flowered, axillary, and terminal; flowers drooping; petals ob-
ovate, longer than the stamens, but about equal in length to the
calyx. η. H. Native of Kamaon. Flowers apparently purple,
large. Perhaps a species of Dali'bóra.

Nodding-flowered Bramble. Sh. pros.

105 R. di'gita'tus (Sprenq. pl. mon. cogn. pug. 1. p. 34. no.
62.) prickles recurved; leaves palately pinnate, pilose; pilose
ovate, jagged; calyx tomentose. η. H. Native country un-
known. Allied to R. affinis.

Digeste-leaved Bramble. Sh. trailing.

106 R. monta'nu's (Libert in Lejeune, fl. spa. 2. p. 317.)
stem terete; prickles recurved; leaflets 3-5, acuminate, tomen-
tose beneath; flowers panicled; peduncles 2-3-flowered; caly-
cine segments tumente. η. H. Native of Belgium, about Spa.

Mountatin Bramble. Sh. trailing.

107 R. arduen'nees (Libert, l. c. 2. p. 317.) stem tetra-
gonal; prickles recurved; leaflets 3-5, ovate-lanceolate, doubly
serrated, tomentose beneath; panicle elongated; peduncles and
calyces elongated. η. H. Native of Belgium, about Spa.

Arduen Bramble. Sh. trailing.

108 R. saxá'tilis (Lin. spec. 708.) stem herbaceous, bluntly
angular, bristly; leaves trifoliate, of the same colour on both
surfaces, smoothish; leaflets ovate-rhomboid, deeply toothed,
'lateral ones sessile; stipulas oblong, broadish; flowers on short
peduncles, either solitary or sub-corymbose; calyce segments
ovate-lanceolate, rather tomentose, deflexed, equal in length
to the corolla; carpels globose, few, red, pellucid, large. η. H.
Native of Asia and Europe; plentiful in the north of England,
Scotland, Wales, and Ireland, in shady places among stones.

109 R. arcticus (Lin. spec. 708.) stems herbaceous, smooth,
unarmed; leaves trifoliate, almost glabrous; leaflets obovate,
obtuse, crenately serrated; stipulas ovate, very blunt; flowers soli-
tary, terminal; calyce segments lanceolate-linear, downy, shorter
than the corolla; petals emarginate. η. H. Native of Siberia
and Canada; in Britain in the Isle of Mull. Smith, engl. bot.
1585. Oed. fl. dan. 488.—Lin. fl. lap. t. 5. f. 2. Curt. bot.
Mag. 132. Root creeping. Flowers deep rose-coloured. Fruit
large, purple or red, sweet-scented. Linnaeus has accurately
figured this species of Bramble in his Fl. Lapponica, out of gra-
titude, as he expresses himself, for the benefit he reaped from it
in his Lapland journey; it having so frequently recruited his
spirits when almost sinking with hunger and fatigue, by the
vinous nectar of its berries. He informs us that the principal
people in Norland make a syrup, a jelly, and a wine from these
berries, which they partly consume themselves, and partly send
to their friends at Stockholm, as a dainty of the rarest and most
delicious kind; and he adds, of all the wild Swedish berries this
holds the first rank.

Var. β, subingu'nelobus (Ser. ms. in D. C. prod. 2. p. 265.)
leaflets 3, lateral ones bipartite. Native of the Ural mountains.

Arctic Bramble or Dwarf Crimson Bramble. Fl. June, July.
Britain. Pl. 3/4 foot.

110 R. acau'lis (Mich. fl. bor. amer. 1. p. 298.) stem very
short, unarmed, 1-flowered, herbaceous; radical leaves tri-
foliate; leaflets ovate-trapeziform, coarsely serrated; stipulas ob-
long, acute; peduncles puberulous; calyce segments lanceolate-
linear, acutish, much shorter than the petals, which are ob-
long; filaments dilated; styles rather club-shaped, approximate.
η. H. Native of North America, in swamps. R. pistillatus,
Smith, exot. bot. 2. p. 58. t. 86. Flowers rose-coloured.

Root creeping.

111 R. me'crona'tes (Ser. ms. in D. C. prod. 2. p. 565.)
stem herbaceous, pilose, unarmed; leaves trifoliate, the same
colour on both surfaces, pilose; leaflets rhomboid, acutely ser-
rated; stipulas ovate-lanceolate, acuminate; flowers terminal,
twin; calyce segments lanceolate, acute, puberulous, shorter
than the corolla. η. H. Native of Newfoundland, Le Clerc.

Flowers red.

Mucronate Bramble. Pl. 1/2 to 3/4 foot.

112 R. trifoil'rus (Richards in Frankl. 1st journ. ed. 2.
append. p. 19. Hook. fl. bor. amer. 181. t. 62.) unarmed, erect,
herbaceous; stemos sulprificoso; leaflets 3, rarely 5, acutely
serrated; stipulas obovate; pedicle usually 3-flowered, glandu-
lar. η. H. Native of North America, throughout Canada
from Lake Huron to the Saskatchewan, and on the shores of
Hudson's Bay near York Factory. R. saxatilis β Candadensis,
ROSACEÆ.

Pedate-leaved Bramble. Pl. proc. 114 R. obovatus (Tratt. ros. 3. p. 94. Hook, fl. bor. amer. p. 180. t. 60.) stems weak, long, procumbent, beset with numerous bristly prickles; leaflets 3-5, evergreen, on short petioles, or almost sessile, obovate, coarsely and unevenly serrated; flowers terminal, panicked, small; segments of the calyx ovate, acute, not half so long as the petals. 2. L. Native of North America, from America, to Carolina, and about Montreal, in stagnant basins. R. obovalis, Michx. fl. bor. amer. 1. p. 298. R. semprevirens, Bigelow, fl. bost. ed. 2. p. 201. Petals obovate, white. Fruit small, black, and bitter, according to Bigelow.

Obovate-leaved Bramble. Pl. proc. 115 R. nivalis (Doughl. mem. Hook. fl. bor. amer. p. 189.) plant small, fruticose, leaves cordate, 3-lobed, acutely toothed, glabrous; nerves and petioles beset with recurved prickles, stipulas ovate, acute; peduncles short, 2-flowered; calycine segments lanceolate, pilose. 2. L. Native of North America, on the high snowy ridges of the Rocky Mountains.

Snow Bramble. Pl. ½ foot.

§ 3. Leaves simple, lobed.

* Herbaceous plants.

116 R. parviflorus (Nutt. gen. amer. 1. p. 309.) stem suffrutescent, unarmed; leaves pinnately lobed; pedicels usually 3-flowered; calycine segments ovate, acuminate, villous; petals ovate, oblong, shorter than the calyx. 2. L. Native of the Island of Michillimakinak, in Lake Huron. Flowers small, white.

Small-flowered Bramble. Pl.

117 R. trifidus (Thunb. fl. jap. 217.) stem herbaceous, flexuous, erect, glabrous, unarmed; leaves cordate, 3-lobed, glabrous; lobes cut, unequally serrated; flowers almost solitary; pedicels and petioles villous; calyx white from tomentum. 2. L. Native of Japan. Fruit red, with a grateful taste.

Trifid-leaved Bramble. Pl. 1 foot?

118 R. stellatus (Smith, icon. med. fasc. 3. t. 64.) stem simple, 1-flowered, villous, unarmed; leaves nearly reniform, flat, serrated, 3-lobed; stipulas ovate, obtuse; calycine segments linear, elongated, deflexed; petals spatulate, distant, longer than the calyx. 2. L. Native of North America and the Island of Unalaska. R. chamaemorus, Fisch. in litt. Flowers purple. Root creeping.

119 R. chamaemorus (Lin. spec. 708.) stem simple, 1-flowered, puberulous, unarmed; leaves somewhat reniform, wrinkled, pilate, roundly lobed and toothed; stipulas ovate, obtuse; flowers dioecious; calycine segments ovate, longer than the corolla; petals elliptical, rather incumbent; carpels nearly globose, large. 2. L. Native of Europe, Siberia near Salair, and of North America; plentiful on the highest mountains of Scotland, north of England and Wales, in peat soil. Smith, engl. bot. 716. Oed. fl. dan. t. 1. Lin. fl. lapp. 208. t. 5. Root creeping. Flowers white. Fruit large, of a dull orange-colour, acid, muscosa-alcaeous, and pleasant to the taste. From their exalted situation they are called cloud berries, also knot berries or knot berries or toe-buck berries. The plant flowers in June soon after the snow is dissolved, and the berries are scarcely well ripened in August before the plant is again overwhelmed with its winter covering. The snow preserves the fruit, and is used by the Laplanders to keep it through the winter; for they, as well as the Scottish highlanders, esteem it one of their most grateful and useful fruits, especially on account of its long duration. Its taste is moderately acid and mucicaginous, with something of the flavour of tamarinds. They are held to be an excellent antiscorbutic. The Norwegians pack them up in wooden vessels, and send them to Stockholm, where they are served up in dessert, or made into tarts. The Laplanders bruise and eat them with the milk of the rein-deer. Neils observes, that they are the most grateful kind of fruit gathered by the Scotch Highlanders. On the sides and near the bases of the mountains, it may be collected for several months in succession. It is not cultivated without difficulty, and it seldom yields fruit in a garden. By crossing the flowers with those of the bramble or raspberry, and raising from the seeds so impregnated, in all probability this plant might become a valuable accession to the kitchen garden.

120 R. filipes (Tratt. ros. 3. p. 73.) stems straight, rather angular, glabrous; prickles recurved; lateral branchlets clothed with glandular pubescence, and bearing the flowers; leaves on the branches trifoliate, the upper one simple, unequal; leaflets coarsely toothed, glabrous above, hoary beneath, and pubescent on the nerves; calyxes tomentose, reflexed. 2. L. Native of North America. Flowers large, white.

Flowery Bramble. Pl. 1 foot.

121 R. coriaceus (Poir. dict. 6. p. 237.) stem herbaceous, compressed; prickles scattered; leaves coriaceous, glabrous, ovate-oblong, serrated; stipulas ovate, toothed; pedicels usually solitary, terminal, hirsut; calycine segments lanceolate, acuminate, large, glabrous; petals roundish, crenated at the apex, shorter than the calyx. 2. S. Native of Peru. Flowers yellow?

Coriaceous-leaved Bramble. Pl. ½ foot.

** Shrubs.

122 R. incisus (Thunb. fl. jap. 217.) stem frutescence, erect, prickly; prickles spreading; leaves cordate, serrated, glabrous; petals prickly; pedicels axillary, capillary, glabrous, solitary; calyx glabrous on the outside, but clothed with white tomentum on the inside. 2. L. Native of Japan.

Cut-leaved Bramble. Shrub.

123 R. oedora (Lin. spec. 707.) stem erect, beset with glandular pilis; leaves 5-lobed, unequally serrated, more or less glandular beneath; corymbs compound; calyx beset with glandular bristles, having the segments cupuliform, rather shorter than the petals; stipulas free, deciduous. 2. L. Native of North America, in woods. Curt. bot. mag. t. 150. Mill. fig. t. 223. Flowers large, rose-coloured. Fruit red, not palatable.

124 R. deliciosus (Torrey, in ann. lyc. 2. p. 196.) stem branched, unarmed; branches and petioles pubescent; leaves roundish-cordate, slightly 3-5-lobed, downy, wrinkled; bracts lanceolate, unindentate; flowers terminal, subcoriaceous; calycine segments ovate-oblong, acuminate, foliaceous at the apex, shorter than the petals. 2. L. Native of North America, among the Rocky Mountains. Flowers purple.

Delicious Bramble. Sh. 4 to 6 feet.
125 R. natans (Moc. pl. nutk. with a figure. D. C. prod. 2. p. 566.) stem erect, flexuous, stoloniferous, beset with glabrous pubescence at the apex, and naked at the base; leaves 5-lobed, unequally toothed; corollas simple; calyx unarméd, with equal cuspitate segments; stipulas connate, permanent.  

2. H. Native on the north-west coast of America, in Queen Charlotte’s Sound, in lat. 51°, Nootka Sound, at Cape Oxford, in lat 45°, from New California to Nootka Sound, and from the coast throughout in woody hills to the head-springs of the Columbia, in lat. 35°, and in mountain woods on the east side of the Rocky Mountains. Lindl. bot. reg. 1368. Flowers white. Fruit red, ridged.  

Natka Bramble. Fl. June, July. Ct. 1826. Sh. 3 to 6 ft.  

126 microphyllus (Lin. fl. suppl. 263.) stem shrubby; branches terete, flexuous, glabrous; prickles scattered, recurved; leaves cordate, trifid, unequally toothed, glabrous, but with the veins pubescent beneath; middle lobe elongated, lateral ones margined at the apex on the outside, peduncles solitary; calyces villous.  

Small-leaved Bramble. Shrub 3 to 4 feet.  

127 R. trilobus (Moc. et sess. fl. max. icon. ined. D. C. prod. 2. p. 566.) stem erect, branched, glabrous; branches, petioles, and peduncles hirsut; leaves 3-lobed, unequally serrated, villous; lobes acute, serrated, lateral ones diverging, middle one the longest; stipulas and bracteas lanceolate, villous; flowers solitary at the tops of the branches; calyces segments ovate, concave, spreading, rather foliaceous, and spatulate at the apex, longer than the petals; carpels numerous, subglobose.  

2. G. Native of Mexico. Flowers large, white. Fruit purple.  

Three-lobed-leaved Bramble. Shrub 3 to 4 feet.  

128 R. vitifolius (Cham. et Schlecht. in Linnæa. 2. p. 10.) shrubby; branches prickly, pruinose, puberulous; peduncles, calyces, petioles, and nerves of leaves prickly; prickles weak, straightish, somewhat reversed; leaves 3-lobed, unequally serrated, smoothish; lobes acute, lateral ones diverging, middle one the longest; stipulas and bracteas lanceolate, villous; flowers solitary at the tops of the branches; calyces segments ovate, concave, spreading, rather foliaceous, and spatulate at the apex, longer than the petals, which are obovate.  

Vine-leaved Bramble. Shrub 3 to 4 feet.  

129 R. reflexus (Ker. bot. reg. 461.) branches terete, clothed with rufous tomentum; prickles small, scattered; leaves oblong, cordate, 3-5-lobed, densely clothed with tomentum beneath; middle lobe elongated; veins numerous, reticulate; stipulas and bracteas lanceolate and fringed; racemes few-flowered, nearly sessile, reflexed; calyx segments ovate, obtuse, equal in length to the corolla.  

130 R. variegatus (Cham. et Schlecht. in Linnæa. 2. p. 11.) branches terete, tomentose; petioles, nerves of leaves, peduncles and calyxes silky; prickles numerous, slender, subulate, straight; leaves of the fertile branches simple and ternate, doubly serrated, pilose above, but clothed with hoary tomentum beneath; leaflets ovate, middle one cordate and slightly lobed; stipulas membranous, linear; flowers panicled; calyx segments ovate, acuminate; acumen usually foliaceous; petals obovate.  

2. H. Native of California, at St. Francisco. Allied to R. vitifolius.  

Bear’s Bramble. Shrub trailing.  

131 R. hamiltonianus (Ser. in D. C. prod. 2. p. 566.) leaves cordate, 5-lobed, serrated, beset with pubescent above, but densely villous beneath; petioles and branchlets densely tomentose, intermixed with prickles; stipulas denticulate; flowers in axillary, sessile clusters, and terminal; calyx villous, longer than the petals.  

2. H. Native of Upper Nipaul, at Suesnu, where it is called by the natives Fegi Ayshala, and Cumbuta. R. rugosus, Hamilt. ex D. Don, prod. fl. nep. p. 234. Wall. pl. rar. assiat. 3. t. 234. Flowers white. Berries red. It differs from R. moluccanus, in the leaves being flat and nakedish above, less deeply lobed, and in being tomentose beneath.  

132 R. moluccanus (Linn. spec. 707.) branches hirsute; prickles recurved; leaves cordate, 3-lobed, unequally clothed with silky tomentum beneath; flowers racemose and axillary, pedunculate; stipulas jagged; calyces segments ovate, acute, deeply toothed, tomentose.  

2. S. Native of Amboyna and the Moluccas. Rumph. amb. 5. t. 47. f. 2. Petals white. A decumbent plant.  

Var. β, ochraceus (Blum. bib. pr. 1109.) flowers ochraceous beneath.  

133 R. rugosus (Smith, in Rees’ cyclop. vol. 50.) stem unarmed; branches prickly; calyxes and under surfaces of leaves clothed with brown tomentum; leaves wrinkled, somewhat 5-lobed; lobes rounded; stipulas villous, denticulated; bractae oval; flowers racemose, axillary; calyces segments oval, mucronate, a little dentilicate.  

Wrinkled-leaved Bramble. Shrub straggling.  

134 R. tillaecus (Smith, in Rees’ cyclop. vol. 50.) stem and branches tomentose; prickles scattered; leaves roundish-ovate, slightly lobed, crenated, hoary beneath and smoothish above; racemes axillary; bracteas dissected, serrated, small; calyces segments lanceolate, villous, rather deflexed; petals spatulate.  

135 R. cordifolius (D. Don, prod. fl. nep. p. 233.) leaves cordate, acuminate, serrated, flat, woolly beneath and on the branches, and furnished with a few prickles; stipulas cut; flowers disposed in branched panicles; calyx segments ovate-lanceolate, acute, tomentose.  

2. H. Native of Nipaul. R. moluccanus, Wall. in litt. Leaves nearly entire, never lobed, rusty beneath. Perhaps the same as R. tiliae-cus.  

Cordate-leaved Bramble. Shrub.  

136 R. alecefolius (Poir. dict. 6. p. 247.) branches villous, somewhat tetragonal, prickly; prickles scattered, recurved; leaves roundish, cordate, palmately lobed, scabrous above, but tomentose beneath and prickly on the middle nerve, acutely toothed; bracteas dissected; cymes of flowers axillary and terminal, nearly sessile; calyx inflat, woolly, with the segments length of tube.  

2. S. Native of Java. Flowers white.  

Narrow-leaved Bramble. Shrub.  

137 R. sieboldii (Blum. bib. pr. 1110.) leaves roundish, cordate, acute, angular, unequally and sharply toothed, with the veins prickly on both sides, pale, and pubescent beneath; branches terete, tomentose; prickles dense, straight; stipulas serrate-jagged.  

2. G. Native of Java.  

Siebold’s Bramble. Shrub.  

138 R. purinéavis (Blum. bib. pr. 1110.) leaves cordate, acuminate, 3-5-cleft, doubly serrated, pubescent on the veins on both surfaces; branches terete, smooth; prickles scattered, straight; stipulas semilanceolate; peduncles usually solitary, 1-flowered; calyx segments ovate, acuminate, villous.  

2. G. Native of Japan. Like R. microphyllus, Lin.  

Downy-nerved Bramble. Shrub.  

139 R. glomeratus (Blum. bib. pr. 1111.) leaves cordate, acute, oblong to 3-5-lobed, sharply denticulated, hairy on both
surfaces, prickly on the middle nerve beneath; branches terete, tomentose; prickles scattered, recurved; stipulas jagged; racemes terminal, drooping, prickly; flowers glomerate; calyce segments ovate, acute, clothed with silky pubescence, nearly entire.  h. G. Native of Java, on Mount Gede. Like R. clongatus, Smith.

Gloecome-flowered Bramble. Shrub.

140 R. Sundaflora (Blum. bijdr. 1111.) leaves cardate, acute, obliquely angular, unequally toothed, smooth above, but covered with coarsely pubescent tomentum beneath, as well as on the branches, and with prickles on the middle nerve; prickles of branches scattered and recurved; racemes terminal; flowers sub-umbellate; calyce segments ovate, acuminate, rather serrated, tomentose.  h. S. Native of the islands in the Malay Archipelago.

Var. 1, discolor (Blum. I. c.) leaves smaller, denticulated, clothed with grey tomentum beneath; segments of the calyx entire.  h. S. Native of Java. Perhaps a proper species.

Sunda Bramble. Shrub.

141 R. elongatus (Smith, icon. ied. fasc. 3. t. 62.) branches clothed with coarsely pubescent tomentum; prickles scattered and recurved; leaves cardate, acuminate, acutely crenated, tomentose beneath; stipulas jagged; panicle drooping, prickly; peduncles tomentose; bracteas deciduous; calyce segments obtuse, hardly the length of the tube and shorter than the petals, which are obovate.  h. S. Native of Java. Corolla white. Fruit red. Elongated Bramble. Shrub.

142 R. paniculatus (Smith, in Rees' cyc1. vol. 30. but not of Schlecht.) branches terete, villous; prickles scattered, recurved; leaves cardate, acuminate, slightly lobed and serrated, tomentose beneath; panicle villous, rather loose; calyce segments ovate, acute, villous, but not silky; petals small.  h. H. Native of Nipaul. Fruit black. Panicle terminal.

Paniced Bramble. Shrub.

143 R. pyrifolius (Smith, icon. ied. fasc. 3. p. 61.) branches flexuous, hairy; prickles scattered; leaves oblong, acuminate, serrated, glabrous on both surfaces; panicle many-flowered, rather thyrsoid, with cortybose branches; bracteas cut, pubescent, deciduous; calyce segments lanceolate, acute, outer ones jagged; petals very minute, toothed at the apex.  h. S. Native of Java.

Pear-leaved Bramble. Shrub.

144 R. corchordolum (Linn. fil. suppl. 263.) stem and branches tomentose; prickles recurved; leaves ovate, cardate, acute, slightly lobed, clothed with hoary tomentum, the middle nerve furnished with prickles above; peduncles axillary, solitary, 1-flowered, tomentose.  h. G. Native of Japan. R. villosus, Thumb. fl. jap. 218. but not of Ait. Petals hardly longer than the corolla.

Corchorus-leaved Bramble. Shrub.

145 R. Lambertianus (Ser. in D. C. prod. 2. p. 567.) branches nearly terete, rather pilose; prickles recurved; leaves cardate, acuminate, slightly lobed, serrated; stipulas fringed; flowers panicked; peduncles pubescent; calyce segments puberulous, lanceolate, acuminate, with tomentose margins; petals obovate, cuneate, narrow, length of calyx.  h. G. Native of China. Lambert's Bramble. Shrub.

146 R. acuminatus (Smith, in Rees' cyc1. vol. 30.) leaves ovate, cardate, acuminate, smooth, unequally serrated, rounded at the base; stipula minute, gland-formed; flowers sub-racemose; pedicels 2-6-together, naked as well as the calyces; branches terete, glabrous, furnished with a few distinct prickles as well as on the petioles.  h. H. Native of Nipaul. R. betulinus, D. Don, prod. fl. nep. p. 233. Leaves like those of the birch or hornbeam. Terminal flowers panicled.

Acuminated-leaved Bramble. Shrub 4 to 6 feet.

147 R. iedicus (Leschen. in litt. D. C. prod. 2. p. 568.) branches terete, tomentose; prickles scattered, short, compressed, reflexed; leaves elliptic, acuminate, regularly serrated, glabrous; middle nerve prickly; stipulas wanting or setaceous; flowers small, numerous, panicked; bracteas setaceous; calyce segments lanceolate, acute, puberulous, reflexed; petals very narrow, length of calyx; carpels 3-4, ovate-elliptic.  h. S. Native of the East Indies. R. hexagonus, Roxb. Panicle large, downy.

Indian Bramble. Shrub 4 to 6 feet.

Cult. The shrubby kinds of bramble are easily propagated by suckers from the root or by cutting. The herbaceous species thrive best in peat soil, and are also increased by suckers.

Lin. syst. Icosandra, Polygynia. Calyx with a short, concave tube, and with a 5-6-cleft or toothed limb; lobes toothed. Petals 5, deciduous. Stamens numerous. Ovaries 3-12, ending in short terminal styles. Akenia involucrated by the calyx, seated on a dry viscid receptacle, dry or fleshy. Seed pendulous. Herbs or shrubs with petiolate simple leaves, with scape-formed, 1-flowered peduncles or panicles of flowers.

2 D. calycula (D. C. prod. 2. p. 568.) stems creeping, and as well as the petioles villous and bristly; leaves obicular, cardate, crenated, villous; stipulas ovate, sessile; calyx villous and bristly, with the segments foliaceous and deeply toothed, longer than the petals.  h. H. Native of Nipaul, in Gosangthan. Rubus calyculus, Wall. in litt. ex D. Don, prod. fl. nep. 235. Petals obovate, yellow. Habit of the preceding species, but differs in the stems being more elongated, bristly, and villous.

Large-calyced Dalibarda. Pl. creeping.

3 D. geoides (Pers. ench. 2. p. 53.) leaves usually trifid or ternate, the terminal lobe large and ovate, and irregularly serrated, the lateral ones small, usually wanting, or joined with the terminal one.  h. H. Native of the Straits of Magellan. Rubus geoides, Smith, icon. ied. t. 19. Flowers yellow.

Geoid-like Dalibarda. Pl. creeping.

** * Shrubs. Flowers disposed in panicles.

4 D. pyrifolia (Blum. bijdr. 1112.) leaves simple, oblong, acuminate, serrated, pubescent on the veins; prickles scattered, recurved; branches of panicles sub-corymbose; flowers 3-4-petalled.  h. S. Native of Java. Rubus pyrifolius, Smith, icon. ied. fasc. 3. t. 61. Calyce segments jagged. Petals small, yellow? toothed at the apex.

Pear-leaved Dalibarda. Shrub creeping?

5 D. latifolia (Blum. bijdr. 1112.) leaves simple, roundish, deeply serrated, pubescent beneath; prickles small, recurved; branches of panicle corymbose; flowers polygynous.  h. S. Native of Java, in the province of Tjanor. Flowers yellow?

Broad-leaved Dalibarda. Shrub creeping?

Cult. The herbaceous kinds of this genus do best in a
border of peat soil, or to be grown in pots in a mixture of peat and sand, and placed among other alpine plants; they are easily increased by detaching the runners. The shrubby species, being natives of tropical islands, require to be grown in the stove or hot-house, and cuttings of them will root readily in heat, under a hand-glass.

X. FRAGARIA (from fragrans, fragrant; the perfumed fruit of the strawberry is well known). Tourn. inst. 152. Nestl. pot. 17. Duchesn. mon. frais. 1 vol. 8vo. Ser. in D.C. prod. 2. p. 569.

Lin. syst. Jocosandria, Monogynia. Calyx with a conical tube; the limb 10-parted, the outer 5 segments accrescent. Petals 5. Stamens numerous. Carpels numerous, at length falling from the fleshy and succulent pericarp. Styles lateral. Seeds appended.—Herbs, throwing out runners. Leaves trifoliate; leaflets coarsest toothed. Polyphore roundish, succulent, red, rarely white. In this genus what is called the fruit is a fleshy receptacle or polyphore, with carpels or seeds appended to it.

* Carpels very numerous on the outside of the fleshy receptacle. Staminis numeros. Flowers hermaphroditic.

1 F. ve'sca (Lin. syst. 705.) stolonihera; leaflets pilate, thin, pilose beneath; fruit pendulous; sepals at length reflexed; hairs on the peduncles adpressed. Υ. H. Native of Europe, in woods and on hills; north-west coast of America; plentiful in Britain. Smith, engl. bot. 1524.

Var. a, sylvestris (Lin. spec. ed. 1. p. 495.) Duch. in Lam. dict. 2. p. 331. no. 3.) stolonihera; receptacles egg-shaped; calyx short. Υ. H. Native of Europe, in woods; plentiful in Britain. F. vésea sylvestris. Lin. spec. 709. F. vulgaris, Ehrl. beitr. 7. p. 21.—Blackw. herb. 77. There are varieties of this plant with red and white fruit.

Var. β, sempervirens (Duchesn. l. c. 2. p. 531. no. 1.) stolonihera; receptacle conical-oblong, shining. Native of the alps of Jura. Nois. jard. fr. t. 11. f. 2. There are varieties of this strawberry with red and white receptacles, viz.

1 Red alpine strawberry, fr. des alpes à fruit rouge, fr. des alpes de tous les mois à fruit rouge, fr. des alpes de quatre saisons à fruit rouge, alpine rouge, scarlet alpine, prolific alpine. Fruit conical, large for a wood strawberry, and of a first-rate quality, ripening from June to November.

2 White alpine strawberry, fr. des alpes à fruit blanc, fr. des alpes de tous les mois à fruit blanc, fr. des alpes de deux saisons à fruit blanc, fr. des alpes de quatre saisons à fruit blanc, alpine blanc. Fruit conical, large for an alpine strawberry. A first-rate kind, ripening from June to November.

3 American alpine strawberry. Fruit conical, large. A first-rate kind, like the red alpine strawberry.

4 Danish alpine strawberry.

Var. γ, minor (Duchesn. l. c. 2. p. 431. no. 8.) stolonihera; stem and leaves short; receptacle spherical, shining, red or white. To this variety belong the following sorts of wood strawberry.

1 Red wood strawberry, fraiser d’Angleterra, fr. à chasas, fr. commun rouge, fr. commun à fruit rouge, fr. des bois à fruit rouge. Fruit roundish, large for a wood strawberry. A first-rate kind, ripening from the end of June, through July.

2 White wood strawberry, fr. commun blanc, fr. commun à fruit blanc, fr. des bois à fruit blanc. Fruit roundish, size of the last, of a first-rate quality, ripening end of June and through July.

Var. δ, hortensis (Duchesn. l. c. 2. p. 532. no. 4.) stolonihera; stem and peduncles longer; leaves palpid; receptacle elongated, rather compressed. There are varieties of this with red, white, and black fruit. To this belong the following sorts of strawberry.

1 Frasier de Montreuil à fruit blanc. Fruit ovate, large, of a first-rate quality, ripening about the beginning of July.

2 Frasier de Montreuil à fruit rouge, fr. de Montreuil à Mar- teau, pressant, dent de cheval, de ville de bois. Differing from the last only in the colour of the fruit. They are both only fugitive varieties of the wood or alpine strawberries.

Var. ε, eflagellés (Duchesn. in Lam. dict. 2. p. 532. no. 5.) stolonihera very short or wanting altogether; receptacle elongated, roundish-ovate; leaves longer than the stem. To this variety belong the following sorts of strawberry.

2 White bush alpine strawberry, fraiser buisson des alpes blanc, fr. buisson à fruit blanc. Only differing from the foregoing in the colour of the fruit.

Var. ζ, multiplex (Duchesn. l. c. 2. p. 532. no. 7.) stolonihera; stamens transformed into flowers. Commonly called in France Frasier couronné.

Var. δ, muriçuda (Duchesn. l. c. 2. p. 533. no. 8.) receptacle small; styles elongated, echinated; petals wanting; sepals foliaceous. Commonly called in France Frasier arbrisseau à fleurs vertes.

Pl. 3 to 1 foot.

3 F. collina (Ehrl. beitr. 7. p. 26.) stolonihera; leaflets plicate, thin, silky above and pilose beneath; fruit erect; sepals wanting after flowering; calyx beneath petals erect. Υ. H. Native of Switzerland and Germany. Flowers white. Fruit green. Perhaps only a variety of F. vesca. To this species belong the strawberries called

1 Green strawberry, green pine, pine apple, green alpine, green wood, powdered alpine, fraiser vert d’Angleterre, fraiser vert. Fruit roundish or depressed, globular, large, solid; flesh greenish, very juicy, with a peculiar and somewhat pine apple flavour. A second-rate sort, ripening middle of July.

4 F. platanoideas (Ser. in D.C. prod. 2. p. 570.) leaves palmately 5-lobed, pilose; lobes lanceolate, acute, obsoletely toothed; sepals lanceolate, acute, pilose. Υ. H. Native of North America? Petals red.

Platanus-like Strawberry. Fl. April, June. Clt.? Pl. 2/3 ft.

* Carpels few, immersed in little pits in the receptacle (f. 71. d.). Staminis feis (f. 71. c.). Flowers usually dioecious from abortion.

5 F. Majau ‘fea (Duchesn. in Lam. dict. 2. p. 533.) stolonihera; leaflets plicate, thin, pilose beneath; flowers herma-
phrodite; stamens long; receptacle middle-sized; carpels numerous; calyces erectly adpressed after flowering. 2. H. Native of France. To this species belong the following strawberries.

6. F. Bresslina (Duchesn. in Lam. dict. 2. p. 553.) leaflets plicate, rather coriaceous, green; pili long and firm; petals narrow, whitish, yellow; sepals adpressed after flowering; receptacle adherent; carpels rather turgid.

Var. a. abortiva (Duchesn. l. c. p. 554. no. 11.) almost sterile; leaves thin, less pilose; branches elongated; receptacle depressed, greenish, red; carpels hardly adhering. Commonly called Frasier concou and fr. avenge.

Var. b. nigra (Duchesn. l. c. p. 555. no. 12.) very sweet-scented, usually sterile; branches short; leaves usually 5-lobéd; stolons numerous. Commonly called Breslinge d'Allemagne.

Var. g. pendula (Duchesn. l. c. no. 13.) receptacle pear-shaped, adpressed, red, without any carpels at the base. Native of France. Commonly called Frasier mareutse and Breslinge de Bourgogne.

Var. c. hispida (Duchesn. l. c. p. 14.) plant humble, robust; stolons numerous; branches rather prostrate; receptacles elongated, purple. This variety of strawberry is known in France under the names of Brestlinge de Longchamp and Frasier de Longchamp.

Var. e. viridis (Duchesn. l. c. p. 536. no. 15.) leaves late, greyish; petioles usually appendicate; peduncles long; receptacle roundly turbinate, greyish green, hardly coloured. Nois. et jard. fr. t. 13. f. 2. There is a kind of this with yellowish and shorter petals. To this variety belong the following strawberries.

Var. . pratensis (Duchesn. l. c. p. 536. no. 16.) plant humble; branches short; stolons short; leaves small; receptacle round, adhering to the calyx; pulp rather brittle, very tiamid. F. vésen pratensis, Lin. spec. 709.? Flowers usually rising before the leaves. This strawberry is called in France Frasier de Brugnon and Breslinge de Suède.

7. F. Ele'tior (Ehrh. beitr. 7. p. 23.) leaflets plicate, rather coriaceous, green; flowers usually dioscious from abortion; sepals at length reflexed on the peduncle; petals snow white, roundish; entire; receptacle firm, adhering but little to the calyx. 2. H. Native of North America; in the south of England, in groves, but rare. Smith, engl. bot. 2197. Caprorniers, Duchesn. in Lam. dict. 2. p. 534. The haubois are the most variable of all strawberries, but they retain a general character from which they naturally do not depart; the fruit sometimes changes from globular to ovate, and from ovate to globular, while fertile plantations will produce runners that may perhaps be sterile, and seedlings many of which will prove so. The latter ought to be extirpated. In all the sorts of haubois there exist prolific and sterile plants, which last have long stamens, and are commonly called males; these ought in all cases to be destroyed. The varieties of haubois strawberies are as follow:

2. Brown haubois. Fruit large. A second-rate sort, ripening the same time as the last.

3. Caperon framboise, frasier framboise, frasier d'apricot. Fragaria elatior d'apricot. Duchesn. in Lam. dict. 2. p. 536. no. 18. F. magna, Thuill. fl. par. p. 254. Flowers always dioecious from abortion. There is a variety of this with curled leaves.

6. Large flat, white, Bath, Salter's, Fornosa, Lowder's, Weymouth. Fruit roundish, large. A first-rate sort, retains its character better than any of the other sorts of haubois. It ripens in the end of June or beginning of July.

8. Proliche or conical, double-bearing, hermaphrodite, Hudson's Bay, musk, Regent's, dwarf, sucombe, Sir Joseph Banks's, spring grove, caperon royal, caperon hermaphrodite, caperonnier royal. Fruit large, conical. One of the best of the haubois, ripening end of July or beginning of August. Flowers the largest of the class. Receptacle broad. Stamens long, permanent round the base of the fruit, even to the period of its maturity.

8. F. Virginia'na (Mill. dict. ed. 8. Ehrh. beitr. 7. p. 25.) flowers late, dioecious from abortion, rather campanulate; petals ovate; leaflets coriaceous, not plicate; petals short; peduncles and pedicels length of leaves; receptacle very tumbid, pendulous; styles very long. 2. H. Native of Virginia. Duchesn. in Lam. dict. 2. p. 539. no. 24. Nois. jard. fr. p. 40. t. 12. f. 2. Flowers white. Fruit deep red when ripe. To this species belong the following kinds of strawberry; they are commonly called scarlet strawberies.

6 Black roseberry, black round-fruiting roseberry. Fruit roundish, large. A first-rate sort, of a fine dark shining colour, and a good bearer; ripens about the end of June or beginning of July.

7 Carmine scarlet, carmine roseberry. Fruit roundish-ovate, middle-sized. A second-rate sort and a bad bearer; ripens beginning of July.

9 Chimonon scarlet. Fruit roundish, middle-sized. A second-rate sort, but a good bearer, ripening end of June.

11 Cockcumb scarlet. Fruit large, compressed. A second-rate sort, ripening end of July.

13 Coutil late scarlet, Sir George Mackenzie's late scarlet. Fruit ovate, large. An excellent late sort, and a good bearer. Ripens beginning and middle of July.

14 Diack's seedling, new Aberdeen. Fruit roundish, large. A second-rate sort but a great bearer. Ripens end of June and beginning of July.

18 Garstone scarlet. Fruit large, roundish. A first-rate sort, ripening in the end of June and beginning of July.

19 Globular Hudson's Bay. Fruit roundish, small. A worthless sort, ripening in the end of June.

21 Orange Hudson's Bay. Fruit small, oblong. A worthless sort, ripening in the end of July.

22 Grinstead scarlet. Fruit small, conical. A second-rate sort, and a very bad bearer.

23 Grave-end scarlet. Fruit large, depressed, spherical. A first-rate sort, very handsome, and a most abundant bearer.

24 Hudson's Bay, York river scarlet, American scarlet, late scarlet, Hudson's pine (of Scotland), Atkinson's scarlet, Hopewood's scarlet, velvet scarlet. Fruit ovate, large. A second-rate sort, ripening in the end of June. Requires to remain till it assumes a dark colour, otherwise it is acid.

26 Lewisham scarlet, scarlet cluster. Fruit roundish-ovate, small. A worthless sort, ripening about the end of June.

29 Methen scarlet, Methen castle, Southampton scarlet. Fruit large, roundish. A coarse sort, ripening in the end of June.

30 Morrisania scarlet, Hudson's. Fruit small, round. A worthless sort, ripening in the middle and end of June.

32 Narrow-leaved scarlet, Knight's. Fruit conical, middle-sized. A second-rate sort, ripening in the end of June.

33 Oblong scarlet, long-fruiting scarlet, Padley's early scarlet, Padley's large scarlet. Fruit oblong, middle-sized. A second-rate sort, ripening in the middle and end of June.

34 Old scarlet, scarlet, early scarlet, original scarlet, Virginian, scarlet Virginian, old Bath scarlet of some, orange or Irish of the Dutch, scarlate, scarlette de Virginie, de Virginie. Fruit roundish, middle-sized. A first-rate sort, valuable for its carliness, but more especially for its excellence in preserving.

40 Round-fruiting scarlet, late round-fruiting scarlet, Knight's (no. 18. hort. trans.). Fruit round, middle-sized. A second-rate sort, but a good bearer. Ripens in the end of June and beginning of July.

41 Scone scarlet. Fruit round, middle-sized. A second-rate very acid sort, ripening in the end of June.

42 Sir Joseph Banks's scarlet. Fruit roundish, small. A worthless sort, ripening in the middle and end of June.

44 Solid scarlet, solid fleshed. Fruit roundish, middle-sized. A second-rate sort, ripening in the beginning of July. It is a hybrid between the Hauhois and scarlet.

Black strawberries.

1 Downton, Knight's seedling, Knight's strawberry. Fruit ovate, large, ripening beginning and middle of July. The best of the black strawberry.

2 Elton seedling. Fruit large, ovate. A first-rate sort, ripening middle of July. A great bearer, valuable as a very late sort.

3 Gibb's black seedling. Fruit conical, small. A second-rate sort, and a bad bearer, ripening beginning of July.

4 Knight's scarlet fleshed. Fruit conical, middle-sized, more red inside than out. A first-rate sort, ripening end of June.

5 Pitmaston black, late Pitmaston black. Fruit ovate, mid-
dile-sized, ripening in July. Although an excellent sort, it is so
tender as almost entirely to die off in the winter, consequently it
is unfit for general culture.
6 Old black, black Canterbury, black pine, Turkey pine, black
beacon, mulberry. Fruit conical, middle-sized. A first-rate sort,
ripening beginning of July.
7 Sweet cone, Knight's sweet cone. Fruit ovate, large, ripen-
ning end of June. Of excellent flavour, but not so prolific as the
Domina.

9 T. grandiflora (Ehrh. beitz. 7.) late; flowers always
dioecious from abortion; leaflets glaucous, coriaceous, broadly
crenated, glabrous above, and pilose beneath; peduncles thick;
sepal reflexed; hairs on pedicles and peduncles spreading.
2. H. Native of Surinam. F. magna, Thul. fl. par. p. 254?
F. calycina, Mill. fig. 288. F. Chilensis (S. andana), Duchesne in
Lam. dict. 2. p. 538. Flowers white. Fruit red. Called in
English pine strawberries, and in French fraise ananas.
The following are the varieties.
1 Bath scarlet, Bath, new Bath scarlet, Liverpool, golden drop,
Devonshire, North's seeding, Milne's seeding, imperial scarlet,
Austin's, Carolina pine, Surinam of some, scarlet fleshed
Caroline, Chili. Fruit ovate, middle-sized. A second-rate sort,
ripening beginning of July. F. Caroliniensis, Duchesne in Lam.
dict. 2. p. 539.
2 De Bath. Fragária Chilénias γ calycúlata, Duchesne in
3 Black prince, Wilmot's black imperial. Fruit roundish,
middle-sized. A second-rate shy bearing kind, ripening end of June.
4 Rostock, Rostock, Rostock seeding, Rostock pine, Rostock
scarlet, Wellington, cone, Byram, Caledonian,ervous,
Montague's, prolific Bath, new Bath, Whiteley's pine, Beattie's
seeding, English globe, red Chili, Devonshire, Devonshire Chili, red
Bath, sre scarlet. Fruit large, roundish. A good bearer, but
the fruit is rather coarse and hollow. Ripens end of June.
5 Bullock's blood. Fruit roundish, large. A worthless sort,
ripening beginning of July.
6 Chinese, North's seeding, red Chili, North's large scarlet,
Bourbon (of the Americans), chapelized, Carolina of some, large
Chili, pine apple, Frasier ananas. Fruit large, roundish. This
and the Surinam were formerly much cultivated on account of
their bearing, but are now giving way to the superiority of Keen's
seeding. It ripens end of June and beginning of July.
7 Dutch. Fruit roundish, large. A worthless sort, ripening
beginning of July.
8 Dwarf white Carolina. Fruit roundish, ovate, large. A
worthless sort, ripening end of June and beginning of July.
The synonyms attached to the round white Carolina are also
applicable to this, with the exception of the last.
9 Glazed pine, Knott's pine, scarlet pine-apple, Chinese of
some, Carolina of some, red Chili of some. Fruit conical, large.
A second-rate sort.
10 Keen's imperial, imperial, black imperial, large imperial
black, imperial pine, black Isleworth, Keen's black, Keen's large
fruited, Isleworth pine, large black, Keen's black pine, nectarine.
Fruit roundish, large. A second-rate tender and shy bearing kind,
ripening end of June.
11 Keen's seeding, Keen's new seeding, Keen's new pine,
Keen's black pine, Murphy's child. Fruit large, roundish. A
first-rate sort, ripening middle and end of June. It is very pro-
ductive, and one of the best for forcing.
12 Knevet's new pine. Fruit large, roundish. A second-
rate sort, ripening end of June. It is a shy bearer, and will not
grow in many soils.
13 Large black seeding. Fruit roundish, large. A second-
rate sort, ripening beginning of July.

ROSACEE. X. FRAGARIA.

14 Mulberry, Mahone, King, Cherokee, Surinam of Scotland.
Fruit ovate, middle-sized. A worthless sort, ripening begin-
ning of July.
15 Old pine or Carolina pine, Carolina, scarlet pine, old scarlet
pine, old Carolina, common Carolina, Carolina pine, large Carolina,
blood pine, Pyne hill, grandiflora, black pine, Bordeaff, Surinam
or scarlet fleshed, superior, Shen's scarlet. Fruit ovate, large.
A first-rate sort, ripening end of June and beginning of July.
As a solid, juicy, and peculiarly rich fruit, this kind is exceeded
by none. Keen's seeding is earlier, more productive, and pro-
fitable for the market, but its cultivation on these accounts
ought not to supersede that of the old pine strawberry, the su-
perior quality of which entitles it to be strongly recommended.
16 Red cone. Fruit ovate, middle-sized. A second-rate sort,
ripening end of June.
17 Round white Carolina, Carolina, white Carolina, white
pine, large blush pine, white Bath, red and white Bath, large
white, Chili, red Chili, large white Chili, large pale Chili, large
flesh-coloured Chili, cone, globe, conical white Carolina. Fruit
roundish or irregularly ovate, large. A worthless sort, ripening
end of June and beginning of July.
18 Surinam, red pine, red pine apple, Sutton's large, Oldaker's
new pine, red Chili, Chinese, Devonshire scarlet, North's seeding,
ananas or apricot of the Dutch, De Carolina. Fruit roundish,
ovate, large. A worthless sort, ripening beginning of July.
The cultivation of this sort is on the decrease, and is likely to
soon lost altogether.
19 Taylor's new emperor.
20 Variegated pine, striped-leaved scarlet. Leaves variegated
with white. A tender and worthless sort with regard to its fruit.
21 Westbere. Fruit ovate, middle-sized. A second-rate sort,
ripening end of June and beginning of July.
1 foot.
10 F. Chil'nsns (Ehrh. beitz. 7. p. 26.) late; flowers always
dioecious from abortion; leaflets obovate, obtuse, coarsely sar-
rated, coriaceous, wrinkled, clothed with silky villi beneath;
calyx and peduncles silky; peduncles thick; fruit pendulous;
sepal erect. 2. H. Native of South America, in Chili and Peru;
and west coast of North America. Duchesne in Lam. dic-
t. 12. f. 1. Hairs on peduncles and petioles spreading. Fruit
rose-coloured; flesh white. Called Chili strawberry. The
varieties are as follow:
1 Black Chili. Fruit large, of an irregular shape. A coarse
kind, ripening beginning and middle of August.
2 Large blush Chili. Fruit large, ovate, of indifferent quality,
ripening beginning and middle of July. It is hardly distinc-
table from the true Chili.
3 Pine Chili. Fruit large, ovate. A worthless sort, ripening
beginning and end of July.
4 Scarlet Chili. Fruit large, ovate. As a Chili strawberry
one of the best. Ripens beginning of July.
5 True Chili, Patagonian, Greenwell's, Greenwell's French,
Greenwell's new giant, du Chili, Fruitiller. Fruit large, ovate,
ripening beginning and middle of July. It may be said of the
Chili generally, that they are tender bad bearers, and of in-
different quality.
6 Wilmot's superb. Fruit large, roundish, hollow, and woolly.
As a Chili strawberry one of the best. Ripens beginning of July.
7 Yellow Chili. Fruit large, of an irregular shape. One of
the best of the Chilis. Ripens beginning of July.
8 Quinçino de Canterberi, Canterberi. Fruit ovate, with red
flesh and juice. Fragária Chilénias var. & tintca, Duchesne in
Lam. dict. 2. p. 539.
Chili Strawberry. Fl. April, May. Cl. 1727. Pl. 1 foot.

Buenos Ayres Strawberry. Fl. April, June. Pl. 1 foot.
12 F. CANADENSIS (Mich. fl. bor. amer. 1. p. 299.) large; leaves ample, oval, manifestly petiolate; pedicels long, recurved, pendulous; receptacle globose, scrobiculate, villous. 2. H. Native of North America, in woods and hilly places from Hudson's Bay to the United States. Flowers white.

Canadian Strawberry. Fl. April, May. Pl. 1 foot.
13 F. SUNDACA (Blum. biogr. 1106.) calyce segments spreading, entire; down on petioles and peduncles spreading; leaves ternate and quinate; leaves simply and bluntly serrated, pubescent on the nerves beneath. 2. H. Native of Java, on Mount Gede. Flowers not described.

Sunda Strawberry. Pl. ½ foot.

*** Leaves simple.

14 F. MONOVILLAU (Willh. spèce. 1093. Uster, nuee ann. face. 8. p. 40. t. 1. Curt. bot. mag. t. 63.) stoloniferous, weak, leaves simple, crenately toothed; fruit pendulous; receptacles elongated, red; sepals at length reflexed; hairs on peduncles adpressed. 2. H. Native of Europe. F. vésca var. é monophylla, Duchesn. in Lam. dict. 2. p. 532. no. 6. F. abnormis, Tratt. ros. 3. p. 166. Flowers white, hermaphroditic. Fruit round, small, worthless. Called one-leaved Alpine strawberry, Frasier de Versailles, Frasier à feuilles simples.

One-leaved Strawberry. Fl. May. Cl. 1773. Pl. ½ foot.

The greater part of the varieties of strawberries are furnished with stolons or runners. By some botanists the species have been considered only varieties, but generally are distinguished as species. T. A. Knight (Hort. trans. 3. p. 207.) considers the F. CHILÉNIUS or Chili, the F. grandiflora or pine, and the F. VIRGINIÆ or scarlet, (the first supposed to be a native of Surinam, the second of Chili, and the third of Virginia,) to be varieties only of one species, as all may be made to breed together indiscriminately. The fruit has received its name from the ancient practice of laying straw between the rows, which keeps the ground moist and the fruit clean. They are natives of temperate or cold climates, as of Europe and America, and on the higher mountains of Asia. The fruit, though termed a berry, is in correct botanical language, a fleshy receptacle or polyphore studded with the carpella, commonly called seeds.

Use.—The fruit is fragrant, whence the generic name Fragaria, delicious, and universally esteeemed. It consists almost entirely of matter soluble in the stomach, nor neither there nor when laid in heaps and left to rot, does it undergo the acetous fermentation. Hence it is very nourishing, and may be safely eaten in quantity. In addition to its grateful flavour, the sub-acid juice has a cooling quality, particularly acceptable in summer. Eaten either alone or with sugar and cream, there are few constituents with which strawberries, even when taken in large quantities, are found to disagree. Further, they have properties which render them in most conditions of the animal frame positively salutary; and physicians concur in placing them in their small catalogue of pleasant remedies. They dissolve the tartaric incrustations of the teeth. They promote perspiration. Persons afflicted with the gout have found relief from using them very largely; so have patients afflicted with the stone; and Hoffmann states he has known consumptive people cured by them. The bark of the root is astringent.

Of species and varieties.—The classification of strawberries by Mr. James Barnet, published by the Horticultural Society, has been adopted with some little variation in the foregoing enumeration of varieties. In regard to the size it will be necessary to state that the comparisons are made between the individual varieties of which each species is composed, and do not extend to those of other species. The general estimation of many of the sorts is not so high as had been formerly stated, owing to their having been found tender or indifferent by some, compared with others which experience has proved to be superior.

Modes of propagation.—The plants multiply spontaneously every summer, as well by suckers from the parent stem as by numerous runners, all of which, rooting and forming a plant at every joint, require only to be removed to a bed where there is room for them to flourish. Each of these separately bears a few fruit the following season, and will bear in full perfection the second summer. A plantation of the Alpine yields fruit the same year that it is made. The wood and the Alpines come regularly from seed, and bring a finer fruit than from offsets, except the intention be to try for new varieties. Knight, in making experiments with a view of ascertaining whether most of the sorts would not breed together indiscriminately, raised about 400 varieties, "some very bad, but the greater part tolerably good, and a few very excellent." The fruit of above a dozen of the sorts were sent to the Horticultural Society in August, 1818, and found of various degrees of excellence. The seeds, if sown immediately after being gathered, will produce plants which will come into bearing the following year.

Soil and site.—Neill says, "Strawberries are generally placed in a quarter of the garden by themselves, and it should be one which is freely exposed to sun and air. They are sometimes, however, planted in single rows, as edgings to borders, and in this way they often produce great crops. In either case care must be taken to replant them every fourth or fifth year at the farthest. The Alpine and Wood varieties may be placed in situations rather cool and shady; perhaps as an edging in the shrubbery. In such places they produce their fruit perfectly well, and late in the season, which is desirable."

General culture.—The following excellent instructions for cultivating strawberries are given by Mr. Keen of Isleworth, one of the best growers of that fruit. He says, "I will commence with a general detail of my practice; this may be considered as applicable to all the varieties of the strawberry, and afterwards, in noticing each kind that I cultivate, I will specify such peculiarities of treatment as are exclusively applicable to each.

"In preparing the soil for strawberries, if it be new, and as is frequently the case, very stiff, it should be trenched, but if the bottom spit of the soil, as sometimes happens, be of inferior quality, I then recommend only a simple digging, placing dung at the bottom underneath the mould so dug; on the contrary, should the land have been kept in a high state of cultivation or be good to the full depth, it will be advisable for the bottom spit to be brought up to the top, placing the dung between the spits. The best way to obtain new plants is by planting out runners in a nursery for the express purpose in the previous season; for it is a very bad plan to supply a new plantation from old plants. With respect to the time of planting, I have always found the month of March better than any other. Sometimes when my crops have failed I have had runners planted in the autumn for the following year, but these have always disappointed my expectations. I plant them in beds containing 3 or 4 rows, and the plants in each row, at a certain distance from each other, leaving an alley between each bed, the distance of the rows and of the plants in the rows, as well as the width of the alleys, depending on the kind of strawberry planted. The width of the alleys, as it will afterwards be stated, may appear
considerable, but I am satisfied that allowing this space for the workmen to stand on when they water the plants or gather the fruit is beneficial, because I have observed in other persons' grounds, where less space is allotted for this purpose, that great damage is done to the plants and fruit by the trampling of the people.

"After the beds are planted I always keep them as clear of weeds as possible, and on no account allow any crop to be planted between the rows. Upon the growing of the runners, I have them cut when necessary; this is usually three times in each season. In the autumn I always have the rows dug between; for if I find it refreshes the plants materially, and I recommend to those persons to whom it may be convenient to scatter in the spring very lightly some loose straw or long dung between the rows. It serves to keep the ground moist, enriches the strawberry, and forms a clean bed for the trusses of fruit to lie upon; and thus by a little extra trouble and cost a more abundant crop may be obtained. A short time before the fruit ripens I always cut off the runners to strengthen the root, and after the fruit is gathered I have what fresh runners have been made taken off with a reaping hook, together with the outside leaves around the main plant, after which I rake the beds, then hoe them, and rake them again. In the autumn, unless the plants appear very strong, I have some dung thrown in between the rows, but if they are very luxuriant the dung is not required, for in some rich soils it would cause the plants to turn nearly all to leaf. I also have to remark, that the dung used for manure should not be too far spent; fresh dung from the stable door is preferable to that dung, which many persons are so fond of. The duration of the beds must be determined by the produce of the plants, which varies much according to the different sorts; it always varies with the same sort in different soils, so that the precise time of the renewal of the beds must be regulated by the observation of the gardener in each particular case.

"I commence my observations on the different sorts with the *pine strawberry*. The best soil for it is a light loam, though no other kind of *strawberry* will bear a strong loam better than this. It is likewise to be noticed, that this is of all others the most difficult *strawberry* from which to procure a good crop. Particular care must be taken that they are planted in open ground; for in all gardens they grow very strong, but seldom bear fruit, in consequence of being so much shaded by standard trees; and I have observed the shade of the walnut tree to be much more injurious to these than to others, for under it they seldom bear at all, but run entirely to leaf. In planting the beds of *pine strawberries* I keep the rows two feet apart, and put the plants 18 inches from each other in the row, leaving alleys of three feet wide between each bed; these large distances I find necessary, for the trusses of fruit in my garden ground are frequently a foot long. The duration of this *strawberry* with me is three years; the first year it bears the best; the second year the crop is very good, and the third year it is less.

"The *imperial strawberry*, which was raised by myself from seed, may be treated in a similar way with respect to planting, distance, &c. as the *pine*; but I have to remark, that it requires rather a lighter and richer soil, and is not so liable to run to leaf when planted under trees.

"The *scarlet strawberry* must also be treated like the *pine*. With respect to distance for planting the beds of *scarlets*, I put each row 21 inches apart, and each plant 18 inches distant in the row, and make the alleys 2 feet 6 inches wide. The duration of this *strawberry* with me seldom exceeds three years.

"The *hautbois* I have always found to thrive best in a light soil, and it must be well supplied with dung, for excess of

X. *Fragaria*.

mature does not drive it into leaf like the *pine strawberry*. In planting the beds each row must be 2 feet apart, and from plant to plant in the rows must be 18 inches, leaving the alleys between the beds 3 feet wide. There are many different sorts of *hautbois*; one has the male and female organs in the same blossom, and bears very freely; but that which I most approve is the one which contains the male organs in one blossom, and the female in another; this bears fruit of the finest colour, and of far superior flavour. In selecting these plants care must be taken that there are not too many of the male plants among them, for as these bear no fruit they are apt to make more runners than the females. I consider one male to ten females the proper proportion for an abundant crop. I learned the necessity of mixing the male plants with the others by experience in 1809; I had before that period selected female plants only for my beds, and was entirely disappointed in my hopes of a crop. In that year, suspecting my error, I obtained some male blossoms, which I placed in a bottle on the bed of female *hautbois*. In a few days I perceived the fruit near the bottle to swell; on this observation I procured more male blossoms, and in like manner placed them in bottles in different parts of the beds, removing the bottles to fresh places every morning, and by this means obtained a moderate crop where I had gathered no fruit the preceding year. The duration of the *hautbois* with me seldom exceeds three years.

"The *wood strawberry* is best raised from seed, which I obtain from fruit just gathered, sowing it immediately in a bed of rich earth. When the plants are of a proper size, I transplant them into other beds, where I let them continue till the March following. They are then planted in rather a moist soil in beds as the others, each row being 2 feet apart, and the plants in each row 18 inches distant, the alley between each bed being 3 feet wide; in this way I produce abundant crops of very fine fruit. I have propagated this *strawberry* from runners, but never with such good success as from seeds, particularly if the runners were taken from old roots. The duration of this *strawberry* with me seldom exceeds 2 years.

"The *alpine strawberry* must always be raised from seed, which should be sown in a bed of rich earth in spring. When the plants are of a proper size, which will be in July and August, I plant them in rows at the back of hedges, or walls, in a rich or in a very moist soil; the rows should be 2 feet apart, and the distance from plant to plant in the rows 12 inches. My alpines, thus managed, bear most abundantly, so much so that in gathering them there is not room for the women to set their feet without destroying many. The alpines differ from all other strawberries in quickness of bearing; for no other sort sown in the spring of the year will produce fruit under 2 years, whereas this yields a crop at the end of one year. Its duration with me seldom exceeds 2 years."—Hort. trans. 4. p. 2.

Mr. Atkinson (Hort. trans. 5. p. 189.) describes a method of making strawberry beds, which he saw in a garden at Chatian, and which he thought excellent. The beds were upon flat ground, each about 3 feet wide, and between them were trenches 9 inches wide, and 4 inch walls of brick on each side of the trenches to keep up the earth, these trenches were about the depth of 2 or 3 layers of bricks and were for the purpose of holding water, which was supplied from a pump, whenever the ground was dry while the plants were in fruit. By this means a much greater crop of fruit was obtained, and the plants continued bearing much longer than in beds where there were no trenches for water. According to this plan considerable extent of strawberry ground is watered with very little labour, and it has the advantage of letting the water to the roots of the plants,
so as to keep the ground moist without hardening the surface, as is the case when the tops of the beds are watered with watering pots.

Mr. Knight (Hort. trans. 6. p. 103.) considers half the distance allowed by Mr. Keen to be sufficient space for strawberry plants. His beds also are wholly expended at the end of 16 or 17 months after being formed, and the ground is then applied to other purposes. He has consequently the trouble of renewing his beds every year; but he finds his trouble much less than properly managing old beds, and he is quite certain that he obtains a much larger quantity of fruit, and of a very superior quality, than he ever did obtain by retaining the same beds in bearing during 3 successive years, from the same extent of ground. By employing heat to strawberry plants raised from seed in spring, he has obtained abundant crops from yearly plants of every species.

Taking the crop.—The fruit ripens from June to August and September, but the main crop is usually over in July. Gather when the weather is dry, and the same day that the fruit is to be sent to table, otherwise it will soon lose its flavour. Pinch off the calyx and a quarter of an inch of the pedicel, along with the fruit.

Forcing the strawberry in hothouses, pits, and hot beds.—This fruit is forced in every description of forcing house, and also in the pinery, though the heat of the latter often prevents the setting of the blossoms. Where they are forced in large quantities, it is a good method to apply a pit to their sole cultivation. M'Phail says, "They will occasionally do well in a hot-house for growing the pine, but a heat sufficient to force peaches and nectarines is more natural and likely to secure the obtaining of good crops of fine fruit. A good way of forcing the strawberry," he adds, "is to bring them forward in a gentle heat, in melon frames, till the fruit be nearly about half swelled, and then to give them a stronger heat to ripen them" (Gard. rememb. 29.). Nicol thinks "the climate of the cherry-house most suitable to the nature of the strawberry; they will do well in a hot-bed, but the best method is to force them in fluent pits, such as those for raising pines."

Still.—Strawberries, to be forced in pots, require a strong and very rich loamy earth. Nicol.

Choice of sorts.—Abercrombie and Nicol recommend the alpine and scarlet Virginia, to which Nicol adds the wood strawberry. William Morgan (Hort. trans. 2. p. 376.) begins with the alpines, next he takes the Bath scarlets and common scarlets, and after these the pinies. But it is allowed by all that Keen’s seedling and the old pine are the best for forcing.

Potting and preparing the plants.—Abercrombie says, "the plants selected should be 2 years old, having attained a full bearing state. It conduces to the perfection of the fruit to put as many plants as are intended to be forced, into pots, that they may be previously nursed for a longer or shorter time, according to the age of the stock.—1st. New runners of the present summer may be potted in July and August, and nursed in pots for 2 seasons, having the blossoms pinched off in the second. This course of preparation is attended with most trouble, but the crop repays it. Three offsets may be planted in one large pot. 2d. Runners made last year may be potted in April, and then plunged in the earth, to be nursed throughout the growing season, with a view to forcing, having such blossoms as appear pinched off, while the roots are carefully watered.—3d. Stools of 2 years old standing, which have borne one crop, may be put into pots in August, September, or October. They may also be put into pots during any mild interval from the beginning of November till the end of the year; but they will not be so strong and well rooted. The method of potting established bearers is this: the pots should be twenty-fours or thirty-twos; provide at the same time some fresh and good rich loam. Put some of the earth, well broken with the spade and free from grubs or hurtful worms, into each pot, to the depth of 3 or 4 inches. Then take up the plants, with a ball of earth to the root of each; pare the ball with a knife till it is pretty round, and having cleared the stem of the plant from any withered or rotten leaves, place it in a pot, which fill up to the surface of the ball with the prepared earth. Water the plants as they are potted, and remove them to a warm situation. On the approach of winter, all the potted plants, whether established bearers or runners, should be placed under a frame or other sufficient shelter, till the hot-bed or forcing house is ready to receive them.”—Abercrombie.

M'Phail says “strawberry plants, intended for forcing, should be planted in pots eight or ten months before they are set into the forcing house, or strong plants may be taken up with balls of earth about their roots, and be potted and set into the forcing house immediately.” Nicol says, “some force old roots or stools, and others the runners only. Those who force the old roots generally lift and pot them about October or November, lifting a bulk from the bed, nearly sufficient to fill a 9 or 10 inch pot of plants 3 or more years old. Others plant runners of the former year in April, 3 or 4 in a large pot, or 2 in a middle-sized one, and plunge them in the earth all summer, giving them occasional waterings, and taking proper care of them. These succeed better than old roots, treated as above. But when I was in the practice of forcing strawberries, I used to prepare my plants in the following manner:—In July or August I planted runners of that season, 3 in a 9 or 10 inch pot, watered them and placed them in the shade for a few days; then plunged them to the brim in a freely exposed situation. In October their leaves were dressed off and the plants trimmed, and before winter they were covered with a little dry litter, in order to preserve the pots from the effects of the frost. The following spring any flowers that made their appearance were pinched off, and throughout the summer the plants were occasionally refreshed with water, and kept clear from weeds. In autumn the leaves were again dressed off as before; and when taken up for forcing, the pots were dressed and fresh earthed at top, previous to being placed in the forcing house. This method of preparing the plants is no doubt more troublesome than either of the above mentioned, but the plants, by being completely established and of a proper age, produce better crops. I have tried all the three ways repeatedly, and prefer the last.”

Morgan raises his alpines from seed, sowing in January, in frames or boxes, to be placed in a gentle heat; he hardens them after they are come up by removal to a colder situation; pot in May, in pots 6 inches in diameter and 6 inches deep. In October they are in flower, when he puts them under shelter, and in the latter end of November he places them in the forcing house or pinery, where they bear fruit through the winter. The scarlets he pots 3 plants in a pot, of the same size as those used for the alpines; in May or early in June, taking the runners of the previous year, he picks off the blossoms as they appear, and keeps them in a shady place till January, when he places them in the forcing house on shelves, 18 inches from the glass, each pot in a pan. The pine strawberry he pots in the same manner, and takes them into the forcing house in February or March. T. A. Knight (Hort. trans. 5. p. 438.) prepares his strawberry plants for early forcing as follows:—he manures a small piece of ground very highly but very superfi-
and 4 inches in the other half, the thickly and thinly planted rows occurring alternately. In July all the plants of the thickly planted rows are removed to ground that has produced an early crop of peas or potatoes; and these, having the roots well preserved, always afford an abundant crop of fruit in the following summer. The other plants remain unnoticed till the end of November, when the mould between the rows is removed with the spade, and the most widely extended lateral roots detached from it. The spade is also made to pass under each plant, and between it and the plant adjoining, so that each plant becomes capable of being removed at a subsequent period, without having any of the roots ruptured. As each plant becomes detached from the surrounding soil, the ground is closed around it, and it remains till it is wanted, but it should be placed in its pot as early as the middle of February, if it be not sooner removed. In potting strawberry plants, Mr. Knight always employs soil of the richest quality and very finely reduced, and a good deal of water, holding manure in solution, is employed to occasion the newly introduced soil to occupy all space previously vacant in the pots. The plants are then in a state to be subjected immediately to artificial heat.

Time of beginning to force.—If the fruit be wanted very early, the plants are put into hot-beds or pits in October, but the crops from strawberries so forced Nicol thinks hardly worth the trouble. Abercrombie says "begin to force strawberries about nine weeks before you want to gather fruit. Plants excised before the first of January seldom repay the trouble, and in proportion as the time of beginning to force approaches the vernal equinox the returns are more abundant. Have reserve sets of potted plants for removal into a house or frame every three weeks till the middle of March;" he adds, "strawberries, taken into the house in March, fruit in highest perfection than those forced earlier." M'Phail and Nicol begin in January. The latter observes, "those who force strawberries to a considerable extent, perhaps 1000 pots, bring them in to different successions, perhaps 100 or 200 at a time; that is in places where there are several forcing houses." M'Phail says "when the weather begins to get cold in September, strawberries of the alpine kind in pots may be set in a forcing house or brick frame, and if they be in good health, they will produce fruit for a considerable time. They require only a gentle heat of from 50° to 60°; give them water occasionally, but as it is constantly blooming and fruit on them, they need not be watered all over broadcast. Give them great plenty of air; they only require protection from heavy rains and cold weather." Morgan, as he has been already noticed, begins to force alpines in November, the scarlets in January, and the pinés in February and March. Thus ensuring, as he says, a sucessional supply of fruit from October till June.

Temperature.—Abercrombie says, begin at 40° and raise the heat as in the cherry-house. When a pit is employed, Nicol directs the pots to be plunged in a mild hark-bed, and the temperature, by the aid of the flues, to be kept at 50°, and 55° or 60° in sunshine. Such treatment will make the plants thrive and the fruit set freely. Morgan prefers beginning with the heat of a frame on dung, or a pit, and then moves to the peachhouse, and after the fruit is set removes his plants to ripen in the vineyard or stove. Scarlets he finds bear more heat than the other sorts.

Air and water.—Air is to be freely admitted in good weather, and water plentifully supplied at all times, until the fruit begins to ripen off. Then it is to be withheld, lest the flavour become insipid. Morgan prefers supplying water from pans, in order not to rot the hearts of the plants. He gives as little water as possible when the plants are nearly ripe, this being essential to have good-flavoured fruit.

Treatment of the plants after the fruit is gathered.—The strawberry, it is generally considered, will not force the year after like fruit trees, but must be rested by plunging in the open ground for one or two years, pinching off all blossoms as they appear. Williams states that "the scarlet strawberry, after affording a crop of fruit in a hot-house early in the spring, if carefully removed out of the pots or boxes, and placed in the open ground, will yield another crop of fruit in September. This second crop is very abundant, the warm rains in July and August proving highly favourable to the growth of the fruit; and as there is no other strawberry to be had at this season of the year except the alpine, the addition of the scarlet makes a pleasing variety in the dessert." (Hort. trans. 2. p. 28.) Morgan observes, without limiting his observations to any one sort, that "after the fruit has been gathered from the plants, the pots should be plunged in a shady border, giving them a good watering, and at the same time cutting off all the leaves; when thus treated, they will in the year following, produce as good crops in forcing as fresh potted plants. If not wanted for this purpose, they may be turned out into the natural ground, and will then bear a crop in the autumn of the same year, as described by Williams above."

LIN. SYST. Icosandria, Polygynia. Calyx 10-parted, the outer 5 segments accessory, large, foliaceous, tridentate at the apex and spreading. Petals 5. Stamens numerous. Carpels numerous, adhering to an elevated fleshy receptacle. Styles lateral. Seed pendulous. A herb, with habit of the strawberry, furnished with stolons which extend widely. Leaves trifoliate; leaflets cuneate-ovate, deep green, shining, coarsely crenated towards the apex, and hairy beneath. Peduncles axillary, solitary, 1-flowered. Flowers golden yellow. Fruit like that of the strawberry, red, and insipid.

Cult. This plant will grow in any common soil, and is easily increased by the stolons or runners. It prefers a dry warm situation.

LIN. SYST. Icosandria, Polygynia. Calyx 10-parted, the 5 outer segments accessory (f. 72. a.). Petals 5 (f. 72. b.). Stamens numerous. Carpels numerous, with lateral styles, seated on a dry, permanent, elevated receptacle. Seeds pendulous.—Herbs or sub-shrubs, with compound leaves, and with the stipules adnate to the petioles. Flowers white, yellow, rarely red.

§ 1. Leaves ternate.

* Flowers yellow.

1 P. Ni'væa (Lin. spec. 715.) stems ascending, few-flowered; leaves ternate; leaflets obovate-cuneiform, with flat, deeply serrated margins, rather hairy above, but clothed with white tomentum beneath; petals broad, obcordate, a little longer than the calyx. 2. H. Native of Switzerland, Lapland, and Siberia;
in America, Labrador, the mountains and alpine prairies from Carlton House to the Rocky Mountains, and to the shores of the Arctic sea. Vahl. fl. dan. 1035. Hook, in bot. mag. 2982. Loddd. bot. cab. 460. Flowers yellow.

**Var. β. macrophylla** (Ser. ms. in D. C. prod. 2. p. 571.) petioles elongated; leaflets larger; flowers larger. P. nivea β, pallidior, Swartz, ex Lehm. pot. 184. P. leucophylla, Pall. itin. 3. p. 194. ex Sieb. fl. taur. suppl. 359.—Gmel. sib. 3. t. 37. f. 1. Var. γ, cælorum; leaves the same colour and rather villous on both surfaces.

**Var. ε, prostrata** (Retz. prod. ed. 1. p. 97. ex Lehm. pot. 184.) flowers glomerulate.

**White-leaved Cinquefoil.** Fl. Ju. Aug. Clit. 1816. Pl. asc. 2 P. Anuygria (Schlecht. berl. mag. ann. 7. p. 296. and Lehm. pot. p. 186. t. 19. but not of D. C.) stems ascending, few-flowered; leaves ternate; leaflets oblong-lanceolate, smoothish above and densely clothed with whiteomentum beneath, with pectinately-serrate, revolute edges; serratures piliferous at the apex; calyx white; the segments about equal in length to the petals. 2. H. Native of Eastern Siberia. P. leucophylla, Fisch. in litt. Flowers yellow.

**Narrow-leaved Cinquefoil.** Fl. May, June. Clit. 1820. Pl. ascending.

3 P. macranthia (Led. in act. nov. soc. petr. 5. p. 541. no. 30. fl. alt. 2. p. 260.) stems oblique, few-flowered; leaves ternate; leaflets ovate-oblong, deeply serrate, beset with spreading pili above and on the flat margins, but clothed with white villi beneath; petals obcordate, twice the length of the calyx; stipulas green. 2. H. Native of Siberia, beyond the Baikal and in subalpine places at the river Tsacharysh, and of Kamtschatka. P. nivea γ, Camtschâtkâ, Schlecht. et Cham. in Linn. t. 2. p. 21. Flowers yellow.

**Var. β, wulfbera** (Led. l. c.) stem erect, 1-flowered; leaflets obovate, rather retuse. 2. H. Native of Dahuria.

**Large-flowered Cinquefoil.** Fl. April, May. Clit. 1820. Pl. 1 foot.

**Var. β, Brauniana** (Ser. ms.) leaflets cuneate, toothed; flowers larger; calyce segments acute. P. Brauniana, Nastl. pot. 70. t. 10. f. 4. but not of Hoppe, exclusive of nearly all the synonyms.

5 P. xlegans (Cham. et Schlecht. Linn. vol. 2. p. 28.) stem erect, 1-flowered; leaves petiolate, smoothish, ternate; leaflets deeply lobed; lobes linear, obtuse, entire, and trifid; stipulas membranous, acute; petals obcordate, longer than the calyx. 2. H. Native of Kamtschatka. Flowers yellow.

**Élegant’Cinquefoil.** Pl. 1/2 foot.

6 P. oëlda (Meyer, verz. pld. 146.) plant rather pilose; radical leaves ternate; leaflets obovate-roundish, toothed; stipulas obvate, obtuse, almost quite entire; stems filiform, decumbent, usually 3-flowered; petals obcordate, twice the length of the calyx, outer segments of the calyx elliptic, obtuse, inner ones longer, lanceolate, acute. 2. H. Native of Caucasus. P. grandiflora, Bieb. fl. taur. 1. p. 409. Allied to P. Brauniana and P. glacialis. Flowers yellow.

**Var. a. gladiolus** (Meyer, l. c.) leaflets smoothish, bluntly toothed; stipulas very blunt.

**Var. β, pilosula** (Meyer, l. c.) leaflets more or less pilose, acutely toothed; stipulas bluntish or acutish. 2. H. Native on the banks of Kasbek, at the height of 2300 feet.

**Cold Cinquefoil.** Pl. decumbent.

7 P. Helvetica (Schlecht. cat. 1897. p. 20.) plant very pilose; root thick; stems tufted, rather diffuse, few-flowered; leaves ternate; leaflets ovate, pectinately toothed; the teeth rather imbricated; calyce segments bluntish, shorter than the corolla. 2. H. Native of Vallais and Switzerland, on the mountains. P. frigida a, D. C. fl. fr. 4. p. 3748. P. Norvégica, Sutl. fl. helv. 1. p. 910. but not of Lin.

**Swiss Cinquefoil.** Fl. April, June. Clit. 1819. Pl. 1/2 foot.

8 P. prigionia (Vill. dauph. 3. p. 655. ex Nastl. pot. 70. t. 10. f. 3. exclusive of the synonyms) plant very pilose; root thick; stems tufted, rather diffuse; leaves ternate; leaflets ovate, crenated; calyce segments lanceolate, longer, or equal in length to the petals, which are obcordate. 2. H. Native of the Alps of Dauphiny. Flowers yellow.

**Frigid Cinquefoil.** Fl. April, June. Clit. 1819. Pl. 1/2 foot.

9 P. grandiflora (Lin. spec. 715.) stem ascending, few-flowered; leaves ternate; leaflets obvate, cuneate at the base, deeply serrated, pilose; stipulas large; petals obcordate, twice the length of the calyx; receptacle pilose. 2. H. Native of the Alps of Europe and Siberia. Lehm. pot. 184. Curt. bot. mag. 73. Hall. hist. no. 1114. t. 20. f. 1.—Gmel. sib. 3. p. 188. no. 83. t. 36. f. 1. Flowers large, yellow.

**Var. γ, minor** (Venezis, in litt.) stem and leaves smaller. 2. H. Native of Vallais.

**Great-flowered Cinquefoil.** Fl. Ju. Jul. Clit. 1640. Pl. asc. 10 P. fragifôrmis (Wildl. in mag. der. gesell. nat. freunde, p. 294. Lehm. pot. p. 165. t. 15.) stem erect, few-flowered; leaves ternate; leaflets roundish-obovate, bluntly toothed, beset with spreading pili on both surfaces, and having the margins villous; petals obcordate, a little longer than the calyx. 2. H. Native of the Aleutian Islands. Flowers yellow.

**Strawberry-like Cinquefoil.** Fl. Ju. Jul. Clit. 1800. Pl. 1 ft. 11 P. retusâ (Oed. fl. dan. 799.) hairy; stems erect, few-flowered; leaves ternate; leaflets cuneiform, tridentate at the apex, pilose; stipulas entire; petals obvolute, longer than the calyx. 2. H. Native of Denmark. Flowers yellow.

**Retuse-leaved Cinquefoil.** Pl. 1/2 foot.

12 P. Villâsâ (Pallas, ex Pursh, fl. amer. sept. 1. p. 358.) stem erect, few-flowered; leaves ternate; leaflets roundish-cuneiform, serrated, clothed with silky villi above, and with hairyomentum beneath; petals obcordate, twice the length of the calyx. 2. H. Native of North America, on the west coast, Durands Island, Unalaska and about Behring’s Straits, Kotzebue’s Sound, &c. Lehm. pot. 166. t. 16. P. ileïda, Willd. in berl. mag. ann. 7. p. 296. Corolla large, golden yellow.

13 P. Norvégica (Lin. spec. 715.) stem erect, dichotomous at the apex; leaves ternate, petiolate; leaflets oblong, acutely serrated, beset with spreading pili; pedicels axillary; petals obvolute, shorter than the calyx. 2. H. Native of Lapland, Norway, Siberia; North America, throughout Canada, Hudson’s Bay, Labrador, shores of the Columbia, at Fort Vancouver, and towards the mouth of the river. Lehm. pot. 153. Oed. fl. dan. t. 171. P. millegra and P. gràssa, Doug. in herb. hort. soc. P. dichotoma, Meuch. Flowers small, pale yellow.

**Norwegian Cinquefoil.** Fl. Ju. Jul. Clit. 1764. Pl. 1/2 to 1 ft. 14 P. Nana (Schlecht. in berol. mag. ann. 7. p. 296. and
Lehm. pot. 181.) stem erect, usually 1-flowered; leaves ternate; leaflets roundish-ovate, bluntly toothed, pilose on both surfaces, crenate beneath; petals obcordate, 3-times the length of the calyx. *H. Native of the Aleutian islands, and of North America on the most elevated of the Rocky Mountains, Labrador, Kotzebue’s Sound, &c. Outer calyce segments roundish and very obtuse. Corolla large, pale yellow.

_Dwarf_ Cinquefoil. Pl. 2 inches.

17 P. _Vahliana_ (Lehm. pot. p. 172.) stem erect, usually 1-flowered; leaves ternate; lateral leaflets cuneiform and trifid at the apex, middle one rhomboid, all very hairy, clothed with shining, yellowish, or white down beneath; petals reniform, twice the length of the calyx. *H. Native of Greenland and North America, on the dry and elevated ridges of the Rocky Mountains; shores and islands of the Arctic Sea. P. hirsuta, Vahl. in litt. Horn. fl. dan. t. 1390. but not of Michx. P. Jamesoniana, Grev. in mem. soc. wern. 3. p. 417. t. 20. Flowers yellow.

_Vahl’s_ Cinquefoil. Pl. 2 to 3 inches.

18 P. _subacalis_ (Linn. spec. 715.) stems prostrate, few-flowered; radical leaves as well as those of the runners ternate, but the calyce ones are simple; leaflets obvate-cuneate, serrated to the middle, densely clothed with hoary tomentum; petals round, obcordate, about twice the length of the calyx. *H. Native of Germany, Switzerland, Valais, Piedmont, and of Siberia. Jacq. icon. rar. vol. 3. t. 491. P. cinerea, Poir. P. glaucescens, Willd. P. verna, Kunth, fl. berol. p. 142. P. ovata, Poir. P. incana, Moench. P. arenaria, Borek. P. opaca, Vill.—All. fl. pedem. t. 24. f. 2. Gmel. sib. 3. t. 36. f. 2. Flowers yellow.

_Far. latiloba_ (Ser. in D. C. prod. 2. p. 573.) leaflets broader and shorter. Native of Siberia, about Barnaul.

_Emaragnate-petalled_ Cinquefoil. Pl. 2 inches.

21 P. _dentiflora_ (Ser. mss. in D. C. prod. 2. p. 573.) hairy; stems creeping, filiform; leaves ternate, petiolate; leaflets broadly obovate, of the same colour on both surfaces, doubly toothed, petiolar; stipulas denticulate; flowers axillary, solitary; petals obvate, about equal in length to the calyx. *H. Native of Nipaul. Flowers yellow.

_Toothed-petalled_ Cinquefoil. Pl. creeping.

22 P. _walessicola_ (Ser. in D. C. prod. 2. p. 574.) hairy; stem creeping, filiform; leaves ternate; leaflets obovate, sessile, toothed; flowers axillary, solitary; petals obvate, longer than the calyx. *H. Native of Nipaul. Flowers yellow.

_Wallich’s_ Cinquefoil. Pl. creeping.

23 P. _monatthes_ (Lindl. in Wall. cat. no. 1025. Lehm. pug. 3. p. 35.) stem erect, 1-2-flowered; leaves ternate, rather pilose on both surfaces, and somewhat ciliated; leaflets cuneiform, truncate, crenately toothed; teeth roundish, obtuse; stipulas short, entire; outer calyce segments the largest, roundish, and obtuse; petals nearly orbicular, quite entire, length of calyx. *H. Native of Sirmore. Flowers small, yellow.

_One-flowered_ Cinquefoil. Pl. 1/2 to 1/4 foot.

24 P. _cuneata_ (Wall. cat. no. 1015. Lehm. pug. 3. p. 34.) stem ascending, but erect and leafless at the apex; leaves ternate, on very long petioles, pilose; leaflets obvate, rounded at the base, truncate at the apex, deeply trilobate, acute; flowers terminal, crowded, sub-cymose. *H. Native of Gossainshan. Flowers yellow.

_Hairy-fruited_ Cinquefoil. Pl. 1/4 foot.

25 P. _argyrophylla_ (Wall. cat. no. 1030. Lehm. pug. 3. p. 86.) stem erect, nearly simple; leaves ternate, almost sessile, distant; leaflets oblong, serrate-toothed, densely clothed with white tomentum beneath; teeth pilose; stipulas ovals, lanceolate, deeply serrated; petals broad, obcordate, longer than the calyx. *H. Native of Gossainshan. Flowers large, yellow.

_Silver-leaved_ Cinquefoil. Pl. 1/4 foot.

27 P. _cathaclinus_ (Lehm. pug. 3. p. 87.) stems prostrate, usually 1-flowered; leaves ternate, distant; leaflets roundish, deeply serrated, densely clothed with silky pili above, but with white tomentum beneath; stipulas ovate, almost entire; petals obcordate, longer than the calyx. *H. Native of Gossainshan. Flowers blood-coloured.

_Reclining_ Cinquefoil. Pl. prostrate.

28 P. _atrosanguinea_ (Lodd. bot. cab. 786.) plant clothed with silky villi; stems decumbent; leaves ternate, petiolate; leaflets obvate, deeply serrated, clothed with white tomentum beneath; stipulas ovals, lanceolate, entire, or bifid; petals obcordate, longer than the calyx. *H. Native of Nipaul and Gossainshan. Sims, bot. mag. 2689. Peduncles few, 1-flowered at the tops of the branches. Corolla dark blood-coloured.

29 P. _muraathia_ (Ram. in D. C. fl. fr. 4. p. 3760.) stems prostrate, hairy, 1-flowered; leaves ternate; leaflets ovate, obtuse, serrated, unequal at the base, silky; outer calyce segments a little toothed; petals obcordate-cuneated or nearly entire, shorter than the calyx. *H. Native of the Pyrenees; of Italy, on Mount Generoso; in Calabria, on Mount Poleno. Lehm. pot 158. Ser. mus. helv. 1. p. 60. t. 5. P.
552

Shining Cinquefoil. Fl. May, June. Pl. ½ foot.

Shned Cinquefoil. Fl. May, June. Pl. creeping.
34 P. nitidá (Lin. spec. 716.) stems ascending, usually 1-flowered; leaves ternate; leaflets obovate-cuneiform, toothed at the apex, clothed on both surfaces with silvery silky down; petals oboval, emarginate, longer than the calyx. 2. H. Native of the mountains of Dauphiny and Savoy. Lehm. pot. 187. Ser. mus. helv. 1. p. 62. t. 5. f. a, b, c, d. Jacq. fl. austr. app. t. 25. Sturm, deutsch. fl. fasc. 12. with a figure. P. Torglovensis, Vittm. summ. 3. p. 270.—Bocc. mus. t. 9. f. 4. Flowers white or peach blossom coloured. Plant tufted.

Shining Cinquefoil. Fl. May, June. Clt. 1815. Pl. 2 to 3 inches.
55 P. Apennína (Tenor. cat. hort. neap. 1815. p. 50. fl. neap. 1. p. 80. t. 46.) plant shining; stems tufted, 1,4-flowered; leaves ternate; leaflets oval, obtuse, somewhat 2–3-toothed at the apex, teeth connivent; stipulas broad; petals obovate, longer than the calyx. 2. H. Native of the Apennines.—Bocc. mus. t. 8. f. 4. Flowers white.

36 P. Boccóni (Nestl. pot. 73. t. 10. f. 2.) stems ascending, few-flowered; leaves ternate; leaflets elliptic, clothed with silky hoary down on both surfaces, retuse and closely tridentate at the apex. 2. H. Native of the Apennines.—Bocc. mus. t. 8. Flowers white or red.

37 P. tríden'ta (Sol. in Æt. hort. kew. ed. 1. vol. 2. p. 216. t. 9.) root creeping; stems ascending; leaves ternate; leaflets obovate-cuneiform, tridentate at the apex, smoothish above, but pubescent and glaucous beneath. 2. H. Native of Greenland, Labrador, Canada, and Newfoundland. In Scotland on Werron hill near Brechin. Smith, engl. bot. 2389. Flowers corymbose, white, tinged with red.

38 P. níflóra (Lehm. pot. p. 195. t. 20.) stem erect, 2-flowered at the apex; leaves ternate, finely pilose; lateral leaflets deeply tripartite, terminal one bipartite, with the segments linear, entire, and ciliated on the margins. 2. H. Native of Eastern Siberia and North America, in barren grounds from lat. 64° to the shores of the Arctic sea and Kotzebue's Sound, Richards in Frankl. first journ. ed. 2. app. p. 21. Flowers white or red.

Two-flowered Cinquefoil. Pl. ½ foot.

§ 2. Leaves digitate, with usually 5–7–9 leaflets.

* Flowers yellow.

39 P. umbrósa (Stev. in Bess. cat. hort. crem. ann. 1816. p. 110. Biebl. fl. turc. suppl. 327.) stems erectish, naked from the base to the bifurcations; radical leaves with 5–6 obovate-oblong, bluntly serrated leaflets, cauleine leaves ternate; stipulas falcate; petals obovate, rather longer than the calyx. 2. H. Native of the south of Faurin, in shady places. Allied to P. réptans, but abundantly distinct. Petals of a golden yellow inside, but brownish yellow on the outside.

40 P. réptans (Lin. spec. 714.) stem creeping; leaflets 5, obovate-cuneiform, sharply serrated, pilose; pedicels axillary, solitary, longer than the leaves; bracteas (f. 73 d.) 3–lobed; petals obovate, longer than the calyx. 2. H. Native of Eastern Siberia; Corolla yellow.

41 P. flagellá'rb (Lehm. pot. p. 141. t. 12.) stems filiform, prostrate; leaflets 5, lanceolate, serrated, nearly glabrous; pedicels axillary, solitary, filiform, elongated; petals obovate, quite entire, a little longer than the calyx. 2. H. Native of fields and dry woods in Canada about Que-

Simple-stemmed Cinquefoil. Pl. trailing.
43 P. neumayéria'na (Tratt. ros. 4. p. 75.) stems decumbent; radical leaves quinate, cauleine ones ternate; leaflets roundish-cuneate, deeply toothed at the apex, pubescent on both surfaces; flowers solitary, supra-axillary, on long pedicels; petals 3 times the length of the calyx. 2. H. Native of Austria.

Newmayer's Cinquefoil. Pl. decumbent.
44 P. canadénsis (Lin. spec. 713.) stem ascending, weak; radical leaves quinate; leaflets sessile, obovate-cuneiform, acutely serrated above, clothed with silky white down; petals orbicular, almost entire, length of calyx. 2. H. Native of Canada and

Dissected Cinquefoil. Pl. 1 foot. 46 P. ve'nosa (Linn. spec. 712.) stems decumbent; lower leaves quinate, oval-oblong, rather-cuneiform, deeply serrated at the apex, pilose on the nerves, with the teeth blunt; flowers subpanicled; petals obcordate, longer than the calyx. 2. H. Native of Europe and the north of Asia, in dry places. In Britain in elevated pastures and barren hilly ground, near Kippax, Yorkshire; about Bury, Suffolk; Cambridgeshire; on St. Vincent's Rocks, Bristol; and in the King's Park, Edinburgh. Smith, eng. bot. t. 37. Sturm, deutsch. fl. fasc. 17. with a figure. P. dëbilis, Schleich. cat. 1815. Flowers yellow. There are several slight varieties of this plant.

Spring Cinquefoil. Fl. April, May. Britain. Pl. decumbent. 47 P. patula (Waldst. et Kt. pl. hung. 2. p. 218. t. 199.) stems tufted, rather decumbent, beset with adpressed pili; radical leaves with 7-9 leaflets; leaflets cuneiform, deeply toothed at the apex, naked above, but pilose beneath; petals retuse, longer than the calyx. 2. H. Native of the Carpathian mountains. Nestl. pet. 56. Flowers yellow.

Spreading Cinquefoil. Fl. May, July. Clt. 1818. Pl. tufted. 48 P. op'aca (Linn. spec. 713.) stems decumbent, filiform; leaflets 5-7 on the lower leaves, lanceolate-cuneiform, deeply serrated, pilose on both surfaces; petals obcordate, about equal in length to the calyx or a little longer; stipules entire, bifid or trifid. 2. H. Native throughout Europe, Siberia, and Labrador. In Scotland on the hills of Clова, Angusshire, as also in Perthshire. Jacq. icon. rar. t. 91. Smith, engl. bot. 2449. P. dubia, Sut. fl. helv. t. 1. p. 508. P. Gàliciàna, Pohl. et Bess. Flowers yellow, disposed in a leafy corymb; pedicels filiform; stems purplish.

Opaque Cinquefoil. Fl. May, June. Britain. Pl. ascending 1/2 foot. 49 P. au'rea (Linn. spec. 712.) stems ascending; radical leaves quinate; leaflets oblong-cuneiform, middle one stalked, serrate-toothed at the apex, rather silky with silvery margins; petals obcordate, nearly twice the length of the calyx. 2. H. Native of the Alps of Europe. P. Halleri, Ser. mus. helv. t. 1. p. 75. P. maculata, Gilb.—Hall. enum. t. 6. f. 4. hist. no. 1122. t. 21. f. 6. Flowers yellow.

Copper-coloured-flowered Cinquefoil. Fl. May, July. Clt. 1816. Pl. ascending 1/2 foot. 52 P. or'ánchoides (Wild. spec. 1101.) stems decumbent; lower leaves with 5-7 leaflets; leaflets cuneiform, somewhat pinnately pinnatifid, pilose, with the segments linear; petals obcordate, a little longer than the calyx. 2. H. Native of Armenia and Syria. Nestl. pet. 47. t. 5. f. 1. Corolla yellow.

53 P. Lindacké'i (Tauch. ex Spreng. syst. 2. p. 538.) leaves quinate, silky beneath; leaflets cuneiform, deeply toothed, the teeth oblong and roundish; petals filiform, procumbent; petals exceeding the calyx. 2. H. Native of Bohemia.

Lindacke's Cinquefoil. Fl. proc. 54 P. ranuncu'lides (Humb. et Bömpl. in Nestl. pet. 56. t. 3. f. 1. H. B. et Kunth, nov. gen. amer. 6. p. 216.) stems erect, few-flowered; radical leaves with 5-7 obvate, roundish, bluntly toothed, nearly glabrous leaflets; petals obcordate, a little longer than the calyx. 2. F. Native of Mexico, at the bottoms of the mountains called Cerro de las Cruces. P. maccrorrhiza, Schleich. consp. pot. in berol. mag. t. 292. Lehmi. pet. 114. Flowers yellow.

Ranunculus-like Cinquefoil. Fl. 1/2 foot. 55 P. hyéma'lis (Schleich. et Cham. in Linnaea. 5. p. 572.) root thick; radical leaves quinate; leaflets ovate, obtuse, cuneato-toothed, green and pilose above, but clothed with whiteomentum beneath; stems ascending, corymbose at the apex, 7-15-flowered, very hairy, as well as the calyces; calycin segments lanceolate, acute; receptacle villous. 2. G. Native of Mexico, at Cruz Blanca. Flowers yellow, about the size of those of P. alba.

Winter Cinquefoil. Fl. Nov. Pl. 1/2 foot. 56 P. thoma'sii (Tenore, prod. 2. suppl. 1. p. 61. fl. neap. 1. p. 285. t. 44.) stems erect, corymbose; radical leaves with 5, rarely with 7 leaflets; leaflets obovate, cuneately toothed, clothed on both surfaces with silky villi, greenish above, but hairy beneath; petals obcordate. 2. H. Native of Italy. Flowers yellow.

Thomass's Cinquefoil. Fl. Pl. 1 foot. 57 P. ar'ente'ae (Linn. spec. 712.) stems ascending; leaves quinate; leaflets cuneiform, deeply cut at the top, clothed with whiteomentum beneath, the margins revolute; petals retuse, longer than the calyx. 2. H. Native of Europe; plentiful in Britain, and of Canada. Smith, engl. bot. t. 89. Fl. dan. t. 865. Flowers yellow.

Var. t, dentáta (Wallr. sched. 237.) leaflets almost entire, only with 2 or 3 teeth at the apex, tomentose beneath. 2. H. Native of Germany and America. P. cinerea, Rafn. in litt.

Var. γ, dissec'ta (Wallr. sched. 237.) leaflets more or less deeply divided into linear segments, tomentose beneath. 2. H. Native of Germany and France.

58 P. guntue'ri (Pohl. tent. 2. p. 285. Lehmi. pet. 97. f. 10.) stems weak, diffuse; lower leaves quinate, upper ones toothed; leaflets cuneated, acutely serrated at the top, canescent beneath, with flat margins; petals retuse, a little longer than the 4 B.
calyx. 2. H. Native of Silesia and Bohemia, in arid places. P. Weinnmanniâ, Gunther. Flowers yellow.

Gunter's Cinquefoil. Fl. Ju. July. C18. 1818. Pl. ½ to 1 ft. 39 P. CALIAPA (Tenor. suppl. 2. p. 67. fl. neap. 1. p. 287. t. 45.) stems prostrate; leaves quinate, tomentose on both surfaces, very white beneath; leaflets cuneiform, multifid; petals longer than the calyx. 2. H. Native of Calabria, on the mountains. Flowers yellow.

Declinate Cinquefoil. Fl. Ju. July. C18. 1817. Pl. pros. 61 P. PETRAS (Schlecht. berol. mag. ann. 7. p. 292. Lehm. pot. 119. t. 11.) stems ascending; leaves quinate; leaflets cuneiform-rhomboid, deeply serrated at the apex, clothed with hoary silky down on both surfaces; corollas small; petals roundish-obcordate, exceeding the calyx. 2. H. Native of France, about Dijon, in rocky stony places.

Var. 3. MACROBLÁTA (Scm. in D. C. prod. 2. p. 577.) flowers large; leaves small; stipula ovate. P. intermedia, Thom. cat. 1818. p. 24.

Var. 4. EOLIGA (Ser. l. c.) leaflets smaller and narrower; stems elongated. P. oligata, Goldh. ex Fisch. gor, in litt.

Intermediate Cinquefoil. Fl. May. Sept. C18. 1786. Pl. 1 to 1½ ft. 64 P. NEXIA (Desf. cat. hort. par. ex Nuel. pot. 51. t. 4. f. 1. but not of Lag.) stems decumbent, dichotomous; lower leaves quinate, upper ones ternate; leaflets oblong-cuneiform, deeply cut at the apex, pilose; petals cuneate, retuse, a little longer than the calyx. 2. H. Native country unknown. Corolla pale yellow.

Cut-leaved Cinquefoil. Fl. Ju. July. C18. 1818. Pl. dec. 65 P. GRACILE (Dugl. mess. Hook. fl. bor. amer. 192.) stems erect, tall, beset with soft hairs, corymbosely panicled at the apex; leaves quinate, lower ones on long petioles, upper ones almost sessile; leaflets lanceolate, deeply and pinnatifidly serrated, clothed with white tomentum beneath; stipulae large, lanceolate, entire; petals obcordate, longer than the calyx, which is silky. 2. H. Native of North America, on the banks of the Columbia and the plains of the Multnomah river. Hook. bot. mag. t. 2984. Flowers golden yellow.

Slender Cinquefoil. Cl. 1826. Pl. 1 to 2 feet. 66 P. LINDMANNI (Spreng. syst. app. 199.) stems erect, hoary, pilose; leaves with 5-7 leaflets; leaflets pinnatifidly serrated, hairy above, hoary and pilose beneath; flowers corymbose; petals retuse, exceeding the calyx. 2. H. Native of Siberia. P. violacea, Lodd. bot. cal. with a figure. Flowers yellow.

Loddiges's Cinquefoil. Fl. Ju. July. Pl. 1 foot. 67 P. RUS Nhiều (Bess. ex Spreng. syst. app. 199.) stems erect, densely woolly as well as the leaves; leaves quinate; leaflets pinnatifid, white beneath; stipulae oblong, cut; peduncles corymbose; petals exceeding the calyx. 2. H. Native of Podolia, at Tyras. Flowers yellow.

Normal Cinquefoil. Pl. 1 foot. 68 P. FLABELLIÓRPÉMS (Lehm. pot. 2. p. 12.) stems erect, slender, leaves with 7-9 leaflets; leaflets deeply pinnatifid, beset with adpressed pili above, but with white hoary tomentum beneath, with the segments linear, distant, and revolute at the margins; flowers corymbose; petals obcordate, exceeding the calyx. 2. H. Native of North America, in the plains of the Saskatchewan. Hook. fl. bor. amer. p. 192. t. 64. Corolla golden yellow.

Fan-formed-leaved Cinquefoil. Pl. 1½ foot. 69 P. CHRYSANTHÉ (Trey. ind. sem. hort. wats. 1828.) stems ascending, beset with spreading pili; leaves with 5, rarely with 7 leaflets, upper ones ternate, pubescent; leaflets oblong-cuneate, deeply serrated; upper stipulae rather cut; petals obcordate, twice the length of the calyx. 2. H. Native of Siberia, in dry grassy places and on the sides of hills; of North America in moist prairies near the Rocky Mountains, and of Germany. Led. fl. ross. alt. illust. t. 398. P. Thurigia, Behn. ex Link. enum. fl. hort. berol. 2. p. 64. Flowers golden yellow, loosely corymbose.

Desert Cinquefoil. Fl. Ju. July. Pl. 1 foot. 71 P. DEBRÁTA (Bunge in Led. fl. ross. alt. ill. t. 396. fl. alt. 2. p. 250.) stems ascending, pubescent; leaves with 5 or 7, rarely with 9 leaflets, upper ones ternate, all smoothish above, but clothed with white tomentum beneath; leaflets oblong, cuneate at the base, pinnatifidly serrated, with revolute margins; stipulae nearly entire; petals obvolute, hardly exceeding the calyx. 2. H. Native of Altaia, at the rivers Jiryes, Bekum, Kirutsham, in meadows, and near Lokowitz. Flowers yellow, panicked.

Neat Cinquefoil. Pl. 2 to 3 inches. 73 P. LEPTÓRA (Lehm. ind. sem. hort. hamb. 1830. Fl. S. pag. 3. p. 32.) stems ascending, pilose, nearly leafless; leaves quinate; leaflets ovate, serrated, densely clothed with white tomentum beneath; stipulae ovate, entire; petals obcordate, veiny, shorter than the calyx. 2. H. Native of mountains between the town of Mexico and Toluco. Root brown, woody. Corolla small, yellow.

Slender-petalled Cinquefoil. Pl. ½ foot. 74 P. WALLACHIAN (Del. in Wall. cat. no. 1023. Lehm. pag. 3. p. 50.) stems erect, bluntly angled; leaves quinate,
piole on both surfaces; leaflets stalked, obovate, bluntly serrated at the apex; flowers pedicellate, crowded; calyce segments lanceolate, outer ones usually bifid; petals emarginate, a little longer than the calyx. \( Y \). H. Native of Nipal. Corolla yellow.

*Wallich's Cinquefoil*. Fl. 4 foot. 75 P. *virgata* (Lehm. post. 75, no. 27.) stem erect, twirly; leaves with 7-9 leaflets; leaflets lanceolate, pinnatifid, glabrous above, and clothed with white tomentum beneath; stipules lanceolate, entire; corolla small; petals obvate, quite entire, twice the length of the calyx. \( Y \). H. Native country unknown. Flowers yellow, panicked at the tops of the branches.

*Twiggy Cinquefoil*. Fl. June, July. Clt. 1820. Fl. 1½ foot. 76 P. *canescens* (Bess. fl. galic. no. 607. 1 p. 330.) stem erect, many-flowered; leaves quinate; leaflets oblong-cuneiform, deeply serrated, clothed with adpressed pili above, and canescent from tomentum beneath; stipules ovate-lanceolate, entire or toothed; petals obcordate, length of calyx. \( Y \). H. Native of Europe, Caucasus, and Siberia. P. Hungarica, Schlecht. P. parviflora, Gaal. P. ornithopoda, Tausch. hort. can. 1. fasc. 1. t. 16. ex Tratt. ros. 4. p. 72—Jacq. fl. aust. 4. t. 383. Flowers yellow.

*Conescent Cinquefoil*. Fl. June, July. Clt. 1817. Fl. 1 to 1½ foot. 77 P. *stipulaires* (Lin. spec. 712. but not of Lapey.) stems erect, weak; lower leaves with 7 leaflets, upper ones ternate; leaflets linear-oblong, tridentate, nearly glabrous; stipulae large, dilated; petals obvate, hardly emarginate, longer than the calyx; receptacle glabrous. \( Y \). H. Native of Siberia.—Gmel. sib. 3. t. 37. f. 2. Flowers small, yellow, panicked.

*Large-stipled Cinquefoil*. Fl. June, July. Clt. 1727. Fl. 3 to 1 foot. 78 P. *hiata* (Lin. spec. 712. Lehm. pot. t. 8.) stem pilose, corymbose, flowers with 5-7 leaflets; leaflets pilose, cuneiform, cut at the apex; stipulae lanceolate, entire; petals obcordate, longer than the calyx. \( Y \). H. Native of the Pyrenee, south of France, Piedmont, Silesia, Siberia, &c. P. crysopétala, Bess. in litt. P. angustifolìa, D. C. fl. fr. 5. p. 540. Flowers yellow.

*Pedate-leaved Cinquefoil*. Fl. June, July. Clt. 1819. Fl. ascending 1 foot. 80 P. *Astracana* (Jacq. icon. rar. 1. t. 92.) stem ascending, pilose, dichotomous; radical leaves quinate; leaflets oblong, bluntly serrated; cauline leaves toothless, tripartite, pubescently pilose; stipulae large; petals obcordate, longer than the calyx. \( Y \). H. Native of Caucasus and about Constantine. P. corymbosa, Munch. Flowers terminal and axillary.

*Astracan Cinquefoil*. Fl. Ju. July. Clt. 1787. Fl. 1 to 1½ ft. 81 P. *Taurica* (Schlecht. in loc. mag. fam. 7. p. 291. Lehm. post. 90. t. 9.) stem erect, pilose, many-flowered; leaves quinate; leaflets obvate, cuneated at the base, serrated in front, clothed with adpressed silky pili; stipulae lanceolate, entire; petals obcordate, a little longer than the calyx. \( Y \). H. Native of Tauria, on the higher mountains, and at Sarepta in arid places. Flowers large, pale yellow, sub-peduncled.

*Taurian Cinquefoil*. Fl. June, July. Clt. 1820. Fl. 1 foot. 82 P. *reética* (Lin. spec. 711.) stem erect, pilose; leaves with 5-7 leaflets; leaflets oblanceolate, deeply serrated, beset with spreading pili; lower stipulae lanceolate, entire, upper ones broader and jagged; petals obcordate, exceeding the calyx. \( Y \). H. Native of Tauria, Caucasus, Austria, Germany, Italy, Switzerland, France, and the Pyrenees. Nestl. pot. 42. t. 6. All. fl. pedem. 71. f. 1. Sav. hort. rom. 5. t. 49. Flowers pale yellow, disposed in terminal corymbs.

*Upright Cinquefoil*. Fl. Ju. Aug. Clt. 1648. Fl. 1 to 1½ ft. 83 P. *caesarea* (Wildl. spec. 2. p. 1100.) stem erect, pilose, reddish; leaves with 5-7 leaflets; leaflets oval-oblong, deeply toothed, beset with adpressed pili; stipulae ovate-lanceolate, for the most part cut; petals obcordate, hardly longer than the calyx. \( Y \). H. Native of Hungary. P. cardiopétala, Bess. in litt. Flowers yellow, disposed in corymbose panicles.

*Jagged-leaved Cinquefoil*. Fl. June, July. Clt. 1816. Fl. 1 to 1½ foot. 84 P. *Davicka* (Poir. suppl. 4. p. 540.) stem erect; leaves with 5-7 leaflets; leaflets obvate, tapering a long way at the base, deeply serrated, smoothish; stipulae pinnatifid; petals obcordate, about equal in length to the calyx. \( Y \). H. Native of Corsica. D. C. fl. fr. 6. p. 541. Stems dichotomously corymbose at the apex, with the branches divaricate. Corolla yellow.

*Divaricate-branched Cinquefoil*. Fl. Ju. July. Fl. 1 to 1½ ft. 85 P. *Valériea* (Lin. spec. 714.) stem erect, hoary as well as the whole plant; leaves with 5-7 leaflets; leaflets obvate, serrated, clothed with silky tomentum, hoary beneath; stipulae lanceolate, entire, rarely denticulated; petals obvate-oblong, hardly emarginate, shorter than the calyx. \( Y \). H. Native of Piedmont, Valder, &c. in stony places. All. pedem. t. 24. f. 1. Flowers pale sulphur-coloured.

*Valder Cinquefoil*. Fl. May, June. Clt. 1825. Fl. ¼ to ¾ ft. ** Flowers white or red.

*Lupine-like Cinquefoil*. Fl. July. Clt. 1739. Fl. ¼ to ½ ft. 4 v 2
ROSACEÆ.

88. P. Clusiana (Jacq. auct. t. 2. t. 116. Sims, bot. mag. 1327.) stems ascending, few-flowered, purplish, pubescent; radical leaves quinate, cauline ones ternate; leaflets ovate-cuneiform, pubescent, truncate at the apex, with the teeth coarsely serrate; stipulas ovate-lanceolate, entire; petals roundish, hardly longer than the calyx.  \( H. \) Native of Austria, Styria, Carniola, Tyrol, and Salisburg, on rocks and among stones. P. caulescens 3 Clusiana, Poir. supp. 3. p. 313. P. caulescens, Scop. fl. carn. ed. 2. vol. 1. p. 361. Corolla terminal. Corolla large, white.

89. P. caulescens (Linn. spec. 713.) downy; stem erect, weak, many-flowered, pilose; radical leaves quinate, cauline ones ternate; leaflets oblong, coarsely serrated at the apex, with pilose margins; stipulas entire; petals oblong-cuneiform, hardly emarginate, longer than the calyx.  \( H. \) Native of the south of Europe, on the higher Alps. Jacq. auct. 3. p. 11. t. 220. Sturm, deutsch. fl. fæs. 1. with a figure. P. albâ var. Lam. fl. fr. 3. p. 118. Peduncles crowded at the tops of the stems. Corolla white.

90. P. glauca (Moris, elench. sard. p. 18.) plant very cinnamomum; stems ascending; radical leaves quinate, cauline ones ternate or simple; leaflets oblong-cuneiform, pubescent on both surfaces, bluntly and unequally many-toothed at the apex.  \( H. \) Native of Sardinia. Halbt. of P. caulescens, Linn. but differs from it in the teeth of the leaflets being more close.

Glaucaus Cinquefoil. Pl. 1/3 foot.

91. P. alba (Linn. spec. 713.) stems procumbent, weak, few-flowered; lower leaves quinate, upper ones ternate; leaflets oblong, coarsely serrated at the apex, smoothish above, but clothed with silky canescent down beneath; stipulas lanceolate, entire; petals obcordate, longer than the calyx.  \( H. \) Native of middle and west Europe and Sarcus. In Wales in mountainous woods according to Mr. Haviland, but not observed by any other person. Smith, engl. bot. 1384. Jacq. auct. 2. t. 115. P. nitida, Scop. carn. ed. 2. vol. 1. p. 362. P. Clusiana, Geshat. scep. no. 272. P. cordata, Braune, fl. salsb. 2. p. 80. Fragaria alba, Crantz. Pedicels axillary and terminal. Flowers white.

92. P. alchemiloides (Lapeyr. act. ton. 1. p. 212. t. 17.) stems erectish, many-flowered; leaves with 5 or 7 leaflets; leaflets oblong-lanceolate, truncate at the apex, the teeth coarsely, glabrous above, but with silky-silvery down beneath; stipulas of radical leaves subulate, of cauline ones ovate-lanceolate; outer calyce segments lanceolate; petals oblong-oblong, emarginate, a little longer than the calyx.  \( H. \) Native of the Pyrenees, among rocks. P. Pyrenaica, Schlecht. Flowers white.

93. P. comaroides (Humb. et Bonpl. ex Nlstl. pot. 62. t. 4. f. 3. and Kunth, nov. gen. amer. 6. p. 217.) stems firm, erectish; radical leaves quinate, cauline ones ternate; leaflets elliptic, usually 5-toothed at the apex, smoothish above, but clothed with silky hoary down beneath; stipulas entire; petals obcordate, much longer than the calyx.  \( H. \) Native of Mexico, on mount Jorullo at the height of 1600 feet. P. rubra, Schlecht, in herald. mag. nat. 291. Corolla dark purple.

94. P. colorata (Lehm. sem. hort. hamb. 1821. p. 8,) stems erect, purple; lower leaves quinate, with oblongate-lanceolate leaflets; upper leaves ternate, with lanceolate leaflets; leaflets serrated, and beset with silky incumbent pili; stipulas ovate, quite entire, sheathing; petals obcordate, veiny, longer than the calyx.

95. P. russelliana (Sweet, fl. gard. t. 273.) villous; stems branched, diffuse; radical leaves petiolate, ternate, quaternate or quinate; leaflets ovate or obovate, obtuse, deeply serrated, feather-nerved, rather silky beneath; stipulas adnate, ovate-lanceolate, acuminate; calyce segments lanceolate, acute; petals large, obcordate.  \( H. \) A hybrid between P. formosa and P. atropurpurea. Petals bright scarlet, with a darker base.

96. P. Horwoodiana (Sweet, fl. gard. 2. ser. t. 61.) stems ascending, clothed with villi; lower leaves with 5-6 leaflets, upper ones ternate; leaflets oblong-cuneiform, coarsely toothed, hairy on both surfaces; calyce segments ovate, acuminate; petals obcordate, imbricated, longer than the calyx.  \( H. \) A hybrid, produced from P. formosa impregnated by the pollen of P. opica. Petals pale yellow tinged with red, and light red at the base.

\( \text{3. Leaves pinnately digitate.} \)

98. P. diversifolia (Lehm. lug. 2. p. 9. Hook, fl. bor. amer. 190.) stems ascending; radical leaves pinnate, with usually 3 pairs of leaflets, and quinate; cauline leaves with 2 pairs of leaflets, pinnate or ternate; leaflets cuneiform, coarsely and deeply toothed above, and clothed with silky pili at the apex; stipulas ovate-lanceolate, quite entire; petals obcordate, longer than the calyx.  \( H. \) Native of North America, in the prairies as well as on the dry banks of the Rocky Mountains between lat. 52° and 56°. Corolla yellow.

Divis-prelved Cinquefoil. Pl. 1/2 to 1 foot.

99. P. pulcherrima (Lehm. lug. 2. p. 10. Hook, fl. bor. amer. 190.) stems ascending, villous; leaves impari-pinnate; leaflets cuneiform, coarsely and deeply toothed above, and clothed with pellucid pili above and clothed with whiteomentum beneath; stipulas ovate, acute, quite entire, woolly; petals entire, longer than the calyx.  \( H. \) Native of North America, in the prairies as well as on the dry banks of the Rocky Mountains, between lat. 52° and 56°. Corolla golden yellow.

Very fair Cinquefoil. Pl. 1 foot.

100. P. rubriceus (Lehm. lug. 2. p. 11. Hook, fl. bor. amer. 191.) stem ascending; radical leaves pinnate, with 2 pairs of leaflets, cauline ones ternate; leaflets approximate, oblong, pinnatifidly serrated, glabrous above and tomentose beneath; stipulas quite entire; petals obcordate, exceeding the calyx a little; receptacle smoothish.  \( H. \) Native of North America, about Bear Lake, in lat. 66°. Flowers golden yellow, disposed in a dichotomous panicle.

Red-stemmed Cinquefoil. Pl. 1 foot.

101. P. pulchella (R. Br. chl. melv. p. 193.) stems procumbent; usually 1-flowered; leaves pinnate, with 2 pairs of leaflets, clothed with silky tomentum beneath; leaflets 2-3-lobed or linear, entire, with revolute edges, the terminal or odd one pinnatifid; stipulas ovate, sheathing; styles glandular and dilated at the base; petals obovate, emarginate, length of calyx.  \( H. \)
Native of the islands of the Arctic sea; shores of the mainland between the Coppermine and Mackenzie rivers. Corolla yellow.

*Prettty Cinquefoil.* Pl. procumbent.

102 P. rutheana (Wild. spec. 1079.) stem erect, diffuse, pilose; radical leaves quinately-pinnate, cauleine leaves ternate; leaflets hairy, obovate, unequally and deeply serrated; stipulas oblong-lanceolate, outer side toothed; petals shorter than the calyx. 2. H. Native of Siberia. Flowers small, yellow, pinnated on the tops of the branches pedicles hairy, primary ones solitary in the forks of the stem.

*Russian Cinquefoil.* Fl. May, June. Ckt. 1799. Pl. 1 to 2 ft.

103 P. difussa (Willd. edw. 555.) stem diffuse, beset with spreading pili; radical leaves quinately pinnate, cauleine ones ternate; leaflets lanceolate, unequally and coarsely serrated, beset with spreading pili on both surfaces; primary pedicels solitary; petals retuse, shorter than the calyx. 2. H. Native country unknown. Flowers small, yellow, pinnated at the tips of the branches.

*Diffuse Cinquefoil.* Fl. May, July. Ckt. 1817. Pl. 1 ft.

104 P. Dombeyi (Nestl. fl. p. 50. t. 2. 5 f. 2.) stems decumbent, pilose; leaves quinately pinnate, upper ones ternate; leaflets obovate, cuneiform, hardly pilose, serrated at the apex; stipulas lanceolate, acute, entire; petals a little longer than the calyx; receptacle hairy; carpels glabrous. 2. H. Native of Chili. Corolla yellow.

*Dobney's Cinquefoil.* Pl. decumbent.

§ 4. Leaves pinnate. *Flowers yellow.*

105 P. bifurca (Lin. spec. 711.) roots creeping; stems ascending; leaflets about equal in size, bifiid or entire, outer ones confluent; stipulas oblong, entire, or a little cut; flowers sub-corymbose; pedicels pilose; petals obvate, entire, longer than the calyx. 2. H. Native of Iberia, Siberia, and Silesia.—Gmel. t. 37. f. 1. Corolla pale yellow.

Var. β, subarctica (Ser. ms. in D. C. prod. 2. p. 580.) stems, leaves, and calyces smaller, and clothed with rather silky down. 2. H. Native about Astrakan.

Var. γ, montrósa (Fisch. gor. in litt. Led. fl. alt. 2. p. 246.) branches much crowded, short. 2. H. Native of Dahuria and Altai, in sterile salt places.

106 P. astragalofolia (Led. fl. Ross. alt. ill. t. 228. fl. alt. 2. p. 246.) plant clothed with silky villi; stems prostrate, nearly leafless; radical leaves pinnate, usually with 6 pairs of leaflets; leaflets oblong, quite entire, or 2-3-parted, upper ones rather confluent, terminal or odd one trifid; caudine leaves small, simple, entire, or wanting; stipulas oblong, entire, or cut a little; petals nearly orbicular, twice the length of the calyx. 2. H. Native of Altai, in sterile deserts on the right bank of the river Tschina. Flowers pale yellow, 2-4, terminal.

107 P. Japónica (Blum. bijdr. 1103.) stolons decumbent; radical leaves pinnate, usually with 3 pairs of leaflets, beset with striose villi; cauleine leaves ternate; leaflets obvate, obtusely serrated, outer ones largest and approximate; stipulas trifid at the apex. 2. H. Native of Japan.

*Japan Cinquefoil.* Pl. creeping.

108 P. ezoensis (Bieb. fl. taur. 1. p. 404.) plant hairy; stems erect; leaves pinnate; leaflets roundish, a little lobed, hairy, outer ones the largest; stipulas multifid; panicle somewhat dichotomous; calcine segments obtuse, denticulated at the apex; petals obvate, entire, about equal in length to the calyx. 2. H. Native of Tauria, among rocks towards the top of Mount Tschurudag. L. & H. nat. t. 2. P. fragarioides, Habl. 147. but not of Lin. Corolla yellow, about the size of those of *Géum urbanum.*

109 P. fragaíoides (Lin. spec. 710.) stem erect, dichotomous, with creeping stolons issuing from the base; radical leaves pilate, cauleine ones ternate; leaflets oval, sharply serrated, silky-pilose, outer ones larger and more confluent; stipulas serrated; petals obovate-cuneiform, a little longer than the calyx. 2. H. Native of Siberia. L. & H. nat. t. 4. Gmel. 3. sib. 3. t. 34. f. 2. P. poterioides, Schlecht. berol. mag. ann. 7. p. 286. Plant pilose. Flowers yellow, in corymbose panicles.

110 P. pimpeiíoloides (Lin. spec. 711.) stem erect, pilose; leaves pinnate; leaflets about equal, roundish, dentately serrated, pilose; stipulas cut; petals obovate, a little longer than the calyx. 2. H. Native of America, among stones. Nestl. t. 32. f. 1. Buxb. cent. 1. t. 48. Flowers yellow, disposed in dichotomous panicles.

111 P. cicutariifolia (Wild. spec. 2. p. 1098.) stem erect, beset with adpressed pili; leaves pilate; leaflets cuneiform, deeply toothed, with a few hairs on both surfaces; stipulas nearly entire; flowers in corymbose panicles; petals obovate, about equal in length to the calyx; receptacle glabrous. 2. H. Native of Galatia. Nestl. t. 2. 2 f. 2. Flowers yellow, about the size of those of *P. argéntea.* Leaves resembling those of *Erodium cicutarium.*

112 P. supina (Lin. spec. 711.) stems decumbent, dichotomous; leaves pinnate; leaflets oblong, deeply serrated; stipulas ovate, entire; pedicels axillary, solitary; petals obovate, length of calyx. 2. H. Native of Europe and Siberia, also of North America, in the plains of the Saskatchewan. J. fl. aust. 5. t. 406.—Gmel. fl. can. vol. 1. t. 27. f. 1. P. prostrata, Haenke. Corolla small, yellow.

113 P. effusa (Dough. ms. Hook. fl. bor. amer. p. 187.) plant clothed with hoary tomentum; stems ascending, weak; leaves interruptedly pinnate; leaflets oblong, deeply serrated; flowers in dichotomous panicles; stipulas lanceolate, acuminate, entire; petals obovate, equal in length to the sepals, which are acuminate. 2. H. Native of the north-west coast of America, on the elevated grounds of the Assinaboyne, and the higher parts of the Red river. Receptacle villous. Corolla golden yellow.

*Effuse Cinquefoil.* Pl. ascending.

114 P. pensylvánica (Lin. mant. 76.) stem erect, rather pilose; leaves interruptedly pinnate, clothed with hoary tomentum; larger leaflets oblong, truncate, deeply serrated, smaller ones quite entire, about the size of the segments of the larger ones; stipulas lanceolate, usually entire, but sometimes with a few teeth; petals obovate, a little longer than the calyx. 2. H. Native of the south of Europe, North America, and Siberia, plentiful. J. acq. hort. vind. 2. t. 189. P. hispida, Poir. suppl. 4. p. 538. Willd. fl. 553. Panicle branched. Flowers yellow.

115 P. missouriaca (Horn. ex Lind. bot. reg. 1412.) stem erect; leaves pinnate, with usually 3 pairs of leaflets, hoary and silky above, and clothed with white down beneath; leaflets oblong, pinnatifid, with the segments lanceolate-linear and acute;
stipulas foliaceous, cut; flowers corymbose; petals emarginate, longer than the woolly calyx. 2. H. Native of North America, on the plains of the Missouri. P. arguta, Spreng. syst. 2. p. 334. but not of Pursh. Flowers yellow.

**Sharp-serrated-leaved Cinquefoil.** Fl. June, Jul. Clt. 1826. Pl. 1 to 3 feet.

117 P. hiptelic (Lehm. pg. 2. p. 7. Hook. fl. bor. amer. p. 188. t. 64.) stem erect; leaves pinnate; leaflets lanceolate, oblong, deeply and coarsely serrated, silky above, and clothed with hoary shiningomentum beneath; stipulas lanceolate, acuminate, quite entire; panicle somewhat dichotomous, loose; petals obcordate, exceeding the calyx. 2. H. Native of North America, on the plains of the Saskatchewan and prairies of the Rocky Mountains. P. leucophylla, Torrey, ann. lyc. 2. p. 197. but not of Pall. itin. 3. p. 194. P. dealbata, Doug. ms. Flowers yellow.

**Hippoc's Cinquefoil.** Fl. June, July. Pl. 1 to 2 feet.

118 P. pinnaatifida (Doug. ms. Hook. fl. bor. amer. p. 188.) stem erect; leaves pinnate; leaflets ovate, pinnately pinnatifid, clothed with silky silvery down above, and with whiteomentum beneath; stipulas rhomboid, cut; flowers corymbose, crowded; petals ovate, entire, longer than the calyx. 2. H. Native of North America, in Louisiana and plains of the Saskatchewan and Red rivers. P. arguta, Lehm. pot. p. 62. but not of Pursh. Flowers yellow.

**Bipinnatifid-leaved Cinquefoil.** Fl. June, July. Clt. 1826. Pl. 1 to 2 feet.

119 P. drummondii (Lehm. pg. 2. p. 9. Hook. fl. bor. amer. p. 189. t. 65.) stem herbaceous; radical leaves irregularly and subverticillately pinnate, caudine ones with 2 pairs of leaflets; leaflets ovate, truncate, cuneate at the base, profusely serrated, ciliolate, smoothish; stipulas ovate, entire; petals obcordate, veiny, twice the length of the calyx. 2. H. Native of North America, in alpine woods on the Rocky Mountains, north of the Smoking River, in lat. 56°. Panicle terminal. Petals golden yellow.

120 P. virgo (Donn. hort. cantah. ed. 7. and Lehm. pot. p. 67.) stems erect, and are as well the leaves clothed with clamyx pubescence; leaves greenish on both surfaces, pinnate; leaflets oblong, sharply and deeply serrated, superior ones decurrent, lower ones small; stipulas almost entire; petals obovate, emarginate, hardly longer than the calyx; receptacle pilose. 2. H. Native of Dahurian and Siberia, on rocks at the rivers Tscharych and Buchtorn, and in fields at the river Irtsch. Led. fl. ros. alt. ill. t. 343. P. hispida, Nestl. pot. t. 36. but not of Wild. P. longifolia and P. nudicaulis, Schlecht. berl. mag. p. 287. P. Pennsylvanica, Horn. hort. hauf. 2. p. 476. P. pubescens, Monch. meth. p. 658. P. dentata, Vitun. Flowers yellow, crowded at the tops of the branches into a few-flowered panicle.

**Clammy Cinquefoil.** Fl. Ju. Aug. Clt. 1797. Pl. 1 to 1 1/2 ft.

121 P. agrimonoides (Bieb. fl. taur. 1. p. 403.) stems ascending, beset with spreading villi; leaves interruptedly pinnate; leaflets numerous, obtuse-oblong, obtuse, deeply and bluntly toothed or almost pinnatifid, pubescent above, and clothed with hoary villi beneath; stipulas nearly entire, ovate-lanceolate; petals longer than the calyx; receptacle villous. 2. H. Native of Armenia, and Siberia in dry grassy places at the river Irtsch. Led. fl. ros. alt. ill. t. 397. -Gmel. sib. 3. t. 35. Flowers yellow, disposed in a terminal panicle.

**Agrimony-leaved Cinquefoil.** Fl. May, June. Clt. 1817. Pl. 1/2 to 1/4 foot.

122 P. strigososa (Pall. ex Tratt. no. 31. exclusive of the American plant. Led. fl. alt. 2. p. 237.) stem erect, straight, pubescent; leaves pinnate; leaflets oblong, cuneate at the base, deeply and pinnately toothed, with revolute margins, clothed with hoary pubescence above and with woollyomentum beneath; stipulas half pinnate; flowers panicked; petals obovate, hardly exceeding the calyx. 2. H. Native of Altai, at the river Tscharysch and Tschaja.-Gmel. sib. 3. p. 181. no. 29. t. 34. f. 1. Flowers yellow.

**Strigos Cinquefoil.** Fl. June, July. Pl. 1 foot.

123 P. filipendula (Schlecht. berol. mag. ann. 7. p. 286. ex Lehm. pot. 59.) stem erect, pilose; leaves interruptedly pinnate, beset with spreading villi, pale green on both surfaces; leaflets lanceolate, pinnatifidly serrated, smaller ones quite entire, outer ones confluent; stipulas tootied; panicle crowded, somewhat trichotomous; petals obcordate, exceeding the calyx; receptacle villous. 2. H. Native of Dahuria. Corolla yellow.

**Dropwort-like Cinquefoil.** Fl. June, July. Clt. 1823. Pl. 1 to 2 feet.

124 P. tanacetifolia (Schlecht. berol. mag. ann. 7. p. 286. ex Lehm. pot. p. 60.) stems ascending, pilose; leaves pinnate, very hairy; leaflets lanceolate, pinnatifidly serrated, upper ones opposite, with the terminal one stalked; stipulas jagged; panicle terminal, corymbose; petals obcordate, twice the length of the calyx; receptacle villous. 2. H. Native of Siberia. Corolla pale yellow.

**Tanzy-leaved Cinquefoil.** Pl. 1/4 to 1 foot.

125 P. sanguisora (Schlecht. berol. mag. ann. 7. p. 286. ex Lehm. pot. 51. t. 5.) stem erect, 1-2-flowered, glabrous, publuris; leaves pinnate, quite glabrous; leaflets obovate, bluntly serrated; stipulas cut; petals obcordate, hardly the length of the calyx; receptacle glabrous. 2. H. Native of Siberia. Corolla cream-coloured.

126 P. microphylla (D.Don. prod. fl. nep. 231.) stems almost simple, slender; lower leaves pinnate, upper ones ternate; leaflets 7-9, obovate-oblong, serrate-toothed, outer ones much the largest, all clothed with whiteomentum beneath; stipulas oblong, obtuse, scarios, quite entire; pedicels opposite the leaves, usually solitary; petals oval, quite entire, one half shorter than the calyx. 2. H. Native of Gosangistan. Corolla small, yellow. Outer calyce segments bifid or bipartite. Cimarrum flavum, Hamm. Röxb. hort. beng. p. 36. P. albiiformum, Wall. cat. no. 1018.

**Small-petalled Cinquefoil.** Pl. 1/4 foot.

127 P. lechenaultiana (D.C. prod. 2. p. 584.) plant thickly beset with yellow hairs; stems ascending, few-flowered; radical leaves pinnate, caudine ones ternate, on short petioles; leaflets obovate-roundish, obtuse, crenate-toothed, outer ones the largest, silky above and clothed with whiteomentum beneath; stipulas dilated, almost quite entire; petals obcordate, longer than the calyx. 2. H. Native of the East Indies, on the Neelghiry Mountains, where it is called Gahé-gwada, according to Leschenault. Corolla yellow.

**Leschenault's Cinquefoil.** Pl. 1/4 foot.
128. P. leucocôta (D. Don, prod. fl. nep. p. 230.) stems erect, almost simple; leaves pinnate, with many pairs of leaflets; leaflets oblong, obtuse, deeply serrated, green above, but clothed with silvery white down beneath; stipulas ovate, deeply serrated; flowers small, sub-umbellate, involucrated; calyce segments nearly equal; petals obovate, quite entire, exuding the calyx. 2. H. Native of Gossingsthan. Corolla yellow.

White-backed-leaved Cinquefoil. Pl. ¾ foot.

129 P. POLYPHYLLA (Wall. cat. no. 1026. Lehm. pug. 2. p. 14.) stem erect; leaves interruptedly pinnate, with many pairs of leaflets; leaflets quite glabrous, lined with veins; the large ones oblong and bluntly crenate-toothed; stipulas sheathing, oval, crenate-toothed; outer calyce segments large, 3-lobed, with the lateral lobes small; petals obovate-ovariculare, longer than the calyx. 2. H. Native of Gossingsthan. Panicle terminal, corimbosely. Corolla golden yellow.

Var. β, barbara (Wall. cat. 1630.) stem very pilose; calyxes more foliaceous.

Many-leefletted Cinquefoil. Pl. 1 to 1½ foot.

130 P. PEDUNCULAIRIS (D. Don, prod. fl. nep. p. 230.) stem slender, erect, simple, few-flowered, leafless at the apex; leaves radical, pinnate, length of stem; leaflets oblong, contigous; sharply and deeply serrated, rather silky above and silvery beneath; outer calyce segments longish, usually 2-3-cleft; petals nearly orbicular, entire, twice the length of the calyx. 2. H. Native of Gossingsthan. P. velutina, Wall. cat. 1016. but not of Leland. Corolla yellow. Habitat of P. anserina.

Peduncular Cinquefoil. Pl. ½ foot.

131 P. COMMUTATA (Lehm. pug. 2. p. 16.) stems ascending, 1-2-flowered, almost leafless; leaves pinnate, with many pairs of leaflets, green above, but clothed with silky villi beneath; leaflets oblong, deeply serrated or somewhat pinnatifid; flowers small, outer calyce segments oblong, obtuse, the rest ovate, acute. 2. H. Native of Kamson. P. microphylla, latifolia, Wall. cat. no. 1010. Corolla small, yellow.

Changed Cinquefoil. Pl. ½ to ¾ foot.

132 P. MICROPHYLLA (D. Don, prod. fl. nep. p. 231. Wall. cat. no. 1010. Lehm. pug. 2. p. 17.) plant humble, tufted, clothed with silky villi; stems erect, 1-flowered, almost leafless, peduncule-formed, length of leaves; leaves pinnate, with many pairs of leaflets; leaflets crowded, deeply and digitately pinnatifid; segments linear, bluish; petals obovate, quite entire, twice the length of the calyx. 2. H. Native of Gossingsthan. Flowers golden yellow.

Var. β, glabriscula (Wall. l. c.) plant a little larger, and less silky, villous.

Var. γ, depressa (Wall. l. c.) plant more densely tufted; stems shorter.

Small-leaved Cinquefoil. Pl. 2 to 3 inches.

133 P. Chinensis (Ser. in D. C. prod. 2. p. 581.) canescens; stem erect, paniculately corimbosely at the apex, many-flowered; leaves interruptedly pinnate, larger leafflets oblong, pinnatifidly pinnatifid, glabrous above, and clothed with hoaryomentum beneath, with the nerves rather prominent; segments parallel, spreading, linear, with revolute edges; stipulas ovate, upper ones cut; flowers small; outer calyce segments minute. 2. H. Native of China, in the province of Pichileu. Corolla yellow.

China Cinquefoil. Pl. 1½ foot.

134 P. GERARDIANA (Lindl. in Wall. cat. no. 1023. Lehm. pug. 2. p. 23.) plant woolly; stem erect, slender; leaves pinnate; leaflets 5-7, green above, and densely clothed with villi beneath, outer ones much the largest, obovate, bluntly serrate-toothed; stipulas broad, lanceolate, quite entire; flowers terminal, sub-corymbose; petals obovate-cuneiform, somewhat 2-lobed, longer than the calyx. 2. H. Native of Sirmore. Corolla yellow.

Gerard’s Cinquefoil. Pl. ¾ to 1 foot.

135 P. NIAVIS (Torrey, ann. lyc. 2. p. 32. t. 3. f. 1.) plant nearly glabrous; stems erect, leafless, 1-flowered; leaves pinnate, with numerous, contiguous, somewhat imbricated, ovate, rather ciliated 2-3-lobed leafflets, upper ones confluent; lobes acute, spreading; petals nearly orbicular, quite entire, a little longer than the calyx. 2. H. Native of North America, among the Rocky Mountains. Corolla yellow.

Snow Cinquefoil. Pl. ¾ foot.

136 P. MOUNTCROSSII (Wall. cat. 1014. Lehm. pug. 3. p. 29.) stems erect, simple, few-flowered; leaves pinnate, with 3-4 pairs of leafflets, plicate, and glabrous beneath; leafflets obovate-oblong, almost quite entire, terminal one trifid; stipulas ovate-lanceolate, quite entire, ciliated; inner calyce segments ovate-roundish, obtuse; petals obovate, quite entire, longer than the calyx. 2. H. Native of North America.

Moorcroft’s Cinquefoil. Pl. ¾ to ¾ foot.

137 P. ANSERINA (Lin. spec. 710.) roots and stems creeping; leaves interruptedly pinnate; leafflets oval, sharply serrated, silky; pedicels axillary, solitary, length of leaves; stipulas multifid; petals obovate, longer than the calyx. 2. H. Native of Europe, Siberia, and America, in meadows and by road sides; plentiful in Britain. Smith, engl. bot. 861. Sturm, deutsch. fl. with a figure. Pl. dan. t. 544. Curt. lond. t. 31. Corolla large, yellow. The roots are astringent, with a sweetish taste, and were formerly used for tanning leather.

Var. β, geminisflora (Ser. in D. C. prod. 2. p. 582.) flowers white.—Moria. hist. sect. 2. t. 20. f. 4. P. anserina β, Nels. pot. 55. Leman. pot. 72.

Var. γ, concolor (Ser. l. c.) leaves silky on both surfaces.

Var. ε, Grenelandica (Tratt. ros. 4. p. 13.) leaves smaller, with fewer pairs of leafflets; leafflets ovate-roundish, pinnatifidly serrated, glabrous above; stolons very long. 2. H. Native of Greenland.

139 P. CANADIANA (Humb. et Bovini. ex Nels. pot. p. 34. t. 3. f. 2. and H. B. et Kunth, nov. gen. amer. 6. p. 216.) stems ascending, few-flowered; leaves interruptedly pinnate; leafflets unequal, profoundly pinnatifid, clothed with white silky down on both surfaces; stipulas cut and entire; petals spatulate, obturate, a little longer than the calyx. 2. H. Native of Mexico, on the mountains. Flowers yellow, 2-4 at the tops of the stems, and lateral near the tops of the stems, on long pedicels. Receptacle villous.

Var. β, nana (Humb. et Bovini. ex Nels. pot. 34. f. 2.) P. Humboldtiana, Tratt. ros. 4. p. 41. Stem and leaves smaller. Leman. pot. 67.

White-leaved Cinquefoil. Pl. May, July. Cit. 1820. Pl. ½ to 1 foot.

140 P. VERTICILLATA (Steph. in Wildi. spec. 2. p. 1096.) stems ascending; leaves pinnate; leafflets narrow-linear, clothed with white tomentum beneath, with revolute margins; lateral ones distant, opposite, twin, subverticillate, terminal one trifid; stipulas cut; petals obovate, entire, a little longer than the
calyx. 2. H. Native of Siberia. Flowers yellow, crowded at the tops of the branches.

Verticillate-leaved Cinquefoil. Pl. ½ foot.

Linear-lobed-leaved Cinquefoil. Pl. prostrate.

142 P. approximata (Bunge in Led. fl.ross. alt. ill. t. 225. fl. alt. 2. p. 241.) stems erect or ascending at the base, and are, as well as the petioles, clothed with white villi; radical and lower cauleine leaves with 7 leaflets, upper ones with 5 leaflets or ternate, all pubescent and green above, but clothed with hoary tomentum beneath, pinnately pinnatifid; stipulas oblong-lanceolate, entire, rarely furnished with a large tooth at the base; petals emarginate, longer than the calyx; receptacle villous.

2. H. Native of Altaia, in dry grassy places at the river Irtysch. Panicle dichotomous, with the pedicels solitary in the forks. Corolla yellow.

Approximate Cinquefoil. Fl. June, July. Pl. ½ foot.

143 P. conferta (Bunge in Led. fl. ross. alt. ill. t. 333.) root many-stemmed; stems ascending, and are, as well as the petioles, beset with long spreading villi; leaves pinnate; leaflets 7-11, oblong-lanceolate, distant, pinnately pinnatifid, with revolute margins, green and pubescent above, and clothed with hoary villi beneath; stipulas broad-ovate, a little cut; petals terminal, crowded; petals obovate, rather retuse, about equal in length to the calyx; receptacle villous.

2. H. Native of Altaia, at the river Kerlyk. Corolla yellow.

144 P. Soongariana (Bunge in Led. fl. ross. alt. ill. t. 332. fl. alt. 2. p. 244.) stem loose, ascending at the base, puberulous; petioles clothed with white villi; leaves pinnate; radical ones with 3-4 pairs of leaflets, those under the flower lanceolate and entire, the rest of the cauleine ones with 2 pairs of leaflets; leaflets cinnereous beneath, superior ones deeply pinnate-parted, lower ones smaller, lowest ones almost entire; lower stipulas pinnately jagged; flowers in loose dichotomous panicles; petals obovate, somewhat emarginate, exceeding the calyx; receptacle villous.

2. H. Native of Altaia, on the mountains of Arkul and Dolon-Kara in the Soongarian desert. Corolla yellow.

Soongarian Cinquefoil. Fl. May. Pl. ½ to 1 foot.

145 P. Eern'inn (Wormsk. in fl. Dan. 9. p. 5. t. 1578.) stem short, rather branched; leaves pinnate, quite glabrous; leaflets oval, pinnatifid; segments lanceolate, acute; pedicels axillary, solitary, longer than the leaves; stipulas quite entire; petals obovate, longer than the calyx. 2. H. Native of Greenland, near Holsteinborg. Corolla large, yellow.

Eged's Cinquefoil. Pl. 1 to 2 inches.

146 P. sericea (Lin. spec. 70.) stems hoary, puberulent; leaves pinnate; leaflets ovate or obovate-oblong, deeply pinnate parted, clothed with silky tomentum on both surfaces; segments linear, obtuse, with revolute margins; stipulas lanceolate, entire or a little cut; flowers in dichotomous panicles; petals obcordate, twice the length of the calyx; receptacle villous. 2. H. Native of Siberia, on rocks at the rivers Tschuha, Koksun, and Tscharysch. Lehm. pot. t. 6. Led. fl. ross. alt. ill. t. 284. Corolla yellow.

Var. β, glabrata (Hook. fl. bor. amer. p. 189.) leaves hardly silky at the apex. 2. H. Native of North America, on the Rocky Mountains between lat. 52° and 56°.

147 P. dasiphylla (Bunge in Led. fl. ross. alt. ill. t. 331. fl. alt. 2. p. 243.) stems ascending, rather villous; leaves pinnate; leaflets oblong, pinnate-parted; segments oblong-linear, bluntish, green and pubescent above, but clothed with hoary-silky villi beneath; stipulas ovate-lanceolate, entire; petals terminal, few-flowered; petals obovate, entire, longer than the calyx; receptacle villous. 2. H. Native of Altaia, on rocks at the rivers Korgon, Tscharysch, Koksun, and Tschujin, in the Soongarian desert. Corolla yellow.

Thick-leaved Cinquefoil. Fl. May. Pl. ½ foot.

148 P. multifida (Lin. spec. 710.) stems ascending, pubescent; leaves pinnate, with few pairs of leaflets; leaflets pinnate-parted; segments linear, green and pubescent above, and clothed with hoary tomentum beneath; stipulas linear-lanceolate, acuminated, entire; flowers corymbose; petals emarginate, about equal in length to the calyx; receptacle pilose.

Var. β, angustifolia (Lehm. pot. p. 64.) leaves more profoundly pinnate-parted, the segments much longer, and more distant.

149 P. coiandriodifolia (D. Don, prod. fl. nep. p. 232.) plant tufted, nearly glabrous; stems simple, few-flowered, nearly leafless; radical leaves very numerous, pinnate; leaflets profusely pinnate-parted; segments linear, ending each in a tuft of long white hairs, tipped with obtuse glands; stipulas lanceolate, acute, and entire; petals 2-flowered, twice the length of the calyx. 2. H. Native of Gossangsthan. P. meifolia, Wall. cat. no. 1011. Corolla yellow.

Coriander-leaved Cinquefoil. Pl. ½ to 3/4 foot.

150 P. dissecta (Pursh, fl. sept. 1. p. 355.) plant nearly glabrous; stems erect, loose; radical leaves pinnate; lower leaflets lanceolate, quite entire, upper ones cuneiform, pinnatifid; cauleine leaves dually-pinnate, the lateral leaflets the smallest; stipulas large, entire or dentilicate; flowers pedunculate at the tops of the stems; petals obovate, hardly longer than the calyx. 2. H. Native of Hudson's Bay. Flowers pale yellow, corymbose.

Dissected-leaved Cinquefoil. Pl. ½ foot.

§ 5. Leaves pinnate. Flowers white.

151 P. bupesstris (Lin. spec. 711.) stems erect, dichotomous, reddish brown; radical leaves pinnate, cauleine ones ternate; leaflets roundish, cuneated at the base, serrate-toothed; stipulas undivided; petals obovate, longer than the calyx. 2. H. Native of Europe and Siberia, in mountainous regions. In Wales on the sides of a hill called Craig Wriddin or rather Breddin, Montgomeryshire, but a doubtful native. Jcqu. austr. 2. p. 91. t. 114. Ser. mus. helv. 1. p. 65. t. 6. f. 2. Smith, engl. bot. 2058. Krok. fl. sil. 2. t. 9. P. rubens, Munch. meth. p. 637. P. fragariaeoides, Poir. suppl. 5. p. 586. Outer calyceine segments usually bifid according to Ledebour, but linear and shorter than the inner ones according to Lehman. According to Smith the petals are obcordate in the British plant, if so it is a distinct species. Corolla white.

152 P. fruticosa (Lin. spec. 709.) shrubby; leaves pinnate; leaflets oblong-lanceolate, quite entire, hairy; flowers subcorymbose; stipulas lanceolate, scarious, pilose above; petals obovate-roundish, longer than the calyx. 2. H. Native of Poland, Germany, Dahuria, Piedmont, and the Pyrenees. In

**Stiff Cinquefoil.** Fl. Ju. Aug. England. Sh. 2 to 4 feet. 153. P. florulenta (Poir. suppl. 4. p. 54. Pursh, fl. am. sept. 1. p. 355.) shrubby; leaves pinnate, pilose, grey; leaflets lanceolate, quite entire; flowers corymbose; stipulas lanceolate, scarios; petals obovate-roundish, longer than the calyx. \( \frac{1}{2} \). H. Native of North America, throughout Canada from Lake Huron to the plains of the Saskatchewan and Bear Lake rivers under the Arctic circle, and from Newfoundland to the valleys of the Rocky Mountains on both sides, Kotzebue's Sound, and Behring's Straits. Wats. dent. brit. 70. P. fruticosa \( \beta \), Nestl. pot. p. 30. P. tenuifolia, Schlech. in berol. mag. ann. 7. p. 285. Upper leaves ternate, sessile? Flowers yellow.

**Buddle-flowered Cinquefoil.** Fl. June, Oct. Clt. 1811. Sh. 2 to 4 feet.

154 P. parvifolia (Fisch. in litt. Lehm. pug. 3. p. 6.) shrubby, branched; leaves ternate, pilose on both surfaces; lateral leaflets deeply bipartite, rarely bifoled or entire, terminal one triplicate, with the segments divaricate, linear, with revolute margins; stipulas lanceolate, acuminate, membranous, scarios, pilose above, purplish; flowers 2-3, terminal; petals obovate-cuniform, entire, much longer than the calyx. \( \frac{1}{2} \). H. Native of the Soongarian desert. Flowers yellow. Receptacle woolly.

**Small-leaved Cinquefoil.** Shrub 2 to 4 feet.

155 P. dahu'ica (Nestl. pot. 31. t. 1.) shrubby, nearly glabrous; lower branches horizontal, upper ones erect; leaves impari-pinnate, with 5 leaflets; leaflets oblong, quite entire, with revolute margins, superior ones confluent; flowers in terminal corymbose panicles; stipulas connate in one, pilose, scarios; outer calyce segments ovate, inner ones the largest, ovate, and coloured; petals obovate, entire, longer than the calyx. \( \frac{1}{2} \). H. Native of Dahuria, near Nertschinsk. P. fruticosa \( \beta \), Lehm. pot. 32. P. glabra, Lodd. bot. cab. t. 514. Led. fl. Ross. alt. ill. t. 175. Flowers white.

156 P. salesova (Poir. suppl. 4. p. 588. Lehm. pot. p. 35. t. 1.) shrubby; leaves pinnate, with 3-4 pairs of oblong sharply serrated leaflets, clothed with white tomentum beneath; stipulas ovate, acuminate, entire; flowers crowded at the tops of the branches; petals obolate, entire, longer than the calyx; outer calyce segments narrow. \( \frac{1}{2} \). H. Native of Siberia. Corolla white.

**Salesovee's Cinquefoil.** Fl. June, Jul. Clt. 1823. Sh. 1 to 2 ft.

157 P. arbuscula (D. Don, prod. fl. nep. p. 256. Wall. pl. asiat. rar. 3. t. 228.) shrubby, much branched; leaves pinnate; leaflets 5, oval, obtuse, villous above, and naked beneath, when young silky on both surfaces; peduncles elongated, 1-flowered, terminal, solitary, villous; stipulas brown, lanceolate, obtuse, membranous; calyce segments dissimilar, outer ones roundish-obtuse, oblong, deeply bipartite; petals orbicular, entire, longer than the calyx. \( \frac{1}{2} \). H. Native of Gosaingsthian. P. Nepalensis, D. Don, prod. fl. nep. p. 229. but not of Hook. Stems rooting. Flowers yellow.

**Little-tree Cinquefoil.** Shrub creeping.

158 P. a'fonda (Wall. cat. 1009. Lehm. pug. 3. p. 3.) shrubby, much branched; leaves ternate; leaflets oblong, entire, silky above, and glabrous beneath, with revolute margins; flowers terminal, usually solitary; stipulas broad, lanceolate, entire, membranous, sheathing; outer calyce segments usually deeply bipartite; petals orbicular, deeply emarginate, twice the length of the calyx. \( \frac{1}{2} \). H. Native of Gosaingsthian and Kamaon. Flowers yellow.

**Stiff Cinquefoil.** Shrub 2 to 3 feet. 159 P. lindsaya (Willd. herb. ex Spreng. syst. append. p. 314.) shrubby; branches twisted, compressed; leaves quinimately digitate; leaflets cuneated, truncate, 3-toothed at the apex; peduncles solitary. \( \frac{1}{2} \). H. Native of Ireland.

**Woody Cinquefoil.** Shrub.

† **Species not sufficiently known.**

160 P. lagascana (Ser. in D. C. prod. 2. p. 586.) tomentose; leaves quinimately pinnate; leaflets cuneiform, cut; floral leaves ternate, with the leaflets sessile and trifid; petals equal in length to the calyx; receptacle hairy. \( \frac{1}{2} \). H. Native country unknown. P. incisa, Lag. gen. et spec. p. 16. but not of Desf. Lagasca's Cinquefoil. Pl. ² foot.

161 P. corymbosa (Poir. act. toul. 3. p. 325.) stem shrubby, ascending; leaves quinate and ternate, villous. \( \frac{1}{2} \). H. Native country unknown.

**Corymbos-flowered Cinquefoil.** Shrub.

162 P. bhuyana (Horn. hort. hafn. suppl. 55.) stem much branched; radical leaves quinate; leaflets roundish-ovate; cauline leaves ternate; petals shorter than the calyx. \( \frac{1}{2} \). H. Native of Bithynia.

**Bithynian Cinquefoil.** Pl. ² foot.

**Cult.** All the species of Potentilla are of easy cultivation, and some of them are handsome when in flower. They will grow in any common garden soil, and are easily increased by dividing the plants, or by seed. The shrubby kinds are very proper for the front of shrubberies, and they propagate freely by cuttings planted in the autumn in a sheltered situation.

**XIII. TORMENTILLA (from tormentum, pain; in reference to its supposed efficacy in tooth ache, as well as from being supposed to cure diseases of the bowels).** Lin. gen. no. 256. Smith, engl. fl. 2. p. 423.

**Lin. syst. Icosaandria, Polygynia.** Calyx 8-parted, the 4 outer segments accessory and narrowest. Petals 4, inversely heart-shaped. Stamens 16 or more, not half so long as the corolla. Styles lateral, deciduous. Carpels or akenia seated on a small depressed hairy receptacle.—Herbaceous plants, with weak terete stems, digitate leaves, and solitary lateral pedicels, bearing small yellow flowers.

1 T. erecta (Lin. spec. 716.) stem ascending, branched, dichotomous; leaves ternate; cauline ones sessile; leaflets oblong, acute, deeply serrated; stipulas cut; pedicels solitary in the forks of the stem, and lateral; petals obcordate. \( \frac{1}{2} \). H. Native of Europe, in barren pastures, heaths, and bushy places; plentiful in Britain. Oed. fl. dan. 589. T. officinalis, Smith, fl. brit. 552. engl. bot. t. 863. Curt. lond. facs. 5. t. 35. Potentilla Tormentilla, Sibth. 162. Nestl. pot. 65. Potentilla tetrapetala, Hall. jun. in Ser. mus. 1. p. 57. The flowers are sometimes to be met with having 5 petals, and a double blossomed variety was found by the late Miss Jones, of Hafod, in Cardiganshire. The roots are so astringent as to be used in the Western Isles of Scotland and in the Orkneys for tanning leather; for which purpose they are superior even to oak bark. They are at first boiled in water, and the leather is then steeped in the cold liquor. They are also used for dyeing a red colour. The root has an austeri styptic taste, with a slight kind of aromatic flavour, and it is one of the most agreeable and efficacious of our indigenous aromatic astringents, and may be employed with good effect in all cases where medicines of this class are proper.

It is sometimes given in powder, but usually in decoction.

**Erect Tormentil.** Fl. June, July. Britain. Pl. ½ foot or pr. 2 T. repta (= Lin. spec. 716.) stems procumbent, hardly
branchlet; leaflets 3-5, obovate, deeply toothed, hairy, as well as the petioles; stipulas lanceolate, entire; pedicels lateral, 1-flowered, long, and slender; petals obovate. 2. H. Native of Europe, about hedges and the borders of fields. In Britain in several parts of Oxfordshire, and at Brantree, Essex; at Lakenham, near Norwich; in Hertfordshire and Surrey; at Bright House, near Halifaxes, Yorkshire; in barren grounds of Scotland. Smith, engl. bot. t. 864. Potentilla procumbens, Sibth. Potentilla nemoralis, Nutt. Plots tormentil, Pet. herb. brit. t. 41. f. 10. Flowers sometimes with 5 petals.

3 T. humifusa (fl. pros. stems short and filiform, procumbent; leaflets 5, cuneate-oblong, obtuse, deeply toothed, clothed with white tomentum beneath. 2. H. Native of North America, in the plains of the Missouri. Potentilla humifusa, Nutt. gen. amer. i. p. 130.

_Trailing Tormentil._ Pl. trailing.

_Cult._ Plants of the easiest culture and propagation; however they are not worth growing except in botanical gardens, to fill up the arrangements.

XIV. COMARUM (from κόμαρος, comaros, the arbutus; similar in fruit). Lin. gen. no. 638. Smith, engl. fl. 2. p. 433.

LIN. GEN. LEOSSÁNDRIA, MONOGYNYÁ. Calyx 10-parted, the 5 outer segments accessory and small. Petals 5, lanceolate, shorter than the calyx, attached to the rim of the calyx along with the stamens. Styles lateral. Carpels or akenia numerous, seated on a large, dry, spongy, hairy, hemispherical receptacle. An herbaceous creeping plant, with broad pinnate and ternate leaves, and terminal panicles of purple flowers.

1 C. PALUSTRE (Lin. spec. 718.) 2. H. Native of Europe, Siberia, and North America, in marshes; plentiful in Britain. Smith, engl. bot. t. 173. Schkuhr, handb. t. 138. f. 1. Pl. dan. 637. Potentilla Camarum, Sop. fl. carp. ed. 2. vol. i. p. 359. Potentilla palustris, Lehm. pot. 32. Potentilla rubra, Hall. fl. in Ser. mus. helv. 1. p. 5. 6. Root creeping. Stems ascending. Leaves pinnate. Leaflets broad, acutely serrated, green above, but glaucous beneath. Flowers pedicellate, axillary, and terminal, dark purple; petals lanceolate, acuminate, much shorter than the calyx. The roots dry wool of a dirty red-colour, and have astringing power with other plants of the same class to tan leather. In Scotland the fruit are called sum-berrys.

_Marsh Cinquefoil._ Fl. June, July. Britain. Pl. 1 to ½ foot.

_Cult._ This plant will grow in any kind of moist soil, and is increased by dividing at the root.

LIN. SYST. DECANDRÍA, POLYGYNÍA. Calyx campanulate, semi-10-cleft, outer segments accessory. Petals 5, small. Stamens 10, inserted by 2 series in the sides of the calyx. Ovaries numerous, seated on a dry, conical, villous, receptacle. Styles simple, articulated with the ovaries, almost terminal. Akenia inclosed in the calyx.—Erect herbs, with pinnate leaves, and crowded terminal insignificant flowers.

1 H. CONGESTÀ (Doug. mss. Hook. bot. mag. 2830.) radical leaves pinnate; leaflets cuneate-oblung, cut at the apex; outer calycine segments quite entire; petals longer than the calyx. 2. H. Native of California, at Cape Mendocino, and on the low hills of the Umtqua river in lat. 41° to 42°. Corolla white.

2 H. CALIFÓRNICA (Cham. et Schlecht. in Linnæa. 2. p. 27.) erect, clothed with villous pil; leaves pinnate and pinnatifid; flowers panicked; petals shorter than the calyx. 2. H. Native of California. Sibbaldia Californica, Spreng. syst. app. p. 341. Corolla white.

_Californian Horkelia._ Pl. 1 to 2 feet.

_Cult._ The species of _Horkelia_ will grow in any common garden soil, and are readily increased by dividing at the root.

LIN. SYST. PENTA-DECANDRÍA, PENTA-DECAGYNYÁ. Calyx flatish, 10-cleft, the 5 outer segments accessory. Petals 5, linear-spathulate. Stamens 5-10. Styles 5-10, lateral. Carpels or akenia 5-10, seated on an almost naked receptacle.—Evergreen, dwarf, glandless herbs, with trifoliately divided leaves, and glomerate or corymbose heads of yellow or white flowers.

1 S. PROCO'MBENS (Lin. spec. 496.) leaves trifoliolate; leaflets equal, cuneated, and coarsely toothed at the apex, rather pilose; flowers corymbose; petals shorter than the calyx. 2. H. Native of Europe, Siberia, and North America, on high mountains. Plentiful on the summits of the highland mountains of Scotland, in mountainous soil. Smith, engl. bot. t. 897. Fl. dan. 32. Petals small, yellow.

_Procumbent Sibbaldia._ Fl. July, Scotland. Pl. 1 to 5 inches.

2 S. ADPRESSÀ (Bunge in Led. fl. ros. alt. t. 276. fl. alt. 1. p. 429.) leaves ternate; lateral leaflets oblong-lanceolate, quite entire, intermediate one cuneated, tripartite, with the lateral segments entire, and the middle one tridentate at the apex, silky beneath; flowers with 10 stamens and 10 styles; petals equal in length to the calyx. 2. H. Native of Altai, on high dry fields at the rivers Kan and Tschuja. Petals white.

_Adpressed Sibbaldia._ Pl. ½ foot.

3 S. PARVIFLO'RA (Wildl. act. soc. berol. vol. 2.) leaves trifoliolate; leaflets beset with strigose pili on both surfaces; flowers in glomerate heads; petals obvate, one-half shorter than the calyx. 2. H. Native of Cappadoce. Fragr. orientalis flore luteo, Tourn. cor. 21. Petals yellow.

_Cult._ _Sibbaldia_ is a genus of small alpine plants. They do best in small pots in a mixture of peat, loam, and sand, and are increased by dividing.

XVII. CHAMER'EO'DOS (from χαμαρια, chamaí, on the ground, and ῥοδος, rhodos, a rose, dwarf-rose). Bunge in Led. fl. ros. alt. t. 257. fl. alt. 1. p. 429. Hook. fl. bor. amer. p. 196.

_Sibbaldia species of Lin. D. C. and others._

LIN. SYST. PENTANDRÍA, PENTA-DECAGYNYÁ. Calyx campanulate, 5-cleft. Petals 5, obvate. Stamens 5. Styles lateral, rarely 5, usually 10 or more. Carpels 5-10 or more, seated on a villous receptacle.—Small plants, with dissected leaves, beset with glandular pili. Corolla white or purple.

1 C. ERÉCTÀ (Bunge in Led. fl. alt. t. 431.) herbaceous, pubescent; stems elongated, racemously pilose; radical leaves bilaterally multifid, upper caulin ones 3-5-cleft; segments linear-liliform; flowers pentandrous; styles 5-20; petals exceeding the calyx. 2. F. Native of Siberia, and Altai, in pine woods, and of North America about Baltic Mountains, Hook. fl. alt. 157. f. 58. p. 58. t. 221. Lam. ill. t. 221. f. 2. Sibbaldia erécta, Lin. spec. p. 406. Corolla purple.

_Erect Chamærho'dos._ Fl. June, Aug. Cl. 1806. Pl. 1 ft.

2 C. GRANDIFLÓRÀ (Bunge, fl. alt. t. 431.) stems numerous, erect, leafy; leaves divided into numerous linear segments, pubescent; petals twice the length of the calyx. 2. H. Native of Dahuría, on granite rocks near Ouda, and at the river Selenga. Sibbaldia grandiflora, Pall. in Wildl. rel. ex Schultes, syst. 6. p. 776. Corolla red, larger than that of _C. erécta._

_Great-flowered Chamærho'dos._ Pl. 1 foot.

3 C. SULFUROSÀ (Led. fl. ros. alt. t. 257. fl. alt. 1. p. 432.) plant suffruticosum, clothed with pinnate villi, tufted; stems as-
cending, dichotomously and corymbose panicle at the apex; leaves trinervate; segments obovate-oblong, obtuse; flowers with 5 stamens, and usually with 10 styles; petals equal in length to the calyx. *Y. H.* Native of Siberia. Petals white.  

**Sand Chamærhothod**. Fl. June. Pl. procumbent.  
4. C. **POLYGYNA**; stem straight, beset with glandular hairs, panicked; leaves multifid; segments linear; flowers polygynous, disposed in glomerate heads; petals about equal in length to the calyx. *Y. H.* Native of Siberia. Sibiria Polygyuna, Willd. rel. ex Schultes, syst. 6. p. 770. Petals rose-coloured.  

5. C. **ALTAECA** (Bunge, fl. alt. 1. p. 429.) plant suffruticosum, tufted, prostrate; leaves palmate or 3-parted, middle segment trifid, lateral ones bifid or trifidicate; sepals linear; flowers usually solitary, with 5 stamens and 10 styles; petals more than twice the length of the calyx. *O. H.* Native of Altaia, at the rivers Kan and Kerlyk, in schistous saltish soil. Sibiria Althicca, Lin. suppl. 191. Flowers large, red.  

**Altaian Chamærhothod**. Fl. June, July. Pl. prostrate.  

**Cult.** The species of Chamærhothod are very difficult to preserve through the winter, as they are very liable to be carried off by the damp. They should be grown in pots in a mixture of sand, peat, and loam, and should be placed on a dry shelf in a cold frame in winter, at which time they should be but sparingly watered, if at all. They are only to be increased by seed.  

**XVIII. AGRIMONIA** (a corruption of Argemone, a name given by the Greeks to a plant which was supposed to cure cataract of the eye, from ἀργος, argos, white, the cataract of the eye being white). Tourn. inst. t. 155. Nestl. pot. 16. D. C. prod. 2 p. 587.  

**LIN. SYST. Dodecaëdrya, Digynia.** Calyx tubular, foveolate on the sides, with 5 small acute marginal segments (f. 73 d.), the tube subsequently hardened, and closed over the seeds, furnished on the outside by a circle of hooked bristles, forming an involucr. Petals 5 (f. 73. b.) Stamens 7-20, from the rim of the calyx along with the petals. Carpels 2, in the bottom of the calyx. Styles 2, lateral (f. 73. c.) Seeds pendulous.—Astringent aromatic herbs, with interruptedly pinnate leaves, each accompanied by a pair of stipulas united to the petioles. Flowers small, numerous, spiked, yellow. Bracteas trifid (f. 73. a.).  

1. A. **EUPATRIOBA** (Lin. spec. 443.) hairy or smoothish; leaves interruptedly pinnate; leaflets elliptic-oblong, coarsely serrated, odd one stalked; petals twice the length of the calyx; fruit distant; tube of calyx campanulate, en-circled by a whorl of hooked prickles above; spikes of flowers elongated. *Y. H.* Native of Europe, in bushy places by roadsides, and about the borders of fields; plentiful in some parts of Britain. Smith, engl. bot. 1335. Curt. lond. fasc. 5 t. 32. Woody. med. bot. suppl. 238. Fl. dan. t. 588. The herb is slightly bitter, aromatic, astringent, evincing a tonic property, for which it has always been noted, and which has procured it a place in several British herb teas. In decoction it was formerly used as an astringent for a gargete, and in diarrhoea and leucorrhoea. Kalm informs us, that the Canadians use the infusion of the root with great success in burning fevers, and Dr. Hill says it is an effectual cure for jaundice, sweetened with honey, in the quantity of half a pint three times a day. The plant will dye wool of a nankeen colour. It is also recommended for dressing leather.  

**Eupatia's Agrimonia.** Fl. June, July. Britain. Pl. 1 to 2 ft.  
2. A. **NEPALIS** (D. Don, prod. fl. nep. p. 229.) leaves interruptedly pinnate; leaflets ovate, serrated, odd one stalked, very villous on both surfaces, as well as the stems; racemes erect, slender; bracteas trifid, shorter than the calyx; calyce segments lanceolate, acute, keeled. *O. H.* Native of Gansingthan.  

**Nyapal Agrimonia.** Fl. June, July. Citt. 1820. Pl. 1 to 2 ft.  
3. A. **DAHE'A** (Willd. herb. ex Stev. in latt. D. C. prod. 2. p. 587.) glabrous; leaves interruptedly pinnate; the rest unknown. *O. H.* Native of Dahuria. Very like A. Eupateria, but differs in the leaves being narrower and more acute, and in the flowers being more remote.  

**Dahurian Agrimonia.** Fl. June, July. Citt. 1811. Pl. 1 to 2 ft.  
4. A. odo'ra (Cam. epity. 7. D. C. prod. 2. p. 587.) hairy; leaves interruptedly pinnate; leaflets oblong, lanceolate, deeply crenate-toothed; petals twice the length of the calyx; fruit distant; tube of calyx campanulate, pilose, with the foveole obovate, and drawn out even to the base, and with the bristles ascending and short. *O. H.* Native of Italy. A. Eupatia, Desf. cat. 176. ex D. C. fl. fr. 4. p. 451.—Mill. fig. t. 15. Spikes several.  

5. A. **PILOSA** (Lid. ind. hort. dorp. suppl. 1823. p. 1 fl. alt. 2. p. 263.) pilose; leaves interruptedly pinnate; leaflets cuneate-rhomboid, smoothish above, but pilose at the nerves beneath, the smaller ones almost quite entire; bristles of fruit erectly connivent; the foveole drawn out beyond the middle. *O. H.* Native of Altaia, frequent in meadows and by waysides. Rehh. icon. pl. rar. 3. p. 49. t. 252. f. 414. Stems usually simple, bearing only one spike, rarely branched.  

**Pilose Agrimonia.** Fl. June, July. Citt. 1819. Pl. 1 to 2 ft.  
6. A. **FARGITORKA** (Ait. hort. kew. ed. 1. vol. 2. p. 130.) smoothish; leaves interruptedly pinnate; leaflets numeros, lanceolate, deeply serrated; spikes slender; petals one-half longer than the calyx; fruit distant; tube of calyx turbinated; foveole drawn out even to the base; bristles ascending. *O. H.* Native of North America, from Pennsylvania to Carolina, and throughout Canada. Fibres of the root tuberous, as in Spiræa a filipendula.  

**Small-flowered Agrimonia.** Fl. June, July. Citt. 1766. Pl. 1 to 2 ft.  
7. A. suave'olen's (Pursh. fl. amer. sept. 1. p. 336.) plant very hairy; leaves interruptedly pinnate; leaflets lanceolate, sharply serrated; spikes of flowers twiggy and clammy; flowers almost sessile; petals twice the length of the calyx; fruit obconical, with divaricate bristles. *O. H.* Native from Virginia to Carolina.  

8. A. **BLUMEI**; leaves interruptedly pinnate, velvety, pubescent; the terminal leaflet sessile; racemes elongated, spicately racemose, clothed with clammy pubescence. *O. H.* Native of Java and Japan, on the mountains. A. suaveolens, Blum. bijdr. 1113. but not of Pursh.  

**Blume's Agrimonia.** Pl. 1 to 2 feet.  
9. A. **STRA'TA** (Michx. fl. bor. amer. 1. p. 887.) leaves interruptedly pinnate; spikes twiggy; fruit reflexed, turbinated, sulcately striated. *O. H.* Native of Canada. Flowers white. This species is hardly known.  

---
XX. Brayera. XXI. Neurada. XXII. Rosa.

ROSEÆ (so named in consequence of the section comprising roses). D. C. Prod. 2. p. 596. -Rose, Juss. gen. p. 355. Calyx with the tube contracted at the mouth (f. 75. g.), and with a 5-parted limb (f. 75. b. f. 76. d.); the segments somewhat spirally imbricated at the apex in aestivation, and usually pinnately divided (f. 75. b. c. f. 76. d.). Petals 5 (f. 75. e. f. 76. e.). Stamens numerous. Carpels numerous, bony, inserted on the inside of the calyx, which at length becomes baccate (f. 75. f. f. 76. b.), and incloses them; they are dry and indehiscent, bearing each a style on the inner side. Styles exserted from the contracted part of the calycine tube (f. 75. g.), sometimes distinct, sometimes connected into a columnar style. Seeds solitary, exalbulminous, inverted. Embryo straight, with flattish cotyledons.

— Shrubs, usually with impari-pinnate leaves, serrated leaflets, and with the stipulas adnate to the petiole (f. 75. a.).

LIN. SYST. Icosandria, Polygynia. The character the same as that of the tribe.

Tribe III.

ROSAE (so named in consequence of the section comprising roses). D. C. Prod. 2. p. 596. -Rose, Juss. gen. p. 355. Calyx with the tube contracted at the mouth (f. 75. g.), and with a 5-parted limb (f. 75. b. f. 76. d.); the segments somewhat spirally imbricated at the apex in aestivation, and usually pinnately divided (f. 75. b. c. f. 76. d.). Petals 5 (f. 75. e. f. 76. e.). Stamens numerous. Carpels numerous, bony, inserted on the inside of the calyx, which at length becomes baccate (f. 75. f. f. 76. b.), and incloses them; they are dry and indehiscent, bearing each a style on the inner side. Styles exserted from the contracted part of the calycine tube (f. 75. g.), sometimes distinct, sometimes connected into a columnar style. Seeds solitary, exalbulminous, inverted. Embryo straight, with flattish cotyledons.

— Shrubs, usually with impari-pinnate leaves, serrated leaflets, and with the stipulas adnate to the petiole (f. 75. a.).

LIN. SYST. Icosandria, Polygynia. The character the same as that of the tribe.

Tribe III.

ROSAE (so named in consequence of the section comprising roses). D. C. Prod. 2. p. 596. -Rose, Juss. gen. p. 355. Calyx with the tube contracted at the mouth (f. 75. g.), and with a 5-parted limb (f. 75. b. f. 76. d.); the segments somewhat spirally imbricated at the apex in aestivation, and usually pinnately divided (f. 75. b. c. f. 76. d.). Petals 5 (f. 75. e. f. 76. e.). Stamens numerous. Carpels numerous, bony, inserted on the inside of the calyx, which at length becomes baccate (f. 75. f. f. 76. b.), and incloses them; they are dry and indehiscent, bearing each a style on the inner side. Styles exserted from the contracted part of the calycine tube (f. 75. g.), sometimes distinct, sometimes connected into a columnar style. Seeds solitary, exalbulminous, inverted. Embryo straight, with flattish cotyledons.

— Shrubs, usually with impari-pinnate leaves, serrated leaflets, and with the stipulas adnate to the petiole (f. 75. a.).

LIN. SYST. Icosandria, Polygynia. The character the same as that of the tribe.

Sect. I. Simplicifolia (Lindl.). Leaves simple, exstipulate. Fruit bristly.

Var. a. glabra (Ser. in D. C. Prod. 2. p. 602.) stipulas connate, leaf-formed, glabrous; prickles substipular, twin. -H. H. Native of the Soongarian desert, in salt places beyond the river Irtysh. -Red et Thor. ros. 1. p. 27.

Var. b. veltina (Ser. mas. in D. C. Prod. 2. p. 602.) stem, prickles, and leaves velvety; leaflets spatulate-lanceolate; prickles substipular, twin. -H. H. Native of Persia.

are then remarkable for their hoary branches, bristles and numerous prickles. Their fruit is perfectly smooth, which character separates them from the next section, in which the fruit is downy. Sepals usually toothed.

**Var. b. nitens** (Lindl. bot. reg. 824.) leaves shining, pale green, glabrous on both surfaces; flowers pale crimson. R. Kantschätica γ, nitens, Ser. in D. C. prod. 2. p. 607.

**Fierce Rose.** Fl. July, Aug. Cl. 1796. Shrub 3 to 4 ft.

**Wrinkled Rose.** Shrub 3 to 4 feet.

4. **R. Kantschätica** (Vent. cels. t. 67.) prickles intra-stipular, falcate, large; leaves opaque. h. H. Native of Kantschata, in dry rocky places. Lindl. in bot. reg. t. 419. Flowers solitary, deep red. Fruit spherical, scarlet, less than that of *R. foetida*.

**Kantschätaka Rose.** Fl. June, Jul. Cl. 1791. Sh. 3 to 4 ft.

**Sect. III. Bracteata (from bracteatus, propped or covered with plates; flowers furnished with bracteas).** Branches and fruit clothed with permanent tomentum. This section is readily distinguished from the last by the woolliness of the fruit. Leaves dense, usually shining, and prickles are placed under the stipulas in pairs. Sepals simple or nearly so.

**Involucrated Rose.** Fl. Ju. Jul. Cl. 1818. Sh. 3 to 4 ft.

**Var. b. s. paniculata** (Lindl. ros. 10.) branches asetigera, prickles smaller, straightish. h. H. Native of China. R. bracteata, Meanch. meth. suppl. 390. Jacq. fragm. 30. t. 34. f. 2. Sims, in bot. mag. 1377.

**Braacted or Macartney’s Rose.** Fl. June, Oct. Cl. 1795. Shrub 2 to 3 feet.

**Lyell’s Rose.** Shrub 3 to 4 feet.

**Sect. IV. Cinnamomeae (plants agreeing in character with R. cinnamomea).** Lindl. ros. 13. Plants setigerous or unarmed, bracteate. Leaflets lanceolate, glabrous. Disk thin, never thickened. This section is distinguished by its long, lanceolate leaflets, without glands, upright shoots, and compact habit; red flowers never solitary except by abortion, and always supported by bracteas; an inconvenient disk but little thickened; round, small, red fruit, losing their long narrow sepals, and small, smooth, shining pericarps. The shoots are usually setigerous next the ground, but rarely so towards the apex, except in one or two instances. *R. alpina* and *R. acaulis* of the following division sometimes have bracteae, but their sepals never fall off till the fruit is decayed. Sepals simple, entire, or nearly so, unlesswhen mentioned otherwise.

**Shining-leaved Rose.** Fl. June, Aug. Cl. 1807. Sh. 2 ft.

**Tumrip Rose.** Fl. June, Aug. Shrub 3 to 4 feet.

11. **R. lucida** (Ehrb. beitr. 4. p. 22.) compact; prickles of the branches stipular; leaflets oblong, imbricated, flat, shining; fruit globose, depressed. h. H. Native of North America, from New York to Carolina; near Boston, in bogs, and upon the edges of marshes, and of Newfoundland. R. r. hedicia, Ross. ros. t. 7. and t. 25. f. 1. R. hedicia, Jacq. fragm. 71. t. 107. f. 3. Red. ros. 1. p. 45. t. 11.—Ehli. cic. 325. t. 245. f. 316. Flowers red, overtopped by the leaves and young branches. Fruit bright red.

**Lucida Rose.** Fl. June, Aug. Cl. 1724. Sh. 4 to 6 feet.

**Lindley’s Carolina Rose.** Fl. July, Aug. Cl. ? Sh. 3 to 4 feet.

**Loose Rose.** Shrub 3 to 4 feet.

14. **R. Kosisiga** (Bess. ex Spreng. syst. append. 2. p. 548.) prickles almost stipular, recurved; leaflets with cuspidate serrations, glabrous on both surfaces, pale beneath; peduncles and calyxes hispid; fruit oblong, glabrous. h. H. Native of Polonia, at Tyra.

**Kosington Rose.** Shrub 4 to 6 feet.

15. **R. frutetorum** (Bess. ex Spreng. syst. 2. p. 548.) prickles almost stipular, strong, reflexed; petioles unarmed, and are as well as the under surface of the leaves villous; leaflets elliptic; peduncles very short, glabrous; fruit globose, glabrous. h. H. Native of Volynia.

**Bush Rose.** Fl. June, July. Cl. 1818. Shrub 5 to 6 feet.

*Var. β, *fibro-pleno; flowers double, pale blush, unexpanded. A neat little rose. +Red. ros. 2. p. 73. with a figure.

17 R. Wolos (Lindl. ros. p. 21.) stipulas and sepalas commi-
vent; leaflets oblong, obtuse, glabrous. +H. Native of North America, near the Missouri and north of the Saskatchewan and as far as the Bear Lake. Lindl. bot. reg. t. 976. R. lutea nigra, Pronv. nom. p. 24. A low shrub, with dull dark branches. Flowers pink. Fruit ovate, naked. There is a plant which was gathered about Cumberland House Fort, which Mr. Borrer takes to be a variety of the present species, having the leaves downy beneath.

*Var. β, *Florida (Lindl. ros. t. 23.) leaves without pubescence, thinner. R. Flórida, Donn. cant. ed. 8. p. 109. R. ennea-
phylla, Rafin.

19 R. bla nda (Ait. hort. kew. 2. p. 202.) taller; prickles deciduous; leaflets oblong, flat; petioles pilose. +H. Native of North America, on the west coast, Hudson’s Bay, Ca-
da as far north as Bear Lake. R. fraxinifólia a, blanda, Ser. in D. C. prod. 2. p. 606. Flowers solitary, large, pale red.

*Bland Rose.* Shrub 2 to 6 feet.

*Var. γ, *L’Heritieriana (Ser. l. c.) flowers corymbose, semi-
double; prickles scattered, recurved. R. L’Heritieriana, Red. ros. 3. p. 21. with a figure.

*Ash-leaved Rose.* Fl. May, June. Chl. ? Shrub 4 to 6 feet.

21 R. CINNAMÔMEA (Besl. hort. eyst. vern. ord. 6. p. 5. Lin. spec. 703.) tallum, cinnamoneus; branches straight; prickles stipular, straightish; stipulas dilated, undulated; leaflets oblong, obtuse, wrinkled, tomentose beneath. +H. Native of Denmark, Belgium, Portugal, Germany, Switzerland, France, Bohemia, and Caucasus. Lindl. ros. p. 28. t. 5. Red. ros. 1. p. 105. t. 37. and p. 135. t. 51. R. foecundissima, Munch. hauss. 5. p. 279. Fl. dan. t. 1214. R. majalis, Herm. diss. 8. Flowers solitary or 2-3 together, pale or bright red. Fruit round, naked, crimson. The double-flowering variety is much more common than the single.

*Var. β, *fluviális (Lindl. ros. p. 28.) leaflets ovate, acute.

+Cinnamon Rose.* Fl. May, June. Chl. 5 shrubs to 6 feet.

22 R. Dicksoniana (Lindl. hort. trans. 7. p. 221. syn. brit. fl. p. 39.) branches flexuous, setigerous, armed with a few slender, scattered prickles; leaflets folded together, unequal, with coarse double serratures; stipulas, petioles, and sepals glandular, the latter unequal; fruit naked. +H. Native of Ireland. Flowers white.

*Dickson’s Rose.* Fl. June, July. Ireland. Sh. 5 to 6 feet.

23 R. TAU’RECA (Bieb. fl. taur. 1. p. 394.) taller, cinnemonous; prickles scattered, weak; branches straight, unarmed towards the apex; leaflets oblong, wrinkled, villous beneath; sepals compound; styles stretched out, glabrous. +H. Native of Tauria, in bushy places. Habit of R. cinnamomea. Flowers red.

*Taurian Rose.* Fl. June, Jul. Chl. 1817. Shrub 5 to 6 feet.

24 R. Dauri’rica (Pall. fl. ross. 61. Lindl. ros. p. 32.) tall, much branched; branches slender, coloured; prickles stipular, spreading, a little recurved; stipulas linear; leaflets oblong, wrinkled, tomentose beneath, deeply serrated. +H. Native of Dauria and Mongol Tartary, in birch woods. Flowers red. Fruit ovate, red.

*Daurian Rose.* Fl. May, June. Chl. 1824. Sh. 4 to 6 feet.

25 R. Soong’a’rica (Bunge in Led. fl. alt. 2. p. 226.) tall; branches brown; prickles stipular, strong, reflexed; stipulas ovate, lanceolate, glaberrily serrated; leaflets glabrous, oval-oblong, simply serrated; fruit globose, glabrous. +H. Native of the Soongarian desert, on the mountains of Arkual and Dolenkara, at the river Irtych. Peduncles corymbose, beset with glandular bristles. Petioles prickly. Flowers white; petals length of calyx. Prickles of the sterile branches straight.

*Soongarian Rose.* Fl. May. Shrub 5 to 6 feet.

26 R. Gmel’ni (Bunge in Led. fl. alt. 2. p. 228.) branches dark brown, sterile branches very prickly, floriferous ones almost unarmed; prickles setaceous, unequal; sepals ovate, acumi-

*Gmelin’s Rose.* Shrub 4 to 6 feet.

27 R. Arista’ta (Lapeyr. fl. pyr. t. 105.) upper leaves usually with 2 pairs of leaflets, and with the petiole ending in a spine. +H. Native of the Pyrenees. Stem with a few prickles. Flowers solitary, purple. Perhaps a monstrosity of R. cinnamomea.

*Amelled-petiolod Rose.* Shrub 4 to 6 feet.

28 R. MAJAL’Teis (Retz. obs. bot. 3. p. 33.) dwarf, grey; branches straight, coloured; prickles scattered, nearly equal; stipulas linear; leaflets oblong, flat, glaucescent, and tomentose beneath. +H. Native of Sweden, Lapland, and Britain, near Pontefract, Yorkshire. R. mütica, Fl. dan. 688. R. spinossi-

*Hog Rose.* Fl. May, June. Britain. Shrub 3 to 4 feet.

29 R. MACROPHYLLA (Lindl. ros. p. 33. t. 6.) unarmed; leaves very long; leaflets 5-11, lanceolate; petioles with a few glands, and are, as well as the leaflets, woolly beneath; sepals narrow, longer than the petals, which are apiculated. +H. Native of Sweden.
Native of Gossingsthan. Flowers red. Peduncles villous, and furnished with a few unequal setae, as well as the fruit.

Long-leaved Rose. Shrub to 6 feet.

Sect. V. Pimpinellifolium (from pimplinellum, pimpernel, and folium, a leaf; resemblance in leaves to those of pimplinellum). Lindl. ros. p. 36. Plants bearing crowded, nearly equal prickles, or unarmed. Bracteas, rarely bracteate. Leaflets ovate or oblong. Sepals connivent, permanent. Disk almost wanting. This section is essentially different from the last in habit, but in artificial characters they approach very nearly. It, however, may be distinguished by the greater number of leaflets, which vary from 7 to 13, and even to 15, instead of from 5 to 7. The flowers are also universally without bracteas, except in the R. alpina, R. Sabini, R. Dostimi, and perhaps R. marginata. These having connivent permanent sepals, cannot be confounded with the preceding division, nor on account of their disk with the following. There is no instance of stipular prickles in the present tribe. The sepals are entire or nearly so, unless when mentioned otherwise.

Var. ε. lagenaria (Ser. in D. C. prod. 2. p. 611.) stem and branches glabrous; peduncles hispid; neck of calyx tapering; leaflets lanceolate or oblong, doubly and sharply serrated. H. Native of the Alps and Pyrenees.

Var. ζ. sorbifolia (Ser. in D. C. prod. 2. p. 611.) peduncles short, hispid; calyx smooth; leaflets oblong-lanceolate, distant, acutely and doubly serrated. H. Native of the Alps of Bern.

Var. η. hispidula (Ser. l. c.) branches armed with slender, more or less numerous, recurved prickles; peduncles and calyces smoothish; leaflets elliptic. R. alpina, C. D. fl. fr. 4. p. 440. R. alpina coronata, Desv. journ. bot. 1813. p. 119.

Var. ι. pyriformis (Ser. l. c.) stem, peduncles, and calyces glabrous; fruit short, pear-shaped. H. Native on mount Belpherg, about Bern.

Var. κ. setosa (Ser. l. c.) stem smooth; peduncles and calyces beset with numerous, yellow, long bristles; leaflets distant, elliptic or obovate, sharply and doubly serrated; fruit pear-shaped. H. Native of Switzerland about Bern, and of the Pyrenees. R. alpina hircina, Desv. journ. bot. 1813. p. 119.

Alpine Rose. Fl. June, July. Cl. 1683. Shrub to 8 ft.

Var. β. melanocarpa (Lindl. ros. p. 40.) fruit shorter, blackish-brown.

De Candolle’s Rose. Shrub to 4 feet.

32 R. rubella (Smith, engl. bot. 2521.) prickles slender, straight, crowded; fruit globose; leaflets glabrous; peduncles bristy. H. Native of England, in Northumberland, on the sandy sea-coast. Flowers either bicoloured or white, blotched with pink. Fruit bright scarlet.

Var. υ. pubescens; leaves pubescent beneath. H. Native of North America, on the Saskatchewan.

Straight Rose. Fl. June. Cl. ? Shrub to 4 feet.

34 R. sauvia (Willd. enum. suppl. p. 37. Link. enum. 2. p. 57.) stem hispid; leaves glabrous, glaucous beneath; peduncles and petioles clothed with glandular bristles. H. Native country unknown. Petals deep purple, deeply 8-lobed. Fruit oblong, glabrous.

Sweet Rose. Fl. June, July. Cl. 1813. Shrub to 4 feet.

35 R. acicularis (Lindl. ros. p. 44. t. 8.) tall; prickles acicular, unequal; leaflets glaucous, wrinkled, rather convex; fruit sub-ampellaceous, drooping. H. Native of Siberia. Flowers solitary, pale blush, fragrant. Fruit ovoboate, naked, of a yellowish orange colour. R. alpina, aculeata, Ser. in D. C. prod. 2. p. 611.

Acicular-prickled Rose. Fl. May, Ju. Cl. 1805. Sh. 6 to 8 ft.

Yellow American Rose. Fl. May, Ju. Clt. 1780. Sh. 4 to 6 ft.

38 R. flava (Wicks \( \text{\textbullet} \) ex Spreng. syst. 2. p. 550.) fruit glabrous, and as is well the peduncles hispid; prickles of the branches much crowded, somewhat setaceous; petioles prickly; leaflets pubescent beneath. \( \text{\textbullet} \). H. Native of Siberia. Flowers yellow.

Yellow Siberian Rose. Shrub 4 to 6 feet.

39 R. vismita (Lindl. ros. p. 40.) branches twiggy; prickles setaceous, much crowded, straight, spreading, unequal; leaflets membranous, flat, glabrous, simply serrated. \( \text{\textbullet} \). H. Native of Siberia. R. hórrida, Lindl. ex Spreng. syst. 2. p. 549. Flowers very large.

Twiggy Rose. Shrub 3 to 4 feet.

40 R. spinosissima (Lin. fl. succ. 442, spec. 491.) prickles unequal; leaflets flat, glabrous, simply serrated. \( \text{\textbullet} \). H. Native of Europe; plentiful in Britain. A dwarf, compact bush, with creeping roots. Flowers small, solitary, white or blush coloured. Fruit ovate, or nearly round, black or dark purple.

Protex.

Var. γ, R. polycépa (Lindl. l.c.) dwarf; fruit depressed, and are as well as the peduncles bristly. FLICT. H. Native of Iceland.

Var. ε, pólása (Lindl. l.c.) leaflets acute, pilose beneath. FLICT. H. Native of Iceland.

Var. ε, turbinátæ (Lindl. l.c.) dwarf; fruit turbinate. FLICT. H. Native of Ireland.

Var. δ, Pallássi (Lindl. l.c.) taller; prickles nearly equal, much crowded. FLICT. H. R. pinnimelinífolia, Pall. fl. ross. 62. t. 75. Red. ros. 1. p. 84. R. Aláctica, Willd. enum. 543. R. Sibiriá, Tratt. ros. 2. p. 290. R. pinnimelinífolia 6, Aláctica, Red. ros. 1. p. 84. Flowers white. Grows in elevated plains and exposed precipices, from the northern part of the Altaic mountains, extending through Siberia. Its more robust habit, and its approach to equal size in its prickles are its principal characters.

Var. η, Róssica (Lindl. l.c.) taller; prickles long and very slender. FLICT. H. Native of Russia.

Var. θ, argéntea (Ser. in D. C. prod. 2. p. 508.) branches and stems hispid from prickles, intermixed with minute bristles; peduncles and calyxes purple, hispid; leaflets ovate, clothed with whiteomentum beneath; flowers white, semi-double.

Var. θ, echiínélla (Ser. l.c.) teeth of leaflets very numerous; peduncles and calyxes hispid.

Var. ε, flavéscens (Ser. l.c.) peduncles and fruit smooth; flowers pale yellow. R. Cambréllae flavéscens, Red. ros. 2. p. 46. Var. λ, microcérpa (Ser. l.c.) flowers and leaves smaller; fruit smaller, and are as well as the peduncles hispid or smooth; stem prickly. FLICT. H. Native of Podolia. R. melancoróps, Bess. enum. pl. Volks. 18. 61 and 62.

Var. ν, marmoráta (Ser. l.c.) flowers small; more or less variegated or blotched; leaflets small, roundish; stems and branches more or less prickly. FLICT. H. Lois. in Duham. ed. nov. ex Red. ros. 1. p. 84. R. pinnimelinífolia θ, Red. ros. 1. p. 84.

Very-spiny or Scotch Rose. Fl. May, June. Britain. Sh. 1 to 2 feet.

41 R. Híbeníca (Smith, engl. bot. 2196.) prickles unequal, slightly hooked, smaller ones bristle-formed; leaflets ovate, acute, simply serrated, with the ribs hairy beneath; sepals pinnate; fruit nearly globular, smooth as well as the peduncles.

HIBERNICA. FLICT. H. Native of Ireland, in the counties of Derry and Down, in thickets. Flowers rather small, light blush coloured. Fruit orange-coloured.

42 R. oxyacánta (Bieb. fl. taur. 3. p. 339.) stem very prickly; prickles setaceous, reversed; petioles prickly and glan- 
dular; leaflets sharply and simply serrated, glabrous; sepals undivided; peduncles clothed with glandular bristles, when in fruit reflexed; fruit nearly globose, glabrous. FLICT. H. Native of Siberia. Flowers red.

43 R. sangusorífoliá (Domm. hort. cant. ed. 8. p. 169.) tall; prickles nearly equal; leaflets 9-11, oblong, glabrous, simply serrated; fruit glabrous, depressed. FLICT. H. Native country unknown. R. spinosissima, var. s, sangusorífolia, Lindl. ros. t. 51. R. spinos., macrophylla, Ser. in D. C. prod. 2. p. 609. Flowers white. This plant is easily distinguished from the last in the greater number of leaflets, and in the globose depressed fruit.

Burnet-leaved Rose. Fl. May, June. Ctt. Sh. 3 to 5 ft.

Great-flowered Rose. Fl. May, Ju. Ctt. 1818. Sh. 4 to 6 ft.

45 R. Calíforníca (Schlecht. et Cham. in Linnaea. 2. p. 33.) branches glabrous; prickles stipular, twin, a little recurved, the rest of the shrub unarmed; leaflets 5-7, ovate, obtuse, sharply serrated, pubescent above and tomentose beneath; stipulas with a few glands on the margins; corymb terminal; peduncles pilose; sepals ovate, acuminated, dilated, and spatulate at the apex, pubescent outside and tomentose inside, white, and densely ciliated on the edges. FLICT. H. Native of California. Petals rose-coloured, size of those of R. pinnimelinífolia.

California Rose. Shrub.

46 R. Nánke'nsiss (Lour. cochl. 334.) dwarf, much branched; prickles crowded; leaflets acuminated, ciliately serrated; sepals prickly; petals apiculate. FLICT. G. Native of China, about Canton and Nankin. Flowers pale red, small, double.

Nánkin Rose. Shrub.

Myriad-spined Rose. Fl. May, Ju. Ctt. 1820. Sh. 1 to 2 ft.

48 R. involúlata (Smith, engl. bot. 2063.) prickles very unequal, and very much crowded; leaflets doubly serrated, pubescent; petals convolute; fruit prickly. FLICT. H. Native of the western parts of Scotland; in several parts of the Hebrides; in the Isle of Arran (G. Don); and in Glen Lyon. R. nivalis, Dom. hort. cant. ed. 8. p. 170. Petals pale red, concave.

Involuted-pegelled Rose. Fl. June. Scotland. Sh. 2 to 3 ft.

49 R. revérsia (Waldst. et Kit. hung. 3. p. 293. t. 264.) prickles setaceous, nearly equal, reflexed; leaves doubly serrated, pubescent; fruit hispid. FLICT. H. Native of Hungary, on the mountains of Mátara, in stony places. Flowers solitary, white, tinged with pink. Fruit ovate, dark purple.

Reversed Rose. Fl. June, July. Ctt. 1816. Sh. 2 to 5 ft.

50 R. máriginata (Wallr. ann. bot. 68. Lindl. ros. p. 58.) dwarf; branches twisted, when young pruneous; leaflets ovato-cordate, triply serrated, quite glabrous; sepals muralated. FLICT. H. Native of Germany, in fields about Bennstadt. Petals bluish-coloured, with yellow claws. Fruit ovato-globose, purplish. Prickles numerous, straight. Peduncles and calyxes bristly, with glands.

Marginata Rose. Shrub. 1 to 2 feet.

51 R. Sábiní (Woods. in Lin. trans. 12. p. 188.) peduncles, branches, fruit, and calyx bristly; prickles scattered, straightish; leaflets doubly serrated, nearly smooth, with hairy ribs; sepals 4 D

Vol. II.
ROSACEÆ. XXII. Rosæ.

55 R. Reclina'ta (Red. ros. 3. p. 79, with a figure) stem nearly unarmed, but very prickly in the single-flowered variety; leaflets 3-7, lanceolate-oblong; flower bud reclinate before expansion; sepals nearly entire; fruit nearly globus, and are as well as the peduncles globus. ɹ H. Native of? Perhaps a hybrid between R. alpina and R. Indica, ex Red. l. c. Flowers lilac purple.

Var. ɹ, mi'ttiplex (Red. l. c. p. 79, with a figure,) flowers nearly double, inclinate, somewhat panicled; leaflets 3-5, ovate, rather cordate; stem rather prickly. ɹ H. Reclinate-flowered Rose. Shrub.

† Species belonging to section Pimpinellifoliæ, but are not sufficiently known.

56 R. Live'scens (Rosæ suppl. cat. Hort. crem. et enum. p. 20, 61 and 67;) prickles stipular, spreading; leaflets oblong, serrated, of a livid glaucous colour, partly coloured beneath, and are glaucous as well as the petioles; sepals glaucous, exceeding the petals; peduncles twin, glabrous; fruit oblong, smooth. ɹ H. Native of Volhynia. R. Guttensteinigens, Jacq. f. 110. R. Damascena, var. livescens, Ser. in D. C. prod. 2. p. 604. Livescent-leaved Rose. Shrub 4 to 5 feet.

57 R. Falls'ens (Retz, ex Spreng. syst. append. p. 200.) prickles of branches twin, horizontal; leaflets ovate, quite glabrous; sepals nearly equal; fruit hemispherical, and are smooth as well as the peduncles. ɹ H. Native of Sweden.

Pale Rose. Shrub 4 to 5 feet.

58 R. Hemisphe'rica (Spreng. syst. append. p. 200.) prickles of branches twin, horizontal; leaflets small, roundish, and are as well as the petioles quite glabrous; peduncles bristly; fruit hemispherical, short, glabrous. ɹ H. Native country unknown. Hemispheric-flowered Rose. Shrub.

59 R. Mosqui'sens (Spreng. syst. append. 200.) prickles stipular, straight; leaflets oblong, serrated, pubescent as well as the petioles, which are unarmed; fruit globose, glabrous, as well as the peduncles. ɹ H. Native about Moscow, in fields. Moscow Rose. Shrub 4 to 5 feet.

60 R. Gorinke'nsis (Fisch. ex Spreng. syst. append. p. 200.) branches shining, nearly unarmed; petioles and leaves pubescent beneath; fruit nearly globose, and are as well as the peduncles quite glabrous. ɹ H. Native about Moscow, in fields. Goriniki Rose. Shrub 4 to 6 feet.

61 R. ochroleu'ca (Swartz, ex Spreng. syst. append. p. 200.) This species differs from R. spinosissima in the prickles being straight, and in the petioles being nearly unarmed. ɹ H. Native country unknown. Flowers cream-coloured.

Cream-coloured-flowered Rose. Shrub 2 to 4 feet.

62 R. Coru'scans (Waltz. ex Link. enum. 3. p. 57.) stem bristly and very prickly; petioles pubescent; leaflets oblong-lanceolate, acuminate, serrated, glabrous; peduncles naked; tube of calyx globose and naked, the segments with tomentose edges. ɹ H. Native country unknown. Flowers pink.

63 R. Kentu'ke'ssis (Rafin. ros. amer. in ann. ac. phys. 5. p. 213.) stems weak, and are as well as the petioles glabrous; prickles recurved; branches flexuose; leaflets ovate-elliptic, attenuated at the base and apex, serrated, pale and pubescent beneath; calyx hispid and villous; fruit globose, glabrous. ɹ H. Native of North America, in Kentucky. Leaves 3-5. Fruit dark purple. Prickles bay-coloured. Kentucky Rose. Shrub 2 to 3 feet.

64 R. Tri'folia'ta (Rafin. l. c. p. 213,) quite glabrous; prickles recurved; leaflets 3, acute, serrated, and pubescent; flowers subcorystome; fruit globose, glabrous. ɹ H. Native of North America, in Kentucky. Flowers large, rose-coloured. Anthers copper-coloured. Trifoliate Rose. Shrub 4 to 5 feet.

65 R. Ele'gans (Rafin. l. c. p. 214,) branches and petioles prickly; leaflets 5-7, elliptic, subcordate, serrated, glabrous, the same colour on both surfaces; flowers 1-3, terminal; fruit globose, hispid. ɹ H. Native of North America, on the banks of Hudson's river. Flowers large, rose-coloured, fragrant. Stipulas hispid. Elegant Rose. Shrub 4 to 5 feet.

66 R. Glo'ro'sa (Rafin. l. c. p. 215,) branches glabrous; prickles twin, straight, short; petioles pubescent, prickly; leaflets 3-5, ovate, serrated, villous beneath; flowers panicled; fruit globose, large, glabrous. ɹ H. Native of North America. Globose-fruited Rose. Shrub.

67 R. C'us'kson (Rafin. l. c. p. 215,) branches flagelliform, glabrous; prickles recurved; petioles, nerves, peduncles, and calyxes glandular; leaflets 3-5, oblong, acuminate, serrated, pubescent, and villous beneath; flowers numerous, corymbose; peduncles jointed, bracteolate; fruit globose, glabrous, small. ɹ H. Native of North America, in Kentucky. Stems running even to the tops of trees. Stipulas narrow. Flowers large, scentless. Fruit pear-shaped. Runner Rose. Shrub cl.

68 R. Ob'o'vata (Rafin. l. c. 5. p. 217,) stem glabrous; prickles stipular, straight; petioles prickly, pubescent; leaflets 7, obvate, acute, entire, pubescent beneath; flowers solitary; fruit globose, depressed; peduncles glabrous. ɹ H. Native of New York. Flowers large, rose purple, very fragrant. Branches beset with glandular dots. Obovate-leafletted Rose. Shrub.

69 R. Ser'i'la'ta (Rafin. l. c. p. 218,) stem and petioles prickly and hispid; stipular prickles straight; stipulas ciliate; leaflets 5-7, obvate, doubly serrated, pale; flowers usually solitary; sepals stellate; fruit globose, hispid. ɹ H. Native of North America. Flowers middle-sized, rose-coloured, sweet-scented. Petals almost entire.

Var. ɹ, rotundifolia (Rafin. l. c.) prickles slender, straight, numerous; leaflets oval-roundish. Native of Kentucky.
Serrulately-lobed Rose. Shrub 3 to 6 feet.

Damasco or Damask Rose. Fl. June, July. Clt. 1573. 
Shrub 2 to 4 feet.

R. Damascen (Mill. dict. no. 15.) prickers unequal, larger ones falcate; leaves ciliate with glands; flowers drooping; calyces cluny; fruit oblong. H. Native of Syria. Redout. ros. 1. p. 157. t. 58. R. Belgica, Mill. dict. no. 17. R. Calendarum, Muench. hausd. ex Bork, holz. 330. Rossig. ros. t. 8 and t. 33. R. bifera, Poir. suppl. 6. p. 276. Red. ros. 1. p. 107. t. 35. and p. 121. t. 45. Flowers large, white, or red, single or double. The present species may be distinguished from R. centifolia in the greater size of the prickers, green bark, elongated fruit, and long reflexed sepals. The petals of this species, and all the varieties of R. centifolia, as well as those of other species, are employed indiscriminately for the purpose of making rose water. The following are the garden varieties of the Damasc rose.

Achat, rouge. 
Aurora.

Belgique, rouge. 
Auguste, belle. 

Damasco or Damask Rose. Fl. June, July. Clt. 1573. 
Shrub 2 to 4 feet.

R. Centifolia (Lin. spec. 704.) prickers unequal, larger ones falcate; leaves ciliate with glands; flowers drooping; calyces cluny; fruit oblong. H. Native of Eastern Caucasus, in groves. Bull. parc. 275. Rossig. ros. t. 1. Red. ros. 1. p. 25. t. 1. p. 37. t. 7. p. 77. t. 26. p. 79. t. 27. p. 111. t. 50. R. provincialis, Mill. dict. no. 18. R. polyanthos, Rossig. ros. t. 35. R. Caryophyllea, Poir. suppl. 6. p. 786. R. Unguiculata, Desc. Cat. 175. R. Varian, Pohl. h. 2. p. 171. Flowers white or red, single, but most commonly double. This species is distinguished from R. Damascena in the sepals not being reflexed, the flowers full, double, and the petals very large, whence the name of Cabbage-rose. Its fruit is either oblong or roundish, but never elongated. From R. Gallica it is distinguished by the flowers being drooping and by the larger size of the prickers, with a more robust habit. The following are the garden varieties of the hundred-leaved or cabbage-rose.

Damasco or Damask Rose. Fl. June, July. Clt. 1573. 
Shrub 2 to 4 feet.
Var. β, muscosea (Lindl. ros. p. 64.) calyx and peduncles mossy. "β, H. R. muscosa, Mill. dict. no. 22. Lawr. ros. t. 14. Rossig. ros. t. 6. Ker. bot. reg. t. 53. and t. 102. Red. ros. 1. p. 39. t. 8. p. 41. t. 9. p. 57. t. 31.—Mill. fig. t. 221. f. 1. R. provincialis β, Smith, in Rees' cyc. The Moss rose is either white or red and always very double. The following are the names of the varieties:

- moss, bluish
- moss, common
- moss, dark
- moss, prolific

- De Meaux,
- dwarf Bagshot,
- mossy de Meaux,
- mignonne charmante,
- pompone.

**Hundred-leaved Cabbage, Pompone, Provinis, and Moss Roses.** Fl. June, July. Clt. 1596. Shrub 3 to 6 feet.  

74 R. Ga'Llica (Lin. spec. 704.) prickles nearly equal, the same shape, weak; leaflets stiff; elliptic; flowers erect; sepals ovate; fruit nearly globose. "β, H. Native of middle Europe and Caucasus, in hedges. Mill. fig. t. 221. f. 2. Rossig. ros. t. 17. 22. 25. figures 6. 26. 28. 31. 36. 38. 39. Red. ros. vol. 1. p. 73. t. 25. p. 135. t. 52. vol. 2. p. 17. t. 7. p. 19. t. 8. and 16. R. centifolia, Mill. dict. no. 41. R. sylvestris, Gater. mont. p. 94. R. rubra, Lam. fl. fr. 3. p. 130. R. holosericea, Rossig. ros. t. 16. R. Damascena, rubra-purpurea, Rossig. ros. t. 18. R. Béllica, Brot. fl. lus. 1. p. 338. R. blanda, Brot. l. c. Flowers from red to crimson, double or semidouble. The flowers of the officinal rose have not the fragrance of the Dutch hundred-leaved rose, but the beautiful colour of the petals, and their pleasant astrangent, have rendered them official. It must, however, be remarked, that their odour is increased by drying, while that of the damask rose is almost destroyed. They are kept dried for making garsles. The following are the names of the garden varieties of the French or officinal rose.

- admirable.
- siglé, noir.
- Albanian.
- amaranth.
- Antwerp.

Var.  β, pumila (Lindl. ros. p. 68.) flowers single; roots creeping.  
γ. H. Native of Austria, Piedmont, Tauria, Caucasus, Siberia, and about Geneva.  
austr. 2. p. 59. t. 198. R. répens, Munchch. hausv. 5. p. 281.  
R. hispida, Munchch. l. c. R. Austriaca, Crantz. austr. 36.  
Var. γ, arvina (Lindl. ros. p. 69.) leaves naked on both surfaces.  
δ. H. Native of Silesia.  
R. arvina, Krok. siles. 2. p. 150.  

Var. ε, inaperta (Ser. mel. 1. p. 86.) branches and peduncles hispid from prickles; calyx campanulate, glandular; flowers double from abortion, white and red.  
Called silmorin rose.  

Var. ζ, Agatha (Red. et Thor. ros. 3. p. 35. with a figure,)  
leaves small or large; sepals more or less pinnate; flowers small, very double, outer petals spreading, but the inner ones are concave.  
Called Agala rose.  

Var. η, intermis (Ser. in D. C. ros. 2. p. 604.) glabrous;  
branches smooth; peduncles hardly glandular; tube of calyx bell-shaped; flowers double, purple; sepals shortly and simply pinnate.  

French or Official Rose.  
Fl. June, July.  
Sh. 2 to 3 feet.  

75 R. graphæ'a (Biebr. f. taur. 1. p. 397. suppl. p. 342. cent.  
pl. ross. 1. t. 2.) stems unarmed; branches and petioles hispid from prickles; leaflets ovate, acute, glandularly serrated, smoothish above, and glaenescent beneath; sepals entire; fruit rather obovate.  
γ. H. Native of Tauria.  
Flowers red.  
Perhaps a variety of R. Gallica.  

Pygmy Rose.  
Fl. June, July.  
Shrubs 2 feet.  

76 R. parvifolia (Ehrh. beitr. 6. p. 97.) dwarf; prickles nearly equal; leaflets stiff, ovate, acute, sharply serrated; sepals ovate, nearly simple.  
δ. H. Native on mountains in the neighbourhood of Dijon.  
Ker. bot. reg. t. 452. R. Burgundica, Rossig, t. 4. R. Remenis, Desf. cat. 175.  
R. Galiaca var.  
parvifolia, Ser. in D. C. prod. 2. p. 664.  
Shrub compact, bluish grey.  
Flowers solitary, overtopped by the young shoots, purple, very double.  
Red. ros. 3. p. 107. with figures.  

Small-leaved or Burgundy Rose.  
Fl. June, July.  
Shrubs 1 to 2 feet.  

77 R. pulchella (Willd. enum. p. 545.) ovaries roundish- 
ovariate; peduncles and calyxes beset with glandular bristles;  
petioles clothed with glandular pubescence, unarmed; cauline  
prickles scattered.  
γ. H. Native country unknown.  
Allied to R. turbinata, but the stems are much smaller; flowers also  
smaller, and the form of the ovaries is different.  
Perhaps this is the rose de Meaux of the gardens, or some variety of  
R. Gallica.  

Neat Rose.  
Fl. June, July.  
Clt. 1824.  
Shrub 2 feet.  

78 R. adenophylla (Willd. enum. 546.) ovaries ovate, and  
are, as well as the calyxes and peduncles, clothed with glandular  
bristles; petioles beset with glandular pubescence, unarmed;  
leaves simply serrated, glaucous beneath, with glandular margi- 
gins; prickles of the branches scattered.  
γ. H. Native country  
unknown.  
Flowers large, single, red; petals emarginate.  
Allied to R. turbinata and R. pulchella.  

Gland-leaved Rose.  
Fl. June, July.  
Shrub 2 feet.  

79 R. orbesana (Red. ros. 2. p. 21. with a figure.)  
This appears to be some garden production, and possibly a variety of  
R. Gallica, but its fruit is that of R. turbinata.  
Flowers red, double.  
δ. H. Native country unknown.  

Orbessan Rose.  
Fl. June, July.  
Shrub 2 to 4 feet.  

80 R. verocin'da (Waitz in Tratt. ros. vol. 1.) prickles  
crowded, straight; petioles villous, prickly; leaflets sweet-scented,  
avate-oblong, acute, simply serrated, hoary-green, hairy above,  
and villous beneath, and on the margins; stigmas quite entire;  
branchlets setigerous and prickly; fruit oblong, and is, as well as  
the peduncles, clothed with glandular villi; flowers sub-cymose;  
styles exserted.  
γ. H. Native country unknown.  
Perhaps a variety of R. Damascena.  

Reddish Rose.  
Shrub 3 to 6 feet.  

81 R. le'pida (Waitz in Tratt. ros. vol. 1.) prickles  
crowded, unequal; branches prickly, glanduliferous, as well as  
the petioles, peduncles, and base of fruit; leaflets ovate, acute,  
simply serrated, hairy on both surfaces, with ciliated margins.  
δ. H. Native country unknown.  
R. Franciscæ, Hortul.  
Perhaps a variety of R. Damascena.  

Lepid Rose.  
Fl. June, July.

Sect. VII. Villœse (from villous, villous; shrubs villous). Lindl. ros. p. 72. Surculi straight. Prickles straightish. Leaflets ovate or oblong, with diverging serratures. Sepals connate, permanent. Disk thickened, closing the throat. This division borders equally close upon those of Canina and Rubiginosa. From both it is distinguished by its root shoots being erect and stout. The most absolute marks of difference, however, between this and Sect. Canina, exist in the prickles of the present section being straight, and the serratures of the leaves diverging. If, as is sometimes the case, the prickles of this tribe are falcate, the serratures become more diverging. The permanent sepals are also another character, by which this tribe may be known from Sect. Canina. The section Rubiginosa cannot be confounded with the present section on account of their unequal, hooked prickles, and glandular leaves. Roughness of fruit and permanence of sepals is common to both.

Var. \( \beta \), resinosa (Lindl. ros. p. 77.) dwarf, grey; leaflets narrow; flowers very red. \( \text{H} \). Native of Ireland.

84. R. sylvéstris (Linl. syn. brit. fl. p. 101.) stem erect, coloured, flexuous; prickles hooked; leaflets oblong, acute, hoary on both sides; sepals diverging, deciduous before the fruit is ripe; fruit elliptic, bristly. \( \text{H} \). Native of Oxfordshire, in hedges. R. tomentosa sylvestris, Woods.

85. R. boreykiana (Bess. ex Spreng. syst. 2, p. 652.) prickles of branches scattered, recurved; pelticles prickly; leaflets doubly serrated, pubescent beneath, glandular on the margins, but not beneath; peduncles corymmetric, covered with glandular bristles; fruit oblong, glabrous. \( \text{H} \). Native of the north of Podolia.

Borekyian Rose. Shrub 6 to 8 feet.

Var. \( \beta \), scabriuscula (Smith, engl. bot. 1896.) leaves greener, nearly smooth except the ribs, which are hairy. \( \text{H} \). Native near Newcastle. R. ferróïda, Batard, suppl. 29. Red. ros. 1. p. 131. t. 150.

87. R. sierad (Davies, Welsh. bot. 49.) prickles conical, hooked, compressed; leaflets elliptical, acute, downy on both surfaces; sepals pinnate; fruit globular, abrupt, rather bristly. \( \text{H} \). Native near Kingston-upon-Thames, near Tonbridge Wells, and Down in Kent; in Cambridgeshire and Anglesea.
R. subglobosa, Smith, engl. fl. 2. p. 384. R. tomentosa, var. ε and η, Woods. in Lind. trans. 12. p. 201. Peduncles from 1-8, the more numerous the shorter, beset with glandular bristles. Fruit large, globular.

88 R. mifipda (Poir. encyc. bot. no. 15.) ovaries globose, and are as well as the peduncles hispid from prickles; leaflets ovate, white from tomentum beneath; stem prickles scattered; flowers solitary. η. H. Native of Europe. R. villosa β, Pomífera, Desv. journ. bot. 1813. p. 117.

Hispid Rose. Shrub to 6 feet.

89 R. aetha (Lin. spec. 705.) leaflets oblong, glaucous, nakedish above, simply serrated; prickles straightish or falcate, slender or strong, without setae; sepal pinnate, reflexed; fruit unarmed. η. H. Native of Piedmont, Cochín-china, Denmark, France, and Saxony. Lawr. ross. tt. 23. 25. 23. 37. Oed. fl. dan. 1215. Red. ros. 1. p. 97. t. 34. and 117. t. 43. R. usitatissima, Gatt. monbaut. 94. Flowers large, either white or of the most delicate blush colour, with a grateful fragrance. Fruit oblong, scarlet, or blood-coloured. The following garden varieties belong to this species:

agata, belle Aurore, blanche à cœur vert, blanche de Belgique, blush, double white, bouquet blanc, céléstial, Duc d'Orléans, Eliza, feuille fermée, grande cuisse de nymphé, Henriette, belle, Joanne d'Arce, maiden's blush, cluster.

90 R. mollis (Led. ex Spreng. syst. 2. p. 551.) ovaries ovate, glaucous, and are prickly as well as the peduncles; branches glabrous, unarmed, pubescent as well as the petioles; leaflets obtuse, doubly serrated, villous on both surfaces. η. H. Native of Caucasus. R. Ledebouri, Spreng. syst. 2. p. 551.

91 R. teretinthaeca (Bess. ex Spreng. syst. 2. p. 551.) prickles of the branches straight and compressed; petioles pubescent; leaflets tomentose beneath; peduncles corymbose, bristly; sepal lanceolate, emarginate; fruit oblong, tapering to both ends, bristly. η. H. Native of Podolia, at Tyra.

Turbentine Rose. Shrub 4 to 6 feet.

Sect. VIII. Rubiginosae (from rubiginosus, rusted; the leaves of the species are usually clothed with rust-coloured glands beneath). Lindl. ros. p. 84. Prickles unequal, sometimes bristle-formed, rarely wanting. Leaflets ovate or oblong, glabular, with diverging serratures. Sepals permanent (f. 75. d.). Disk thickened. Sircalarchi. The numerous glands on the lower surface of the leaves will be sufficient to prevent any thing else being referred to this section. But R. tomentosa has sometimes glandular leaves, but in such cases the inequality of the prickles of Rubiginosae, and their red fruit, will alone distinguish them.

Var. β, subvorida (Red. ros. 3. p. 78. with a figure) peduncles rather hispid and glabular; leaves and petioles glabrous; stem prickly at the base; prickles unequal, scattered; petals of a hurned red above and yellowish beneath; stigmas yellow.

Var. β, lattamitica (Red. ros. 3. p. 95. with a figure) fruit ovate and hispid as well as the peduncles; prickles of the branches somewhat horizontal; leaflets nearly glabrous above; flowers white.

Var. γ, rotundifolia (Lindl. ros. 58.) branches flagelliform; prickles straightish, slender; leaflets roundish, small, tube of calyx nearly globose, glabrous. η. H. Native of Germany. R. rubiginosa rotundifolia, Rau, enum. p. 136. Flowers solitary.

Var. ε, aculeatisima (Dnp. gym. ros. p. 18. ex Red. et Thor. ros. 2. p. 97.) flowers usually solitary; fruit ovate, and are as well as the peduncles beset with glandular bristles; leaflets ovate-roundish; prickles straightish, very numerous. Cultivated in gardens.

Var. ε, memorialis (Red. et Thor. ros. 2. p. 23. with a figure) flowers usually solitary, small; fruit ovate, and as is well as the peduncles beset with glandular bristles; leaflets ovate-roundish; prickles straightish, very numerous. Cultivated in gardens.

Var. η, pithera (Ser. in D. C. prod. 2. p. 616.) flowers usually solitary; fruit ovate, smooth; peduncles beset with glandular bristles; leaflets roundish, glandular beneath, and are as well as the petals puberulous. η. H. Native of Switzerland, about Aarberg.

Var. ι, grandiflora (Lindl. ros. 88.) leaflets nearly naked; petioles villous; flowers large; fruit purple, and are as well as the peduncules glabrous. η. H. Native of Germany. R. grandiflora, Wallr. ann. bot. 66.

Var. κ, major (Ser. exs. no. 4. mel. 1. p. 45.) stems erect; flowers solitary or corymbose, numerous; fruit ovate, and are as well as the peduncle clothed with glandular bristles; leaflets 4 E.
broad, sparingly glandular beneath; petiole and middle nerve villous; flowers semi-double.

Var. κ, spinulifolia (Ser. in D.C. prod. 2. p. 616.) prickles large, straight, or somewhat deflexed; leaflets oval, spinulose beneath; tube of calyx ovate, and as well as the peduncles more or less hispid. H. Native about Fribourg and Veriers. R. spinulifolia, Dem. ess. p. 8. R. spinulifolia, Dematratiana, Thor. ros. t. 1. Red. et Thor. ros. p. 8.

Var. λ, flexuosa (Lindl. ros. 88.) branches very flexuous; leaflets nearly orbicular; bracteas deciduous; flowers usually solitary; styles smooth. H. Native of Germany and Switzerland. R. Reynié, Hall. fil. in Rom. arch. 6. l. st. 2. p. 7. R. flexuosa, Rau, ens. p. 127. R. montana, D. C. suppl. 532.?

Garden varieties of the Sweet Briar.

American, single.

blush.

Clementine.

clover.

dwarf.

maidens.

Rusty Rose, Sweet Briar, or Egglantine. Fl. June, July. Britain. Shrub 4 to 6 feet.

95 R. montana (Vill. dauph. 3. p. 547.) prickles solitary, hooked; leaflets roundish, abrupt, doubly serrated, smooth, hardly glandular; peduncles and petioles bristly and glandular; sepals partly pilose, bristly and glandular on the back; stems strong, reddish. H. Native of Douphny and other parts of the south of Europe. Smith in Rees' cyc. Flowers small, generally white.

Mountain Sweet Briar. Fl. June, July. Shrub 2 to 3 feet.

96 R. micrantha (Smith, engl. bot. 2490.) prickles hooked, scattered, nearly uniform; leaflets ovate, doubly serrated, hairy, glandular beneath; sepals pinnate; fruit elliptic, rather bristly, contracted at the summit; stems straggling. H. Native of Britain, in hedges and thickets, chiefly in the south of England. R. rubiginosa β, micrantha, Lindl. ros. p. 87. with erroneous synonyms. Leaves sweet-scented. Flowers small, pale red.

Small-flowered Sweet Briar. Fl. June, July. Britain. Sh. 4 to 5 ft.

98 R. pulverulenta (Bieb. fl. taur. 1. p. 399.) branches glandular; leaflets pruinose on both surfaces; prickles recurved, dilated at the base; fruit ovate, and as well as the peduncles glabrous. H. Native of Caucasian, on hills about Narza. Flowers solitary, pale red, almost sessile. Leaves grey, with glands on both surfaces.

Var. β, ericarpa (Ser. in D.C. prod. 2. p. 617.) leaflets oval, doubly serrated; fruit smooth. R. pulverulenta, Lyell. in Lindl. ros. p. 93.

99 R. uncinella (Bess. ex Spreng. syst. 2. p. 552.) prickles of the branches scattered, recurved; pedicels rather prickly; leaflets pubescent beneath, doubly serrated, glandular on both surfaces; fruit oblong, and as well as the peduncles glabrous. H. Native of Volhynia and Tauria.

Small-hooked Briar. Shrub 5 to 6 feet.

100 R. carophyllacea (Bess. ens. p. 19.) prickles of branches equal, recurved, scattered; pedicels nearly unarmed; leaflets doubly serrated, glandular on both surfaces, and hoary beneath; fruit oblong, glabrous as well as the peduncles. H. Native of Podolia, Volhynia, and Iberia. R. rubiginosa var. μ carophyllacea, Ser. in D.C. prod. 2. p. 617.

Clove-scented Briar. Shrub 5 to 6 feet.

101 R. Isennea (Stev. in Bieb. fl. taur. suppl. 434.) cauina prickles scattered, hooked, dilated at the base; pedicels glabrous and prickly; leaflets broad ovate, glandularly biseriatus, and beset with glands on both surfaces; fruit ovate, smooth, or with a few bristles as well as the peduncles. H. Native of Eastern Iberia, about the town of Krzehinol. Very nearly allied to R. pulverulenta according to Bieberstein.

102 R. lappoedra (Fries. nov. fl. suec. 9.) stem very prickly; leaflets oblong, clamy and glandular beneath; fruit oblong, and as well as the peduncles glabrous. H. Native of the north of Holland. Leaves scentless. Sepals reflexed, pinate. Fruit oblong-ovate, purple. Said to be the same as R. Borreri. no. 122.

Scentless Briar. Shrub 4 to 5 feet.

103 R. cuspida (Bieb. fl. taur. 1. p. 396.) prickles strong, hooked, dilated at the base, scattered; leaflets ovate-lanceolate, acute, villous on both surfaces, glandular beneath; flowers corymbose; sepals pinnate, ending in a narrow serrated point; fruit oblong, and as well as the peduncles hispid. H. Native of Tauria, about Kastiar. Flowers white. Fruit dark purple.

Cuspidate-sepalated Briar. Shrub 5 to 6 feet.

105 R. agrestis (Swarz et spreng. syst. 2. p. 553.) prickles of branches scattered, recurved; pedicels unarmed, villous, and
glandular; leaflets equally serrated, villous and glandular beneath; germens oblong, and are, as well as the peduncles, quite glabrous.  h. native of sweden.

field briar. shrub 6 feet.

106 r. pseudorubignosa (lejeune, fl. spa. 1, p. 229.) stem and petioles armed with recurved prickles; leaflets ovate-oblong, beset with glandular pili, covered with rusty glands beneath and on the margins; fruit roundish, hispid.  h. native of france near malmedy. sepals pinnate. petals red.

false-rusty rose or false sweet briar. shrub 2 to 3 feet.

107 r. wolfangeliana (bess. enum. p. 61. and p. 67.) leaflets hardly glandular; styles very long, pubescent above; peduncles hispid from glandular bristles; fruit elongated, contracted at the neck, nearly naked, pear-shaped, with hardly any glandular bristles at the base.  h. native of podolia, in a wood near wiehlor.

wolfangel's briar. shrub 4 to 5 feet.

108 r. dimorphia (bess. ex spreng. syst. append. p. 200.) prickles of branches scattered and recurved; petioles prickly and pubescent; leaflets pubescent on both surfaces; peduncles short, crowded, thickly beset with glandular bristles, as well as the germens, which are ovate and contracted at both ends; calyx thickly beset with glands.  h. native of podolia.

two-formed briar. shrub 5 to 6 feet.

109 r. willydonovi (spreng. syst. 2. p. 547.) prickles on the branches opposite, a little recurved; petioles villous, unarmed; leaflets oblong, narrow, equally serrated, villous beneath, and full of resinous dots; bracteas apressed; peduncles short, solitary, glabrous, as well as the ovate fruit.  h. native of siberia. r. microphylla, willd. herb. r. arenaria, bieb. et stev. in willd. herb. ex spreng. l. c.

willdonow's briar. shrub 4 to 5 feet.

110 r. kulki (bess. cat. hort. cram. 1816. suppl. 4. p. 19. bieb. fl. taar. suppl. 343.) cauline prickles strong, compressed, dilated at the base, recurved; pedioles villous and prickly; leaflets small, elliptic, acute, sharply beset, with the serratures glandular, villous above, but rusty and glandular beneath; peduncles and fruit beset with glandular bristles.  h. native of tauria. r. rubiginosa, bieb. fl. taar. no. 979. exclusive of the synonyms. r. floribunda, stev. and r. balsamica, bess. flowers pink. allied to r. rubignosa, according to bieberstein, but according to besser to r. alba.

kulki's sweet-briar. fl. june. july 1819. sh. 5 to 6 ft.

111 r. floribunda (bess. hort. cram. ex spreng. syst. append. but not of steven.) prickles of branches strong, recurved; petioles prickly and villous; leaflets doubly serrated, wrinkled, glandular beneath and on the margins, as well as pubescent; peduncles aggregate, clothed with glandular pili, as well as the elliptic-oblong fruit.  h. native of podolia.

bundl-flowered briar. shrub 5 to 6 feet.

112 r. montezume (humb. et bonpl. in red. ros. 1. p. 55. t. 16.) petioles armed with little hooked prickles; branches unarmed; leaflets ovate, sharply serrated, glabrous; flowers solitary, terminal; tube of calyx elliptic, and is as well as the peduncles glabrous.  h. native of mexico, on the chain of porphyry mountains, which bound the valley of mexico on the north, at the elevation of 1416 toes, on the top of cerro ventosa, near the mine of san pedro. flowers pale red. sepals compound, dilated at the end.

montezuma's briar. fl. june. july. clt. 1825. sh. 4 to 6 ft.

sect. ix. canina (from canis, a dog; because r. canina is commonly called dog-rose. the name is applied to this section because all the species contained in it agree in character with r. canina.) linld. ros. 97. prickles equal, hooked. leaflets ovate, glandless or glandular, with the serratures con-

**Var. 5.** Schottiana (Ser. in D. C. prod. 2. p. 116.) branches rugged, unarmed; stipules and petioles glabrous and hispid; leaflets ovate, acuminate, glabrous, glaucous beneath; fruit ovate, smooth; peduncles hispid.  R. H. Native of Podolia. R. glauca, Schott, ex. Besser. enom. 64.

**Var. A. plenissimae (Desv. journ. bot. 1813. p. 115.)** branches prickly; petioles tomentose and hispid; leaflets ovate, acute, puberulous beneath and smooth above; fruit ovate, smoothish; peduncles hispid. R. humilis, Bess. suppl. cat. crem. 4. R. nitidula, Bess. enom. p. 20. and 61. R. Friedlandiriarnna, Besser. enom. 46. 60. 68. R. collina, Rau, enom. no. 163.

**Var. 7.** hispidula (Desv. journ. bot. 1813. p. 114.) branches prickly; petioles smoothish; leaflets ovate, acute, about the same colour on both surfaces, glabrous; fruit ovate, and are as well as the peduncles hispid. R. canina, var. lancelata grandifolia, Bast. 1. c. p. 114. and 115. R. Andegavensis, Bast. ess. 189. suppl. 29. D. C. fr. 5. p. 539. Red. ros. 2. 9. with a figure. R. sempervirens, Bast. ess. p. 188. Rau, enom. 120. Lindl. ros. p. 142. but not of Lin.

**Var. 8.** microcorys (Desv. journ. bot. 1813. p. 115.) leaflets oblong-lanceolate, velutin beneath; fruit smaller, ovate, glabrous. R. H. Native of France.

**Var. 9.** Meratiina (Ser. in D. C. prod. 2. p. 614.) prickles strongly arched, and are as well as the petioles glabrous; leaflets broad, blissared, glabrous; flowers usually solitary; fruit large. R. H. Native about Paris. R. biserrata, Mer. fl. par. 190. Red. ros. 3. p. 27. with a figure. Perhaps the same as R. canina vulgaria.

**Var. 10.** ambigua (Desv. journ. bot. 1813. p. 114.) prickles straight; leaflets ovate-roundish, and are as well as the petioles glabrous; flowers solitary or tern; fruit ovate-glabose, and is as well as the peduncles smooth. R. H. Native about Malmedy, in France. R. Malmundariensis, Lejeune, fl. sp. 1. p. 231. Red. ros. p. 54. with a figure.

**Var. 11.** squarrcea (Rau, enom. 77.) petioles and primary nerves of leaves glandular; prickles prickless, straightish, strong, and much crowded; leaflets doubly serrated. R. H. Native of Germany. R. canina Bieb. fl. taur. 1. p. 400. ex Rau, l. c.

**Var. 12.** rubifica (Ser. in D. C. prod. 2. p. 614.) prickles strong, and are, as well as the petioles, rather puberulous, rarely hispid; leaflets large, the same colour on both surfaces, smooth, and simply serrated; flowers usually solitary, about the size of those of Ribes Iioaeus; peduncles and fruit smooth. R. H. Native about Geneva.

Forster's Dog-rose. Fl. June. July. Britain. Sh. 6 to 8 ft. 117 R. Gmelini (Bunge in Led. fl. alt. 2. p. 229.) fruit ovate, glabrous; peduncles hispid; sepals ovate, acuminate, undivided, glandular, and prickly; flower-bearing branches almost unarmed, young sterile ones very prickly; prickles setaceous, unequal; leaflets 5-7, ob-

ovate-oblong, simply serrated, pubescent, and glandless beneath. R. H. Native of Siberia. R. canina, Sievers in Pall. nord. beitr. 7. Petals deep rose-coloured, shorter than the sepals, emarginate.

Bractescent Dog-rose. Fl. Ju. July. England. Sh. 6 to 7 ft. 120 R. sermentalcalca (Swartz, miss. Woods, in Lin. trans. 12. p. 215.) prickles hooked; leaflets ovate, doubly serrated, smooth, glandular; peduncles aggregate, smooth or minutely bristly; sepals pinnate, deciduous; fruit broadly elliptic, naked. R. H. Native of Europe, in hedges and bushy places common; plentiful in Britain. Borr. in engl. bot. suppl. 2555. R. glaucophylla, Winch, geogr. distri. 45. R. canina, Roth. fl. germ. 2. p. 560. Curt. lond. fasc. 5. t. 34. Flowers pink, fragrant. Fruit scarlet, as grateful to the palate probably as that of R. canina, with which this equally common plant is generally confused.

Sarmentaceous Dog-rose. Fl. Ju. Jul. Britain. Sh. 8 to 10 ft. 117 R. caesia (Smith, engl. bot. t. 2367.) prickles hooked; uniform; leaflets elliptical, somewhat doubly serrated, glaucous, hairy beneath, without glands; sepals distantly pinnate, deciduous; flower-stalks smooth, solitary; fruit elliptical, smooth. R. H. Native of Scotland, in the highland valleys, but rare; at Taymill, in Mid-Lorn, Argyleshire; and in Strath Tay between Dunkeld and Aberfeldie, and by the side of Loch Tay. R. canina pubescens, Ait. ros. spec. tent. 1. p. 2. R. canina & caesia, Lindl. ros. p. 39. Flowers of an uniform carnation hue, occasionally white.

FIG. 76.

Hill Dog-rose. Fl. June, July. Shrub 4 to 5 feet. 124 R. Baætica (Roth, nov. spec. pl. 254.) leaflets oblong-ovate, obtuse, simply serrated; petioles nearly unarmled, pilose; tube of calyx globose, with its base and peduncles beset with glandular bristles; sepals nearly simple, covered with rusty glandular bristles on the outside; bracteas coloured. H. Native near Rostock by the sea side. Flowers pale red.

Jundzill's Dog-rose. Shrub 5 to 6 feet. 126 R. Turbinélla (Swartz ex Spreng, syst. 2. p. 554.) prickles of branches few, and a little recurved; petioles unarmled, villous; leaflets equally toothed, clothed with hoary villi beneath; sepals entire, villous, elongated; glands globose, depressed, and are, as well as the aggregate peduncles, glabrous. H. Native of Sweden.

Small-turken-fruiting Dog-rose. Shrub 5 to 6 feet. 127 R. Vendéa (Swartz ex Spreng. syst. 2. p. 554.) prickles of branches scattered, strong, and recurved; petioles unarmled, glabrous; leaflets doubly serrated, veiny, quite glaucous, glaucescent beneath; sepals elongated, a little cut, with the margins tomentose; glands ovate, and are, as well as the peduncles, glabrous. H. Native of Sweden.

Veiny-leaved Dog-rose. Shrub 5 to 6 feet. 128 R. coriöfolia (Fries. ex Spreng. syst. 2. p. 554.) prickles of branches scattered, curved; petioles unarmled, villous; leaflets coriaceous, opaque, unequally serrated, villous beneath; peduncles solitary, short, glaucous; glands globose, glabrous. H. Native of Denmark. R. crassiöfia, Liljeb.

Hide-leaved Dog-rose. Shrub 5 to 6 feet. 129 R. Swartzi (Fries. in Billberg Svensk, bot. ex Schrad. neuve edn. 3. p. 210.) glands ovate, and peduncles smooth; branches and peduncles beset with recurved scattered prickles; glands globose on both surfaces, shining, unequally and glandularly serrated; styles excorcted. H. Native of the south of Sweden. Allied to R. canina.

Swartz's Dog-rose. Fl. June, July. Shrub 4 to 6 feet. 130 R. Sakaöiles (Stev. in Biebl. fl. taur. p. 319.) glands ovate, and are, as well as the peduncles, hispid; caudine prickles scattered, strong, compressed, recurved; petioles clothed with glandular villi, prickly; leaflets largish, unequally and sharply serrated, smoothish on both surfaces, paler beneath; the serrataes somewhat duplicate; flowers corymbose. H. Native of Tauria. Allied to R. canina.

Var. ß, hispida (Ser. mus. helv. 1. p. 8 and 12. t. 1.) leaflets ovate; flowers red; fruit corymbosse, smooth; peduncles hispid; sepals entire. R. cinnamomea gläaca, Desf. journ. bot. 1813. p. 120. Red. ros. 1. p. 134.

Var. γ, Reddoeta (Ser. in D. Ç. prod. 2. p. 609.) stems and branches reddish; prickles slender, hardly curved; petioles spinose; corymba few-flowered; leaflets ovate; petals very pale red, with rose-coloured and dotted margins. R. Redoeta, Red. ros. p. 3. and Mill. in ann. encycl. 1818. p. 35. R. Redoeta gläaca, Red. ros. 1. t. 38. p. 101. Lindl. ros. 137. This appears to be a hybrid production between R. rubriföia and R. spinosissima.

Var. ε, inermis (Ser. in D. Ç. prod. 2. p. 610.) stem and branches unarmed; petioles prickly; leaflets ovate; peduncles and calyces smooth; stipulae broad. H. Native of Switzerland. R. rubriföia, Thomens.

Var. φ, pinatifida (Ser. in mus. helv. 1. p. 11. t. 2. f. 11.) leaflets ovate; flowers solitary, terminal; sepals pinatifid; fruit globose, and are, as well as the peduncles, smooth. H. Native of Switzerland. R. rubriföia germinibus ovatis, and R. montana germinibus glabris, Scléich. cat. 1815. pp. 24. 46. R. canina gläaca, Desf. journ. bot. 1813. p. 114.

Red-leaved Dog-rose. Fl. June, July. 132 R. sérkia (Lindl. ros. 105. t. 12.) prickles stipular, compressed; leaflets 7-11, oblong, obtuse, serrated at the apex, silky beneath; flowers solitary, bracteats; sepals entire, ending in long points. H. Native of Gosaingstan. Flowers pale red? Fruit and peduncles naked.

Silky Rose. Fl. June, July. Shrub 4 to 6 feet. 133 R. miroöphylia (Rosxb. Lindl. ros. p. 146.) prickles under the stipulas straight; stipulas very narrow, spreading at the tip; leaflets 5-9, shining, sharply serrated, glabrous; flowers solitary; calyx beset with straight prickles; sepals short, broadly ovate, apiculate, downy at the edge. H. Native of China. A charming little shrub, resembling the Macaëtry Rosé. Flowers very double, pale red.

Var. β, Noissettiāna (Ser. in D. Ç. prod. 2. p. 600.) stem firm, and is, as well as the branches, prickly; stipulas nearly entire; flowers panicked, very numerous, semidouble, pale red; styles excorcted. R. Noissettiāna, Red. ros. 2. p. 77. with a figure. Noissette rose.

Var. γ, Ternauziāna (Ser. in D. Ç. prod. 2. p. 600.) stem rather firm, and is, as well as the branches, prickly; leaflets lanceolate, small; flowers panicked, red, size of the Pompe rose. R. Noissettiāna purpurea, Red. ros. p. 103. with a figure.
**Rosaceae.**

Var. *È, longifolia* (Lindl. ros. p. 106.) stems firm, nearly unarmed; leaflets 3-5, long, lanceolate; stipulas nearly entire; flowers rose-coloured, almost single; peduncles roughish. R. longifolia, Wildfl. spec. 2. p. 1079. Red. ros. 2. p. 27. t. 12.

Var. *È, pinnata* (Lindl. ros. p. 106.) smaller in every part than the other varieties; flowers purplish; pedals ovate. ½. H. Native of China. R. Indica pinnata, Red. ros. 1. p. 115. t. 42. R. Indica c húmilis, Ser. mal. 1. p. 44.

Var. *È, carophylleca* (Red. ros. 3. p. 69. with a figure,) leaflets large, thin; flowers subpanicled; petals cullatuately inflexed.

Var. *È, patnàsa* (Red. ros. 2. p. 37. and p. 38. with a good figure.) stem and branches firm and prickly; leaflets ovate, red beneath; stipulas finely dentilicatèd; flowers drooping a little, purple on the outside; petals oblong, concave, outer ones purple; inner ones somewhat cullatuately, rose-coloured.

Var. *È, crucinata* (Red. ros. 1. p. 128. with a figure, and 2. p. 38.) large; stems and branches almost unarmed, firm; leaflets large, red beneath; stipulas almost entire; flowers purplish, drooping, size of those of var. odoratissima; petals concave, broad.

Var. *È, riga* (Lindl. bot. reg. t. 1388.) flowers double blushe, changing to white, sweet-scented. The rugo-rose is a hybrid, raised between the sweet-scented Chinese rose and R. arenicola.

Var. *È, ochroleucia*; flowers double, large, cream-coloured, without any scent. This variety was introduced from China in 1824 by Mr. Parks, and is figured in the thirteenth volume of the Botanical Register. It is commonly called the yellow Chinese rose.

† Garden varieties referrible either to R. Indica or R. semperflorens.

1. *È, alba.*
2. *È, animating.*
3. *È, atrotrigra.*
4. *È, Bengale à Bouquet.*
5. *È, Bengale à Fl. Panaché.*
7. *È, bichonía.*
8. *È, carnescens.*
9. *È, centifolia.*
10. *È, cerve eclatante.*
11. *È, chaffinée.*
12. *È, cullatuata.*
15. *È, gigantea.*

Indian Rose, Moonly Rose, Blush or Common China Rose. Fl. year. Cit. 1789. Shrub 4 to 20 feet.

135. *È, semperflorens* (Curt. bot. mag. 284.) branches dark green, armed with scattered compressed hooked prickles, and a very few glands; leaflets 3-5, ovate-lanceolate, crenate-serrate, shining above, glaucous and slightly pubescent beneath, deeply stained with purple; pedioles glandular, and slightly sericose; sepals compound, narrow; fruit spherical. ½. H. Native of China. Lawr. ros. t. 23. Smith, exot. bot. 2. p. 91. Jacq. schömbr. 3. p. 281. R. diversifolia, Vent. cels. t. 35.

**Rosaceae.**

R. Bengálensis, Pers. ench. 2. p. 50. R. Indica, Red. ros. 1. p. 49. t. 13. p. 123. t. 46. and 2. p. 37. t. 16. Flowers solitary, single or semidouble, and deep crimson. There are some very splendid varieties of this species with semidouble crimson flowers in our gardens, and the French appear to have some others still more beautiful, which have not yet been imported.

Ever-flowering China rose. Fl. year. Cit. 1789. Shrub 3 to 10 feet.

Miss Lawrence’s Chineese rose. Fl. year. Cit. 1810. Sh. 1 ft.

137. *È, atrospurpurea* (Brot. fl. lus. 2. p. 488.) stem and pedios prickly; leaflets 5, lanceolate, serrulatèd, glabrous, permanent; flowers terminal, solitary or few; germens nearly oval, and are, as well as the peduncles, hispid. ½. H. Collected in the gardens of Lisbon, where it flowers all the year. Flowers semidouble, about the size of those of R. moschata. Perhaps R. semperflorens.

Dark-purple China rose. Fl. year. Shrub.

138. *È, pseude-indica* (Lindl. ros. 132.) prickles nearly equal; stipulas very hairy; peduncles covered with little short prickles; calyce tube and sepals very hairy; flowers double, deep yellow; leaves more finely serrated and coriaceous than those of R. Indica. ½. G. Native of China. Habit of R. Indica.

**False-Indian Rose.** Shrub.

**Sect. X. Syûtyla.** (From συν, syn, together, and στυλος, sty-los, a column; in reference to the styles being connected). Lindl. ros. p. 111. Styles cohering together into an elongated column. Stipulas adnate. The habit of this section is nearly the same as that of the last division. The leaves are frequently permanent.

Var. *È, lanceolatâ* (Lindl. ros. 111.) leaflets ovate-lanceolate; fruit spherical. ½. H. Native of Ireland.

Var. *È, glendulbiêsa* (Ser. l. c.) leaflets 5-7, obovate-elliptic, somewhat biserrulatèd, glabrous above, but covered with rusty glands beneath; petals postenose and glandular; column of styles short.

Var. ß, hybrida (Lindl. ros. 113.) surculi thicker and shorter; floriferous stems erect, many-flowered; branches bearing a few bristles; styles free. H. Native of Switzerland. R. hybrida, Bastel. edinb. phil. journ. no. 3. p. 102. Flowers white, in clusters, fragrant.

Var. ã, Anderssonii (Smith, engl. fl. 2. p. 393.) habit stout; flowers large, pale flesh-coloured. Found wild in a hedge in Somersetshire.

Var. ë, Agyreshae (Ser. in D. C. prod. 2. p. 597.) prickles slenderer, very sharp; leaflets sharply serrated, thin; peduncles beset with glandular bristles. H. Cultivated in the gardens under the name of Ayrshire rose. R. capreolata, Neill, edinb. phil. journ. no. 3. p. 102. Flowers white, in clusters, fragrant.

Var. ï, obtusifiata (Ser. 1. c.) leaflets roundish, blunt. H. Native of Switzerland, about Bern.

141 R. ABYSSINICA (Brown in Salt's abyss. append. 64.) surculi climbing; prickles much crowded, falcate; leaflets ovate, evergreen; peduncles and calyces tomentose; sepals entire; petioles very rough, with unequal glands and setae. H. Native of Abyssinia. Lindl. ros. n. 116. 13. Abyssinian Rose. Shrub cl.

142 R. SEMPERVERENS (Lin. spec. 704.) surculi climbing; prickles nearly equal, falcate; peduncles numerous, glandular; leaves evergreen; leaflets ovate-lanceolate, simply serrated, smooth on both surfaces, paler beneath; sepals nearly simple; petioles armed with little hooked prickles; styles hairy. H. Native of France, Portugal, Italy, Greece, and the Balearic Islands. Lawr. ros. t. 45. Ker. bot. reg. 459. R. scändens, Mill. diet. n. 8. R. Balcârica, Desf. cat. Pers. ench. 2. p. 49. R. atrovirens, Viv. fl. ital. 4. t. 6. R. sempervirens globosa, Red. ros. 2. with a figure. R. sempervirens var. a, scändens, D. C. fl. fr. 5. p. 533. Flowers very numerous, white, and fragrant. Receptacle of flower conical, very thick. Fruit orange-colour, small.—There are varieties of this plant with semidouble and pale rose-coloured flowers. It is a very ornamental plant, rapidly forming a compact covering to old pales or buildings against which it is planted: and the Ayrshire rose is equally good for that purpose.—Smith, grace. t. 482.

Var. ß, microphylla (Desf. atl. 1. p. 401.) leaflets nearly orbicular. H. Found about Tunis.

Var. ñ, latifolia (Red. ros. 2. p. 16. and p. 49. with a figure,) leaflets broader; peduncles and fruit hispid; stems green.

Var. ï, pilosula (Ser. in D. C. prod. 2. p. 598.) peduncles and leaflets usually pilose and hispid. H. Native of the Eastern Pyrenees.

Var. ù, Russelianâ (Hort.) flowers pale red. Russel's rose.

Var. ë, rose Clare (Lindl. bot. reg. 1488.) an elegant rose, with spreading corymbs of deep red flowers. It is perhaps a hybrid between the present species and R. Indica.

Var. ß, bibracteolâ (Lindl. ros. 2. p. 597.) peduncles furnished with 2 or many bractes; leaflets very numerous; leaflets broadish. H. Native of France. R. arvensis var. prov. Ser. in D. C. prod. 2. p. 597. R. bibracteolâ, Bast. ann. litt. and in D. C. fl. fr. 5. p. 577. Flowers white or pale red.

Red. ros. 2. p. 70.

Var. ß, Thumbiriâ (Red. ros. 2. p. 70.) flowers white; petioles prickly. H. Native of Japan. Flowers small, double clustered.

Var. ë, platiphiûla (Red. ros. 2. p. 69. with a figure,) leaflets broader; flowers large, double, purple, clustered, changing colour as they fade. H. Lindl. bot. reg. 1372. R. Thoryi, Tratt. ros. 2. p. 85. R. Grevillei and R. Roxbârgîhi, Hort.

Var. ñ, Boursoûliâ (Hort.) flowers small, double, pink, clustered. The garden roses known under the names of R. Fra-enciana, R. purpurea, and R. hyacinthinâ are slight varieties of this.

Many-flowered Rose. Fl. June, July. Cilt. 1804. Sh. cl. 145 R. BRUNNOÎN (Lindl. ros. 120. t. 14.) branches, lanceolate leaflets, and calyces tomentose and glandular; stipulas serrated; prickles strong, scattered, hooked; sepals entire; styles hairy. H. Native of Nepal. R. Brönnî, Spreng. syst. 2. p. 556. Leaves simply serrated. Flowers in terminal bunches white or pale red.

Var. ß, nudíâsula (Lindl. in bot. reg. 829.) leaflets oblong, acute, glabrous; petioles, pedicels, and calyces glabrous.

146 R. MOSCHÁTâ (Mill. diet. no. 13.) branches very sparingly glandular, almost naked; prickles strong, hooked, scattered;
leaflets elliptic, acuminate, glaucous beneath, with the serratures connivent; stipulas entire; sepals compound, acuminate; styles hairy; pedicels glandular, downy, like the ovate tube, and reflexed sepals; fruit small, red. *H.* Native of the north of Africa, extending across the continent from Egypt to Mogadore, and thence to Madeira. J. C. s. e. n. 3. t. 260. L. v. r. t. 53 and 64. J. c. f. s. 31. t. 34. f. 3. Red. r. 1. p. 33. t. 5. p. 99. t. 35. R. opostegemia, Ehrh. beir. 2. p. 72. R. glandulifera, Roxb. Cymes very numerous, many-flowered, corymbous, with hairy ramifications. Flowers pure white, with a slight scent of musk. The Persian attar of roses is obtained from this species.

*V. g., m. *f. *leaves oblong, acute, glabrous; petioles, pedicels, and calyxes glandular.

*V. o. nica* (Lindl. bot. reg. 861.) leaves 3 5, large, ovate-cordate; flowers corymbous; peduncles and glandular hipped; petal white, with a tinge of blush, large, obcordate. *H.* R. nivea, Dupont, but not of D. C. R. moschata *p.* rosa, Ser. in D. C. L. t. 2. p. 598.

147 *R. erewatina* (Bocc. dict. Poir. suppl. 714.) branches and pedicels almost unarmed; leaves 3 5, oval, obtuse, nearly equally toothed, green above, paler and rather glaucous beneath; stipulas with 2 sharp teeth; flowers in bunches, terminal, almost umbrillate; peduncles bristy and glandular; sepals entire, acute; germens ovate, hipped. *H.* Native of Carolina. Flowers large, pale red.

148 *R. kewii* (Brown, in Ait. hort. kew. ed. 2. vol. 3. p. 260.) branches glabrous, armed with scattered, falcate prickles; leaflets ovate-lanceolate, serrated, green and shining above, but paler and downy beneath, with the serratures divaricate; petioles glabrous, with a few prickles; stipulas entire, fringed with glands; styles downy. *H.* Native of North America. Peduncles and calyxes glandular, the former glandular. Flowers small, pale red, about 3 together. Fruit about the size of a pea, round and naked.

*V. g., m. *n. *macrophylla* (Ser. in D. C. L. t. 2. p. 599.) flowers twain or in fascicles, large, rose-coloured, approximate. *R. rufiglora*, Red. r. 3. p. 71, with a figure.

**SECT. XI. BANKSIANAE** (so called in consequence of all the species contained in this section agreeing in character with *R. Banksiae*). Lindl. ros. p. 125. Stipulas nearly free, subulate, or very narrow, usually deciduous. Leaves usually ternate, shining. Stems climbing. The species of this section are remarkable for their long, graceful, often climbing shoots, drooping white flowers, and ternate shining leaves. They are particularly distinguished by their deciduous, subulate, or very narrow stipulas. Their fruit is very variable. *R. hystrix* has serrigenous branches and *R. setigerus* has united styles.

149 *R. levigata* (Mich. fl. bor. amer. 1. p. 295.) stipulas linear-lanceolate, half adnate; leaflets shining, glabrous; prickles scattered, falcate; petioles unarmed; fruit mucrinated; sepals entire, permanent. *H.* Native of Georgia, in shady woods. Peduncles and tube of calyx hessed with dense, weak, unequal bristles, also the back of the sepals. Flowers solitary, large, white.

*Smooth Rose.* Shrub cl.

**XXII. ROSA.**

Recurved-prickled Rose. Shrub climbing.

152 *R. setigerus* (Michx. L. fl. bor. amer. 1. p. 295.) stipulas subulate; petioles rough from little setc and little recurved prickles; leaflets 3, rarely 5, acutely serrated, smooth; peduncles setigerous; sepals pinnatifid and setigerous; fruit mucrinated; stem with 1 3 recurved prickles beneath the stipulas. *H.* Native of North America. Flowers numerous, sometimes solitary, rose-coloured. The united styles distinguish it from all the other species of this section.

Setigerous Rose. Shrub.

153 *R. hystricis* (Lindl. ros. p. 129. t. 17.) prickles on branches unequal, crowded, larger ones falcate, small ones straight; stipulas very narrow, united half way, the free part deciduous; leaflets 3, smooth, ovate, shining, simply serrated, with a few prickles on the middle nerve; sepals nearly entire, permanent; fruit broadly. *H.* Native of China, in the province of Kiangsi, and of Japan. Branches flagelliform. Flowers large, solitary. Fruit large, oblong, purple.

Porcupine Rose. Shrub rambling.

154 *R. microcarpa* (Lindl. ros. 130. t. 18.) calyx prickles hooked, scattered; stipulas subulate; petioles downy or naked; leaflets 5 9, ovate-lanceolate, naked, crenate-serrate; flowers corymbose, with smooth peduncles; fruit pea-formed, unarmed. *H.* Native of China, in the province of Canton. Flowers very numerous, small, white.

155 *R. triplofolia* (Rosby. fl. ind. ex Lindl. ros. p. 138.) shrub climbing and armed; leaves ternate; leaflets lanceolate. *H.* G. Native of China. Perhaps the same as *R. microcarpa*, or a variety of *R. Sinica*.

Three-leaved Rose. Shrub cl.

*V. g., p.* lactea (Lindl. bot. reg. 1105.) flowers double yellow. An elegant shrub when in flower.

157 *R. fragariflora* (Set. in D. C. L. t. 2. p. 601.) stem prickly; leaflets petiolulate, ovate, acuminate, entire; flowers corymbose, white; peduncles and calyxes smooth; sepals entire; stipulas solitary? basileen. *H.* G. Native of China.—Braun. Icon. chin. 1821. t. 88. Flowers the size and colour of those of *Fragaria vesca*.

Strawberry-flowered Rose. Shrub cl.
158. **R. amygdalifolia** (Sert. in D. C. prod. 2. p. 601.)
branches prickly; leaves trifoliolate, exstipulate; leaflets oblong-lanceolate, entire, acute; flowers lateral, solitary; peduncles and calyxes hispid; petals longer than the calyx, white; styles combined into a long, filiform column.
Native of China.

—Bram. icon. chin. t. 19. Sepals broad, acute. Fruit ovate, large.

**Almond-leaved Rose.** Shrub cl.

† *Species not sufficiently known.*

159. **R. hispanica** (Mill. dict. no. 7.) leaves villous on both surfaces; sepals acutely serrated; fruit glabrous. 
Native of Spain. Mill. Prickles strong. Flowers bright red.

**Spanish Rose.** Fl. May. Ch.? Shrub 4 feet.

160. **R. santii** (Lindl. ros. p. 132.) very like *R. spinosissima*, except in having no setae, and double flowers the colour of those of *R. sulphurea*. 
Native of China.

**Yellow-nosed Rose.** Shrub 2 to 3 feet.

161. **R. agrestis** (Gmel. fl. bad. als. 2. p. 416.) germens almost globose, and are as well as the peduncles hispid; leaflets round, obtuse, clothed with white tomentum beneath; stem prickly; prickles unequal, straight; flowers solitary. 
Native of Alsatia, in calcareous soil, in fields. Flowers large, white. Fruit roundish, smooth, red. Perhaps allied to *R. tomentosa*.

**Field Rose.** Shrub 1 to 2 feet.

162. **R. lyoni** (Pursh, fl. amer. sept. 1. p. 345.) germens subglobose, glabrous; peduncles hispid; pedicles rather prickly; stem glabrous; prickles scattered, straight; leaflets 3-5, ovate-oblong, acute, serrated above, tomentose beneath; uppermost leaves simple; flowers usually terminal; stipules linear; sepals tomentose, linear, hardly jagged. 
Native of Tennessee. Flowers pale red. Leaves small, with coloured veins. Evidently related to *R. Carolina*.

**Lyon's Rose.** Fl. June, July. Ch.? Shrub 3 to 4 feet.

163. **R. polliniana** (Spreng. pl. min. cogn. pag. 2. p. 66.) tube of calyx ovate, and is, as well as the peduncles and petioles, beset with glandular bristles; leaflets ovate-roundish, serrated, glabrous on both surfaces, having the teeth glandularly serrated; stem prickly. 
Native of Germany. In hedges, at the foot of Mount Baldo. Flowers large, purple. This species is evidently related to *R. rubiginosula*.

**Pollinian's Rose.** Shrub 4 to 6 feet.

164. **R. niphon** (Poiret. encycl. no. 15.) germens globose, and are as well as the peduncles hispid and prickly; leaflets ovate, clothed with white tomentum beneath; stem prickly; prickles scattered; flowers solitary. 
Native country unknown. Evidently nearly allied to *R. tomentosa*.

**Hispian Rose.** Shrub 6 to 8 feet.

165. **R. loureiriana**; stem shaggy, tufted, branched, prickly; petioles prickly; tube of calyx round; peduncles unarmed. 
Native of Cochinn-China; where, and in the latter country it is called *Hoa-kho*, and in the former *Moi-hoa*. R. cinnaenomea, Lour. coch. 323. Leaves with hardly any scent. Flowers single, very red.

**Loureiro's Rose.** Shrub 3 feet.

166. **R. Cochinchinensis**; stem climbing a little, very prickly; tube of calyx roundish, smooth; petioles and peduncles prickly. 
Native of Cochinn-China, where it is called *Hoa luong tau*. R. spinosissima, Lour. coch. p. 323. Flowers bluish-coloured, scentless. Perhaps *R. Sinica*.

**Cochin-china Rose.** Shrub 6 feet.

167. **R. adenophylla** (Wild. enum. p. 516.) germens ovate, clothed with glandular bristles; petioles beset with glandular down, unarmed; leaflets simply serrated, glaucous beneath, with glandular margins; prickles of branches scattered. 
Native country unknown. Flowers single, large, red; petals emarginate. This plant is perhaps allied to *R. parvifolia*.

**Gland-leaved Rose.** Shrub 4 to 6 feet.

168. **R. tourgirom** (Wildl. enum. p. 544.) germens roundish, glabrous; calyxes pilose; peduncles hispid; pedicels villous, prickly; prickles on stem scattered. 
Native country unknown. Called in Germany *Tapefen Rose*. Perhaps nearly allied to *R. arvensis*.

**Cottage Rose.** Shrub.

169. **R. velutina** (Clairv. man. d'herb. 163.) fruit round; leaves cottony beneath, edges glandular. 
Native of Switzerland, about Winterthur. Perhaps this is a variety of *R. spinosissima*.

**Velvety Rose.** Shrub.

170. **R. muricata** (Waiz. in Link. enum. 2. p. 56.) stem muricately above; pedicels almost naked; leaflets oval, obtuse, serrated, glabrous; peduncles glandular; tube of calyx oblong, naked; sepals with tomentose edges. 
Native country unknown.

**Muricated-branched Rose.** Shrub.

171. **R. ruthcula** (Ehrh. beit. 7. p. 138.) prickles very slender, reflexed, covered with bluish bloom; branches unarmed; leaflets lanceolate, acutely serrated, glaucous beneath; tube of calyx globose; sepals undivided, length of corolla; styles shorter than the stamens. 

**Brown-stemmed Rose.** Shrub.

172. **R. verticalacantha** (Mer. fl. par. 190.) prickles minute, rather verticillate, reflexed; leaflets oval, glandless; petioles rather glandular; fruit globose, clothed with glandular bristles; sepals undivided. 
Native about Paris. Perhaps a variety of *R. alpina*.

**Whorled-spined Rose.** Shrub 3 to 4 feet.

173. **R. macrocarpa** (Mer. fl. par. 190.) prickles nearly straight; leaflets oval, toothed, glandless; pedicels hardly glandular; fruit globose, and are, as well as the peduncles, smooth; sepals undivided, glandless. 
Native of France.

**Long-fruited Rose.** Shrub.

174. **R. stipulakis** (Mer. fl. par. 192.) prickles recurved; leaflets doubly serrated, glabrous, glandless; peduncles glandular and prickly; stipules large, entire, glandular; fruit oval, and are as well as the peduncles glabrous; sepals undivided, glandless. 

**Stipular Rose.** Shrub.

175. **R. flexuosa** (Rafin. prec. 37. but not of Rau.) stems twisted; prickles solitary, recurved; pedicels glabrous and nearly unarmed; leaflets ovate, unequally serrated; flowers solitary; germens oblong, or globose, glabrous. 

**Flexuous-stemmed Rose.** Shrub.

176. **R. acuminate** (Rafin. ros. amer. in ann. sci. phys. 5. p. 216.) stem and petioles prickly; leaflets 3-5, oval, acuminate, serrated, pubescent beneath; flowers subumbellate; fruit ovate, and are as well as the peduncles beset with glandular bristles. 
Native of North America, on the banks of the Wabash river.

**Acuminated-leaved Rose.** Shrub.

177. **R. pratensis** (Rafin. l. c. 5. p. 215.) stem flexuous; prickles stipular, straight; petals pubescent; leaflets 5-7, oblong, attenuated at both ends, serrated, glabrous; flowers solitary; fruit ovate, hispid. 
Native of North America, in the meadows of Kentucky. Flowers white.
Var. \( \beta \), *geminata* (Rafin. l. c.) leaflets obovate; flowers twin, rose-coloured.

**Meadore Rose.** Shrub.

178 R. riparia (Rafin. l. c. 5. p. 216.) hispid and prickly; prickles straight; leaflets 5, unarmed, ovate, doubly serrated, ciliate, clothed with glandular pubescent beneath; leaflets solitary; peduncles angular; fruit turbinate, oblong, nearly smooth. \( \gamma \). H. Native of Maryland, on the banks of the Potomac river. Flowers purple, fragrant.

Var. \( \beta \), *ame\'na* (Rafin. l. c.) flowers double.

**River-bank Rose.** Shrub.

179 R. davyelliana (Rafin. l. c. 5. p. 210.) stems nearly unarmed, villous; leaflets 5-7, oval or obovate, serrated, velvety beneath; flowers solitary; sepals simple; fruit oblong, hispid. \( \gamma \). H. Native of North America.

**Thick-stamened Rose.** Shrub.

180 R. waizlani (Tratt. ros. 1. p. 57.) fruit ovate, glabrous, scarlet; sepals appendiculate, bristly on the back; peduncles hispatal; leaflets roundish-ovate, simply serrated; scentless, glabrous; floriferous branches glandular and prickly; prickles hooked. \( \gamma \). H. Native of Saxony, near Altenburg.

**Waizl's Rose.** Shrub.

181 R. rubescens (Bosc. dict. ex Poir. suppl. 4. p. 615. and Tratt. ros. 2. p. 179.) fruit prickly, nearly glabrose; leaflets 5-7, elliptic, obtuse, glabrous, serrated; branches and peduncles furnished with small straight prickles; flowers usually solitary; sepals beset with glandular hairs on the edges. \( \gamma \). H. Native of North America.

**Red-spined Rose.** Shrub.

182 R. scu\'la (Tratt. ros. 2. p. 68.) fruit glabrous, and as well as the peduncles glabrous and unarmed; leaflets orbicular, sharply and doubly serrated, with the teeth all glandular at the apex; petals clothed with glandular villi; stems prickly; prickles subverticillate. \( \gamma \). H. Native of Sicily, on the tops of the Nebrodos.

**Sicilian Rose.** Shrub.

183 R. fraxinifolia (Andr. ros. fasc. 33. ex Tratt. ros. 2. p. 100.) stem glabrous, nearly unarmed; germens oblong; peduncles glabrous; petals prickly; leaflets rough, oblong, narrow, acute, serrated; flowers white, sweet-scented; inner petals small and flexuous. \( \gamma \). H. Native country unknown. Perhaps a variety of *R. sempereirens*.

**Ash-leaved Rose.** Shrub.

184 R. heckeliiana (Tratt. ros. 2. p. 85.) fruit glabrous, glabrous, muricate; peduncles very short, tonsentose; leaflets orbicular, doubly toothed, clothed with hoary tomentum on both sides as well as the stipules, and ciliated with glands; very blunt at the apex; stems prickly; prickles somewhat verticillate. \( \gamma \). H. Native of Sicily, on the Nebrodos.

**Heckel's Rose.** Shrub.

185 R. erube\'xens (Andr. ros. fasc. 30. ex Tratt. ros. 1. p. 119.) fruit ovate, and as well as the peduncles clothed with glandular bristles; sepals oblong, entire; glandular, petals rather prickly; leaflets ovate, acute, unequally serrated, discolor; calyptric prickles scattered and solitary, some straight and setaceous, and others large, recurved, and dilated at the base, dark purple. \( \gamma \). H. Native country unknown.

**Reddish Rose.** Shrub.

186 R. incana (Kit. ex Tratt. ros. 1. p. 135.) fruit and peduncles glabrous; calyptric prickles recurved; petals almost unarmed, and are, as well as the leaves, villoyly tomentose. \( \gamma \). H. Native of Hungary.

**Hoary Rose.** Shrub.

187 R. clusiana (Waitz, ex Tratt. ros. 1. p. 119.) fruit nearly globose, glabrous; sepals appressed, and are, as well as the peduncle, hispid; petals villous, glandular, rather prickly; leaflets sweet-scented; ovate-lanceolate, simply serrated, pubescent beneath; stipulas quite entire; stem and branches unarmed. \( \gamma \). H. Native country unknown. Rosa sinapis, Clus. hist. 1. p. 115. f. 1. Perhaps a variety of *R. Gallica*.

**Clusia's Rose.** Shrub 2 to 3 feet.

188 R. ola\'bra (Andr. ros. fasc. 21.) fruit ovate; petals and peduncles hispid; flowers of many equal petals; leaflets oblong, acuminate, serrated, glabrous; stem glabrous, nearly unarmed. \( \gamma \). H. Native country unknown. Size and form of *R. cistifolia* pompona. Leaves like those of *R. noothita*, but the plant altogether is more nearly allied to *R. cinnamomea* ex Tratt. ros.

**Glabrous Rose.** Shrub 4 to 6 feet.

189 R. sprengelliana (Tratt. ros. 2. p. 163.) nearly unarmed; fruit glabrous, hispid; petals smoothish; petals villous; leaflets oblong, serrated at the apex, pubescent beneath; branches nearly unarmed; prickles very few and straight; flowers sessile, aggregate. \( \gamma \). H. Native country unknown. R. Virginica, Curt. ex Spreng. nov. prov. p. 36. no. 80.

**Sprengel's Rose.** Shrub.

190 R. portenschlagiana (Tratt. ros. 2. p. 203.) germens ovate, glabrous, coloured; peduncles very short, and are, as well as the peduncles, prickly and glandular; sepals coloured, subulate, pinnatifid, one-half shorter than the petals; flowers alternate, solitary, large; stem unarmed. \( \gamma \). H. Native country unknown. Flowers rose-coloured.

**Portenschlag's Rose.** Shrub.

191 R. wilfleni (Tratt. ros. 1. p. 200.) fruit nearly globose, coloured, glabrous; peduncles solitary, short, clothed with glandular bristles; leaflets elliptic, somewhat doubled serrated; stipulas biarticulate; branches and petals very prickly. \( \gamma \). H. Native of Germany.

Var. \( \beta \), *rubra* (Tratt. ros. 1. p. 201.) leaves smaller; leaflets ciliated with glands; fruit ovate-oblong; petals deep rose-coloured. \( \gamma \). H. Native of Carinthia, on mount Nanas. Leaves, branches, and calyxes red.

**Wilflen's Rose.** Shrub.

192 R. trichocarpa (Waitz, ex Tratt. ros. 2. p. 45.) fruit oblong; sepals appendiculate, and are, as well as the peduncles, hispid; petals glabrous and prickly; leaflets sweet-scented, ovate-lanceolate, simply serrated, glabrous on both surfaces; stem and branches very glabrous and prickly; prickles hooked, straight, stigmas sessile. \( \gamma \). H. Native country unknown. Perhaps a variety of *R. alba*.

**Hairy-fruited Rose.** Shrub 4 to 6 feet.

193 R. concavifolia (Waitz, ex Tratt. ros. 2. p. 66.) fruit ovate, glabrous; sepals appendiculate, hairy, glandless; peduncles hispid; petals glabrous, prickly; leaves sweet-scented, ovate, doubly serrated, pubescent on both surfaces; stipulas with glandular edges; flowers subcorimbos. \( \gamma \). H. Native country unknown.

**Concave-leaved Rose.** Shrub.

194 R. elliptica (Tausch, ex Tratt. ros. 2. p. 69.) fruit ovate, and are, as well as the peduncles, glabrous; leaflets elliptic, unequally and glabrously serrated, quite entire at the base, glabrous, and beset with glandular pili; prickles reflexed, stipular. \( \gamma \). H. Native of Bohemia. R. rubigniosa, Guippel, deutsch. Holzart. 1. p. 121. t. 91. Fruit blood-coloured.

**Elliptic-leaved Rose.** Shrub.

195 R. ma \' kuirzsch (Schultes in cestr. fl. ed. 2. vol. 2. p. 69. ex Tratt. ros. 2. p. 213.) fruit nearly globose, and are, as well as the peduncles, glabrous; petals beset with glandular bristles; stem prickles scattered, a little recurved; leaflets almost
glabrous. \( \text{f. H.} \) Native country unknown. Nearly allied to \( R. \) rubiginosa ex Tratt. I. c.

**Munkshov's Rose.** Shrub.

196 \( R. \) Andreanis (Tratt. ros. 2. p. 203.) fruit elliptic, glabrous; sepals oblong, quite entire, glabrous; peduncles and petals hispid; stem unarmed; leaflets somewhat doubly serrated, glabrous, glaucescence beneath; flowers lateral, solitary, deep purple, drooping; fruit pendulous. \( \text{f. H.} \) Native country unknown.

**Var. \( \beta \), débitis (Tratt. I. c. p. 206.)** stems weak, decumbent; leaflets small, nearly like those of \( R. \) spinosissima; flowers large, twin, very beautiful, between scarlet and blood-coloured.

**Andrews's Rose.** Shrub 2 to 3 feet.

197 \( R. \) Serafini (Viviani, add. fl. Ital. fragm. and fl. libyc. p. 67. fl. cors. spec. nov. 8.) germs oblong, and are, as well as the peduncles, glabrous; stem and petioles prickly; prickles recurved, falcate; stipules ovate; leaflets roundish, doubly serrated, with the teeth glandular.

**Serafini's Rose.** Shrub 4 to 6 feet.

198 \( R. \) Glabra (Vest, ex Tratt. ros. 2. p. 250.) fruit large, solitary, nearly globose; peduncles very short; leaflets roundish-elliptic, decurrent at the base, doubly serrated, quite glabrous on both surfaces, with glandular margins; prickles scattered, usually twin.

**Simple Rose.** Shrub 4 to 6 feet.

200 \( R. \) Orientalis (Dupont in litt. D. C. prod. 2. p. 607.) dwarf; stem prickly, glabrous; prickles conical, slender; young branches puberulous; leaflets roundish, tomentose, serrate-crenated; fruit globose, hispid; peduncles tomentose and hispid; sepals nearly entire. \( \text{f. H.} \) Native of Persia.

**Var. \( a \), Oliviaria (Ser. in D. C. prod. 2. p. 607.)** leaflets very veiny and smooth beneath; peduncles puberulous, but not glandular; fruit glabrous, hispid. \( \text{f. H.} \) Native of Persia.

**Var. \( \beta \), Ballisiana (Ser. I. c.)** leaflets hardly veiny, puberulous beneath; peduncles tomentose and hispid; tube of calyx very hispid and glandular.

**Oriental Rose.** Fl. June, July. Shrub 2 to 3 feet.

201 \( R. \) Ventiinentiana (Red. ros. 3. p. 83. with a figure.) cauline prickles unequal, crowded, straight; germ finger-shaped, beset with glandular bristles at the base, as well as the peduncles; flowers nearly sessile.

**Ventreit's Rose.** Fl. June, July. Shrub.

202 \( R. \) Canescens (Kroki. fl. siles. 2. p. 155. no. 784. ex Tratt. ros. 2. p. 226.) fruit nearly globose, and are, as well as the peduncles; leaflets lancedolate, glabrous on both surfaces, discoloured, simply serrated; principal stem nearly unarmed, canescent; branches prickly and very hispid; stipules adnate, very long.

**Canescens Rose.** Shrub 4 to 6 feet.

203 \( R. \) Krokieri (Tratt. ros. 2. p. 231.) fruit globose, and are, as well as the peduncles, glabrous and unarmed; leaflets usually 3, elliptic, obuse, serrated at the apex, clothed with hoary tomentum beneath; petioles short, involuriate, stipulate; stem 1-flowered.

**Kroki's Rose.** Shrub 1 to 2 feet.

204 \( R. \) Ambigua (Lejeune. rev. fl. spa. p. 98.) fruit egg-shaped, glabrous, furnished with a few stalked glands; peduncles glabrous, rarely glandular; leaflets glabrous on both surfaces, doubly serrated, acuminate; bracteas and petioles glandularly ciliate.

**Ambiguous Rose.** Shrub 5 to 6 feet.

205 \( R. \) Sylvatica (Tausch, in fl. vol. 2. p. 464. ex Tratt. ros. 1. p. 58.) fruit ovate, and are, as well as the peduncles, hispid; flowers cymose; petioles beset with glandular pili and prickles; leaflets ovate, acute, unequally and deeply glandularly serrated, pilose beneath; stems bristly or prickly.

**Wood Rose.** Shrub 4 to 6 feet.

**History.**—The rose is known by every body at first sight, and has been a favourite flower from time immemorial among the civilized nations of Europe and Asia. The shrub varies in size in different species and varieties, and the colours are red, white, purple, yellow, black, striped, or in almost numberless shades and mixtures, from single to semidouble and double.

Roses are cultivated in every garden, from the most humble cottage upwards. Some species, as \( R. \) centifolia, \( R. \) damascena, &c. are also cultivated on a large scale by commercial gardeners for distilling rose-water, and for making attar or essential oil of roses. Six pounds of rose petals will impregnate by distillation a gallon of water strongly with its colour; but a hundred pounds afford hardly half an ounce of attar. The rose is also used in medicine. Botanists are not agreed as to the number of original species of this genus, and notwithstanding the labours of many scientific men the genus still remains a chaos, from which it can never be extricated. We have endeavoured in the foregoing pages to render the species as clear as it is practicable from the present knowledge of the genus. The most scientific work which has appeared upon the subject in England is the "Rosa rum Monographia," of John Lindley, 1819; and Miss Lawrence has published about ninety plates of "A Collection of Roses from Nature," 1810. In France Guillemeau has published "Histoire Naturelle de la Rose," 1800, and P. J. Redoute and C. A. Thorium have published a splendid work in folio, entitled "Les Roses," containing plates of both species and varieties. C. A. Thorium has published a separate tract on the culture of roses, entitled "Prodrome de la Monographie du genre Rosier," &c. 1820. M. A. Pronville a "Nomenclature Raisonnée," in 1818. J. Sabine has given an account of Scotch roses in Hort. trans. 4. p. 231. Many varieties of the rose are yearly raised from seeds in the nurseries.

**Varieties** are raised from seed on the continent, where the seed ripens better than in this country. A number of varieties have also been raised in this country, especially of the \( R. \) spinosissima or Scotch-rose. New varieties are raised in France and Italy annually. L. Villaresi, royal gardener at Monza, has raised upwards of 50 varieties of \( R. \) indica, some of them are quite black, others shaped like a ranunculus, and many of them highly odoriferous. Ample lists of the varieties are given under their proper species.

**Propagation.**—By seed for new varieties, and chiefly by layers for continuing approved sorts. They are also increased by budding, cuttings, and suckers.

**By seed.**—The hips containing the seeds are obtained from semidouble and single flowers, and to increase the chance of new varieties, these should be taken from plants that have been planted among or near to the kinds of which a cross is desired. Extracting the stamens from one flower, and dusting the stigmas with the pollen of another kind, might answer in most cases.
instances. In France and Italy the usual mode is to form a plantation of double and semidouble sorts, mixed indiscriminately, and take the result of promiscuous impregnation; it is also done in some of the nurseries of this country. The hips generally ripen in October or November. The seeds do not vegetate till the second season after sowing. The first year, instead of sowing them, they may be preserved among sand, or the hips entire may be so preserved a full year, when the husks will be perfectly rotten, and the seed being separated and sown in February will come up in May or June following. The seeds should be sown in soft soil, and in a shady situation, or they may be covered with earth from a \( \frac{1}{4} \) to \( \frac{1}{2} \) an inch, according to the size of the seeds. Early in the second spring they may be planted in rows a foot or 2 feet apart every way, according to the size of the sorts. Here they may remain till they flower, which varies in the different sorts from the third to the fifth year, but most commonly they flower the fourth summer.

By layers.—The common mode is to lay down the young shoots of the preceding summer late in autumn or early in the succeeding spring, and then, with the exception of the moss-rose, and one or two others, they form rooted plants by the next autumn. But it is now found, that if the same shoots are laid down when the plant is beginning to flower in July, they will, with a few exceptions, produce roots, and be fit to remove the same autumn, by which a whole year is gained. Such sorts as do not root in one year must be left on the stools till the second autumn; but layers made when the shoot is in a growing state, and furnished with healthy leaves, root much more freely than shoots of ripe wood. After the plants are removed from the stools they are planted in nursery rows, and in a year the blossom buds, having been carefully pinched off from the first laying down, they will be fit for removal to their final destination. The stools are then to be pruned, and the soil stirred and enriched.

By suckers.—Many of the commoner sorts admit of being rapidly multiplied in this way, and the plants obtained may be planted in their final destination at once.

By cuttings.—Most sorts might be propagated in this way from cuttings of young wood, cut at a joint where it is beginning to ripen, and planted in sand and vegetable mould under a handglass. But this mode is only adopted with such sorts as strike easily, as the Indian and Chinese kinds.

By budding.—This mode of propagating roses is adopted only with the rarer kinds, and such as are difficult to propagate by layers; for it is found that plants so originated, even though on stocks of the hardier sorts, are less durable than such as are raised by any of the other modes. But the chief use of budding in the culture of the rose is to produce standard-roses, or to produce several sorts from the same tree or bush. Standard-roses are a modern invention, it is generally supposed of the Dutch, first carried to Paris, and about 30 years ago to England. They are highly artificial objects of great beauty, and form magnificent ornaments to parterres and borders. The stocks are either of the tree rose, *Rosa villoisa*, or of any sorts of wild roses, which grow to a large size. They are budded at different heights, from 3 to 7 feet, but commonly between 5 and 6 from the ground. A stock in the Paris garden, which carries several sorts, has a naked stem of nearly 15 feet high, and there are others at Malmaison and at Grand Trianon of equal height. The stocks are procured from woods and copeses, and after being planted in nursery lines are often budded the same summer, sometimes in summer by the scale mode of budding, *l’evil plusiant* of the French; and never later than the succeeding spring or summer by the common mode. Generally two buds are inserted on opposite sides of the stock, but often 3-4 or a dozen in alternate positions on the upper 6 or 12 inches of the stem. Every stock is supported by a rod, which should reach a foot or eighteen inches higher than the situation of the bud; to this rod the stock is tied, and afterwards the shoots from the buds, which are otherwise liable to be blown out by high winds. The Paris nurserymen being supplied with stronger stocks than can readily be procured in England, and having a better climate and more experience in the culture of roses, excel us in this department of *rose* propagation, and their standards afford an article of commerce with other countries. Their common plants raised by layers are also in extensive demand, but in these we equal if not surpass them. Fine collections of standard roses may be seen in Lee’s nursery at Hammer Smith, in the Count de Vande’s garden at Bayswater, in the duchess of Dorset’s at Knowle, and in various other places.

Final situation.—No species of rose, wild or cultivated, thrives well in or near large towns, on account of the smoke or confined air. The yellow and Austrian *roses*, *R. lutea* and *R. biolor* are difficult to flower in any situation. Roses are generally planted in the front of shrubberies and in borders; they are also planted by themselves in rose gardens or rosaries, in groups on lawn or gravel, either with common box or other edgings, or with edgings of wire, in imitation of basket-work; these last are called baskets of roses; the ground inclosed in the basket margin is made convex, so as to present a greater surface to the eye, and increase the illusion; the shoots of the stronger sorts are layered or kept down by pegs till they strike root, so that the points of the shoots furnished with buds appear only above the soil, which is sometimes covered with moss or small shells; under this treatment the whole surface of the basket becomes in two or three years covered with rose-buds and leaves, of one or of various sorts. Where one of the larger free growing sorts is employed, as the moss rose, or any of the Provins’ varieties, one plant may be trained so as to cover a surface of many square yards. Where different sorts are introduced in the same basket, they should be as much as possible assimilated in size of leaves and flowers and habits of growth, and as different as possible in the colours of their flowers: By mixing small-flowered with large-flowered sorts, the beauty of the former is lost without adding to the effect of the latter. In rosaries commonly but one plant of a sort is introduced, and the varieties which most resemble each other are placed together, by which their distinctive differences are better seen. Particular compartments are often devoted to one species, as the Scotch, Chinese, yellow, burnet-leaved, &c. which has an excellent effect, sometimes a piece of rock-work in the centre is covered with creeping roses, and on other occasions they are trained to trellis-work, which forms a fence or hedge of roses round the whole. In this hedge standard *roses* are sometimes introduced at regular distances; a grove of standards is also frequently formed in the centre of the rosary, and sometimes they are introduced here and there in the beds. Standard *roses* however, have certainly the best effect in flower borders, or when completely detached on a lawn; their sameness of form, and that form very compact and bushy, prevents them from grouping well, either among themselves or with other objects. Their beauty consists in their singularity, as *rose* plants, and in their flowers; and therefore to display these beauties to the best advantage, they require to be seen singly, or in succession. This is the case where they occur as single objects on a lawn, or in the centre, or here and there among groups of flowers, or in lines or avenues along flower-walks.

Soil.—Most species of the *rose*, in their wild state, grow in sandy and rather poor soil, excepting such as are natives of woods, where the soil is richer and comparatively moist. But
all the cultivated roses, and especially the double flowering kinds, require a rich loamy soil, inclining to clay rather than sand, and they require also, like most double flowers, plenty of moisture when in a growing state.

General culture.—To produce strong flowering roses requires some attention in pruning; old wood should be yearly cut out, and the young shoots thinned and shortened, according to their strength, and whether number or magnitude of flowers be wanted. Those sorts which throw out numerous suckers, should be taken up every three or four years, reduced, and replanted, and most sorts, excepting the standards, will be improved by the practice, provided attention be paid to remove a part of the old soil and replace it by new. The points of the shoots of the more delicate sorts of roses are very apt to die when pruning is performed in winter or spring; to avoid the consequences of this evil, many give a second pruning in June, or do not prune the tender sorts at all till the beginning of that month. A very good time for performing the operation is immediately after the bloom is over, cutting out old exhausted wood, shortening shoots which have flowered, to a good bud, accompanied with a healthy leaf, but leaving such shoots as are still in a growing state till October. Where very large roses are wanted, all the buds, except on that of the extreme point of each shoot, should be pinched off as soon as they make their appearance, and the plant liberally supplied with water. To lessen evaporation, and keep up a constant moisture at the roots of their roses, the Paris gardeners generally mulch them with half rotten stable dung or partially rotten leaves.

Forwarding and retarding roses.—The earliest flowering rose is the **monthly**, which in mild seasons and planted against a wall, will sometimes flower in the beginning of April; the **roses** next in succession are the **cinnamons**, which flowers in May, the **damask**, in the end of May or beginning of June; the **blush, York, and Lancastre, Provias**, and Dutch hundred-leaved, in June, July, and August. The **Virginia** and **musk roses** are the latest European sorts; they flower in September, and in shaded situations will sometimes continue in bloom till the middle of October; but the earliest rose (the **monthly**), is also the latest, and generally continues flowering till intercepted by frost. The earliest sorts may be materially forwarded by being planted against a south wall, and if portable stakes be placed before them, and the wall is either fluided or heated by fires, or a lining of dung placed behind, the plants may be brought to flower in February or March. The **monthly rose**, being protected by glass in autumn, or aided by artificial heat, may be continued in bloom till Christmas. A very common mode of obtaining late roses, and one of the greatest antiquity, is by cutting all the flower shoots off when the buds begin to appear, or by rubbing off all the rudiments of shoots of every kind early in the spring; a second crop is in consequence produced, which will not be in a state to bloom before the autumn.

Forcing the rose.—The best sorts for this purpose are the common and moss **Provençal**. The Indian sorts force well, or rather in stoves continue in bloom all the year; but the common varieties not being fragrant, they are in less repute than the European roses. **Roses** plants should be a year in pots previously to the autumn when it is intended to force them; they should be planted in pots 6 or 8 inches in diameter, in rich loam, and plunged in an open airy situation, their flower-buds pinched off as they appear, and the plants put into a state of rest, by excluding the sun and rain, but not a free circulation of air. Abercrombie says, "There is no certainty of obtaining a fine blow of roses in the depth of winter by the most expensive artifices of forcing; and yet fine flowers may be produced early in the spring by any ordinary stove, put in operation in December. When the plants are first introduced, keep the air of the house about 55°, never letting it fluctuate to more than 2 or 3 degrees below the above. In the second week, aim at 60° as the standard; in the third week 65°. When a month has nearly elapsed, begin to increase the heat gradually to 70°, having brought it to this standard, let it afterwards exceed it from 3 to 5 degrees rather than sink below. A succession may be kept up by introducing some pots every 8 or 10 days.

**Insects.**—All the species of **Rissa** are very liable to the attacks of insects, especially of the aphides; some, particularly the **brier** and **Scotch rose**, are attacked by the cynips rose, which by puncturing the bark, occasions the production of rose-galls, and of those massy tufts often seen on wild roses, which were formerly known under the name of bedeguar, and used in medicine. A great number of insects seem fond of the flowers of roses, from the earwig to the seemingly harmless lady-bird, which deposits its larvae in the leaves of various species, both wild and cultivated. There seems no remedy for insects on plants in the open air so simple and effectual as gathering them by hand, or removing the leaf or that part of the shoot which is infected by them. Under cover tobacco smoke will prove an effectual remedy for the aphides; but the larvae of many others, and especially of the **tipulids** and the **tephritidinae**, by occasioning the wrapping up and shrivelling of the leaves, can only be removed by hand.

† A genus allied to **Roses**.

Lin. syst. **Icosandria, Monogyne**. Calyx 5-parted, with a short tube, and oblong, acute lobes. petals 5, obtuse and emarginate at the apex, larger than the calyx, and inserted in its base. Staminodes about 20, disposed in one series, shorter than the petals. Ovary ovate, free, 3-celled, many-ovulate. **Style** filiform, acute. **Capsule ovate**.—A herb, with alternate, bipinnate, palmatifid leaves on long petioles, having the lobes serrated at the apex, and joined together at the base by a foliaceous membrane. Peduncles solitary, opposite the leaves, or nearly terminal, 1-flowered, inflexed at the apex. Flowers large, red.

Habit of **Neurada** or **Drupas**, but the characters are not sufficiently known to determine which of the genera it comes nearest.

1 A. **Palnatipoda** (Moc. et Sesse, fl. mex. icon. ined.). 24. 7. 2. \* G. Native of Mexico.

**Palmatipod-leaved Amoreuxia.** P1. trailing.

**Cult.** A mixture of loam, sand, and peat, will probably suit this plant, and cuttings will perhaps root if planted in sand or mould, with a hand-glass placed over them.

Flowers usually unisexual from abortion. Calyx with a thickened tube (f. 78. a.) and a 3 (f. 80. a.) -4 (f. 79. b. f. 77. b.) -5 lobed limb, its tube lined with the disk. Petals none. Staminodes definite, sometimes fewer than the segments of the calyx, with which they are alternate, arising from the orifice of the calyx; anthers 2-celled, innate, bursting longitudinally, occasionally 1-celled, and bursting transversely. Ovary solitary, simple, with the style proceeding from the apex at the base. Ovulum solitary, always attached to that part of the ovaries which is next the base of the style. Stigma compound or...
simple. Nut solitary, inclosed in the often-indurated tube of the calyx. Seeds solitary, suspended, or ascending, exalbuminous. Embryo with a superior radicle, and large plano-convex cotyledons.—Herbaceous plants or under shrubs, occasionally spiny. Leaves simple, lobed, or pinnate, alternate, furnished with stipules. Flowers small, usually capitulate. This order differs from Rosaceae in the apetalous flowers and indurated calyx, and the reduction of the carpella to one only. Their general character is astringency. A decoction of Alchemilla vulgaris is slightly tonic. Sanguisorba is useful as fodder.

Synopsis of the genera.

1 Cercocarpus. Calyx coloured, with a cylindrical permanent tube, and a sinately 5-lobed, deciduous limb. Stamens 20, inserted in the limb of the calyx. Carpel ending in a plumose style.

3 Cephalotus. Calyx coloured, 6-cleft (f. 78. b.). Stamens 12 (f. 78. c.). Anthers didymous (f. 78. c.), glandular on the back. Ovaries 6 (f. 78. d. b.), distinct. Styles terminal (f. 78. i.). Akenia 1-seeded.

4 Margareta. Calyx with the tube contracted at the mouth, the limb 4-5-parted, each segment furnished with a toothed spinula on the outside at the base. Stigma feathery. Carpel 1, drupaceous.

8 Pothergilloides. Flowers monocious or polygamous. Calyx furnished with 3 scales at the base (f. 79. a.); the limb 4-parted (f. 79. b.). Stamens 20-30. Stigma pelliformed. Akenia 2, dry.

I. Cercocarpus (from keres, kerko, a shuttlecock, and karpos, karpos, a fruit; in reference to the shape of the fruit). H. B. et Kunth, nov. gener. Amer. 6. p. 292.—Bertolonia, Moc. et Sesse, fl. mex. icon. ined.

Lin. syst. Icosandria, Menogynia. Calyx coloured, with a cylindrical permanent tube, and a sinately 5-lobed deciduous limb, with the throat open. Petals wanting. Stamens 20, inserted in the limb of the calyx. Carpel 1, free. Fruit membranous, tailed by the plumose permanent style, 1-seeded, involved by the calyx.—A tree, with alternate, entire leaves, furnished with 2 petiolar stipulas; and axillary umbellate fascicles of flowers.

II. Alchemilla (Alkemelyck the Arabic name of one of the species). Tourn. inst. t. 288. D. C. prod. 2. p. 589.—Alchemilla and Aphanes. Lin. gen. no. 165. and 166. Lam. ill. t. 86. and 87.

Lin. syst. Di-Tetrandra, Mono-Digynia. Calyx tubular (f. 77. c.), with the tube rather contracted at the apex; and with an 8-parted (f. 77. b.) limb, the alternate lobes or bracteoles the smallest (f. 77. b.), sometimes very small and tooth-formed. Petals wanting. Stamens 1-4. Styles lateral, filiform, capitulate at the apex. Carpels 1-2, 1-seeded, at length becoming dry and indurated. Seed inserted. Herbs with palmate or lobed leaves. Flowers small, corymbose.

Sect. I. Alchemilla (see genus for derivation). Lin. gen. no. 165. Calyx 8-cleft (f. 77. b.), alternate lobes smallest (f. 77. b.). Stamens 2-4. Perennial plants.

*Leaves palmately 7-9-cleft.*

1 A. Cape'snia (Thunb. fl. cap. 1. p. 558.) leaves reniform, somewhat lobed, rependently crenated, and as are as well the stems hairy; racemes axillary and terminal. H. G. Native of the Cape of Good Hope, on the sides of hills and mountains. Lam. ill. t. 86. f. 2.

Cape Lady's-mantle. Pl. ½ foot.

2 A. vulgaris (Lin. spec. 178.) leaves roundish, reniform, plicate, concave, 9-lobed, serrated; stem and petioles smoothish; flowers disposed in dichotomous corymbs. H. Native of Europe and Siberia, in woods and pastures frequent; plentiful in some parts of Britain. Oed. fl. dan. 983. Smith, engl. bot. t. 597. Mill. fig. t. 18. f. 2. This plant varies much in hairiness and smoothness, as well as in size and stature. Stipulas cut. The whole plant is astringent and slightly tonic. The leaves were formerly used in medicine, and were esteemed to be vulnerary.

4 A. pure-scens (Bieb. fl. taur. 1. p. 114.) leaves roundish-reniform, 7-lobed, toothed, silky beneath; corymbs terminal, crowded, clothed with silky villi. H. Native among rocks on the higher Caucasus. Willd. hort. berl. 2. t. 79.

**Leaves palmate; leaflets 5-7, serrated at the apex.**

5 A. alpina (Lin. spec. 179. var. a.) leaves digitate; leaflets 5-7, lanceolate-cuneate, obtuse, serrated at the apex, with the segments adpressed, clothed with white satiny down beneath. 2. H. Native of Europe and North America, in mountain pastures; in the mountainous parts of the north of England and Scotland, common among rocks on the banks of mountain rivulets. Smith, engl. bot. t. 244; Oed. fl. dan. 49. A. argentea, Lam. fl. fr. 3. p. 505. The satiny under side of the leaves of this and the following species has given rise to the generic English name of Lady's-mantle.

6 A. sericea (Willd. enum. p. 171.) leaves digitate; leaflets 7, lanceolate-obovate, obtuse, connected at the base, serrated at the apex, clothed with satiny down beneath. 2. H. Native of Caucasus. A. alpina, Bieb. fl. taur. 1. p. 114. exclusive of the synonyms. Much larger in every part than *A. alpina.*

**Leaves digitate; leaflets 3-5, multifid, or serrated all round.**

7 A. pentaphylla (Lin. spec. 179.) leaves 3-5, multifid, glabrous, and rather ciliate; stipulas foliaceous, bi or tridentate at the apex. 2. H. Native of Europe, on the alps.—Boc. mus. p. 18. t. 1. Stems creeping.

8 A. sibthorpioides (H. B. et Kunth, nov. gen. amer. 6. p. 226. t. 501.) leaves deeply 3-parted, clothed with adpressed pubescence beneath; segments deeply serrated, lateral ones bifid; stipulas 2-4-cleft; stems corymbose, many-flowered at the apex; flowers conglamorous, diandrous, and usually digynous. 2. G. Native between Mexico and Tolucco, near Tianguilo, and on Mount Orizaba.

9 A. aphanoides (Mutis, in Lin. fil. suppl. 122.) plant smooth; leaves profoundly 3-parted; segments ciliate, intermediate one trifid, lateral ones bifid; stipulas 2-3-cleft; stems branched, creeping; flowers axillary and terminal, diandrous or tetrameric and digynous. 2. G. Native of New Granada. H. B. et Kunth, nov. gen. amer. 6. p. 225.

Aphanoideas-like Lady's-mantle. Pl. creeping.

10 A. vulcanica (Schlecht. et Cham. in Linnaea. 5. p. 573.) pilose; stems flagelliform, trailing; cauline leaves ternate; leaflets cuneate, deeply 5-7-toothed at the apex; stipulas bifid on both sides; flowers axillary, forming small, leafy racemes at the tops of the branches; stamens 2; styles 3. 2. G. Native of Mexico. on Mount Orizaba.

Volcanic Lady's-mantle. Pl. trailing.

11 A. mirtuca (H. B. et Kunth, l. c.) leaves deeply tripartite, pilose; segments divided in a fan-like manner; stipulas 2-3-cleft; stems racemose, erect, hairy; flowers diandrous and digynous, disposed inglomerate heads. 2. G. Native of South America.

Var. a. campesiris (Schlecht. et Cham. in Linnaea. 5. p. 572.) stems elongated; leaves sessile beneath. 2. G. Native of Mexico, in grassy places near Jalapa.

Var. b. alpaestris (Schlecht. et Cham. l. c.) leaves the same colour on both surfaces; stem short. 2. G. Native of Mexico, on Mount Orizaba.

Hairy Lady's-mantle. Pl. ½ to ¾ foot.

12 A. rupestris (H. B. et Kunth, nov. gen. amer. 6. p. 224.) leaves profoundly 3-parted, clothed with silky pilis beneath; segments deeply serrated; stipulas entire; stems branched, creeping; flowers somewhat corymbose, diandrous and trigynous. 2. G. Native of South America, on the burning mountain Ruca-Pichina, near Quito. Habit of *A. aphanoides.*

Rock Lady's-mantle. Pl. creeping.

13 A. nivalis (H. B. et Kunth, l. c. p. 560.) leaves multifid, sheathing, stem-clasping, and imbricating, clothed with silky hairs on the outside; stems tufted; flowers terminal, sessile, usually tern, diandrous, and usually trigynous. 2. G. Native of Peru, on the cold tops of mountains, in springs.

Snow Lady's-mantle. Pl. tufted.

14 A. tripartita (Ruiz et Pav. fl. per. l. p. 68.) hairy; stems creeping, filiform, dichotomously branched, leafy above; leaves deeply 3-parted; segments cuneiform, 3-5-cleft; stipulas unequally bifid; petioles sheathing; pedicels dichotomously corymbose; flowers diandrous and digynous. 2. G. Native of Peru, on cold mountains in humid places. A phana orchiliaria, Pers. ench.

Orbicular-leaved Lady's-mantle. Pl. ½ foot.

15 A. orbiculata (Ruiz et Pav. l. c.) leaves orbicular reniform, lobed, deeply serrated, glabrous above, and clothed with silvery villi beneath; petioles terete, hairy; peduncles dichotomously corymbose; flowers 8-cleft, diandrous, digynous. 2. F. Native of Peru, in the cold tops of mountains, in springs.

Tripartite-leaved Lady's-mantle. Pl. ½ foot.

16 A. pinnata (Ruiz et Pav. fl. per. l. p. 69.) leaves pinnate; leaflets bifid or trifid; radical ones petiolate, cauleine ones clasping the stem; stems branched, sermentose, creeping; flowers diandrous, digynous. 2. F. Native of Peru, on the high cold humid mountains of Tarma and Panatahuara. A phana pinnata, Pers.

Pinnate-leaved Lady's-mantle. Pl. ½ foot.

**Sect. II. A'phanes (from a priv. and phaino, phaino, to appear; that is to say, a plant of no appearance, being small, and lying flat on the ground.) Lin. gen. no. 166. Calyx 4-cleft, rarely 5-cleft, with small teeth between the lobes. Stamens 1-2, fertile, the rest sterile. Annual plants.**

18 A. avensis (Scop. cara. 1. p. 115.) leaves small, hairy, petiolate, 3-parted; segments 2-3-cleft; flowers axillary, glomerate. 2. H. Native throughout Europe, in cultivated fields; plentiful in Britain, also in Iberia and Jamaica. Smith, engl. bot. 1011. A phanes arvensis, Lin. spec. 179. Oed. fl. dan. t. 973. A. a'phanes, Leers. herb. no. 122.

19 A. cornucopioides (Racm. et Schult. syst. 3. p. 471.) leaves hairy, cut, stem-clasping, almost sessile, 3-parted, with the petiole dilated; segments 2-3-cleft; flowers axillary, glomerate; stipulas cut. 2. H. Native about Madrid, in cornfields. A. phanes cornucopioides, Lag. gen. et spec. nov. p. 99. no. 7.

Cornucopia-like Parsley-Piert. Pl. prostrate.

Cult. The hardy species will grow in any common soil, and are increased by dividing the plants at the root. Those species natives of South America should be grown in small pots, well
drained with sherds, and filled with a mixture of peat and loam, and placed among other alpine plants. They are also to be increased by dividing the plants. The annual species are only weeds, and will grow under any circumstance.

III. CEPHALOTUS (from κεφαλοτος, kephalatos, headed; because the filaments of stamens are capitats). — Labill. nov. holl. 2. p. 7. t. 145. Brown, gen. rem. p. 68. t. 4. D. C. prod. 2. p. 591.

LIN. SYST. Dodecandra, Hexaquifa. Calyx coloured, 6-cleft (f. 78, b.), valvate in rivestment. Petals wanting. Stamens 12 (f. 77, e.), inserted in the calyx. Anthers didymous (f. 77. c.), glandular on the back. Ovaries 6 (f. 78. d., h.), distinct. Styles terminal (f. 78. i.). Akenia 1-seeded. Seed erect. — An almost stemless herb, with the leaves all radical and stalked, some of which are elliptical and flat, and others dilated into the kind of leaves called pitchers (f. 78. c.), which are generally filled with air, which seems as if confined within them by a lid (f. 78. f.), like that of the nepenthis. Scape erect, bearing a panicle of small white flowers at the apex.

1 C. foliolaris (Labill. l. c.)
2. G. Native of New Holland, on the eastern coast, in marshes. Hook. in bot. mag. vol. 5. new series, with a figure. (f. 78.)

Cult. This plant grows best in turfy peat soil, either in a box or pot; it should be kept rather moist: for this purpose the pots may be kept in pans of water. If moss is allowed to grow on the surface of the mould it will tend greatly to the health of the plants, or moss may be planted on the surface of the soil around the plants. There is no known way of increasing the plant except by seed.

IV. MARGYRICARPUS (from παραγως, margaros, pearl, and κερας, karpos, a fruit; resemblance in white fruit). Ruiz et Pav. fl. per. prod. 7. p. 33. II. B. et Kunth, nov. gen. amer. 6. p. 229.

LIN. SYST. Decandria, Monogynia. Calyx with the tube coredate at the apex, and with a 4- or 5-parted limb, each segment furnished with a tooth-formed spine on the outside at the base. Petals wanting. Stamens 2. Stigma multifid, feathery. Carpels 1, converted into a roundish 1-seeded drupe. Seed pendulous. — A much branched shrub, with impari-pinnate leaves, subulate leaflets, and axillary sessile flowers.

1 M. setosus (Ruiz et Pav. fl. per. 1. p. 28. t. 8. f. d.) ḡ. G. Native of Brazil, Peru, Chili, Santa Fe de Bogota, Quuito, &c. on arid hills. Empétrum pinnatum, Lam. dict. 1. p. 567. Ancistrum barbatum, Lam. ill. 1. p. 77. The leaves are either pelliforme or naked at the apex, and therefore M. setosus and M. laevis of Willd. are both referrible to this plant. The fruit is white, with a grateful acid taste. An infusion of the plant is used against hemorrhages.

Bristly Pearl-fruit. — Fl. June, July. Clt. 1829. Sh. 2 to 4 ft. Cult. This shrub will grow very well in a mixture of sand and peat, and cuttings are easily rooted in the same kind of soil, with a bell-glass over them.

V. POLYLEPIS (from τοις, poly, many, and λεπις, lepis, a scale; calyx). Ruiz et Pav. fl. per. prod. p. 34. t. 15. II. B. et Kunth, nov. gen. amer. 6. p. 226. D. C. prod. 2. p. 519.

LIN. SYST. Penta-lecandria, Monogynia. Calyx permanent, with a turbinate 3-4-angled tube, furnished above with spine-formed teeth; the throat contracted, and the limb 3-4-parted. Petals wanting. Stamens 5-20, inserted in the throat of the calyx. Anthers woolly. Carpels 1. Style filiform. Stigma pinnel-formed. Drupe elevate, 3-4-angled, dry, inclosed within the calyx; angles unequal, alternating with the denticulations of the calyx. Seed pendulous. — Shrubs, with compound leaves, and with the stipulas adnate to the petioles. Flowers racemose.

* Leaves trifoliate.

1 P. inca’na (H. B. et Kunth, nov. gen. amer. 6. p. 227.) leaves 3, crenated, clothed with hoary tomentum beneath, as well as the calyx; racemes axillary, few-flowered, about equal in length to the leaves; flowers pentandrous. ḡ. S. Native of South America, on the banks of Rio Blande in Guachacal, in the province of De los Pastos.

Hoary Polylepis. Shrub 2 to 3 feet.

2 P. villosa (H. B. et Kunth, l. c. p. 228.) leaves 3, crenated, clothed with hoary villi beneath, and on the calyxes; racemes many-flowered, exceeding the leaves; flowers usually icosandrous. ḡ. S. Native of Peru, near Caxamarca, where it is called Quinuar. Villous Polylepis. Shrub 12 to 20 feet.

* * Leaves pinnate.

3 P. lanuginosa (H. B. et Kunth, l. c. p. 228.) leaves of 2-4 pairs of nearly entire, rather emarginate leaflets, clothed with silky woolly down beneath, as well as the calyxes; racemes hardly exceeding the leaves. ḡ. S. Native of South America, at the bottom of mount Chimborazo near Calpi. Perhaps sufficiently distinct from the following.

Wooly Polylepis. Shrub 6 to 12 feet.

4. P. racemosa (Ruiz et Pav. syst. 1. p. 139.) leaves impari-pinnate; leaflets obovate or oblong, crenated, emarginate; flowers racemose, icosandrous. ḡ. S. Native of Peru, among broken rocks towards Quinua, Caxamarqua, and Piliao. De Candolle received a specimen from Bonpland, which he gathered near Caxamarca, and which is referrible to P. racemosa, and distinct from P. lanuginosa in the leaves bearing 4-6 pairs of distinctly sub-emarginate leaflets, not 2-4, as in that species. Racemose-flowered Polylepis. Shrub. Cult. See Margyricide ad for culture and propagation.

LIN. SYST. Di-Tetrandra, Mono-Digynia. Calyx furnished with 2 scales at the base, tubular, usually armed with glochidiate bristles; limb 4-parted. Corolla none. Stamens 2-10. Carpels 1-2, dry, 1-seeded, inclosed within the tube of the calyx. Seed pendulous. Styles terminal. Stigma plumose. — Humble evergreen herbs or shrubs, with impari-pinnate leaves, serrated leaflets, and spicate racemes or heads of small flowers. Authors large, purple.

1 A. lappacea (Ruiz et Pav. fl. per. 1. p. 66. t. 103. f. a.) flowers racemose, distant, tetradromous or pentandrous; stem erect; leaflets oblong, serrated. ḡ. F. Native of Peru, on the rocks of Tarma. Burdock Acaena. Pl. 7/8 foot.
SANGUISORBÆ. VI. ALCENA. VII. SANGUISORBA.

2 A. agrimonioides (H. B. et Kunth, nov. gen. am. 6. p. 231.) flowers alternate, spicate, lower ones remote; stem erect; leaflets oblong, coarsely serrated, glabrous, when young pubescent beneath. 1. F. Native of Mexico, in cold places near Tianguillo. Allied to A. Lappacea.

Agrimonia-like Acalna. Pl. ½ foot.

3 A. elongata (Lin. mant. 290.) flowers disposed in elongated spicate racemes; stems ascending; leaflets oblong, serrated, pubescent beneath. 1. F. Native of Mexico. H. B. et Kunth, nov. gen. am. 6. p. 255.

Elongated Acalna. Shrub 1 foot.

5 A. pinnaflora Ruiz et Pav. fl. per. 1. p. 68. t. 104. f. l. plant silky; flowers crowded into cylindrical spikes, lower ones remote; stem erect; leaves of 3–5 pairs of deeply 3–5-parted leaflets, with the segments linear; flowers pentamorous or decandrous. 2. F. Native of the hills of Chili and the Straits of Magellan. Lindl. bot. reg. t. 1271. Fruit covered with glochidiate bristles.

6 A. incisa (Lindl. bot. reg. no. 1271.) plant erect and silky; leaves of 6–7 pairs of oblong, cuneate, deeply serrated leaflets; heads of flowers spicete, lower flowers remote. 2. H. Native of Chili, at the baths of Collina near the limits of the snow.

Cut-leaved Acalna. Pl. ¼ foot.

7 A. myriophylla (Lindl. bot. reg. no. 1271.) erect, pubescent; leaves of 7–9 pairs of linear deeply pinnaflora leaflets; the segments very narrow and silky beneath; spikes cylinrical, interrupted at the base; fruit ovate, tomentose, glochidiate. 2. F. Native of Chili, about Mendoza.

Myriophylla-leaved Acalna. Pl. ¼ foot.

8 A. sericea (Jacq. fil. eclog. 1. t. 55.) flowers collected into globose heads; stems decumbent; leaflets obovate, deeply toothed, pubescent, silky on the back. 2. F. Native of New Spain, at Port Desiré. Poteriurn australe, Salm. prod. 2. p. 360. Ancistrium acron, Lag. nov. spec. p. 7. no. 100. ex Roem. et Schultes.

Silky Acalna. Pl. ¼ foot.

9 A. ovina (Cunningh. in Fields’ new south worlds, p. 358.) plant covered with white hairs; leaflets deeply cut, pinnaflora; segments oblong, obtuse; spikes oblong; lower flowers remote; stem reclinate, somewhat demersed. 2. H. Native of New Holland, frequent on the moist lands of Bathurst.

Sect. II. Ancistrum (from ancistrus, ancistrus, a fish-hook; in reference to the bristles of the calyx, which terminate in hooked points). Forst. gen. t. 2. Lam. ill. p. 22. D. C. prod. 2. p. 592. Calyx tubular, ending at the apex in 4–5 bristles, which are glochidiate at the apex.

11 A. ovalifolia (Ruiz et Pav. fl. per. 1. p. 67. t. 103. f. c.) spikes globose; stems creeping; leaves with 4–5 pairs of oblong and somewhat cuneate leaflets, which are villous beneath. 2. H. Native of Peru, in humid shady places. Ancistrium répen, Vent. hort. cvs. t. 5.

12 A. sarmentosæ (Carm. in Lin. trans. 11. p. 20.) spikes globose; stems creeping; leaves of 4–5 pairs of sharply serrated leaflets, which are glabrous and veiny above, but silky beneath; stipulas undivided. 2. H. Native of the Island of Tristan d’Acunha. Ancistrium sarmentosum, Pers. Th. fl. p. 44. Calyx 4-awned. Stamens 2.

Sarmentose Acalna. Pl. creeping.

13 A. argentea (Ruiz et Pav. fl. per. 1. p. 67. t. 103. f. b.) spikes globose; stems creeping; leaves of 5–4 pairs of ovate-oblong serrated leaflets, which are silky beneath. 2. H. Native of Chili, in bogs and fields. Ancistrium argenteum, H. B. et Kunth, nov. gen. am. 6. p. 230. Calyx villous outside.

15 A. levigata (Alt. hort. kew. 1. p. 68.) terminal spikes cylindrical, lower ones globose; stems decumbent; leaflets oval, deeply crenated, glabrous above, and cuneate beneath. 2. H. Native of the Straits of Magellan.

16 A. magellânica (Vahl. enum. 1. p. 297.) spikes of flowers globose; stems erect, glabrous; leaves with 6 pairs of obovate, deeply serrated trifid leaflets, which are cuneate beneath. 2. H. Native of the Straits of Magellan. Ancistrium Magellánicum, Lam. ill. t. 22. f. 2.

Magellan Acalna. Pl. ½ foot.

17 A. trifida (Ruiz et Pav. fl. per. 1. p. 67. t. 104. f. c.) spikes globose; stems erect, and are, as well as the leaflets, clothed with cuneate tomentum; leaflets 7–8 pairs, cuneiform, 3–5 cleft. 2. H. Native of Chili, in pastures.

Trifid-leaved Acalna. Pl. ½ to 1 foot.

18 A. lucida (Vahl. enum. 1. p. 296.) spikes ovate-oblong; leaflets 8–9 pairs, 3–5-parted, villos beneath, with the segments linear. 2. H. Native of the Falkland Islands. Ancistrium lucidum, Lam. ill. t. 22. f. 3. Calyx 4-awned, pilose outside.

19 A. pu'mila (Vahl. enum. 1. p. 298.) spikes terete; peduncles scapo-formed; stems demersed; leaflets 11–12 pairs, oval, crenate-serrate, quite glabrous, shining above. 2. H. Native of the Straits of Magellan. The fruit is said to be armed; if such be the case this species belongs to the first section, Evecna.

Dwarf Acalna. Pl. ¼ foot.

20 A. cylindracea (Ruiz et Pav. fl. per. 1. p. 68. t. 104. f. 2.) spikes cylinrical; peduncles scapo-formed; stems demersed; leaflets 10–11 pairs, oblong, serrated, silky beneath. 2. H. Native of Peru, on the cold hills of Tarma. Calyx 4-awned.

Cylindrical-spiced Acalna. Pl. ¼ foot.

Cult. The species are of easy culture, and are increased by dividing or by seed. A dry situation and sandy soil suit them best.

VII. SANGUISORBA. (from sanguis, blood, and sorbeo, to absorb; the S. officinalis was formerly supposed to be a power-
**Sanguisorba. VII. Sanguisorba. VIII. Poterium.**

**ful vulnerary.** Lin. gen. no. 146. Lam. ill. t. 85.—Pimpinella species of Tourn. tab. 68. Gartn. fruct. 1. p. 161. t. 32.

Lin. syst. Tetrádria, Monogyinia. Flowers hermaphrodite. Calyx 4-cleft (f. 79. b.), furnished with two scales on the outside at the base (f. 79. a.). Petals wanting. Stamens 4 (f. 79. c.). Carpels 2, inclosed within the tube of the calyx. Style penicil-formed at the apex. Seed inverted.—Perennial herbs, with impari-pinnate leaves and small flowers, crowded into very dense, globose, ovate or cylindrical spikes, the flowers expanding from the top.

* Stamens equal in length to the calyx, or shorter.

1 S. officinalis (Lin. spec. 160.) spikes ovate; stamens equal in length to the calyx; calyxes and leaves glabrous; leaflets ovate, rather cordate. 2. H. Native of Europe, in meadows and woods. In Britain in moist meadows, particularly in a chalky and limestone soil; in marly soil about Stafford; in Cambridgehire at King’s-hedges, Whitwell, Ditton, &c.; in Bedfordshire at Bromham, Fennlake, and Cow Meadows; in Oxfordshire at Islay, Cowley, and Binsey. In Scotland in low moist meadows near Dumfries, but by no means common. Smith, engl. bot. 1312. Oed. fl. dan. t. 97. Mart. fl. rust. t. 142. Flowers dark purple. The plant makes good fodder when young.

Var. β, auriculata (All. ped. no. 292.) leaflets each furnished with a foliaceous stipel, and hence auriculated. 2. H. Native of Savoy, Switzerland, Piedmont, &c. S. Sabauda. Mill. dict. no. 2.—Boee. mus. 19. t. 9. Spikes cylindrical.

Var. γ, Hispánica (Mill. dict. no. 3.) leaflets 4 pairs, pale green above and hairy beneath; spikes of flowers reddish. Miller regards both these varieties as specifically distinct.

**Officinalis Burnet.** Fl. June, Aug. Britain. Pl. 3 to 4 feet.

2 S. caernea (Fisch. hort. gor. ex Link, enum. 1. p. 144.) spikes nearly glabrous; stamens shorter than the calyx; bracteas ciliated; calyx pubescent; leaves glabrous; leaflets oblong-lanceolate, cordate at the base, crenate-toothed. 2. H. Native of Siberia in many places. S. rubra, Schrank, fl. mon. p. 144. t. 69. Leaflets 2 inches long; flowers dark red.

**Flescoloured-flowered Burnet.** Fl. June, Aug. Fl. 1821. Pl. 5 to 4 feet.

3 S. andersonii; spikes cylindrical; stamens about equal in length to the calyx or a little shorter; bracteas ciliated; calyx glabrous; leaves glabrous; leaflets ovate-lanceolate, cordate, deeply serrated; leaves of the upper leaves nearly sessile, and those of the lower ones petiolulate and stipulate. 2. H. Native of Siberia? Grown in the Chelsea botanic garden.

**Anderson’s Burnet.** Fl. July, Aug. Clt.? Pl. 9 to 4 feet.

** Stamens exerted.

4 S. mauritiana (Desf. atl. 1. p. 142.) spikes ovate-cylindrical; stamens exerted; calyxes wrinkled; leaflets lanceolate, profoundly serrated, villous beneath, as well as the stem. 2. H. Native of Algiers, in hedges.—Moris. oxon. sect. 8. t. 18. f. 4. Spikes greenish.

5 S. peniculata (Fisch. hort. gor. ex Link, enum. 1. p. 144.) spikes cylindrical; stamens exerted; bracteas ciliated; leaflets glabrous, oblong-lanceolate, nearly sessile, and serrated. 2. H. Native of Dahuria and China. Spikes of flowers red. Leaflets of the lower leaves petiolulate and stipulate.

**Thin-leaved Burnet.** Fl. June, Aug. Clt. 1820. Pl. 3 to 4 feet.

6 S. medica (Lin. spec. 160.) spikes ovate-cylindrical; stamens but little exerted; bracteas and leaves glabrous; leaflets ovate, rather cordate, toothed. 2. H. Native of North America from Canada to Carolina, and of Siberia.—Moris. oxon. sect. 8. t. 18. f. 8. Spikes red, not so round as those of S. officinalis.

**Middle Burnet.** Fl. July, Sept. Clt. 1785. Pl. 3 to 4 feet.

7 S. alpina (Bunge in Hed. fl. ros. alt. ill. t. 90. fl. alt. t. 142.) spikes elongated, cylindric, drooping; stamens much exerted; bracteas and calyces hairy; leaves glabrous; leaflets cordate-oblong, petiolulate, coarsely serrated. 2. H. Native of Siberia, about fountains. Spikes yellowish.

**Alpine Burnet.** Fl. July, Sept. Pl. 3 to 4 feet.

8 S. neglecta (G. Don, in Loud. hort. brit. p. 42.) spikes cylindrical; stamens much exerted; calyx glabrous; bracteas ciliated; leaflets glabrous, lanceolate, serrated. 2. H. Native of Siberia? Spikes of flowers white. Anthers dark.

9 S. canadensis (Lin. spec. 160.) spikes long, cylindric; stamens much exerted; bracteas and leaflets glabrous; leaflets ovate-oblong, rather cordate at the base, coarsely serrated. 2. H. Native of North America from Canada to New York, in humid places.—Cor. can. p. 175. t. 174.—Barrel. icon. rar. 18. t. 739.—Moris. oxon. sect. 8. t. 18. f. 12. Spikes long, slender, white. There is besides this white kind, a long, red, spiked, American Burnet, having the spikes 3 or 4 inches long, while those of the present plant are not above 2 inches long. It is probably a species of which we know nothing.

All the species of Sanguisorba are of the easiest culture; they grow in any common soil, and are readily increased by dividing the plants at the root.

**VIII. POTERIUM (from poterium, a cup; the P. sanguisorba is infused in drinks).** Lin. gen. no. 1069. Lam. ill. t. 777. D. C. prod. 2. p. 594.—Pimpinella species, Tourn. Gartn.—Pimpinellia, Adans. fam. 2. p. 293.

Lin. syst. Monoc'ea, Polyándria or Polygónia, Monoc'ea. Flowers monoeous or polygamous. Calyx furnished with 3 scales at the base, having the tube contracted at the apex, and the limb 4-parted. Petals wanting. Stamens 20-30. Ovaries 2, terminated each by a bilobed style, crowned by a penil-formed stigma. Akenia dry, 1-seeded, inclosed in the inducted calyx. Seed inverted.—Herbs or subshrub, with impari-pinnate leaves and serrated leaflets. Flowers collected into dense globose or cylindrical spikes.

**Sect. I. Leipotérieum (from lepis, leiso, smooth, and poterium; in reference to the smooth fruit of the species contained in this section).** D. C. prod. 2. p. 594. Fruit (tube of calyx) smooth, somewhat baccate. Spikes cylindrical. Stems shrubby.

1 P. spicatum (Lin. spec. 1411,) shrubby; branches rather villous, ultimate ones terminating in spikes; leaflets smoothish, serrated; spikes oblong. 2. G. Native of the islands of the Archipelago, about Constantinople, on Mount Lebanon, Natolia, &c.—Moris. oxon. sect. 8. t. 18. f. 5.—Sapor. hort. 2. t. 78. Leaves small. Flowers greenish. Fruit baccate, nearly as in the rose.

Var. β, crispum (D. C. prod. 2. p. 594) leaflets smaller, nearly entire, rather tomentose beneath, with revolute curled margins. 2. G. Native of sterile places.
V. Native of the south of France.—Barrel. **632.** Pimpinella agrimonioides, Mor. *excon. sect. 8. t. 18. f. 9. Leaves like those of agrimony, sweet-scented.

Agrimony-leaved Burnet. Fl. July, Aug. C1t. 1822. Pl. 2 ft. 7 P. villorum (Sibth. & Smith, fl. grace. t. 944, ex prod. 2. p. 233.) herbaceous; stems angular from furrows, hairy; leaflets oblong, deeply toothed. 2 H. Native about Constanti-

Villans Burnet. Pl. 1 to 2 feet.

8 P. Veronica (Link, in litt.) very like *P. sanguisorba,* and differs only in the warty fruit. 2 H. Native of? Flowers greenish.

Annual Burnet. Pl. 1 to 2 feet.

Cult. The hardy herbaceous kinds of burnet will grow in any common soil, and are best increased by seeds, as most of them are little better than biennial plants. The shrubby species, or those belonging to the first section, thrive best in a light rich soil, and young cuttings root readily in the same kind of soil under a hand-glass.

IX. CLIFFORTIA (this name was given by Eichrod in honour of George Clifforf, the first patron of Linnaeus, a mer-

Cliffortia

Cult. The hardy herbaceous kinds of burnet will grow in any common soil, and are best increased by seeds, as most of them are little better than biennial plants. The shrubby species, or those belonging to the first section, thrive best in a light rich soil, and young cuttings root readily in the same kind of soil under a hand-glass.

§ 1. Multinervis (multus, many, and nervus, a nerve; leaves with many nerves). *D. C. prod. 2. p. 595.* Leaflets solitary, many-nerved at the base. Stipulas simple, but the leaves, although said to be solitary, are probably composed of 3-jointed leaflets, furnished with a stipula on each side (f. 80. d.).

1 C. illicifolia (Lin. spec. 1469.) leaves roundish-elliptic, stem-clasping, glabrous, stiff, somewhat 5-lobed, and spiny-toothed at the apex. 2 H. Native of the Cape of Good Hope, as are also all the following.—Dill. hort. elth. t. 31. f. 55. Lin. hort. cliff. t. 30. Filaments white; anthers yellow. (f. 80.)

Holly-leaved Cliffortia. Fl. May, Sept. C1t. 1714. Shrub 2 to 3 ft. 4 o 2

FIG. 80.
SANGUISORBEÆ. IX. CLIFFORTIA.

2 C. coryifoia (Lam. dict. 2. p. 47.) leaves ovate, ending in a spine, half stem-clasping, glabrous, stiff, quite entire, or furnished with a spine-like tooth towards the apex. G. Burch. cat. afr. austr. no. 792.

Tridentate-leaved Cliffortia. Fl. May, Sept. Shrub 2 to 3 feet.

4 C. ruscifolia (Lin. spec. 1469.) leaves lanceolate, glabrous, serrated, ending in a spine, entire or furnished with a spine-like tooth on each side. G. Lin. hort. cuff. t. 31. C. arachnoidea, Lodd. bot. cab. t. 260.—Pluk. alm. 297. f. 2. There are varieties of this species with glabrous and pubescent branches.

5 C. graminifolia (Lin. fil. suppl. 429.) leaves linear, acuminate, 5-nerved, glabrous, quite entire or remotely setaceous serrate; stipules large, adnate to the broad petiole, and drawn out in 2 lobes. G. Sieb. pl. exsic. cap. no. 86.

Grass-leaved Cliffortia. Shrub 2 feet.

§ 2. Dichostereae (from ἰκώς, icwa, double, and πέτρος, petros, a wing; in reference to bifid stipulas). D. C. prod. 2. p. 595. Leaflets 1-nerved, solitary at first sight. Stipulas bifid; or the leaves perhaps trifoliate, bistipulate, the lateral leaflets small and tooth-formed.

6 C. odorata (Lin. fil. suppl. 431.) leaves ovate, obtuse, serrated, plicately veined, villous beneath. G. Wild. spec. 4. p. 857.

Sweet-scented Cliffortia. Shrub 2 to 3 feet.

7 C. serrata (Reichb. ex Spreng. syst. add. p. 209.) leaves spatulate-lanceolate, cuspidately serrated, glabrous; stipulas permanent, imbricate, ovate; branches flexuous, twiggy. G. C. serrata, Thunb. prod. 2. p. 93. is perhaps the same.

Serrate-leaved Cliffortia. Shrub 2 feet.

8 C. spicata (Reichb. ex Spreng. syst. add. p. 209.) stem simple, hairy; leaves lanceolate, subverticillate, erect; spikes dense, terminal, leafy. G. C. pubescence. Shrub 2 feet.

Spicate Cliffortia. Shrub 2 feet.

Rusty Cliffortia. Shrub prostrate.

10 C. filicaulis (Schlecht. et Cham. in Lamnæa. 2. p. 32.) trailing; leaves cuneate-obovate, tridentate, with villously ciliate edges, veinless above; flowers monocious. G. C. Stems rooting.

Thread-stemmed Cliffortia. Shrub creeping.

11 C. cuneata (Ait. hort. kew. 3. p. 413.) leaves cuneiform, truncate, 3-5-toothed at the apex, strictly veined, glabrous on both surfaces. G. C. Cuneate-leaved Cliffortia. Fl. April, May. Clt. 1787. Sh. 2 to 3 feet.

§ 3. Tenuifolæae (from tenuis, thin, and folium, a leaf; leaves all fine and Hifiform). D. C. prod. 2. p. 596. Leaflets 3, subulate, linear or oblong, lateral ones sometimes the shortest, but much like the middle ones, ciliate ones usually all abortive, the young or new ones disposed in fascicles in the axils of the stipulas.

12 C. strobilifera (Lin. syst. 749.) leaflets linear, acute, glabrous, with scabrous margins, in fascicles in the axils of the stipulas. G. Pluk. alm. t. 275. f. 2. Stipules connate in one, bifid. Sometimes there are strobile-formed galls on the branches, whence the specific name.

Strobile-bearing Cliffortia. Fl. May, June. Clt. 1818. Sh. 2 to 3 feet.

Heath-leaved Cliffortia. Shrub 2 to 3 feet.

14 C. serpyllifolia (Schlecht. et Cham. in Lamnæa. 2. p. 34.) leaves cuneate-spatulate, awnless, quite glabrous; flowers monocious. G. C. Wild-thyme-leaved Cliffortia. Shrub 1½ foot.

17 C. juniperina (Lin. fil. suppl. 430.) leaflets subulate, glabrous, mucronate, in fascicles. G. C. A much branched shrub. Flowers axillary, sessile. The three leaflets are equal among themselves.

Juniper-like Cliffortia. Shrub 3 feet.

19 C. falcatula (Lin. fil. suppl. 431.) leaflets linear, mucronate, nearly falcat, in fascicles, and are, as well as the branches, glabrous. G. C. This species is usually confounded with the last, but differs from it in being glabrous.

§ 4. Latifolæae (from latus, broad, and folium, a leaf; leaflets broad). D. C. prod. 2. p. 596. Leaflets 3, oval or obcordate, usually dissimilar in shape, lateral leaflets stipulate-formed. Stipulas small.

20 C. ternata (Lin. fil. suppl. 430.) leaflets oval-oblong, acute, all nearly equal in size and shape, and are, as well as the branches, pilose. G. C. Polygonifolia. Lin. syst. 1470. hort. clift. 501. t. 32. Young leaves in fascicles.

23 C. obiloba (Spreng. neuc. ent. 2. p. 174.) leaflets veiny, quite glabrous, crenulated, lateral ones roundish, obliquely cordate, middle one obcordate; branches pubescent. G. C. Oblique-leaved Cliffortia. Fl. June, July. Clt. 1816. Sh. 2 to 3 feet.

24 C. dentata (Willd. spec. 4. p. 842.) leaflets obovate, glabrous, veiny, a little toothed at the apex, middle one tridentate; branches pubescent. G. C. Allied to C. iberocordata. Toothed-leaved Cliffortia. Fl. June, July. Shrub 2 to 3 ft.

§ 5. Bitifolæae (bis, two, fœliola, leaflets; leaves composed of
two opposite leaflets without any middle one). *D. C. prod.* 2. p. 596. Stipulas small. Leaves of 2 opposite leaflets from the middle one being abortive, lateral ones large. Petiole wanting.

25 C. *crenata* (Lin. fil. suppl. 430.) leaflets 2-3, orbicular, adpressed, denticulated, 7-nerved, glabrous. \( \gamma \). G. Perhaps belonging to the preceding section.

26 C. *fulchella* (Lin. fil. suppl. 430.) leaflets 2, orbicular, adpressed, many-nerved, entire, with somewhat erose margins. \( \gamma \). G. Willd. spec. 4. p. 839.

*Neat* Cliffortia. Fl. April, May. Clt. 1795. Shrub 1 1/2 ft. 27 C. *cinerea* (Thunb. prod. p. 93.) leaflets connate, ovate, trigonal, hoary-tomentose. \( \gamma \). G. Perhaps belonging to a different section.

*Grey* Cliffortia. Fl. June, July. Clt. 1800. Pl. 2 feet. Cult. The species of *Cliffortia* are plants of singular habit, and only deserve to be cultivated on that account. They thrive well in an equal mixture of loam and peat. Cuttings of young wood root freely in sand, under a bell-glass.

Calyx superior, 5-toothed (f. 83. a. f. 84. a.), the odd segment posterior. Petals 5 (f. 83. b. f. 84. f.), ungulate, inserted in the throat of the calyx, the odd one anterior. Stamens indefinite, inserted in a ring in the throat of the calyx (f. 83. c. f. 84. b.). Ovaries from 1-5 (f. 82. c. f. 83. c.), adhering more or less to the sides of the calyx (f. 83. c.) and to each other. Ovula usually 2, collateral, ascending, very rarely solitary. Styles from 1-5 (f. 82. d.), having simple stigmas. Fruit a pome, 1-5-celled (f. 81. a. f. 82. d. f. 84. g.), seldom spuriously 10-celled, with the endocarp either cartilaginous, spongy, or bony. Seeds ascending, solitary. Albumen none. Embryo erect, with flat cotyledons or convolute ones as in *Chamezmellis*, and a short, conical radicle. This order is composed of trees or shrubs, with alternate, stipulate, simple, or compound leaves, and terminal cymes of white or pink flowers. *Pomacea* is closely allied to *Rosacea*, from which it differs in the adhesion of the ovary to the sides of the calyx, and more or less with each other. Their fruit is always a pome, that is, it is made up of a fleshy calyx, adhering to fleshy or bony ovaria, containing a definite number of seeds. *Pomacea* is peculiarly distinguished by their ovula being in pairs and side by side, while *Rosacea*, when they have 2 or more ascending ovula, always have them placed one above another. Cultivated plants of this order are apt to produce monstrous flowers, which sometimes depart in a remarkable degree from their normal group. Prussic acid exists in *Cotoneseaster microphyllia*, a plant of this order. The fruit as an article of food, and the flowers for their beauty, are the chief peculiarities of this order. The *apple*, the *pear*, the *medlar*, the *quince*, the *service*, the *rowan-tree*, the *mountain-ash*, are all well known, either for their beauty or their use. The wood of the *pear-tree* is almost as hard as box, for which it is

even substituted by wood engravers. The timber of the *beartree* (*Pyrus Aria*) is invaluable for axle-trees. The bark of *Photinia habia* is used for dying scarlet in Nipaul. Malic acid is contained in considerable quantities in *apples*; it is also almost the sole acidifying principle of the berries of the *mountain-ash*, the *rowan* or rhodon-tree (*Pyrus Aucuparia*).

**Synopsis of the genera.**

5 *Eriobo'trya*. Calyx woolly, 5-toothed. Petals bearded. Styles 5, pilose, inclosed. Pome closed, 3-5-celled (f. 81. a.).

7 *Amel'an'chier*. Calyx 5-cleft (f. 82. c.). Stamens lanceolate (f. 82. a.). Stamens rather shorter than the calyx. Ovary of 10 cells or of 5 bipartite ones (f. 82. c.), with a solitary ovulum in each partition. Styles 5 (f. 82. d.), joined at the base. Mature pome 3-5-celled (f. 82. d.). Seeds 3-5; endocarp cartilaginous.

8 *Mesfilus*. Calyx 5-cleft (f. 83. a.); the segments foliaceous. Petals nearly orbicular (f. 83. b.). Disk large, filled with honey. Styles 2-5, glabrous. Pome turbinate, open at the apex, 5-celled; endocarp bony.

11 *Cydona*. Calyx 5-cleft (f. 84. a.). Petals orbicular (f. 84. f.). Styles 5. Pome closed, 5-celled (f. 84. g.). Cells cartilaginous, many-seeded. Seeds covered with pulp.

† Genera doubtful whether they belong to the present order.

13 *Pyren'aria*. Calyx inferior, 5-sepalate. Stamens numerous, free, hypogynous and somewhat adnate to the base of the
petals. Styles 5. Pome globose, 5-celled; cells covered with papery membranes, containing 2 bony, 1-seeded nuts each.

LIN. SYST. Icosandra, Di-Pentagyntia. Calyx with an urceolate tube and a 5-cleft limb. Petals orbicular, spreading. Ovarium 2-5-celled. Styles 2-5, glabrous. Pome fleshy, ovate, closed by the calyx teeth or the thickened disk, containing a bony nut. Thorny shrubs or trees, with angular or toothed leaves and terminal coryumbs of usually white flowers. Braeas subtale, deciduous.

§ 1. Leaves toothed or nearly entire, never angularly lobed.

1 C. Pyraca'nthia (Pers. ench. 2. p. 37.) leaves glabrous, evergreen, ovate-lanceolate; lobes of calyx blunt; styles 5. H. Native of the south of Europe, in uncultivated places and in hedges. Mespilus pyracantha, Lin. spec. 685. Pall. fil. Ross. 1. p. 29. t. 13. f. 2.—Dulham. arb. 2. t. 20. no. 2.—Lob. Icon. 2. p. 182. f. 1. Flowers white. Fruit about the size of a pea, disposed in cymes, of a beautiful scarlet colour, remaining on the tree nearly all the winter, whence it is called Boisson ardent by the French, as also its Greek name Pyracantha, which signifies fire-thorn. The shrub being evergreen is well adapted for planting against walls or houses, where the green leaves and red fruit have a fine appearance all the winter.

Pyracantha or Evergreen Thorn. Fl. May. Clt. 1629. Sh. 10 to 20 feet.

Var. c, laxifolia (D. C. prod. l. c.) leaves oblong-lanceolate, rarely cuneiform. Ait. l. c.

Var. e, nana (D. C. prod. 2. p. 626.) leaves oval-lanceolate, paler beneath. H. Mespilus nana, Dum. Cours. suppl. p. 386. Branches rather tomentose. Perhaps this is a proper species.

4 C. subspini'sa (D. C. prod. 2. p. 626.) leaves oval, ovate, or obovate, crenate-toothed, glabrous, coriaceous, on short peti-

5 C. puncta'ta (Ait. hort. kew. 2. p. 169.) leaves obovate-cuneiform, glabrous, serrated; calyces rather villous, with the lobes subulate and entire. H. Native of North America. Jacq. hort. vind. 1. and 28. Wats. dendr. brit. t. 57. Mespilus cu-

8 C. prunellifolia (Bosc. ined. cx D. C. prod. 2. p. 687.) leaves oval-elliptic, attenuated at both ends, serrated, glabrous; branches rather villous. H. Native country as well as flowers unknown. Habit referable to Prunus spinos\-a.

9 C. latifolia (Pers. ench. 2. p. 37.) leaves obovate, unequally serrated, rather plicate, and rather villous on the nerves beneath; stipulas and lobes of calyx linear and slightly toothed; corymb villous. H. Native of North America. Fruit oval, red.

10 C. parvifolia (Ait. hort. kew. 2. p. 169.) leaves obovate-cuneiform, deeply serrated, pubescent; flowers usually solitary; branches and calyces villous; stipulas setaceous; lobes of calyx serrated; fruit rather turbinate, 5-seeded. H. Native of North America. Wats. dendr. brit. 65. Mespilus axillaria, Pers. l. c. Mespilus tomentosa, Poir. l. c. Mespilus xantho-

11 C. ovatifolia (Horn. hort. hafn. suppl. p. 52.) leaves oval, serrated, rather pilose on both surfaces, shining above; stipulas half cordate, deeply serrated, glandular. H. Native of North America. Allied to C. cris-galli, according to the author.

12 C. glauc'a (Wall. cat. 673.) leaves elliptic, tapering to both ends, acute, serrated at the apex, downy and glaucous beneath, but glabrous above; corymb terminal, many-flowered; calyx woolly, H. Native of Nipaul and Kamaon. Flowers white.

Glaucous Hawthorn. Tree 20 feet.

13 C. flexuosa (Poir. suppl. 4. p. 73.) leaves obovate, sharply toothed, pubescent on both surfaces; corymb small, tomentose; branches flexuous. H. Native of Carolina. Fruit of a reddish yellow colour. Spines very long, blackish.

Flexuous Hawthorn. Shrub 6 to 10 feet.
14 C. Lu'tra (Poir. suppl. 4. p. 72.) leaves ovate, pubescent, acute at both ends, glabularly serrated; corymb tomentose. H. Native country unknown. Spines long and strong. Fruit yellow.

Yellow-fruited Hawthorn. Shrub 6 to 10 feet. 

15 C. Alpīnà (Mill. dict. no. 3.) leaves oblong-ovate, serrated, green on both surfaces, on short pedicels. H. Native on Mount Baldo and other Italian mountains. Fruit of an obscure brown colour. Alpine Hawthorn. Fl. May, June. Ch 1890. Tree 18 to 30 ft. 

16 C. Lu'tida (Mill. dict. no. 6.) leaves lanceolate, serrated, shining, paler beneath; spines very long. H. Native of North America. Flowers corymbose, of a pale red. Shining-leaved Hawthorn. Fl. May, Ju. Ch. 8 to 10 ft. 

Few-flowered Hawthorn. Tree. 

18 C. Unilàteràlis (Pers. ench. 2. p. 37.) leaves cuneated, or oblong-lanceolate, obtuse, crenated; corymb unilateral. H. Native of Mauritania. Spines none. Stature and appearance of the common hawthorn; also the flowers are like it. Var. β, divergentis (Pers. ench. 2. p. 37.) leaves lanceolate, obtuse, quite entire and cuneately trifid, serrated, glabrous, on long pedicels; corymb corymbose. H. Native of the north of Africa.

Moors' Hawthorn. Tree 10 to 14 feet. 

§ 2. Leaves variously lobed or cut. 

20 C. Apifòlia (Mich. fl. bor. amer. 1 p. 287. but not of Med.) leaves deltoid, deeply lobed; lobes acute, deeply toothed; pedicels of corymb usually simple, and are as well as the oblong tube of the calyx villous; calyx lobes rather serrated. H. Native of Virginia and Carolinas, in humid woods. C. oxyacantha, Walt. cur. p. 147. ex Willd. Flowers white. Fruit scarlet. This shrub is admirably adapted for hedges, and is used for that purpose in some parts of North America.

Parsley-leaved Hawthorn. Fl. May, June. Ch 1812. Sh. 8 to 10 feet. 

24 C. Turbìnàta (Pursh, fl. amer. sept. suppl. 735.) unarmed, glabrous; leaves ovate-cuneate, deeply serrated; corymbs few-flowered; pedicels short; fruit turbinate. H. Native of Carolina and Virginia. Said by the author to be allied to C. spartuláta, but is omitted by Nuttall. Turbinate-fruited Hawthorn. Fl. May, Ju. Tree. 

Scarlet-fruited Hawthorn. Fl. May, June. Ch 1683. Tr. 20 to 30 feet. 

Cordate-leaved Hawthorn. Fl. May, June. Ch. 1738. Sh. 6 to 10 feet. 

27 C. Sangì'neà (Pall. fl. Ross. 1. p. 25. t. 11.) spinose; leaves ovate-cuneate, pubescent at the base, somewhat 7-lobed, opaque and pubescent on both surfaces; stipules serrated; pediots and calyxes glandless; fruit 2-4-seeded. H. Native of Siberia, about the edge of rivulets. C. oxyacantha, Pall. tim. 2. p. 499. Crataegus, Gmel. fl. sib. 3. p. 176. no. 12. exclusive of the synonymes. Flowers rather large, white. Fruit glbose, scarlet, or yellow, for the most part 4-seeded. 

Blood-red fruited Hawthorn. Fl. May, June. Tr. 12 to 20 ft. 

28 C. Labò'ta (Bosc. ined. ex D. C. prod. 2. p. 628.) leaves ovate, on short pediots, unequally serrated or lobed, rather pubescent beneath; stipules entire; branches rather villous; flowers in loose corymbs. H. Native country unknown. Mespilus labota, Poir. suppl. 4. p. 71. Flowers white. 

Lobed-leaved Hawthorn. Fl. May, Ju. Ch. t. 10 to 20 ft. 

29 C. Purpè'rea (Bosc. ined. ex D. C. prod. 2. p. 628.) leaves broadly lobed, ovate, cuneated at the base, serrated, glabrous or pubescent beneath; stipules rather cincinate; serra- tures glandular. H. Native country unknown. Wats. dend. brit. 60. Branches dark purple. Flowers white. 

Purple-branched Hawthorn. Fl. May, June. Ch. 1822. Tree 20 to 30 feet. 

30 C. Florentì'nà (Zucc. obs. 1. no. 72.) leaves ovate-oblong, cordate at the base, deeply serrated, tomentose beneath as well as on the calyxes; fruit ovate-globose, 5-seeded, smooth; lobes of calyx deciduous. H. Native about Florence. Mespilus Florentina, Bert. anm. 29. Pyrus crataegifòlia, Sav. alb. tosc. 1. p. 169. Flowers white. 

Florentine Hawthorn. Fl. May, Ju. Ch. 1800. Tr. 20 to 50 ft. 

31 C. Nigìa (Waldst. et Kit. pl. rar. hung. 1. t. 61.) leaves lobately sinuated, serrated, truncate and somewhat cuneated at the base, clothed with hoary villi beneath; stipules oblong, deeply serrated; calyxes villous, with the segments a little toothed. H. Native of Hungary. Wats. dend. 61. Mespilus nigra, Willd. commun. 524. Flowers white, pentagamous. Fruit black. 

32 C. Peánt'gynà (Waldst. et Kit. in Willd. spec. 2. p. 1006.) leaves ovate, usually trifid, serrated, villous in the axis of the
veins beneath; peduncles and calyces pubescent; lobes of calyx rounded.  H. Native of Hungary. Flowers white, pentagynous. Allied to C. oxyzanthus.

34 C. fissa (Bosc. ined. ex D. C. prod. 2. p. 628.) leaves broadly ovate, deeply lobed, serrated, glabrous on both surfaces, decurrent down the petioles, which are glandless. H. Native country unknown. Mespilus Pissia, Poir. suppl. 4. p. 72. Cleft-leaved Hawthorn. Fl. May, June. Clt. 1810. Tree 12 to 20 feet.

35 C. Moraesia (Pers. ench. 2. p. 37.) leaves cuneate, 3-lobed and pinnatifid, glabrous and glandless; stipulas subapically cut; cortyls terminal, glabrous; pedicels elongated; lobes of calyx blunt; flowers digynous. H. Native of Mauritania. Perhaps distinct from C. Maura.

36 C. oxycaynthia (Lin. spec. 683.) leaves obovate-cuneiform, trifid or pinnatifid, glabrous and shining; flowers corymbose, monogynous, digynous and trinogynous; calyces glandless, acute. H. Native of Europe, in thickets, hedges, copses, and in high open fields; plentiful in Britain. Fl. dan. 634. Jacq. auct. t. 292. f. 2. Mespilus oxycaynthia, Gurt. Fruct. 2. p. 24, t. 87. Sorbus aculeata, Cord. hist. 176. Flowers white, occasionally pink, sweet-scented. Fruit mealy, insipid, dark red, occasionally yellow; its cells as many as the styles. The May or Common Hawthorn is a very variable plant.

Tar. b, vulgaria (D. C. 1. c.) leaves ovate, cuneated at the base, deeply trifid or pinnatifid, the same colour on both surfaces; lobes acute, diverging, a little serrated; flowers with 1-3 styles. Mespilus oxycaynthia of most authors.

Tar. d, monogyna (D. C. prod. 2. p. 628.) leaves obovate-cuneiform, trifid or jagged, discolorous beneath, at length coriaceous; flowers constantly monogynous; stigma peltate. Mespilus monogyna, Wallr. sched. 221. C. monogyna, Jacq. auct. t. 929. f. 1. Mespilus pennis, Med. gesch. 82. C. Mespilus oxycaynthia, Smith, engl. bot. 2504 — Fl. dan. 1162. var. a, florepéono. Flowers double white.

The Hawthorn is also called White thorn and may in France Aubépine; in Germany, hagedorn; in Italy branco spinone. It is a native shrub of great importance, and is also introduced into narrow plantations as an undergrowth. It will not grow, however, under the drip of trees, and therefore, in a profitable point of view, is only to be considered as affording impenetrable, close, durable, and easily raised fences, called quickset hedges, and it bears clipping to any extent. The timber of such plants as grow singly and attain a tolerable size, is valued by the millwright and turner, and the rooys by the cabinet maker. It is often spoiled, Sang observes, through inattention after cutting; if it be allowed to lie in entire logs or trunks, it soon heats and becomes quite brittle and worthless; it therefore ought to be cut up instantly into planks and laid dry. The thorn will not thrive in a wet soil, nor one very hard and poor, much elevated or much shaded; a free deep loam in an airy situation suits it best. The seeds or haws of the thorn do not vegetate until the second year after sowing, unless they have been laid up in a heap mixed with earth immediately after gathering, and turned several times, and sown in a bed the next spring; under such treatment many of them will vegetate the same year. The plants should remain in the seed-bed for two years, and afterwards planted out in nursery rows, where they may remain for two or three years before they are planted for hedges. The best quickset hedges are formed by planting them in two rows, about a foot or a foot and a half apart. The hedges two or three years after planting ought to be clipped once or twice every year, in order to keep them in shape and thicken them, and they should be kept perfectly clear of weeds, at least for the few first years.

Sharp-spined or Common Hawthorn, White-thorn, or May. Fl. May, June. Britain. Shrub 1 to 20 feet.

37 C. tormótna (Fing. in Schlecht. Linn. 4. p. 376. t. 3. f. 1.) thorny; leaves 3-lobed, toothed, glabrous on both surfaces or ciliated on the nerves beneath; flowers corymbosum, monogynous; style deflexed; calyx hairy, with the segments oblong, acuminate, spreading and obtuse at the apex; fruit oblong, foveolate at the base, containing a 1-seeded, ovate-oblong, brownish nut, which is convex on the back, and 3-4-furrowed. H. Native of Europe.

Curved-styled Hawthorn. Fl. May. Tree 10 to 20 feet.

38 C. sosóvta (Fing. in Schlecht. Linn. 2. p. 380. t. 3. f. 2.) thorny; leaves 3-parted, toothed, ciliated at the base on the petioles and nerves beneath; flowers corymbose, for the most part monogynous; style straight; calyx glabrous, or a little ciliated, with oblong, acuminate, reflexed, obtuse segments; fruit globose, containing 1 or 2 oblong-obovate brown nuts, with 2 furrows on the back of each. H. Native of Europe.

Monogynous Hawthorn. Fl. May. Tree 10 to 20 feet.

40 C. Azeròlis (Lin. spec. 683.) leaves pubescent, cuneated at the base, trifid; lobes obtuse, coarsely few-toothed; branches, corymb, and calyces pubescent; lobes of calyx obtuse; flowers with 1-3 styles. H. Native of the south of France and Italy. Andr. bot. rep. 379. Pyrus Azerolism, Scop. carn. no. 597. Mespilus Azerolis, All. pedem. 1809. — J. Bauh. hist. 1. p. 67. Flowers white, sweet-scented. Fruit globose, red, usually 2-seeded; and the common name of the tree at Montpelier Pommettes de deux closes. The fruit when fully ripe has an agreeable taste, for which it is esteemed in Italy and the Levant, where it is served up in the dessert.

Azerole Hawthorn. — Fl. May, Ju. Clt. 1640. Tr. 15 to 20 ft. 41 C. orientális (Bosch. ined. ex D. C. prod. 2. p. 629.) leaves 3-lobed, pubescent beneath; lobes ovate, deeply tootched at the apex, the middle one trifid; stipulas broad, cut; branches
closely with hoary tomentum. \( \gamma \) II. Native of the Levant. Mespilus orientalis, Poir. suppl. 4. p. 72.

Oriental Azarole. Fl. May, Ju. Clt. 1810. Tr. 12 to 20 ft. 42 C. Arônia (Bosc. ined. ex D. C. I. c.) leaves pubescent beneath, cuneate at the base, trifid; lobes obtuse, entire or 3-toothed; teeth obtuse, mucronate; branches pubescent. \( \gamma \) H. Native of the Levant. Mespilus Arônia, Willd. enum. suppl. C. Azarolus \( \beta \), Willd. spec.—Pockock. tr. c 85. The fruit is said to be yellow.

Var. \( \beta \), Teutrica (D. C. prod. 2. p. 629.) fruit brick-coloured. \( \gamma \) H. Native of Tauria, on hills. C. orientalis, Bieb. fl. taur. 1. p. 380. Perhaps Mespilus Celsiaina, Dun. Cours. suppl. p. 286.

44 C. odratus \( \varepsilon \) sima; leaves deeply pinnatifid, pubescent; lobes lanceolate, acute, serrated; flowers pentagonal, corymbose; calyx segments ovate; fruit glabrous. \( \gamma \). H. Native of the Crimea. Mespilus tanacetifolia, Andr. bot. rep. 590. Flowers white, very sweet-scented. Fruit yellow, large.

Sweet-scented Azarole. Fl. May, June. Tree 10 to 20 feet.

45 C. taniya \( \varepsilon \) (Uria ex herb. Moricand, D. C. prod. 2. p. 629.) leaves deeply pinnatifid, downy; lobes oblong, acute, few-toothed at the apex; calyx lobes acutish, reflexed, hairy; fruit elliptic. \( \gamma \) H. Native of Sicily, on mountains. Flowers white.

Jagged-leaved Azarole. Fl. May, June. Clt. 1816. Shrub 6 to 10 feet. 46 C. Melanoca \( \varepsilon \) rpa (Bieb. fl. taur. 1. p. 386.) leaves usually tridid, serrated in front, acutish at the base; flowers usually pentagonal; calyx lobes acute, reflexed, villous. \( \gamma \) H. Native of Tauria, in mountain woods. Flowers white. Fruit black. Allied to C. oxyacantha.

† Species belonging to the last division of the genus, but are not sufficiently known.

47 C. Mexica \( \varepsilon \) na (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 629.) leaves oval, acute, serrated or cut at the apex, ciliate at the base; flowers corymbose; lobes of calyx acute; fruit ovobovate, 5-seeded. \( \gamma \) H. Native of Mexico. Fruit yellowish, 12–15 lines long. Branches spiny.

Mexican Hawthorn. Fl. May, June. Clt. 1823. Tree. 48 C. Leviga \( \varepsilon \) ta (D. C. prod. 2. p. 630.) leaves cuneate, toothed, 3-lobed at the apex, quite glabrous on both surfaces; corymb subumbellate; lobes of calyx obtuse, reflexed; fruit glabrous, 2-seeded. \( \gamma \) H. Native of the Vosgues. Mespilus levigata, Poir. I. c.

Smooth Hawthorn. Fl. May, June. Tree. 49 C. vihidis (Lin. spec. 683.) leaves ovate-lanceolate, somewhat 3-lobed, serrated, glabrous; stipulas semicordate; stem unarmed. \( \gamma \) H. Native of Carolina. Perhaps a variety of C. cochinea.

Green Hawthorn. Fl. May, Ju. Clt. 1810. Tree 10 to 20 ft. 50 C. Triloba (Pers. ench. 2. p. 37.) leaves cuneiform, villous, tridentate at the apex; calyxes acute, and are, as well as the peduncles, tomentose; fruit 2-seeded. \( \gamma \) H. Native of Barbary.

Three-lobed-leaved Hawthorn. Tree.

51 Oliveriâ (Bosc. ined. ex D. C. prod. 2. p. 630.) glabrous; leaves cuneiform at the base, and deeply lobed at the apex; lobes obtuse, almost entire; spines subulate, straight. \( \gamma \) H. Native of Asia Minor. Branches dark brown. Flowers white.

Oliver's Hawthorn. Fl. May, Ju. Clt. 1820. Tree 10 to 20 ft. 52 C. Poiretia \( \varepsilon \) na (D. C. prod. 2. p. 630.) leaves ovate, rather coriaceous, cut, and somewhat lobed, glabrous; stipulas linear-subulate; spines strong, and very long. \( \gamma \) H. Native country unknown. Mespilus linearis, Poir. suppl. 4. p. 72. Flowers white.

N.B.—There are numerous other garden species, but all remain undescribed.

1 C. trifoliata, Bosc. 2 C. quinquelobata, Bosc. 3 C. odora, Bosc. 4 C. obovata, Bosc. 5 C. flaveascens, Bosc. 6 C. flabellata, Bosc. 7 C. Carpatica, Lod. cat. 8 C. forida, Lod. cat.

Cult. The species of hawthorn are well fitted for shrubberies or plantations. They are easily propagated by budding or grafting on the common hawthorn. They are all very ornamental when in blossom. The seeds do not vegetate till the second spring after sowing.

II. RHAPHIOLEPIS (from ῥαφις, rhaphis, a needle, and ἅρπας, lepis, a scale; in reference to the narrow subulate bracteas).

1 LIN. SYNTH. Iouándia, Digiwá Limb of calyx funnel-shaped, deciduous. Filaments filiform. Ovary 2-celled, 2-styled. Pome closed by a thickened disk, containing a chartaceous putamen. Seeds 2, gibbous; the testa very thick and coriaceous.—Trees, natives of China, with evergreen, crenulated, coriaceous, reticulated leaves. Racemes terminal, usually beset with permanent scale-like bracteas. Petals white, but with the filaments usually red.

Lourdesi's Indian Hawthorn. Tree 30 feet.

3 R. Picestron (Lindl. coll. no. 3 in a note) leaves lanceolate, acuminated at both ends; petals roundish; stamens spreading, longer than the calyx. \( \gamma \) F. Native of China. R. Indica, Ker. bot. reg. 468. Petals white. Filaments brown.

4 H
4 R. rubra (Lindl. coll. no. 3. t. 3.) leaves ovate-lanceolate, acuminate at both ends; petals lanceolate; stamina straight, longer than the calyx. ɣ F. Native of Cochin-China and China. Crataegus rubra, Lour. coch. p. 320. Mespilus Sinensis, Poir. Flowers reddish.

5 R. salicifolia (Lindl. coll. p. 3. in a note, bot. reg. 652.) leaves long, lanceolate; petals lanceolate, about equal in length to the teeth of the calyx; stamina coarctate, shorter than the calyx. ɣ F. Native of China. Racemes panicled. Petals and filaments white.

6 R. spiralis; leaves cuneate-oblong, acute, serrated, coriaceous, smooth; racemes terminal, simple, and the pedicels furnished with twisted bracteas; flowers digynous; calyx villous at the base. ɣ F. Native of China. Mespilus spiralis, Blum. bijdr. p. 1102.

Spiral-bracted Indian Hawthorn. Tree.

† Names of species which occur in the gardens, but are most probably identical with some of the above.

1 R. latifolia, Lodd. cat. 2 R. levis, Lodd. cat. Cult. The species of Raphiolepis grow freely in a mixture of loam, peat, and sand. Ripened cuttings strike root readily if planted in sand, with a hand-glass placed over them. Some of the species stand our winters very well against a south wall, in the open air, when covered by mats in severe weather.

III. CHAMELEELIS (from χαμηλός, chamael, on the ground, and μύχος, melon, an apple; in reference to the dwarfish of the shrub, and with a fruit resembling the apple). Lindl. in Lin. trans. 13. p. 164. t. 11. D. C. prod. 2. p. 631.

1 C. coriacea (Lindl. l. c.) ɣ F. Native of Madeira, on the sea cliffs to the eastward of Funchall, about a mile out of the town, along the Canico road.

Coriaceous-leaved Chameleelis. Shrub 3 to 4 feet.

Cult. See Raphiolepis for culture and propagation.

1 P. serrulata (Lindl. I. c.) leaves oblong, acute, serrated; pedicels longer than the calyx. ɣ F. Native of Japan and China. Crataegus glabra, Thunb. jap. 205. Sims, bot. mag. 2105. Lodd. bot. cab. 248. Colla, hort. rip. t. 36. Leaf-buds large, red.

Serrulata-leaved Photinia. Fl. April, July. Cl. 1804. Tree 10 to 20 feet.

2 P. arbutifolia (Lindl. l. c.) leaves oblong-lanceolate, acute, distinctly serrated; pedicels longer than the calyx. ɣ F. Native of California. Petioles red, six times shorter than the leaf.

Entire-leaved Photinia. Cl. 1820. Tree 20 feet.

4 P. nubia (Lindl. l. c. p. 194. t. 10.) leaves lanceolate, distinctly serrated; pedicel coriaceous, smooth. ɣ F. Native of Nipaul. Mespilus Bengalensis, Roxb. Mespilus tinctoria, D. Don, prod. fl. nep. 238. Crataegus Shícula, Hamilt. miss. Fruit 2-celled. Seed one, large, clothed with a loose testa. Fruit 1-celled from abortion, and 2-seeded; hence it is nearly allied to Raphiolepis ex D. Don. l. c. The bark of this tree is used in Nipaul to dye cotton red. Hamilt.

Doubtful Photinia. Cl. 1821. Tree 20 feet.

5 P. Bengalensis (Wall. ms. in Lin. soc. herb.) leaves broad, elliptic-lanceolate, glabraes, distinctly toothed, tapering to both ends; pedicel thyrdios, terminal; calyx downy. ɣ F. Native of Bengal. Flowers white.

Bengal Photinia. Tree.

6 P. sieboldii; leaves cuneate-oblong, obtuse, serrated from the middle to the apex, coriaceous, smooth above, but when in a young state tomentose beneath; as well as the corymbs and calyces; flowers semidigynous. ɣ F. Native of Japan. Mespilus sieboldii, Blum. bijdr. 1102.

Sieboldii Photinia. Tree.

7 P. levis (D. C. prod. 2. p. 631.) leaves ovate, acuminate, serrated; umbel of flowers nearly simple. ɣ F. Native of Japan. Crataegus levis, Thunb. jap. jap. 204.

Smooth Photinia. Tree 20 feet.

8 P. villosa (D. C. prod. 2. p. 631.) leaves oblong, acuminate, serrated, villous; umbel of flowers compound; pedicels villous; fruit villos. ɣ F. Native of Japan. Crataegus villosa, Thunb. jap. jap. 204. Fruit villous.

Villos Photinia. Tree.

Cult. Trees with fine large shining leaves, and corymbs of whitish flowers, worthy of a place in any garden. For their culture and propagation see Raphiolepis.

V. ERIOBOTRYA (from ἔρις, crion, wool, and βωτρυς, a bunch of grapes; in reference to the bunch of fruit and flowers, which are woolly). Lindl. in Lin. trans. 13. p. 102. D. C. prod. 2. p. 631.

Linn. syst. Icosándria, Pentagynia. Calyx woolly, bluntly 5-toothed. Petals bearded. Stamens cret, length of the calice teeth. Styles 5, filiform, inclosed, pilose. Pome (f. 81. a.) closed, 3-5-celled. Chalaza none. Radicle inclosed between base of the corydledon,—Small trees, with tomentose branches, broad simply serrated leaves, which are woolly beneath; woolly compound terminal racemes of flowers, and subulate deciduous flowers. Flowers small, white.

1 E. japónica (Lindl. I. c.) leaves broad, rather wrinkled, elliptic, serrated, tapering at the base, tomentose beneath; lobes of calyx rounded. ɣ F. Native of Japan and China. Mespilus Japonica, Thunb. jap. jap. 206. Vent. malm. t. 19. Ker. bot. reg. 365. Hort. trans. 3. t. 11. Dekin, ann. gen. sc. ph. 2. p. 365. t. 32. Crataegus Bibas, Lour. cochl. p. 319.—Pluck. alm. t. 371. f. 2. Fruit middle-sized, pear-shaped, yellow, downy, disposed in large pendulous bunches; their taste approaches that of the apple. The loquat when it is intended to produce fruit is grafted on the Mespilus vulgaris. It is considered a frame or half hardy tree, but to ripen its fruit with flavour it should have the temperature of the stove; in which, if planted
in a border of rich soil, it will add to the variety of the dessert. Sir Joseph Banks (Hort. trans. vol. 1.) considers it as equally good with that of the mangosteen. Lord Bagot, who has fruited the plant in a very superior manner for several years, at Blithfield, gives the following outline of his practice. "The plan I have usually followed has been to give it a winter (out of doors) during the months of July, August, and September, and about the middle of October, to replace it in a very warm situation in the tan. This summer, however, I was obliged to alter my mode; for just at the moment when I was going to put it out for its winter, it became covered with at least twenty bunches of the finest flowers possible. I was therefore obliged to let it remain where it was. The present year's treatment, therefore, is an exception to the former practice; under that, it usually breaks into flower about the end of December, and the fruit becomes ripe in March or April. The last time my plant was in fruit, Sir William Coke, who had resided many years in Ceylon, says, that he was in the constant habit of eating very large quantities of the fruit daily in that island, but that he had never tasted any so good, and with so much flavour, as those produced in my garden."

*Japan or Common Loquat.* Fl. Oct. Cl. 1787. Tree 10 to 20 feet.

Elliptic-leaved Loquat. Cl. 1823. Tree 30 feet.

Cordate-leaved Loquat. Tree.

Obtuse-leaved Loquat. Tree.

5 E. *chinensis*; leaves ovate-oblong, acute, serrulate, rather villous on the middle nerve beneath; peduncles axillary, crowded, villous; calyxes villous; flowers pentagynous. *H.* Native of China. *Mespilus* *chinensis*, Blum. *bijsp.* 1102.

China Loquat. Tree.

Cult. See *Raphiolepis* for culture and propagation.

**Leaves deciduous.**

Var. *c*, *depresse* (Fries. *nov.* *svec.* *p.* 9.) shrub rather thorny; leaves lanceolate, acutish; fruit of 4 carpels. *H.* Native of Sweden, on rocks near Warberg.

Common Cotoneaster. Fl. April, May. Cl. 1656. Shrub 3 to 5 feet.

One-flowered Cotoneaster. Fl. June. Shrub 2 to 3 feet.

3 C. *multiflora* (Bunge in Led. *fl.* *ross.* alt. *ill.* t. 274.) leaves roundish-oval, attenuated at the base, rounded at the apex, emarginate or with a mucro, rather puberulous beneath, quite glabrous above; peduncles dichotomous, many-flowered, longer than the leaves, and are, as well as the calyxes glabrous. *H.* Native of Siberia, in the Soongarian desert, among rocks on the mountains of Tschingsis-tau and Dschigilen. Pome oblong, purple, 2-3-seeded.

Many-flowered Cotoneaster. Shrub 3 to 5 feet.

Tomentose Cotoneaster. Fl. April, May. Cl. 1759. Shrub 3 to 6 feet.

5 C. *affinis* (Lindl. l. c.) leaves ovate or obovate, mucronulate, attenuated at the base, woolly beneath, as well as the petals, peduncles, and calyxes; peduncles lateral, corymbose, twice-forked, many-flowered. *H.* Native of Nipaul, about Chitlong. *Mespilus* *integriflora*, Hamilt. *ms*. *Mespilus affinis*, D. *com.* *prod.* fl. *nepp.* p. 238.

7 C. *bacillaris* (Wall. ined. Lindl. *bot.* *reg.* no. 1229.) leaves obovate, drawn down into the petiole, glabrous; cymes many-flowered, divaricate, and are, as well as the branches, ploise. *H.* Native of Kamaon.

Rod Cotoneaster. Shrub.

8 C. *obtusa* (Wall. ined. *ex* Lindl. *bot.* *reg.* no. 1229.) leaves obovate or obovate, glabrous beneath; cymes crowded, many-
flowered, and are, as well as the branches, glabrous. ą. H. Native of the mountains of Nipan and Kamaon.

Oblate-leaved Cotoneaster. Shrub.

9 C. Laxitella (Jacq. ex Lindl. bot. reg. 1305.) leaves oblong-obtuse at both ends, woolly beneath; cymes panicled, pilose; calyxes quite smooth. ą. H. Native country unknown. Flowers pink.

Loose-flowered Cotoneaster. Fl. April. Cl. 1826. Shrub 3 to 5 feet.

10 C. Fabicina (Wall. ex Lindl. bot. reg. 1229.) leaves oval-lanceolate, tomentose beneath; cymes woolly, many-flowered. ą. H. Native of Gossangshan. Flowers white. Fruit spherical, red.

Frigid Cotoneaster. Fl. April, May. Cl. 1824. Shrub 10 ft.

** Leaves evergreen.

Round-leaved Cotoneaster. Fl. April, May. Cl. 1825. Shrub 3 to 4 feet.

12 C. Microphylla (Wall. ex Lindl. bot. reg. 1114.) leaves oblong-cuneate, pubescent beneath, evergreen; peduncles usually 1-flowered. ą. H. Native of Gossangshan. Flowers white.

Small-leaved Cotoneaster. Fl. April, May. Cl. 1824. Shrub 3 to 4 feet.

13 C. Biebifolia (Wall. cat. ex Lindl. bot. reg. 1229.) leaves ovate, woolly beneath, evergreen; peduncles 3-flowered, woolly. ą. H. Native of Neelgherry. Flowers white.

Cult. All the species of Cotoneaster are well fitted for shrubbbers; they are easily increased by laying down the branches or by cuttings, which should be planted in a sheltered situation, with a hand-glass placed over them; they are also propagated by separating the suckers from the roots or by seeds.

Lin. syst. Icosandra, Pentagynia. Calyx 5-cleft (f. 82. e.). Petals lanceolate (f. 82. a.). Stamens rather shorter than the calyx. Ovary of 10 cells, or of 5 bipartite ones (f. 82. e.). Ovis 10, solitary in the partitions of the cells. Styles 5 (f. 82. d.), joined together at a base. Pome (f. 82. d.), when mature 5-celled. Seeds 3-5; endocarp cartilaginous.—Small trees, with simple, serrated, deciduous leaves, and racemes of white flowers. Bracteas linear-lanceolate, deciduous.

Common Amelanchier. Fl. Apr. May. Cl. 1596. Sh. 3 to 4 ft.

VIII. MESPLIUS (from μεσος, mesos, the half, and πελος, pilos, a bullet; fruit resembling half a bullet). Lindl. in Lin. trans. 13. p. 99. D. C. prod. 2. p. 633.—Mespilus species of Lin. and others.—Mespilophora species of Neck.

Lin. syst. Icosandra, Di-Pentagynia. Calyx 5-cleft (f. 83. a.). the segments foliaceous (f. 83. a.). Petals nearly orbicular (f. 83. b. c.). Disk large, full of honey. Styles 2-5 (f. 83. d.), glabrous. Pome turbinate, open, 5-celled. Endocarp bony. In a wild state the trees are furnished with spines, but in the cultivated state they are unarmed. Leaves lanceolate, serrulatated, deciduous. Flowers large, nearly sessile, usually solitary, white. Bracteas permanent.
POMACE. VIII. MESPILUS.

Var. a. syléstris (Mill. dict. no. 1.) thorny; fruit small.—Wild Medlar, Neflier du bois. Fruit obovate, middle-sized, dry, and worthless.

Var. \( \gamma \), diffusa (D. C. prod. 2. p. 633.) unarm'd; leaves almost entire. Ait. 1. c. Duham. arb. fr. 1. t. 3. Seeds usually abortive. The following garden medlars belong to this variety:

1. Blake's large medlar.

2. Dutch medlar, common, large Dutch, broad-leaved Dutch, large-fruited, large German, neflier à gros fruit, neflier de Hollande à gros fruit. Fruit large, oblate. The largest of any, but not so good as the following.

3. Nottingham medlar, common, small-fruited, narrow-leaved Dutch. Fruit obovate, middle-sized. This is the best of all the medlars.

4. Stonelose medlar, neflier sans noyau, neflier sans pêpins, French medlar. Fruit small, obovate, of little merit. Use.—The medlar is eaten raw in a state of incipient decay; its taste and flavour are peculiar, and by some much esteemed.

Propagation.—By seeds, by layers, or by grafting on seedlings of their own species, or on any kind of plant of Pomeceu. Miller observes that if the stones are taken out of the fruit as soon as it is ripe, and immediately planted, they will come up the following spring and make good plants in two years. He prefers raising from seed to grafting on the Crataegus. Forsyth says, "those who wish to keep the sorts true, should propagate them by grafting on their own stocks."

Soil.—The soil in which the medlar thrives best is a loamy rich earth, rather moist than dry, but not on a wet bottom.

Final planting.—The medlar, like the quince, is usually grown as standards or espaliers; the former may be planted from 20 to 30, and the latter from 15 to 20 feet apart.

Mode of bearing.—On small spurs at the ends and sides of the branches.

Pruning.—Forsyth recommends the same sort of treatment as for the quince. Cut out all the dead and cankerly wood, and keep the tree thin of branches, when it is desired to have large fruit. Care is requisite to train standards with tall stems. Espalliers will require a summer and winter pruning, as in the apple tree.

German or Common Medlar. Fl. May, July. Britain. Tree 10 to 20 feet.

2 M. Smith (D. C. prod. 2. p. 633.) leaves oblong, elliptic, serrated, pubescent on the nerves beneath; flowers usually solitary. \( \phi \). H. Native country unknown. M. grandiflora, Smith. exot. bot. 1. p. 23. t. 18. Flowers white, one half smaller than those of the common medlar. Stipulas of the sterile branches large and foliaceous.

Cult. For culture and propagation see common medlar.

1 O. anthyllidifolia (Lindl. l. c.). \( \phi \). G. Native of the Sandwich Islands. Pyrus anthyllidifolia, Smith, in Rees' cycl. no. 29. Flowers subcytormose. Fruit small, crowned by the styles and calyx.

Kidney-nut-leaved Osteomelis. Shrub 4 to 6 feet. Cult. A mixture of loam and peat will suit this shrub, and ripened cuttings will probably root if planted in a pot of sand, with a hand-glass placed over them. But the best and surest method of increasing it, when it shall be introduced to the gardens, would be to graft it on the Cydonia Japonica.

L. syst. Icosandria, Pentagynia. Calyx with an urceolate tube, and a 5-lobed limb. Petals roundish. Styles usually 3, rarely 2 or 3. Pome closed, 5-celled; putamen cartilaginos. Seeds 2 in each cell; testa cartilaginos.—Trees or shrubs, with simple or pinnate leaves, and terminal, many-flowered cymes. Bracteas subulate, deciduous.

Sect. I. PYRÔPHORUM (from pyrus, a pear, and φορεο, phoreo, to bear; the trees contained in this section bear pears). D. C. prod. 2. p. 633. Petals flat, spreading. Styles 5, free. Pome more or less turbinate or nearly globose, never umbilicate at the base, as in the apple section. Pedicles simple, umbellate. Leaves simple, glandless.

1 P. communis (Lin. spec. 686.) leaves ovate, serrated, glabrous on both surfaces, as well as the buds and branches; peduncles umbellate. \( \phi \). H. Native of Europe, in woods and hedges; plentiful in some parts of Britain. Smith. Engl. bot. 1784. P. A'ehras, Gertrn. fruct. 2. p. 44. t. 87. P. sylvestris, Dod. pempt. 800. Pyráster, Ray. syn. 452. The tree is thorny in a wild state, but unarmed in the cultivated state.

Var. a. A'ehras (Wallr. sched. 213.) thorny; leaves ovate, acuminate, quite entire, on long pedicles, when young woolly as well as the calyx, but at length becoming smooth; pome drawn out at the base. \( \phi \). H. Wild pear or iron pear.

Var. \( \beta \), pyrdaster (Wallr. sched. 214.) thorny; leaves roundish, acute, sharply serrated, when young glabrous as well as the calyces; pome rounded at the base. \( \phi \). H. Gertrn. fruct. 2. t. 87 t. f. 2.

The pear tree is called poirier in French, birnbaum in German, and pero in Italian. In its wild state, the pear is a thorny tree, with upright branches, tending to a pyramidal form, in which it differs materially from the apple tree. The twigs or spray hang down; the flowers in terminal villous corylis, produced from wood of the preceding year, or from buds gradually formed on that of several years' growth, on the extremities of very short protruding shoots, technically spurs. It is found in a wild state in Britain, and abundantly in France and Germany, as well as other parts of Europe, not excepting Russia, as far as latitude 51°. It grows in almost any soil. The cultivated tree differs from the apple, not only in having a tendency to the pyramidal form, but also in being more apt to send out tap roots, in being as a seeding plant much longer in coming into bearing, and when on its own root, or grafted on a wild pear stock, of being much longer lived. In a dry soil it will exist
for centuries, and still keep its health, productiveness, and vigour. The period at which the Teinton squash pear first sprang from seed,' Mr. Knight observes, 'probably never can be ascertained; but I suspect from its present diseased and worn-out state, that it existed at least as early as the beginning of the sixteenth century; for another kind, the barland, which was much cultivated in the early part of the seventeenth century, still retains a large share of health and vigour; and the identical trees which supplied the inhabitants of Herefordshire in the 17th century with liquor, are likely to do the same good to those of the 19th.' The remarks on the history of the apple will apply, almost without exception, to the pear. The Romans in Pliny's time possessed 32 sorts, and the fruit is still more valued than the apple, both in Italy and France.

Use.—As a dessert fruit, the pear is much esteemed, and generally preferred to the apple. It is also used for baking, compôts, marmalade, &c. Dried in an oven, the fruit will keep upwards of a year, either with or without syrup. This mode of preparing the pear is about as common in France as the making of apple pies in this country. Bose (Nouveau Cours d'Agric. in loco) describes two methods of drying pears for preservation, and adds that he has tried them after 3 years' keeping, and found them still very good. Perry, the poiré of the French, is made from the fermented juice, in the manner of cider, and the best sorts are said by Withering to be little inferior to wine. The wood of the pear tree is light, smooth, and compact, and is used by turners and to make joiners' tools, and picture frames to be dyed black. The leaves will produce a yellow dye, and may be used to give a green to blue cloths.

Criterion of a good pear.—Dessert pears are characterised by a sugary aromatic juice, with the pulp soft and sub-liquid, or melting, as in the beurrés or butter pears. Kitchen pears should be large of size, with the flesh firm, neither breaking nor melting, and rather sweeter than sweet, as the wardenes. Perry pears may be either large or small, but the more austere the taste the better will be the liquor. Excellent Perry was made from the wild pear.

Varieties.—Tusser, in 1573, in his list of fruits, mentions "peeres of all sorte." Parkinson enumerates 64 sorts; Mortimer, 1708, has many sorts, and Miller has selected 80 sorts, and describes them from Tournefort. In France, the varieties of the pear are much more numerous than even the varieties of the apple. The Catalogue of the Luxembourg contains 189 select sorts. The catalogue published by the Horticultural Society in the present year contains 677, which, until it appeared, the nomenclature of pears was in a very imperfect state; this list we insert without any variation. "The new and superior sorts which have of late been added to this important class of fruits, are found to be most valuable. The greater part of them have been obtained from Belgium, and some of them have far exceeded the expectations generally formed of them on their first introduction, especially as regards their adaptation to this climate, in which many, instead of requiring the assistance of walls, as all the best old sorts do, produce abundantly and in great perfection on standards. A knowledge of the excellence of these new kinds has occasioned a great number of the old sorts, formerly reckoned very good, to be now marked as only second-rate in the following table. The sorts distinguished as being of the first-rate quality are still too numerous for any collection; the character of first-rate, as relates merely to quality, could not, however, be withheld from many which nevertheless will be found to deserve only secondary estimation, when their properties, as exhibited in the other columns, are attended to. In a collection so rich in good sorts, possessing also hardness and abundant bearing, none ought to be cultivated for the table except those of the first excellence. Where kinds of secondary or inferior quality are marked as table fruit in the following enumeration, it may be understood as only indicating their having been used as such, and being of a nature rather adapted for that than for perry or kitchen use. In regard to situation, it may be necessary to state, that those marked as succeeding as standards, are calculated to do so in the southern and middle parts of the kingdom, or even considerably more to the northward, in particularly well-sheltered places." Hort. cat. 106. The abbreviations are as follows:

Prevalent colour,—p. pale; d. dark; b. brown; y. yellow; r. red; g. green; rus. russet.

Form.—pyr. pyriform; o. pyr. obtuse pyriform; obo. obovate; ro. roundish; obl. oblong; irr. pyr. irregularly pyriform; turb. turbinate; obt. ell. obtuse-elliptic; ob. oblate; rou. round.

Size.—1. large; 2. middle-sized; 3. small.

Use.—K. kitchen; T. table; P. perry.

Texture.—C. crisp; B. buttery; J. juicy; T. tender, such as are softer than the crisp yet not so fine as the buttery.

Quality.—1. first-rate; 2. second-rate; 3. indifferent or bad.

Season.—The months of ripening are placed in numbers, 1 for Jan., 2 for Feb., and so forth.

Situation.—W. wall; S. standard.

**Remarks:**

- Very excellent; has been confused with glob morceau, leaves more deeply serrated than other of the latter.

- Excellent.

- Varies much according to the soil, climate, and situation.

- A great bearer, withstands late spring frossts better than most others.

- Hardy; great bearer; excellent; deserves extensive cultivation; requires the branches to be well thinned in pruning, to admit sufficient air.

</table>

**Propagation.**—The pear may be propagated by layers or suckers, but not easily by cuttings. These modes, however, are productive of very indifferent plants, and are justly rejected in favour of raising from seed, and grafting or budding.

**From seed.**—This mode is adopted either for the purpose of obtaining new varieties, or for producing pear stocks; in the former case the same principles of selection or crossing are to be followed as in raising seedling apples, between which and the pear tree the chief difference is, that the latter requires a longer period, nearly double, to come into bearing.

In raising pears for stocks, the seeds from perry-makers are generally made use of, but the most proper are those from the wild pears, as likely to produce plants more hardy and durable. There is, however, less difference between the pear stocks or those raised from the cultivated fruit and wild pear stocks, than there is between the free apple and crab stocks. The seeds being procured, may be sown and afterwards treated as directed for seedling crab or apple-tree stocks.

**By grafting and budding.**—The most common stocks on which the pear is grafted, are the common pear and wild pear; the pear, is, however, dwarfed and brought earlier into a bearing state by grafting or budding on the quince or white-thorn. The pear will also succeed well on the whitebeam, medlar, service, or apple, but stocks of the wild pear and quince are in most general use. Pears, on free stocks, grow most luxuriantly in good soil and on a dry bottom, those on wild pear stocks grow less rapidly, but are deemed more durable, and will thrive on the poorest soil, if a hardy variety and not over pruned. “On the quince,” Miller observes, “breaking pears are rendered gritty and stony; but the melting sorts are much improved; trees on these stocks may be planted in a moist soil with more success than those on the wild pear stocks or thorns.” On the thorn, pears come very early into bearing, continue prolific, and in respect to soil will thrive well on a strong clay, which is unsuitable both to those on quinces or wild pears, but it is supposed to have an unfavourable influence on the fruit, in rendering it smaller and hard; and the graft or buds require to be inserted very low, that the moisture of the earth may tend to favour the swelling or enlargement of the diameter of the stock, which does not increase proportionally to, nor ever attains, the same size as the stem of the pear. The free and wild pear stocks are to be planted in nursery rows at the same distances as recommended for free or wild apples; and the quince and thorn at the same distance as the Paradise stocks and creaper apples; in the respects the management is the same as for the apple.

**Choice of sorts.**—Select from the catalogue given, according to purpose and quality.

**Choice of plants.**—Abercrombie takes trees at one year from the graft, and thence to the sixth year or older. Forsyth says “I would advise those who intend to plant pear trees, instead of choosing young ones, to look out for the oldest that they can find in the nursery, and with strong stems.”

**Soil and site.**—“A dry deep loam,” Abercrombie observes, “is accounted the best soil for the pear-tree, when the stock is of its own species; on a quince stock it wants a moist soil, without which it will not prosper. gravel is a good sub-soil, where the incumbrant mould is suitable. Cold clay is a bad subsoil; to prevent fruit trees from striking into it, slates may be laid just beneath the roots. For wall trees the soil should be made good to the depth of 2 or 3 feet; for orchard trees 15 inches may do. Pear trees, on their own stocks, will thrive on land, where apples will not even live; supposing the plants to be hardy varieties, little removed from wild pears, and to have room to grow freely as standards. To the more choice of the early autumn and prime winter pears, assign south-east, or west
walls." Knight and M'Phail recommend a strong, deep, loamy soil, and the latter a high wall for training the better sorts.

Final planting is performed any time, in mild weather, from October to March; standards are placed from 25 to 40 feet apart every way; half standards from 20 to 30 feet; and dwarf standards, in borders, from 15 to 20 feet from stem to stem. Wall and espalier trees are planted from 15 to 30 feet, according as they may have been grafted or budded on pear or quince stocks.

Mode of bearing.—As in the apple tree, "The pear tree," M'Phail observes, "does not produce blossoms on the former year's wood, as several other sorts of trees do. Its blossoms, buds are formed upon spurs growing out of wood not younger than one year old, and consequently, projecting spurs all over the tree must be left for that purpose." In some pears, Mr. Knight observes, "the fruit grows only on the inside of those branches which are exposed to the sun and air; in others it occupies every part of the tree."

Pruning and training standards.—" Permit these to extend on all sides freely. Several years may elapse before any cross-placed, very irregular, or crowded branches, dead or worn out bearers, require pruning, which give in winter or spring. Keep the head moderately open in the middle." "Pruning," Knight observes, "is not often wanted in the culture of the pear tree, which is rarely much eburned with superfluous branches; but in some kinds, whose form of growth resembles the apple tree, it will sometimes be found beneficial."

Wall trees and espaliers will require a summer and winter pruning.

Summer pruning.—"While the spray is young and soft, but not until the wood-shoots can be distinguished from spurs, rub off the forebiter, the disorderly, spongy, and superfluous shoots of the year, rather than let them grow woody, so as to require the knife. Retain some of the most promising, well-placed, lateral, and terminal shoots, always keeping a leader to each main branch, where the space will permit. Leave the greater number on young trees not fully supplied with branches. Train in their at full length all summer, in order to have a choice of young wood in the winter pruning. Occasionally, on old trees, or others where any considerable vacancy occurs, some principal contiguous shoot may be shortened in June to a few eyes, for a supply of several new shoots the same season."

Winter pruning "may be performed any time from the beginning of November until the beginning of April. If on young trees or others a further increase of branches is necessary to fill up either the prescribed space or any casual vacancy, retain some principal shoots of last summer, to be trained for that purpose. As, however, many young shoots will have arisen on the wood branches and bearers, of which a great part are abundant and disorderly, but which have received some regulation in the summer pruning, we must now cut these out close to the mother branches, while we are preserving the best in the more open parts. Examine the parent branches, and if any are very irregular or defective in growth, either cut them out close, or prune them to some eligible lateral to supply the place; or if any branches be over extended, they may be pruned in to such a lateral, or to a good fruit-bud. Cut out the least regular of the too crowded, also any casually declined bearers, with decayed, cankered, and dead wood. The retained supply of laterals and terminals should be laid in as much at length as the limits allow, in order to furnish a more abundant quantity of fruit-buds. During both courses of pruning, be particularly careful to preserve all the orderly fruit spurs, emitted at the sides and ends of the bearers; if, however, any large, rugged, projecting spurs, and woody barren stumps or snags occur, cut them clean away close to the branches, which will render the bearers more productive of fruit-buds, and regular in appearance. As each tree is pruned, nail or tie the branches or shoots to the wall or trellis. If afterwards, in consequence of either pruning out improper or decayed wood, or of former insufficient training, there are any material vacuities or irregularities in the arrangement, un-nail the misplaced and contiguus branches and lay them in order."

Mr. Knight's mode of training the pear tree is as follows:—"A young pear stock, which had two lateral branches upon each side, and was about 6 feet high, was planted against a wall early in the spring of 1810; and it was grafted in each of its lateral branches, two of which sprang out of the stem, about 4 feet from the ground, and the others at the summit in the following year. The shoots these grafts produced were about a foot long, were trained downwards, the undermost nearly perpendicular, and the uppermost just below the horizontal line, placing them at such distances, that the leaves of one shoot did not at all shade those of another. In the next year the same mode of training was continued, and the year following I obtained an abundant crop of fruit.

An old St. Germain pear tree, of the spurious kind, had been trained in a fan-form against a north-west wall in my garden, and the central branches, as usually happens in old trees thus trained, had long reached the top of the wall, and had become wholly unproductive. The other branches afforded but very little fruit, and that never acquiring maturity, was consequently of no value, so that it was necessary to change the variety as well as to render the tree productive. To attain these purposes, every branch which did not want at least 20 degrees of being perpendicular, was taken out at its base, and the spurs upon every other branch, which I intended to retain, were taken off closely with the saw and chisel. Into these branches, at their subdivisions, grafts were inserted at different distances from the root, and some so far from the extremities of the branches, that the tree extended as widely in the autumn after it was grafted, as it did in the preceding year. The grafts were also disposed, that every part of the space the tree previously covered, was equally well supplied with young wood. As soon in the succeeding summer as the young shoots had attained sufficient length, they were trained almost perpendicularly downwards, between the larger branches and the wall to which they were nailed. The most perpendicular remaining branch upon each side was grafted about 4 feet below the top of the wall, which is 12 feet high, and the young shoots, which the grafts upon these afforded, were trained inwards, and bent down to occupy the space from which the old central branches had been taken away, and therefore very little vacant space where remained in the end of the first autumn. A few blossoms, but not any fruit, were produced by several of the grafts in the succeeding spring; but in the following year and subsequently I have had abundant crops, equally dispersed over every part of the tree."

Heading down and pruning old pear trees.—"The method of pruning pear trees," Forsyth observes, is "very different from that practised for apple trees in general. The constant practice has been to have great spurs, as big as a man's arm, standing out from the walls, from a foot to 18 inches or upwards." The constant cutting of these spurs, he says, brings to the canker, and the fruit produced is small, spotted, and kernels. Forsyth's practice with such trees was to cut them down, and remove the soil at their roots, and he refers to a beurré pear, restored from an inch and a half of bark, which, in 1796, bore 450 fine large pears, &c.

C. Harrison and various other gardeners adopt a mode of keeping only short spurs, by which much larger fruit is produced. According to this plan, each spur bears only once, when it is cut out, and succeeded by an embryo bud at its base.
This bud, at the end of the first season, is no more than a leaf-bud, but at the end of the second summer it has become a blossom-bud, and bears the third summer. Some useful observations on the management of pear-trees, in correspondence with the above, will be found in various parts of the Caledonian Horticultural Society's memoirs.

Insects, diseases, &c.—The pear-tree is liable to the attacks of the same insects as the apple-tree, and the fruit of the summer kinds, when ripe, is liable to be eaten by birds, wasps, &c., which must be kept off by shooting, hanging bottles of water, and other usual preventatives. For other points of culture, gathering, and storing, see the apple.

Austria. *Jacc. austr.* 2. t. 107. Flowers white. Fruit very acid, but when ripe and becoming patrid, very sweet.

**Snow Pear.** Fl. April, May. Tree 6 to 10 feet.

17 P. *Michaelii* (Bosc, in Poir. suppl. 4. p. 432.) leaves oval, quite entire, acute, glabrous on both surfaces, and shining above; peduncles usually twin, when bearing the fruit thick and woody; fruit globose. † H. Native of North America.

**Michaelz's Pear.** Fl. April. Tree 20 feet.

18 P. *Farfiora* (Desf. cor. 78. t. 58.) leaves ovate, quite entire, hoary beneath; corymbs terminal; fruit globose. † H. Native of Candia. P. sylvestris Crética, C. Bauh. pin. p. 499. Tourn. cor. 43. Flowers red.

**Small-flowered Pear.** Tree 20 to 30 feet.

**Sect. II. MALUS (mel or mal, Celtic, for the apple, which the Greeks have rendered μηλ, and the Latins *malus*).** Tourn. inst. t. 406. Petals flat, spreading. Styles 5, somewhat connected at the base. Pome usually globose and depressed, always umbilicate at the base. Pedicels simple, umbrate. Leaves simple, glandless.

19 P. *Aceetra* (D. C. prod. 2. p. 635.) leaves ovate, acute, crenated, quite glabrous when young, as well as the calyce; flowers corymbose. † H. Native of Europe, in woods and hedges. P. Mâlus austera, Wallr. sched. 215. Mâlus aceetra, Merat, fl. par. 157. D. C. suppl. 530. P. mâlus sylvestris, Fl. dan. 1101. P. mâlus Smith, eugl. bot. 179. Flowers white tinged with red. There are numerous varieties with acer biff; they are commonly called *cider apples*, and in French pomme à cidre. The fruit of the wild *apple* is globose, yellowish, with a tinge of red, very acid, and astringent, yet there are several varieties among the wild *crabs*, some of them of excellent flavour when baked with plenty of sugar, even surpassing many cultivated apples. The expressed juice of any of them, called *verjuce*, is used to cure scrofula and scalds, being often kept by good housewives in the country for that purpose.

**Sour or Wild Apple or Crab.** Fl. March, April. Britain. Tree 15 to 20 feet.

20 P. *Malus* (Lin. spec. 686.) leaves ovate or elliptic, acute, serrated, clothed with white down beneath, as well as on the calyces, petioles, &c.; flowers corymbose; styles glabrous. † H. Native of Europe, in woods, hedges, and parks; plentiful in Britain. Mâlus mitis, Wallr. sched. 215. Flowers umbellate, beautifully variegated with white and rose-colour, and slightly fragrant.

The *apple* tree is called pomme et pomnier doux or pomnier à couteau in France, *apfel* in German, and *pomo* or *melo* in Italian. It has the branches more horizontal than the pear tree; the flowers terminate in umbels, produced from the wood of the preceding year, but more generally from very short shoots or spurs from wood of two years' growth. The fruit in its wild state is termed a *crab*. It is a native of most countries of Europe in its wild state, and the improved varieties form an important branch of culture in Britain, France, and Germany, for the kitchen, the table, and for the manufacture of cider. From whence we received the cultivated *apple* is unknown, but in all probability it was introduced by the Romans, to whom 22 varieties were known in Pliny's time, and, afterwards the stock of varieties greatly increased at the Norman conquest. According to Stow, *sorbs* and *pears* were brought into England by Masca, who wrote on fruit trees in 1572.

The *apple* tree is supposed by some to attain to a great age. Haller mentions some trees in Herefordshire that attained 1000 years, and were highly prolific; but Mr. Knight considers 200 years as the ordinary duration of a healthy tree grown on a crab stock, and planted in a strong tenacious soil. Speedily (Hints, 58.) mentions a tree in an orchard at Burton-joyce near Nottingham, of about 60 years old, with branches extending from 7 to 9 yards round the bole, which in 1792 produced upwards of 100 peeks of apples. Of all the different fruits that are produced in Britain, none can be brought to so high a degree of perfection, with so little trouble; and of no other is there so many excellent varieties in general cultivation, calculated for almost every soil, situation, and climate, which our island affords. Very good apples are grown in the Highlands and Orkneys, and even in the Shetland Islands (Col. hort. mem. vol. 2.), as well as in Devonshire and Cornwall; some sorts are ripe in the beginning of July, and others which ripen later will keep till June. Unlike other fruits, those which ripen latest are the best.

**Use.**—For pies, tarts, sauces, and the dessert, the use of the *apple* is familiar to every one. The fermented juice forms cider, a substitute both for grape wine and malt liquor. In confectionary it is used for comfits, marmalades, jellies, pastes and tarts, &c. In medicine, verjuce or the juice of crabs is used for sprains, and as an astringent and repellent, and, with the proper addition of sugar, Withering thinks a very grateful liquor might be made with it, little inferior to Rheinish wine. Light-foot airmills, mixed with cultivated apples, or even alone, if thoroughly ripe, it will make a sound masculine wine. The apple when ripe is laxative; the juice is excellent in dysentery; boiled or roasted apples fortify a weak stomach. Scopolii recovered from a weakness of the stomach and indigestion from using them, and they are equally efficacious in putrid and malignant fevers, with the juice of lemons or currants. In perfumery, the pulp of apples, beat up with hard, forms pomatum; and Bosc observes (N. cours d'Agricultur, &c.) that the prolonged stratification of apples with elder-flowers, in a close vessel, gives the former an odour of musk, extremely agreeable. In dyeing, the bark produces a yellow colour, and in general economy the wood of the tree is used for turning, and various purposes where hardness, compactness, and variegation of colour are objects.

**Criterion of a good *apple*.**—Apples for the table are characterized by firm juicy flesh, elevated poignant flavour, regular form, and beautiful colouring; those for kitchen use by the property of falling, as it is technically termed, or forming in general a pulpy mass of equal consistency, when baked or boiled. Some sorts of apples have the property of falling when green, as the *Keswick, Carlisle, Hanthornden*, and other collins; and some only after being ripe, as the *Russet* tribe. Those which have this property when green are particularly valuable for adding sauces to goose early in the season, and for succeeding the gooseberry in tarts. For cider an apple must possess a considerable degree of astringency, with or without firmness of pulp or richness of juice. The best kinds, Knight says, are often tough, dry, and fibrous; and the *Siberian Harvey*, which he recommends as one of the very best cider-apples, is unfit either for culinary purposes or the table. Mr. Knight has found that the specific gravity of the juice of any apple recently expressed indicates with very considerable accuracy the strength of the future cider. Considering the various uses of the apple, it may be regarded as a fruit of more use and benefit to the public in general than all the other fruits the produce of this island.

**Varieties.**—Tusser in 1573 mentions in his list of fruits "apples of all sorts." Parkinson in 1629 enumerates 57 sorts. Evelyn about 30 years afterwards says (Fomona pref.). "It was through the plain industry of one Harris, a fruiterer to Henry VIII. that the fields and environs of about 30 towns in Kent only, were planted with fruit from Flanders, to the universal benefit and improvement of the country." Gibson (Churches of Doove and Hometcy,) mentions that Lord Scudamore, ambassa-
Normandy scions of cider-apples, and when he returned to England encouraged the grafting them throughout the county of Hereford. Hartlib in 1656 speaks of one who had 200 sorts of apples, and "verily believes that there are nearly 500 sorts in this island." Ray in 1688 selected from the information of the most skilful gardeners about London a list of 78 sorts. Succeeding writers have been enabled greatly to increase the list, partly from the almost continual accession of sorts received from the continent during intervals of peace, but principally from the great numbers raised from seeds. A variety of *apple*, like those of most other plants, appears only to have a limited duration; and hence on taking a retroactive view of the lists of sorts given by Parkinson, Evelyn, and other authors, many of them are not now to be found, or are so degenerated or diseased as no longer to deserve the attention of the planter. "The mould," Mr. Knight observes, "and its successful rival the red-streak, with the muskts and golden-pippin, are in the last stage of decay, and the stire and fox-whelp are hastening rapidly after them." After making a great variety of experiments for several years, and after many attempts to propagate every old variety of the *apple*, this author observes (Treat. on Apple and Pear, 15.), "I think I am justified in the conclusion, that all plants of this species, however propagated from the same stock, partake in some degree of the same life, and will attend the progress of that life in the habits of its youth, its maturity, and its decay, though they will not be any way affected by any incidental injuries the parent tree may sustain after they are detached from it." Mr. Knight next directed his attention to raising new varieties from seeds, and has by crossing one sort with another, and by having constantly several thousands of seedlings rearing, from which as they show fruit, to select the best sorts, succeeded in producing several new varieties of apples, much esteemed for the table and the press. Of several of these sorts, and those obtained, accounts will be found in the work above quoted, and in Horticultural Transactions. Several eminent horticulturists in different districts are now engaged in a similar manner, and there can be little doubt a great and valuable accession will be constantly made to this class of fruits. Some, however, as Williamson (Hort. trans. 3. p. 291.) and Speechly (Hints, 188.) consider that the deterioration of the *apple* and other fruits may be owing to the climate, and that the return of genial summers would restore to us from old trees as good fruit as heretofore.

A numerous list of varieties may be considered as puzzling to the inexperienced person, who has to select for a garden or an orchard; but if each of these varieties were correctly figured and described, including the character and habits of the tree, as well as the leaves, roots, blossoms, and fruit, the list could not be too extensive of a fruit so universally grown and liked as the *apple*; for almost every garden and orchard differs in soil, climate, aspect or situation; and, consequently, to be planted in the best manner, must require a corresponding difference in the varieties of each species of fruit with which it is to be planted. Sabine, however, (Hort. trans. 3. p. 263.) considers, that the stock of *apples* requires reduction rather than increase, and observes that one of the chief objects to which the attention of the Horticultural Society is at present directed, is to make a judicious selection. A great variety of *apple* trees in a bearing state may be seen in different nurseries both in Britain and Ireland, but especially near London; from these in the autumn the fruit may be tasted from the trees, and either young plants newly worked or plants in a state of bearing fixed on, and marked to be taken up at the proper season. The advantages of this mode, especially to such as possess but a small garden, are too obvious to require comment.

The only catalogue of *apples* which can be depended upon for accuracy yet published, is that by the Horticultural Society of London in the present year, which none but a public body could have brought to such perfection. It is as follows:

The columns explain 1. The prevailing colour. 2. The usual form. 3. The average size. 4. The use, whether for table, kitchen, or cider. 5. The quality. 6. The usual season of perfection. The abbreviations employed are as follows:

</table>

### Remarks.

- A shy bearer from Herefordshire, but one of this name in Devonshire has been much celebrated.
- Of excellent quality, with a Ribston pippin flavour.
- Requires a good situation.

Most dwarf of any.
Propagation and culture.—The apple, like most other hardy trees, may be propagated by seeds, cuttings, suckers, layers, and by engrafting and budding; by seeds to obtain new varieties, and stocks, and by other modes for continuing such as are in esteem.

By seeds.—The first business here is the choice of seeds, which should be taken from fruits having the properties it is desired to perpetuate or improve in the greatest degree. The sorts of apples proper for crossing or reciprocal impregnation, appear to be those which have a great many qualities in common, and some different qualities. Thus the golden-pippin has been crossed by other pippins or rennets, and not by calcis or codlings. A small-sized apple, crossed by a large sort, will be more certain of producing a new variety than the above mode; but will be almost equally certain of producing a variety destitute of valuable qualities; the qualities of parents of so opposite natures being as it were crudely jumbled together in the offspring. Mr. Knight's mode of cutting out the stamens of the blossoms to be impregnated, and afterwards when the stigmata are mature, introducing the pollen of that intended for the male parent, is unquestionably the most scientific mode of performing the operation. In this way he produced those excellent apples, the Downton, red and yellow lagerest, and Grange pippins from the same parents; viz. the seed of the orange-pippin impregnated by the pollen of the golden-pippin. The Bringwood-pippin he produced from the golden-pippin, dusted with the pollen of the golden-harvey apple.

The seeds may be sown in autumn in light earth, covered an inch, and either in pots or beds. The end of the first year they should be transplanted into nursery rows, from six inches to a foot apart every way. Afterwards they should be removed to where they are to produce fruit, and for this purpose the greater the distance between the plants the better. It should not be less than 6 or 8 feet every way. The quickest way of bringing them into a bearing state, Williams, of Putnamson, considers, (Hort. trans. 1. p. 333.) is to let the plants be furnished with lateral shoots from the ground upwards; so disposed as that the leaves of the upper shoots may not shade those situated underneath, pruning away only trifling shoots. This mode of treatment occurred to him on reflecting on Mr. Knight's theory of the circulation of the sap. Observing the change in the appearance of the leaves of his seedling plants, as the trees advanced in growth, he thought it might be possible to hasten the progress of the plants, and procure that peculiar organization of the leaf necessary to the formation of blossom-buds at a much earlier age. He, in consequence, adopted the mode above described, and succeeded in procuring fruit from seedling apples at four, five, and six years of age, instead of waiting eight, ten, and even fifteen years, which must be the case by the usual mode of planting close, and pruning to naked stems. Macdonald, an eminent Scotch horticulturist, has also succeeded in obtaining fruit from seedlings at an early period by grafting, already stated as one of the uses of that mode of propagation. In 1808, he selected some blossoms of the nonpareil, which he impregnated with the pollen of the golden-pippin and of the Newton-pippin. When the apples were fully ripe, he selected some of the best, from which he took the seeds and sowed them in pots, which he placed in a frame. He had eight or nine seedlings, which he transplanted into the open ground in the spring of 1809. In 1811, he picked out a few of the strongest plants and put them singly into pots. In spring, 1812, he observed one of the plants showing fruit-buds. He took a few of the twigs and grafted them on a healthy stock on a wall, and in 1813 he had a few apples. This year (1816) his seedlings yielded several dozens, and also his grafts; and he mentions that the apples from the grafts are the largest. He is of opinion that in giving names to seedlings raised in Scotland the word Scotch should be mentioned. Ringing has also been recommended by various authors as inducing precocity, and particularly by Hempel, (Hort. trans. 1. appendix,) who says he has proved it experimentally. A very common practice among those who raise fruit trees from seed is, in the second or third season to select such plants only as have broad and roundish leaves, throwing away the rest, experience having taught that the former more frequently produce fruit of improved quality, or at least larger, than those plants which have narrow-pointed leaves. The width and thickness of the leaf Mr. Knight observes, "generally indicate the size of the future apple, but will by no means convey any correct idea of the merits of the future fruit. Where these have the character of high cultivation, the qualities of the fruit will be far removed from those of the native species, but the apple may be insipid or highly flavoured, green, or deeply coloured, and of course well or ill calculated to answer the purposes of the planter. An early blossom in the spring, and an early change of colour in the autumnal leaf, would naturally be supposed to indicate a fruit of early maturity; but I have never been able to discover any criterion of this kind on which the smallest dependence can be placed. The leaves of some varieties will become yellow and fall off, leaving the fruit green and immature, and the leaves in other kinds will retain their verdure long after the fruit has perished. The plants whose buds in the annual wood are full and prominent, are usually more productive than those whose buds are small and shrunk in the bark; but their future produce will depend much on the power the blossoms possess of bearing the cold, and this power varies in the different varieties, and can only be known from experience. Those which produce their leaves and blossoms rather early in the spring are generally to be preferred, for though they are more exposed to injury from frost, they less frequently suffer from the attacks of insects, the more common cause of failure. The disposition to vegetate early or late in the spring is, like almost every other quality in the apple tree, transferred in different degrees to its offspring; and the planter must therefore seek those qualities in the parent tree which he wishes to find in the future seedling plants. The most effective method I have been able to discover of obtaining such fruits as vegetate very early in the spring has been by introducing the pollen of the Siberian crab into the blossom of a rich and early apple, and by transferring in the same manner the pollen of the apple to the Siberian crab. The leaf and habit of many of the plants that I have thus obtained possess much of the character of the apple, whilst they vegetate as early in the spring as the Siberian crab, and I possess at least two plants of this family." Abercrombie observes, "as the codling is a sort found to change very little from seed, or not for the worse, new plants of it are sometimes raised by sowing the kernels, not by way of experiment for a new uncertain variety, but with some dependence in having a good sort resembling the parent."

By cuttings.—Every variety of apple may be grown from cuttings, though some with much greater facility than others. All those of the Burmeist and codling tribes grow as well thus as by any other, and some allege that the trees so raised are not liable to canker (Hort. trans. 1. p. 120.), which is supposed to be owing to their putting out no tap root, but spreading their numerous fibres from the knots or bars horizontally. Even the golden-pippin may be continued in this way, and the trees have remained seven years in perfect health, when grafts taken not only from the trees, but from the very branch, part of which was divided into cuttings, cankered in two or three years. "All apple trees raised in this way," Bigg observes, "from healthy one-year old branches, with blossom-buds upon them, will continue to grow bearing the finest fruit in a small compass for many years. Such trees are peculiarly proper for forcing, and not liable to canker." (Hort. trans. 1. p. 65.) The cuttings are
to be chosen from young wood of horizontal or oblique branches, rather than from upright ones; from six to eight inches or more in length, with a small portion of old wood at the lower end. Cut off the tip of the shoot, and all the buds, excepting two or three next the tip or upper extremity; then smooth the sections at the lower end, and insert three or four inches in sandy loam, pressing the earth firmly to them, watering and covering them with a hand-glass. The proper time for this operation is early in February, and the glass should not be touched, excepting to give water, till the shoots have sprung an inch or two. Slade during the mid-day sun, and begin to harden by giving air in July; finally, remove the glass in August, and in October transplant to nursery rows, or in pots according to future intention. With the Barknett all that is necessary is to plant the cuttings in a shady border, and treat them like those of the gooseberry or currant.

**By layers.**—The success of this mode of propagation may be considered as certain; but it has nothing peculiar in its application to the apple. The after treatment of the plants is the same with that for those originated by the following or foregoing modes.

**By suckers.**—This mode is generally confined to the Paradise and creeping apple for stocks.

**By grafting and inoculation.**—This may be said to be the universal practice in propagating the apple. The first consideration is the choice of stocks; of these there are five sorts in common use; *seedling apples*, used for full standards and riders or wall standards; *seedling crabs*, for standards and half standards; *cutting apples*, from layers or cuttings for dwarfs and espaliers; *Paradise apples*, from layers or cuttings for low dwarfs and trained trees; *creeping apples*, from layers or cuttings for the best dwarfs or bushes.

**Stocks of seedling apples.**—The seeds should be selected from the fruit of vigorous growing young or middle-aged healthy trees; but when wanted in larger quantities they are procured from cider makers; private propagators will adopt the first mode. The sowing and after treatment is the same as for seedling crabs.

**Seedling crabs.**—"A preference," Mr. Knight observes, "has generally and justly been given to apple stocks raised from seed of the native kind or crab, as being more hardy and durable than those produced from the apple. The offspring of some varieties of the crab, particularly of those introduced from Siberia, vegetate much earlier in the spring than other trees of the same genus; and hence the inexperienced planter will probably be led to suppose that such stocks would accelerate the vegetation of other varieties in the spring, and tend to produce an early maturity of the fruit in autumn. In this, however, he will be disappointed. The office of the stock is, in every sense of the word, subservient, and it acts only in obedience to the impulse it receives from the branches; the only qualities, therefore, which are wanting to form a perfect stock are vigour and hardiness."

**Seed sowing and culture.**—In collecting the seeds to sow, it must be remembered that the habits, as well as the diseases, of plants are often hereditary, and attention should be paid to the state of the tree from which seeds are taken; it should be large and of free growth, and rather in a growing state than one of maturity or decay. The crab trees, which stand in cultivated grounds, generally grow more freely, and attain a larger stature than those in hedges or woods, and therefore appear to claim preference. The seed should be taken from the fruit before it is ground for vinegar, and sown in beds of good mould an inch deep. From these the plants should be removed in the following autumn to the nursery, and planted in rows at three feet distance from each other, and 18 inches between each plant. Being here properly protected from cattle and hares, they may remain till they become large enough to be planted out, the ground being regularly worked and kept free from weeds. Rev. J. Venables (Hort. soc. trans. vol. 1. ser. 2. p. 39.) has never found a satisfactory reason why the pips of the best apples should produce most frequently trees little better than the crab, while other products of our gardens are not deteriorated from the parent stock. It would seem that much of the peculiar flavour of fruit depends upon the leaf, and whatever determines the first organization of this member of the tree, must have considerable influence on its produce. In the growth of those seeds furnished with albumen, the albumen is converted into a substance resembling sugar, and this saccharine material affords the first nourishment to the growing plant, and supports it till the radicles spread and are enabled to draw a supply of aliment from the earth; but as the apple pipp is destitute of albumen, we may easily discover the source from which this deficiency is to be supplied. It was evident that the apple itself decaying on the ground, and enriching the soil around the pipp with its saccharine juices, should supply the young tree with its earliest nutriment. When, therefore, we separate the pipp from the apple for the purpose of sowing, we deprive the seedling of a material part of its appropriate nourishment, and consequently raise a tree in no way resembling the qualities of its parent. We have no account of the manner in which the best apples were raised in the 15th and 17th centuries, and possibly the best fruits of those days may have been a selection from numbers raised of an inferior quality. It is probable that we owe some of our best fruits more to the undisturbed production of nature than to the operations of art. An apple has fallen from some tree, and lain unobserved, the fruit has decayed on the spot, and enriched the ground; and, from the soil thus peculiarly prepared by nature, has sprung up a tree, whose produce has proved of peculiar excellence and flavour. According to the above theory, apples should be sown instead of pips, or pips of one sort introduced into the fruit of another, and then sown, or the ground manured with rotten apples. The seedling from this mode of sowing will be more likely to produce fruit of superior flavour than by sowing the pips alone.

**Colling stocks.**—These are raised chiefly from layers, which at the end of the season are taken off and planted in nursery rows, 2 feet between the rows, and 1 foot from plant to plant.

**Paradise stocks.**—As they are called by the French, Donic stocks, are raised from either layers or suckers; and stocks raised from creeping apples, so named from their aptitude to throw out suckers, or the Dutch Paradise, chiefly from the latter mode. They may be planted in nursery rows, somewhat closer than the colling stocks.

All stocks require to stand in the nursery till they are from half an inch to an inch thick at the height at which they are to be grafted; such as are intended for full standards or riders will, in general, require to grow three or four years before they are fit for this operation; those for half standards two years, and those for dwarfs one year. The ground between them must be kept clear of weeds, and stirred every winter; the side shoots of the plants, at least to the height at which they are intended to be grafted, rubbed off as they appear, and all suckers carefully removed. Where budding is adopted, the stocks may be worked at nearly half the diameter of stock requisite for grafted and stocks for dwarfs, planted in autumn or spring, may be inoculated the succeeding summer. No great advantage, however, is gained by this practice, as such plants require to stand at least another year before they have produced their bud-shoots.

**Soil and situation of the nursery.**—"A difference of opinion appears to have always prevailed respecting the quality of the soil pro-
per for a nursery. Some have preferred a very poor, and others a very rich soil; and both perhaps are almost equally wrong. The advocates for the poor soil appear to me to have been misled by transferring the feelings of animals to plants, and inferring that a change from want to abundance must be agreeable and beneficial to both. But plants in a very poor soil become stunted and unhealthy, and do not readily acquire habits of vigorous growth when removed from it. In a soil which has been highly manured the growth of young apple trees is extremely rapid, and their appearance, during 2 or 3 years, generally indicates the utmost exuberance of health and vigour. These are, however, usually the forrunners of disease, and the 'canker's desolating tooth' blasts the hopes of the planter. In choosing the situation for a nursery, too much shelter or exposure should be equally avoided, and a soil nearly similar to that in which the trees are afterwards to grow should be selected where it can be obtained. Pasture ground or unmanured meadow should be preferred to old tillage, and a loam of moderate strength, and of considerable depth, to all other soils." (Treat. on Appl. and Pear.)

Grafting.—The first business is to select the scions. At whatever season scions are to be inserted, Mr. Knight observes, 'the branches which are to form them should be taken from the parent stock during the winter, and not later than the end of the preceding year; for if the buds have begun to vegetate in the smallest degree, and they begin with the increasing influence of the sun, the vigour of the shoots, during the first season, will be diminished, and the grafts will not succeed with equal certainty; though a grafted apple tree very rarely fails, unless by accidental injury or great want of skill in the operator. The amputated branches must be kept alive till wanted, by having the end of each planted in the ground a few inches deep in a shady situation.' Stocks destined to form standard trees may either be grafted at the usual height at which the lateral branches are allowed to diverge, which is commonly six feet, or they may be grafted near the ground, and a single shoot trained from the grafts, so as to form the stem of the tree. The propriety of grafting near the ground or at the height of six or seven feet, will depend on the kind of fruit to be propagated, whether it be quite new, and just beginning to bear, or a middle-aged variety. In new and luxuriant varieties, and these only should be propagated, it will be advantageous to graft when the stocks are three years old, as the growth of such will be more rapid, smooth, and upright than that of the crab, and there will be no danger of their being injured by beginning to bear too early. 'Middle-aged varieties will be most successfully propagated by planting stocks of six or seven feet high, and letting them remain ungrafted till they become firmly rooted in the places in which the trees are to stand. One graft only should be inserted in each stock; for when more are used they are apt to divide when loaded with fruit, and to cleave the stock, having no natural bond or connexion with each other. When the stocks are too large for a single scion, I would recommend that the grafts be inserted in the branches, and not in the principal stem.' This practice is not uncommon in various parts of England, and in general use in Germany with free stocks, where, however, they often neglect to graft the trees, and thus, as Mr. Neill observes, produce an endless variety of sorts, some good, but most of them little better than crabs. Stocks intended to form half-standard are grafted at three or four feet from the ground, and those for dwarfs at eight or ten inches or lower. Miller and Knight agree in recommending to graft near the ground, where lasting and vigorous trees are wanted; but the practice of the continental gardeners, and the opinions of some in this country, are in favour of leaving a stem below the graft of not less than a foot in length. A kind of grafting generally adopted for moderate sized stocks is the whip or tongue method, or the new mode of saddle-grafting adopted by Mr. Knight; and the general time for the apple is in the end of February and the greater part of March. Much depends on the season and situation; the guiding principle is to make choice of the time when the sap of the stock is in full motion, while that of the scions, from having been previously cut off and placed in the shade, is less so. The common season for budding the apple is July, and there is nothing peculiar to this tree in performing that operation.

Transplanting grafted trees in the nursery.—"It has been recommended," Knight observes, "to remove grafted trees once or twice during the time they remain in the nursery, under the idea of increasing the number of their roots, but I think this practice only eligible with trees which do not readily grow when transplanted. I have always found the growth of young apple trees to be much retarded, and a premature disposition to blossom to be brought on by it; and I could not afterwards observe those trees which had been twice removed grow better than others. It has also been supposed that many small roots, proceeding immediately from the trunk, are in the future growth of the tree to be preferred to a few which are large; but as the large roots of necessity branch into small, which consequently extend to a greater distance, the advantages of more transplantations than from the seed-bed to the nursery, and thence to the garden or orchard, may reasonably be questioned."

The choice of sorts depends upon the object in view. The first thing an inexperienced gardener has to do is to consider the various uses of the apple, and then determine what is wanted, according to family, market, or other purpose to be supplied; the next thing is to consider how those wants are to be supplied in his given soil, situation, and circumstances; and the last thing is to study the catalogue of sorts, and to select accordingly. Another source of choice is, as may respect the soil, situation, and climate of the garden or orchard, in which they are to be planted, or the character, whether of dwarfs, espaliers, or wall-trees, which they are to assume there. The winter and spring table apples may require a south wall in one district, while in another they may attain equal maturity as standards or espaliers. Where there is ample room a selection of large sorts, as the Alexander and Baltimore apples, or of such as are the most beautifully coloured, as the violet, cornation, &c. may be made to gratify the eye; or where room is wanting, useful sorts and great bearers are to be preferred, as the golden and ribston pippin, summer pearmain, collins, grey russet, summer and winter Calvilles, &c. In general small sized fruit, as the Harveys and Granges, are to be preferred for standards, as less likely to break down the branches of the trees, or be shaken down by winds, middling sorts for walls and dwarfs, and the largest of all for espaliers. In respect to a soil liable to produce canker, sorts raised from cuttings may be desirable, as the Burknot and coding tribe; and where an occupier of a garden has only a short interest therein, such as come into immediate bearing, as the Burknots and others from cuttings, and the Hawthorndean, Apius's apple, and other short-lived dwarf sorts on Paradise or creeping stocks, may deserve the preference. On the contrary, where a plantation is made on freehold property, or with a view to posterity, new varieties on crab or free stocks should always be chosen, as the Grange, Ingestrie, Harvey, &c. Some excellent sorts will grow and produce crops everywhere, as the Hawthorndean, coding, and Ribston pippin; the latter of which, Nicol says, will grow at John O'Groat's house, and may be planted in Cornwall; others are shy bearers in cold situations, as the Newton pippin of America, &c.

Choice of plants for planting.—This depends in some degree on the object in view, the richness of the soil, and the shelter.
Young trees are more likely to succeed in exposed sites and poor soils, but the apple will bear transplanting at a greater age than any other fruit tree. It may be planted in open weather from November till February.

Soil and site for permanent planting.—Any common soil, neither extremely sandy, gravelly, nor clayey, on a dry subsoil, and with a free exposure, will suit the apple. On wet silly subsoils it will do no good, but after being planted a few years will become cankered, and get covered with moss. When fruit trees must be planted on such soils they should first be rendered as dry as possible by under-draining; next provision must be made for carrying off the rain water by surface gutters; and, lastly, the ground should not be trenched above a foot deep, and the trees planted rather in hillocks of earth above the surface than in pits dug into it. There is no point of more importance than shallow trenching and shallow planting in cold wet soils, in which deep pits and deep pulverization only serve to aggravate their natural evils of moisture and cold. See Sang, in cal. hort. mem. 4. p. 140. "The apple tree," Mr. Knight observes, "attains its largest stature in a deep strong loam or marly clay; but it will thrive in all rich soils, which are neither very sandy nor wet at bottom. It succeeds best," he adds, "in situations which are neither high nor remarkably low. In the former its blossoms are frequently injured by cold winds, and in the latter by spring frosts, particularly when the trees are planted in the lowest part of a confined valley. A south or south-east aspect is generally preferred on account of the turbulence of the west, and the coldness of north winds; but orchards succeed well in all aspects, and where the violence of the west wind is broken by an intervening rise of ground, south-west aspect will be found equal to any." "All the sorts of apple trees," Abercrombie observes, "may be planted in any good common soil, with a free exposure, whether that of a garden, orchard, or field, so that the ground be neither very low, nor excessively wet, nor subject to inundation in winter. Avoid as far as possible very strong clayey and gravelly soils."

Mode of bearing.—"In all the varieties of the common apple the mode of bearing is upon small, terminal, and lateral spurs, or short robust shoots, from half an inch to two inches long, which spring from the younger branches of two or more years' growth, appearing first at the extremity, and extending gradually down the side, the same bearing branches and fruit spurs continue many years fruitful." Abercrombie.

Pruning.—"As, from the mode of bearing, apple trees do not admit of shortening in the general bearers, it should only be practised occasionally; first, where any extend out of limits, or grow irregular or deformed; and secondly, a good shoot contiguous to a vacant space is shortened to a few eyes, to obtain an additional supply of young wood from the lower buds of this shoot for filling up the vacancy. But to shorten without such a motive is not merely cutting away of the first and principal bearing part of the branches, but also occasions their putting forth many strong useless wood-shoots, where fruit-spurs would otherwise arise; and both effects greatly tend to retard the trees in bearing, whereas the fertile branches being cultivated to their natural length, shoot moderately, and have fruit-spurs quite to the extremity." Abercrombie.

Esplairers and wall-trees require a summer and winter pruning.

The summer pruning.—"Train in the young shoots of the same year which are likely to be wanted in the figure, and re-trench them where ill placed or too numerous; for as the trees continue bearing many years on the same branches, they only require occasional supplies of young wood; therefore begin in May or June to pinch off or cut out all forlorn, ill placed, and superfluous shoots, retaining only some of the promising laterals in the more vacant parts, with a leader to each branch; train in these between the mother-branches at their full length all summer, or where any vacancy occurs some strong contiguous shoot may be shortened, in June, to a few eyes to furnish several laterals the same season. Keep the shoots in all parts closely trained, both to preserve the regularity of the espalier, and to admit the air and sun to the advancing fruit."

"The winter pruning may be performed from November till the beginning of April. This comprehends the regulation of the wood branches, the bearers, and the young shoots. First examine the new shoots trained in the preceding summer, and, if too abundant, retain only a competency of well-placed and promising laterals, to furnish vacant parts with a leading shoot to each parent branch. Continue these mostly at their full length, as far as there is room. Cut out close the superabundant and irregular young shoots, and where any of the elder branches appear unfruitful, cankery, or decayed, cut them either clean out, or prune short to some good lateral, as may seem expedient. Also prune into order any branches which are very irregular or too extended. Carefully preserve all the eligible natural fruit spurs, but remove all unfruitful shoots or snags, and large projecting rugged branches. As each espalier is increased, let the old and new branches be laid in at convenient distances according to the size of the fruit, 4, 5, or 6 inches asunder, and neatly tied or nailed to the wall or trellis."—Abercrombie.

Heading down apple-trees that are much cankered, is strongly recommended by Forsyth, who gives an example of one after it had been headed down four years, which bore plenty of fine fruit. The point at which it was headed down was within 18 inches of the soil, and under it on the stump were two large wounds, made by cutting out a cankery part, and which, being covered with the composition, were soon nearly filled up with sound wood. Very little pruning is at first given to trees so cut, but afterwards a regular succession of bearing wood is kept up by removing such as have borne three or four years. Thus, one branch which has done bearing is cut off; and succeeded by another, and when that is tired also, it is cut off and replaced by a third, and so on.

Grafting old apple-trees of indifferent sorts with superior varieties, is an obvious and long tried improvement. In this case, if the tree is a standard, it is only headed down to standard height; in old subjects, most commonly the branches only are cut over within a foot or two of the trunk, and then grafted in the crown or cleft manner.

On fertilising the blossoms of pear and apple-trees.—An almost general unproductiveness, as to the fruit of the superior varieties of pear and apple-trees, has long been a subject of complaint with horticulturists, both in south and north Britain. The Rev. George Swayne (Hort. trans. 5. p. 208.) has a tree of the Gansell's bergamot pear, which had for a long time baffled all his attempts to alter its unfertile habits. The tree had all the appearance of health and sufficient luxuriance, and produced a profusion of blossoms at the proper season, but has never borne more than three or four pears in any one year. Before the blossoms expanded, he cut off all the flowers in each corymb, except the lower three, in this tree, and another tree of the brown beurre. He divested these trees of at least three-fourths of all their flower-buds. On the beurre this operation subsequently appeared to have the best effect, for there was scarcely an instance in which the remaining blossoms did not set, which afterwards produced a fine crop of pears. But on the Gansell, although the blossoms at first seemed to set, and many of them did not fall till Midsummer, yet not a single pear arrived at maturity. By dissecting many of the largest which fell off last, it was plain that the kernels had not been impregnated, indicating
some imperfections in the essential parts of the blossom. In the fall, it is impregnated with pollen of many of the flowers, and the fruits are produced and large well-formed fruit. The cross impregnation had not produced any change in the appearance of the fruit, nor was any difference in flavour discovered.

Before he impregnated the blossoms, he cut off all the buds in the corolla, except the three lowest ones, as in the former year. Whether the result of the above-described experiments be such as to authorize an expectation that artificial assistance in vegetable fecundation will hereafter become of so much importance to gardeners in the instances just alluded to, as in those at present recognized of the cucumber, the melon, the hauhois strawberry, &c. must be left to others to ascertain.

Injures, insects, diseases, &c.—The mistletoe (Viscum album) is frequently, through negligence, suffered to injure trees in orchards, and different species of mosses and lichens those of gardens. "Moss," Mr. Knight observes, "appears to constitute a symptomatous rather than a primary disease in fruit trees; it is often brought on by a damp or uncultivated soil, by the age of the variety of fruit, and by the want of air and light, in closely planted, unpruned orchards. In these cases it can only be destroyed by removing the cause to which it owes its existence."

Blight.—Whatever deranges and destroys the organization of the blossoms, and prevents the setting of the fruit, is in general termed a blight, whether produced by insects, parasitical plants, or an excess of heat or cold, drought or moisture. One of the most injurious insects with which the apple tree has been visited is the Aphid laniger of Lin., the Eriosoma malii of Leach, woolly aphid, apple-bug, or American blight. "The eriosomata," Leach observes, "form what are called improperly galls on the stalks of trees, near their joints and knots, which are in fact excrescences, caused by the efforts of nature to repair the damage done to the old trees by the perforation of those insects, whose bodies are covered with white down." Sam. entyn.—There is no way of getting rid of these insects, but cleaning them off with a brush and water, together with amputation when it has been some time at work; but even this will not do unless resorted to at an early stage of its progress. The caterpillars of many species of butterfly and moth, and the larvae of various other genera of the hemiptera and lepidoptera, &c. as Sarcabæus, Curculia, &c., attack the apple tree in common with other fruit-trees; and on a large scale it is difficult, if not impracticable, to avoid their injurious effects. Burning straw or other materials under the trees has been long recommended; but the principal thing to be relied on is regimen; that is, judicious subsoil and surface soil, culture and pruning.

Ripening the fruit.—Berard, in an essay on the ripening of fruits, which gained the prize of the French Academy of Sciences in 1821, found that the loss of carbon is equal to the ripening of fruit; that this carbon combines with the oxygen of the air, and forms carbonic acid, and that when the fruit is placed in an atmosphere deprived of oxygen, this function becomes suspended, and the ripening is suspended. Hence it results, that most fruits may be preserved during a certain period, by gathering them a few days before they are ripe, and placing them in an atmosphere free from oxygen. The most simple process for effecting this consists in placing at the bottom of a bottle, a paste formed of lime, sulphate of iron, and water; then introduce the fruit, so as to make rest detached from the bottom of the bottle and from each other, and cork the bottle and cover it with cement. Peaches, plums, and apricots have been kept in this way for a month, and apples for three months. (Journ. R. Bot. xi. p. 396.) Doduit of Mazeres, has found that one-third of boiled apple-pulp, baked with two-thirds of flour, having been properly fermented with yeast for twelve hours, makes a very excellent bread, full of eggs, and extremely palatable and light. New Monthly Mag. June, 1821.

Storing the fruit.—The fruit-room ought to be well ventilated, and for this purpose it ought to have a fire-place. The fruit-room was formerly a mere loft, where fruit was kept on the floor in common with onions, with no proper means of separation. Now, however, they are regularly fitted up either with shelves, on which to place slices of different sorts of fruit, or with close shelves, for jars or boxes, &c., according to the various modes adopted for preserving them. The room may be of any form, but one long and narrow is generally best adapted for ventilation, and heating or drying when necessary by a flue. The system of shelves may be placed along one side, and may be raised to the height of six feet or more, according to the number wanted. These shelves are formed of open work, on which to place the slices of fruit, each of which should be numbered, in order to know the kind of fruit contained in each.

Apple-tree. Fl. April. Britain. Tree 3 to 30 feet.

21 P. bonica (Wild. arb. 263. spec. 5. p. 1018.) leaves oval, serrated, clothed with tomentum beneath as well as on the calyx; flowers usually solitary, diocious from abortion; petals linear, length of calyx; styles glabrous. ½. H. Native country unknown, but cultivated in gardens, and perhaps has originated from the Pyrus Malus. P. apetala, Munch. hauv. 5. p. 247. Malus dioica, Audib. cat.

23 P. spectabilis (Ait. hort. kew. 2. p. 175.) leaves oval-oblong, serrated, glabrous as well as the calycine tube; umbels sessile, many-flowered; petals ovate, uniciliate; styles woolly at the base. ½. H. Native of China. Curt. bot. mag. 267. Malus spectabilis, Desf. arb. 2. p. 141. Malus Sinensis, Dum. Cours. ed. 2. vol. 5. p. 429. When it blossoms in perfection no tree can be more showy than the Chinese apple-tree. The flowers are large, of a pale red, when open semidouble, and the buds are of a deeper hue.

Showy or Chinese Apple-tree. Fl. April, May. Clt. 1780. Tree 20 to 30 feet.

24 P. fruítóilla (Willd. spec. 2. p. 1018.) leaves ovate, eminuated, serrated, quite glabrous as well as the calyx; peduncles subulate; styles woolly at the base. ½. H. Native of Siberia? Pyrus Malus β. Ait. hort. kew. 2. p. 175. Malus hybrids, Desf. arb. 3. p. 141. Mill. fig. t. 269. The leaves resemble those of the cherry tree; they are on long petioles.

The flowers are white, much like those of the pear tree. The fruit is globose, when ripe yellowish coloured, but red on the side exposed to the sun, of an austere taste, decaying like the fruit of the medlar, and then more palatable.

Pomaceous or Siberian Crab. Fl. April, May. Clt. 1758. Tree 20 to 30 feet.

25 P. baccata (Lin. mant. 75.) leaves ovate, acute, equally serrated, glabrous, length of pedicels; peduncles crowded; lobes of calyx deciduous. ½. H. Native of Siberia and Dauluria. Wats. den. t. 51. Pall. fl. ross. t. 10. Malus baccata, Desf. arb. 2. p. 141. Amm. ruth. t. 31. Flowers white. Fruit roundish, yellow tinged with red, about the size of a cherry; the pulp is red, and is used for making quassar punch in Siberia.
Tree 15 to 20 feet. 26 P. quinquefolia (Hamilt. ex Lin. soc. herb.) leaves elliptic, acute, downy on the nerves and petioles; pedicels elongated, sessile, 5-6-together, axillary; calyce segments subulate.  7. H. Native of Chittong. Flowers white?

Five-flowered Crab-tree. Tree.
27 P. sieversii (Led. fl. alt. 5. p. 222.) leaves ovate, rather tomentose; flowers umbellate.  7. H. Native of Siberia, at the river Ul'danchi, in the Kirghisian Steppes. P. nova species, Sievers, in Pall. nord. beitr. 7. p. 292. A bush with many stems rising from the same root. Fruit very acid.

Sievers's Crab-tree. Fl. April. May. Tree 8 to 12 feet.
28 P. coronaria (Lin. spec. 687.) leaves broad-ovate, rounded at the base, serrated, and rather angular, smooth; peduncles corymbose, glabrous.  7. H. Native of North America, from Pennsylvania to Carolina. Sims, bot. mag. 2009. Wats. dendr. brit. icon. Mălus coronaria, Mill. Flowers red, and with a very fragrant odour. The fruit is small, sour, and unfit for any but to make vinegar of.

Narrow-leaved Crab-tree. Fl. My, Clt. 1750. Tr. 10 to 20 ft.

Sect. III. Aria (Aria is a name given by Theophrastus to a tree, probably from the name of a place, as many places bear that name). D. C. prod. 2. p. 635. Petals spreading, flat. Styles usually 2 or 3. Pome globose. Flowers disposed in racemose corymbs; peduncles branched. Leaves simple, glandless, clothed with white tomentum beneath. 30 P. Aria (Ehrh. beitr. 4. p. 20.) leaves elliptic, cut, serrated, clothed with adpressed white tomentum beneath; corymbs flat; styles about 2.  7. H. Native of Europe and Siberia, in groves; in Britain, in mountains on a chalky soil, and in the fissures of limestone rocks. Smith, engl. bot. 1838. Crataegus, Aria, Lin. spec. 681. Fl. dan. t. 302. Măpusul Aria, Scop. Sorrhua Aria, Crantz. auct. 1. p. 2. t. 2. —Bauh. hist. 1. p. 65. Young branches very white and downy. Leaves doubly serrated, sometimes with several marginal lobes. Flowers white, in corymbose compound tufts. Fruit globular, scarlet, dotted, mealy, acid, and astringent.

Var. a, obtusifolia (D. C. prod. 2. p. 636.) leaves flat, oval, obtuse, simply serrated, glabrous above in the adult state.  7. H. Fl. dan. t. 302. P. Aria ovatis, Hortul.  
Var. b, acutifolia (D. C. l. c.) leaves oval, stiff, acute at both ends, concave, doubly serrated, grey, cobwebbed above.  7. H. Crataegus longifolia, Duham. ed. nov. 4. t. 34. P. alpina, Willd. enum. 527.

Var. c, undulata (Lindl. hort. trans. 7. p. 234.) leaves flat, oval-lanceolate, broad, undulated, unequally and deeply serrated, acuminate, cobwebbed above.

Var. c, angustifolia (Lindl. l. c.) leaves oval, obtuse, concave, somewhat simply serrated, woolly above.

Var. c, rugosa (Lindl. l. c.) leaves large, ovate-elliptic, doubly serrated, shining above and wrinkled, white beneath.

Var. c, crinita (Lindl. l. c.) leaves flat, orbicularly elliptic, crenate-serrate, retuse, cuneate at the base, smooth above and hoary beneath; branches cobwebbed. P. Aria rotundifolia, Hortul.  7. P. Graeca, Hortul.

Var. c, bullata (Lindl. l. c.) leaves concave, elliptic, acuminate, blistered, coarsely serrated at the apex, entire at the base. P. Aria acuminate, Hortul.

Aria or Common White Beam-tree or White Wild Pear. Fl. May. Brit. Tree 20 to 30 feet.

33 P. vestita (Wall. cat. 679.) leaves, cymes, and young branches clothed with white tomentum; leaves elliptic or obovate-elliptic, acuminate, serrated towards the apex; corymbs branched, terminal.  7. H. Native of Nipaul and Kamaon. Flowers white. Fruit red? Habit of P. Aria.

Clothed White Beam-tree. Tree 20 to 30 feet.
34 P. kaamaonesis (Wall. cat. no. 768.) leaves oblong, pinnafidly lobed and serrated, acuminate, clothed with white down beneath; corymbs, young branches, and petioles tomentose; fruit pear-shaped, about the size of a common medlar, red.  7. H. Native of Kamaon and Sirmore. Flowers small, white. Kamaon White Beam-tree. Tree 20 to 30 feet.

Sect. IV. Tormina'ria (from tormina, gripings; the fruit of P. torminalis was supposed to cure gripings and dysentery by their astrigency). D. C. prod. 2. p. 636. Petals spreading, flat, rather unguiculate. Styles 2-5, connected together, glabrous. Pome turbinate at the base, rather dry, truncate at the apex in consequence of the calyxine lobes being deciduous. Leaves loosely angular, glabrous when in the adult state. Flowers corymbose; peduncles branched.

35 P. tormina'lis (Ehrh. beitr. 6. p. 92.) leaves ovate, somewhat cordate, deeply lobed; lobes serrated, acute, lower ones spreading; when young downy beneath, but in the adult state glabrous.  7. H. Native of Europe, in woods and hedges. In England chiefly in the midland and southern counties. Crater'gus torminalis, Lin. spec. 681. Smith, engl. bot. t. 298. Fl. dan. t. 798. Jacq. aust. t. 443. Sorrhua torminalis, Crantz. aust. p. 85. Flowers white, numerous, in large terminal downy corymbose panicles. Styles 3-4 or 5. The fruit is not much larger than that of the hawthorn, becomes agreeably acid and wholesome after the frost has touched it, and may sometimes be seen in the London fruit-shops. Ray prefers its flavour to the true service, which latter is now become obsolete.

36 P. rivul'a'ris (Dougl. mss. Hook. fl. bor. amer. p. 203. t. 68.) leaves ovate, entire, and angularly somewhat 3-lobed, rather acuminate, acutely serrated, pubescent beneath; corymbs terminal, simple; calyces hairy, and densely tomentose inside; styles 3-4, connected at the base.  7. H. Native of Nootka.
Sound, and other parts of the north-west coast of America. Petals roundish, white. Pome small, hardly half an inch long, subglabrous, red or yellow. The wood is employed for making wedges, and is so hard as to be susceptible of a fine polish. The fruit is used as an article of food, and is called in the language of the Chenook tribe of Indians Pom-itch.

Sect. V. Eriolobus (from erio, erion, wool, and lobos, a lobe; in reference the woolly lobes of the calyx). D. C. pro. 2. p. 636. petals spreading, flat, somewhat unguiculate, rather tridentate at the apex. Styles 5, elongated, rather connected, very hairy at the base. Pome globose, glabrous, crowned by the calycine lobes, which are clothed with tomentum.

Sect. VI. Sorbus (from the Celtic sorrel, composed of sor, wild, and mel, an apple; wild apple). Lin. gen. no. 623. petals spreading, flat or concave. Styles 2-5. Pome globose or turbinately leafed. Leaves impari-pinnate. Flowers corymbose; peduncles branched.

38 P. ari'culata (D. C. prod. 2. p. 636.) leaves of 3 pairs of leaflets, hairy beneath, the lower 2 or 4 leaflets distinct, but the ultimate ones are joined into one large, ovate, crenated leaflet. \( \gamma \). H. Native of Egypt. Sorbus ari culata, Pers. ench. 2. p. 39. Corymbs compact. Flowers white. Perhaps only a variety of Sorbus pinnatifida.

Pinnatifida-leaved Service-tree or Mountain-ash. Fl. May, Cht. 1800. Tree 20 to 30 feet.

39 P. pinnati'fida (Ehrb. beitr. 6. p. 93. Smith, engl. bot. 2331.) leaves deeply pinnatifid or half pinnate, clothed with hoary down beneath, as well as the petioles and peduncules; styles about 3. \( \gamma \). H. Native of Gothland and Thuringia, in mountain woods. In the Western Isles of Scotland on the mountains, particularly in rocky situations on Caithness and Orkney, and other mountains at the north end of the Isle of Arran. P. hybrida, Smith, fl. brit. p. 534. but not of Wild. spec. 2. p. 1092. Sorbus hybrida, Lin. spec. p. 634. Lin. fl. fasic. 11. t. 6. Fl. dan. t. 301. Crata'gus Atr'ia \( \gamma \) Fénica, Lin. spec. ed. 2. p. 167. Flowers cymose, cream-coloured. Pome globose, red. This species is an intermediate plant between P. aucupària and P. A'ria.

40 P. microc'a'rpa (D. C. prod. 2. p. 636.) leaves pinnate, glabrous, as well as the petioles; leaflets acuminated, unequally and deeply serrated, the serratures ending in a seateous mucro; purplish globose, red. \( \gamma \). H. Native of North America, from Carolina to New York. Sorbus aucupària a, Michx. fl. bor. amer. 2. p. 291. Sorbus micrântha, Dum. Cours. ed. 2. vol. 5. p. 464. Sorbus microcárpa, Pursh. fl. amer. sept. 1. p. 341. Flowers whitish.

Small-fruited Mountain-ash. Fl. May, June. Tree 12 ft.

41 P. sam'bucifólia (Cham. in Linnea. 2. p. 36.) leaves with 5 pairs of ovate, lanceolate, sharply serrated, acuminate leaflets, which are pilose on the nerves and margins, and bearded at the apex; stipulas clothed with russet villi. \( \gamma \). H. Native of Kamtschatka.

Elder-leaved Mountain-ash. Shrub.

42 P. aucupa'ria (Gartn. fruct. 2. p. 45. t. 87.) leaves pinnate, downy beneath when young; leaflets uniform, serrated, glabrous; buds and peduncles downy; pomes globose. \( \gamma \). H. Native of Europe and Siberia, in mountains, woods, and hedges; plentiful in some parts of Britain. Sorbus aucupària, Lin. spec. 693. Cranius-Aust. 2. p. 49. t. 1. f. 4. Smith, engl. bot. t. 137. Mill. fig. t. 43. Fl. dan. 1054. Mic'apalus aucupària, All. Flowers white, numerous, with a light almond-like scent; petals concave. Fruit small, globose, scarlet, very juicy, sour, and bitter; they are eaten in some parts of Scotland and Wales, and afford an agreeable fermented liquor, and by distillation a strong spirit; soaked in water to extract some of its bitterness, and then boiled with sugar, makes a kind of jelly, which is tolerably flavoured. Birds of the thrush kind devour them with avidity, and our mountain-ash trees planted for ornament in most parts of England are thus unfortunately stripped early in autumn of their produce. The mountain-ash in profitable planting is chiefly valuable as a nurse tree, growing very fast when young, and enduring the most severe exposure. The timber is used by wheel-wrights, and for other common country purposes; the bark is used by tanners, and the berries afford a dye. As an undergrowth it affords tolerable poles and hoops. It will grow in any soil, dry or wet, and as to situation, it is found on the sea shore, and near the tops of the highest mountains. It seems to thrive best on the sides of moist rocky dells and dingles. In the days of superstition the mountain-ash was considered as an object of great veneration. It is even to be found at this day growing in the neighbourhood of Druidical circles of stones in Scotland. The rodnon tree was formerly in Scotland especially famous as a protection against charms and witchcraft. The tree is called in Scotland rhodon or rodnon tree, roon tree, and rantry. In England mountain-ash, quick-bean, witchen or whitten. In Germany the fowlers' bait-springs or nooses of hair, are suspended in the woods, with these berries attached to them to entice the red-wings and field-fares, whence the specific name aucupària.

Fowler's or Common Mountain-ash or Roon-tree. Fl. May, Britain. Tree 20 to 40 feet.

43 P. americàna (D. C. prod. 2. p. 637.) leaves pinnate; leaflets oblong, acute, almost equally serrated, at length quite glabrous; cymes globose (purple, Pursh; fulvous, Torrey). \( \gamma \). H. Native of North America, in Canada and throughout the woody country; Newfoundland; on the north-west coast, and in the subalpine prairies of the high mountains. Wats. dend. brit. t. 54. Flowers white.

American Mountain-ash. Fl. May. Cht. 1782. Tr. 15 to 20 ft.

44 P. foliolósa (Wall. cat. 677. pl. asiatic. rarr. 2. p. 81. t. 189.) leaves pinnate, with 7-8 pairs of elliptic-lanceolate, mucronate leaflets, which are serrated at the apex, pubescent beneath; cymes branched, terminal, pubescent. \( \gamma \). H. Native of Nipaul. Flowers white. Pome small, obovate-roundish, red.

Leafy Mountain-ash. Tree 20 feet.

45 P. unis'sima (Wall. cat. 675.) leaves pinnate, with numerous pairs of leaflets; leaflets lanceolate, blunt at both ends, mucronate at the apex and cuspidately serrated, rusty beneath; corymbs, branches, racis, and nerves of leaves clothed with rusty villi. \( \gamma \). H. Native of Nipaul, Kamaon, and Gossingshan. Pomes globular, red, about the size of those of the common mountain-ash.

Badger's Mountain-ash. Tree.

46 P. dome'stica (Smith, engl. bot. t. 350.) leaves pinnate; leaflets uniform, serrated towards the points, clothed with deciduous cotton down beneath; buds glabrous, clammy, acumi-
nated; flowers panicled; fruit pear-shaped.  \( \gamma \). Native of Europe, in mountainous parts. In England in the mountainous parts of Cornwall; also in the moorlands of Staffordshire. P. Sörbus, Goert. fruct. 2. p. 45. t. 87. Sörbus doméstica, LIN. spec. 684. CRANZ. str. fasc. 2. p. 48. t. 2. f. 3. Jacq. fl. aust. t. 447. Flowers about the size of those of the headnut, cream-coloured. Styles usually 5. The true service-tree is of slow growth, and, according to Kroker, does not come into bearing before it is 60 years old. The fruit is obovate, about an inch in length, reddish spotted, extremely auster, causing a most painful and disturbing irritation in the throat if tasted in an unripe state; but when mellowed by frost or keeping, it becomes brown, soft, and eatable, resembling a medlar, though to most people less agreeable. It is common in Italy, and ripens at Genoa in September, where it is esteemed good in dysentery and fluxes. The wood, which is very hard, is held in repute for making mathematical rulers and excisemen's gauging sticks. In Italy they have many varieties obtained from seeds; but those generally known in this country are only three; the pear-shaped, the apple-shaped, and berry-shaped. The tree is recommended by Forsyth and Abercrombie to be grown as a standard at 20 or 30 feet distance, and to be pruned and otherwise treated like the apple and pear. It may also be grafted in the same manner on the same kind of stocks, or it may be propagated by seeds, cuttings, or layers, but the first mode is preferable. It is late in the autumn before the fruit can be gathered; after it is collected wipe it dry, and lay it on dry straw, spread on the open shelves of the fruit room, and in about a month it will become mellow and fit for use.

Domestic or True Service-tree.  Fl. May. Britain. Tree 20 to 60 feet.

47 P. lanuginosæ (D. C. prod. 2. p. 637.) leaves pinnate; leaflets serrated, clothed with cottony down beneath, as well as the petioles and buds; pomes globose.  \( \gamma \). Native of Hungary? Sörbus lanuginosæ, Kit. in lit. Flowers white.

Woolly Service-tree.  Fl. May. Tree 20 to 30 feet.

Var. \( \beta \), intermedia (Lindl. hort. trans. 7. p. 220.) fruit globose, brown.  \( \gamma \). H.

VOL. II.
villi above. h. H. Native of Siberia. Malus tomentosa, Dum. Cours. ed. 2. vol. 5. p. 438. Said to be allied to P. bacca, but the flowers as well as the fruit are unknown.

Tomentose Pyrus. Tree.

58 P. rubicunda (Hoffmanns. verz. 1.824. p. 192.) leaves ovate, acuminate, glabrous; pome like that of P. Malus, yellow on one side, and red on the other, covered with a kind of glaucous bloom. h. H. Native country unknown.

Reddish Pyrus. Tree.

Cult. All the species of Pyrus are either trees or large shrubs. They are both useful and ornamental; free growers thrive in any soil, and may be planted in shrubberies, or to stand singly. They may be raised from seeds, cuttings, layers, or by engrafting the rarer on the commoner sorts.

Lin. syst. Icassindria, Pentagynia. Calyx 5-cleft (f. 84. a.). Petals orbicular (f. 84. f.). Stamens erect (f. 84. b.). Styles 5.

P. closed (f.84. g.), 5-celled; cells cartilaginous, many-seeded. Seeds covered with mucilaginous pulp. —Trees, with undivided, quite entire, or serrated leaves, and large flowers, which are either solitary, or few together in a kind of umbel.

1 C. vulgaris (Pers. ench. 2. p. 40.) leaves ovate, blunt at the base, quite entire, clothed with white tomentum beneath, as well as the calyces and pedicels; flowers few, in a kind of umbel. h. H. Native of the south of Europe, among rocks and in hedges. Pyrus Cydonía, Lin. spec. 637. Jacq. austr. t. 542. Woodv. med. bot. t. 73. Cydonia Europae, Savi, alh. tose. 1. p. 90.

The Quince-tree is low, much branched, and generally crooked and distorted. The flowers are large, white, or pale red, and appear in May. The fruit varying in shape in the different varieties, globular, oblong, ovate or obovate; it has a peculiar and rather pleasant apple-smell, and an auster taste. It is mentioned by Tussor in 1753, but has never been very much cultivated.

Use.—The fruit is not eaten raw, but stewed, or in pies or tarts along with apples it is much esteemed. In confectionary it forms an excellent marmalade and syrup. When apples are flat, and have lost their flavour, Forsyth observes, a quince or two in a pie or pudding will add a quickness. In medicine the expressed juice, repeatedly taken in small quantities, is said to be cooling, astringent, and stomachic, &c. A mucilage, prepared from the seeds, was formerly much in use, but is now sup- planted by the simple gums. The fruit taken in small quantity is supposed to restrain vomiting and alvine fluxes. In nursery-gardens the plants are much used as stocks for the pear.

The varieties of the quince are as follow:—

1 Common quince, coignassier commun. This and the two following are often confused with each other; it is very probable that from seeds of either sort varieties have been, and still may be, obtained, some of which would produce apple-shaped, and some pear-shaped fruit.

2 Apple-shaped quince, coignassier maliforme, coignassier pomiforme. Cyd. vulgaris a maliformis, Mill. dict. no. 2. Fruit nearly globose, of the same quality as the last.

3 Pear-shaped quince, coignassier pyriforme. Cyd. vulgaris γ oblonga, Mill. dict. no. 1. Leaves oval or oblong; fruit pear-shaped, of the same quality as the two last species.

4 Portuguese quince, coignassier de Portugal. Cyd. vulgaris, var. Lusitânica, Mill. dict. no. 5. This is a good sort, and distinct from the preceding kinds; it does not become, however, except in very favourable seasons, of so deep an orange; its leaves are broader; its growth less contracted, consequently it is the best sort for grafting pears upon.

5 Orange quince. This and the following possess characters differing so little from what may be found among sub-varieties of the others, that they are scarcely worth distinguishing.

6 Large-fruited quince, coignassier à gros fruit.

Propagation.—Generally by layers, but also by cuttings, and approved sorts may be perpetuated by grafting. In propagating for stocks nothing more is necessary than removing the lower shoots from the larger, so as to preserve a clean stem as high as the graft; but for fruit-bearing trees it is necessary to train the stem to a rod till it has attained 4 or 5 feet in height, and can support itself upright.

Soil and site.—The quince prefers a soft moist soil, and rather shady or at least a sheltered situation. It is seldom planted but as a standard in the orchard, or to grow singly in the garden, and a very few trees are sufficient for any family.

Time of planting, the mode of bearing, and all the other particulars are the same as for the apple and pear.

2 C. sumboshia (Hamilt. in Don. Don. prod. fl. nep. p. 237.) leaves cordate, oval, mucronate, quite entire, clothed with white tomentum beneath, as well as the branchlets and calyces; stipulas elliptic, acute, glandularly serrated; peduncles solitary, terminal, tomentose; calyx segments oblong; pome attenuated at the base. h. H. Native of Nipaul, which is called in the Nawarice language Sumboshi-swa, and Bhe in that of Sirinigr. Very like Cydonia vulgaris.

Sumboshi or Nipaul Quince. Fl. May, June. Tree 20 feet.

3 C. sinensis (Thouin, in ann. mns. 19. p. 145. t. 8 and t. 9.) leaves ovate, acuminate, at both ends, acutely serrated, when young rather villous, but in the adult state glabrous, as well as the calyces; stipulas oblong-linear, glandularly serrated. h. H. Native of China. Pyrus Sinensis, Poir. suppl. p. 4. p. 452. Flowers white. Fruit egg-shaped, large, hard, and nearly dry, greenish. Seeds about 30 in each cell, many of which are abortive. This appears to be an intermediate plant between the last and the following.

Sect. II. CHROMOMELES (from χρωμα, chaino, to open, and μολων, melon, an apple; when the plant was first so called, the fruit examined was split at the top, from some cause or other; perhaps from heat). Lindl. l. c. Lobes of calyx short, obtuse, and quite entire. Stamens inserted in 2 series.

4 C. japonica (Pers. ench. 2. p. 40.) leaves oval, somewhat cuneate, crenate-serrataed, quite glabrous on both surfaces, as well as the calyces; stipulas reniform, serrated. h. H. Native of Japan. Pyrus Japonica, Thumb. fl. jap. p. 207. Curt. bot. mag. t. 682. Moris, fl. consp. t. 1. p. Chromomeles Japonica, Lindl. l. c. Flowers deep scarlet, solitary, or 2-3 together. A very ornamental plant. There is also a white flowered variety, which is also very ornamental.

Japan Quince. Fl. year. Clt. 1815. Shrub 4 to 6 feet.

Cult. All the species of quince are very ornamental when in blossom. The three first species answer well to be planted as standards singly in any conspicuous situation. The C. Japonica
is one of the most elegant hardy shrubs yet introduced to our
gardens, as it produces its beautiful scarlet flowers the greater
part of the year. It is a very proper plant for training against a
wall. All the species may be increased by ripened cuttings off
the roots, planted in a sheltered situation, with a hand-glass
placed over them. They are also to be increased by grafting the
one on the other, or on any of the plants contained in the
present order.

† Genera doubtful whether they belong to the present order.

XII. DICALYX (from ὑποκαλύψις, ὑποκάλυψις, a calyx,
which so named in consequence of the calyx being calcu-
lated by bracteas, which assume the appearance of an outer

the throat of the calyx; the inner ones sterile. Anthers adnate, bursting longitudinally outwardly by 2 cells. Carpels numerous (f. 85. b.), inserted on the inside of the tube of the calyx, as in *Rosa*, 1-celled, biovulate, only one of the ovula coming to maturity, and therefore 1-seeded from abortion. Styles terminal, distinct, exserted from the tube of the calyx; stigmas simple. Carpels of akenia inclosed in the fleshy tube of the calyx, 1-seeded; the pericarp rather corneous. Seed conveyed to the cavity of the akenia, ascending, having the hyllum nearly opposite the ciliate margin of the pericarp. Embryo exalbinoous, straight, with convolute cotyledons, and an inferior radicle.—This order is composed of beautiful hardly early-flowering shrubs, with simple, exstipulate, scabrous, feather-nerved leaves. Flowers yellowish, sweet-scented, or lurid purple, hermaphrodite, solitary, pedicellate, terminal, or in the axils of the leaves of the present or preceding year. The wood, leaves, and flowers of *Calycanthus florisoides* have a scent resembling the quince, hence it is called American allspice. *Calycanthaceae* agree with *Rosaceae* in the carpels or akenia being inserted in the inner sides of the calyx as in *Rosa*, and with *Granataceae* in the opposite leaves, and in the convolute cotyledons of the embryo; in this last respect it also agrees with *Combretaceae*. *Calycanthaceae* differs from *Rosaceae* and *Pomaceae* in the form of the embryo, and from *Granataceae* in the form and imbricate aestivation of the calyx. It differs from both the last-mentioned orders in the absence of petals, in the numerous lobes of the calyx, and in the anthers bursting outwardly.

**Synopsis of the genera.**

1. **Calycanthus.** Lobes of calyx disposed in many series, lanceolate, coriaceous, coloured. Stamens deciduous, 12 outer ones fertile.

2. **Chimonanthus.** Lobes of calyx oval, obtuse, outer ones form of bracteas. Stamens permanent, 5 outer ones fertile.

I. **CALYCANTHUS** (from καλυκτω, calyx, a calyx; and ανθος, anthos, a flower; in reference to the calyx being coloured, and appearing like a corolla). Lindl. bot. reg. no. 404. Nees. nov. act. bonn. 11. p. 107.—Buttneria, Duham. arb. 1. p. 114, but not of Lindl.—Beurrieria, Ehret. pict. t. 13.—Bastiaéría, Adans. fam. 2. p. 295.—Pompadoûr, Duchoz.—Calycanthus species, Lin. Lam. Willd.

*Lin. syst.* Icosandria, Polygynia. Lobes of calyx imbricate, oval, obtuse; outer ones in the form of bracteas; inner ones larger and appearing like a corolla. Stamens nearly equal, permanent, the 5 outer ones fertile, connate at the base, at maturity.—Shrubs, with the flowers rising before the leaves, in the axils of the leaves of the preceding year. Flowers very sweet-scented, yellowish, or purplish inside. Bark and leaves without scent.

1. **Var. β, ovatus;** leaves roundish-ovate. Ait. l. c.

**Smooth American Allspice.** Fl. May, July. Clt. 1806. Sh. 3 to 6 feet.

**Cult.** These shrubs are well worth growing for the exquisite scent of their blossoms, resembling that of ripe apples or quinces; they all grow best in peat borders, although they will grow in any kind of soil, but not so freely as in peat. They are usually increased by layers, put down in the summer.

II. **CHIMONANTHUS** (from χιμω, cheimon, winter, and ανθος, anthos, a flower; in reference to the time of flowering, which is from December to February). Lindl. bot. reg. no. 404. and 451. D. C. prod. 3. p. 2.—Meratía, Nees. in nov. act. bonn. 11. p. 107.—Calycanthes species of Lin. *Lin. syst.* Icosandria, Polygynia. Lobes of calyx imbricate, oval, obtuse; outer ones in the form of bracteas; inner ones larger and appearing like a corolla. Stamens nearly equal, permanent, the 5 outer ones fertile, connate at the base, at maturity.—Shrubs, with the flowers rising before the leaves, in the axils of the leaves of the preceding year. Flowers very sweet-scented, yellowish, or purplish inside. Bark and leaves without scent.

1. **Var. β, praecox;** leaves roundish-ovate. Ait. l. c.

4. **Var. β, grandiflora** (Lindl. bot. reg. 451.) flowers larger and more spreading. Perhaps a proper species, for the fruit of *C. frāgrans* is lageniform, thicker above the base, and tapering at the apex into a long neck, but in the present plant, according to the figure, the fruit is oblong and tapering to the base.

**Cult.** The delightful fragrance of the blossoms, makes the *C. frāgrans* and its varieties desirable objects in all collections.
They thrive in almost any kind of soil, and are usually increased by layers, but young cuttings will also strike root, if planted in a pot of sand, with a bell-glass placed over them, in a little bottom heat. The plants endure our winters in the open air, in a sheltered situation, with very little protection in severe weather. But as they flower during the winter months, the plants are liable to be injured by the frost, if planted in an exposed situation, they are therefore seen to most advantage under shelter, as in a greenhouse, pit, or conservatory.

Order LXXXVII. GRANATEÆ (this order only contains the species of Pomegranate and their varieties). D. Don, in edinb. phil. journ. july 1826. p. 134. D. C. prod. 3. p. 3. A genius of Myrtaceae, Juss. and all other authors.

Calyx with a tubinate tube (f. 86. a.) and a 5-7-leaflet coriaceous, tubular limb (f. 86. c.); segments valvate in actinisation. Petals 5-7 (f. 86. b.). Stamens numerous; filaments free; anthers 2-celled, bursting in front, by 2 chinks. Style filiform. Stigma capitata, papulous. Fruit large, spherical (f. 86. c.), crowned by the limb of the calyx (f. 86. d.), indehiscent; the fruit is the tube of the calyx, divided horizontally into two or three chambers or parts (f. 86. f.), the upper division 5-9-celled, and the lower division 3-celled; the dissipaments membranous, separating the cells; the placentas of the upper division of the fruit fleshy, reaching from the petals to the centre; those of the lower division progressing irregularly from the bottom of the fruit. Seeds innumerable, exalbuminous, covered with pelliculaceous cuticle. Embryo oblong, with a short, straight radicle, and foliaceous, spirally convolute cotyledons. This order is composed of trees or shrubs, with tetragonal subspinose branches, opposite, deciduous leaves, rarely verticillate or alternate; they are oblong-lanceolate and dotless, usually disposed in fascicles in the axils. Flowers 2-5, scarlet, almost sessile, rising near the tops of the branches.—This order only consists of one genus, the well-known pomegranate. It differs from Myrtaceae, in the leaves being destitute of dots, and in being without the marginal nerve, also in the economy of the fruit, the pulp seeds, and in the convolute cotyledons; from Calycanthaceae in the valvate calyx, and in the anthers bursting inwardly; from Memecylaceae in the indefinite stamens; from Combretaceae in the many-celled ovary, and in the situation of the seeds; from Vochysiaceae in the indefinite stamens and regular flowers; and from all in the structure of the fruit.

I. PUNICA (Punica, Carthaginian, because it is a native of the countries from the north of Africa to Rome; or from puniceus, scarlet, from the colour of the flowers). Tourn. inst. t. 401. Lin. gen. no. 618. Gaertn. fr. 1. t. 38. D. C. prod. 3. p. 3.

Lin. syst. Icosándria, Monogónia. Character the same as the order.

1. P. GRANATUM (Lin. spec. 676.) leaves lanceolate; stem arborescent. H. H. Native of Barbary, from whence it has migrated into the south of Europe, and now as it were become indigenous.

* flore-pleno; flowers double, scarlet. More impatient of cold than the single variety. Trew. ehret. t. 71. f. 2.

Var. ãlbescens; corolla white; calyx yellowish; pulp surrounding the seeds pale. H. H. Less impatient of cold than the preceding variety. Andr. bot. rep. 96.

* flore-pleno; flowers double, white, having the calyx yellowish. H. H. This variety is very impatient of cold.

Var. ãlbus, flore pleno; flowers yellow.

This variety is very rare.

The rind of the fruit and the flowers of the pomegranate are the parts directed for medicinal use. They are both powerful astringents, and have long been successfully employed as such both externally and internally as gargles, in diarrhœas, &c. The dose in substance is from half a draehm to a draehm. In infusion or decoction to half an ounce. The pulp is subacid, allaying heat, quenching thirst, and gently laxative.

2 P. ãNA (Lin. spec. 676.) leaves linear; stem shrubby. H. G. Native of the West India Islands, and South America; about Demerara, &c. Sims. bot. mag. 634. Trew. ehret. t. 71. f. 3. Flowers red. Perhaps only a variety of the preceding. The flowers are much smaller than those of the common pomegranate, and the fruit is about the size of a nutmeg. In the West Indies, where it is a native, it is planted for hedges, and continues flowering all the year.

Dwarf Pomegranate. Fl. Jul. Sept. Cht. 1729. Sh. 5 to 6 ft. Cult. There is no tree more showy than the Pomegranate, when in flower. It is best planted against a wall with a south aspect. All the varieties strike root freely from cuttings or layers; the rarer varieties are sometimes increased by grafting on the commoner kinds. Those varieties most impatient of cold had better be grown in pots, that they may the more easily be protected by placing under shelter in the winter.

Order LXXXVIII. MEMECYLIÆ (plants agreeing with Memecylon in important characters). D. C. prod. 2. p. 5.

Calyx with an ovate or subglobose tube and a 4-5-lobed or 4-5-toothed limb. Petals 4-5, inserted in the calyx and alternating with its lobes. Stamens 8-10, or double the number of the petals; filaments free; anthers incurved, 2-celled. Style filiform. Berry crowned by the limb of the calyx, 4-5-celled. Seeds few, exalbuminous. Cotyledons foliose, convolute. Radicle straight.—Intratropical shrubs, with simple, quite entire, dotless, opposite leaves, which are nearly always feather-nerved; and axillary pedicellate flowers. This is a very doubtful order, but is, on account of its convolute cotyledons, allied to Calycanthaceae, Granátaceae, and Combretaceae, but from the form of the anthers and the number of the parts of the flower, it is nearer related to Melastomáceae, nor is it far removed from Myrtaceae in the habit, flowers, and opposite leaves.

Synopsis of the genera.

1 Memécylon. Calyx with a globose tube and a bluntly 4-

1. MEMECYLON (from μεμεκύλον of Dioscorides, the Greek name of the fruit of the Arbutus). Lin. gen. no. 481. Lam. dict. 4. p. 88. ill. t. 284. Pet. Th. obs. p. 57. and p. 58. but not of Mitch. D. C. prod. 3. p. 5.—Valikaha, Adams. fam. 2. p. 84.

Lin. syst. Octandria, Monogyinia. Calyx with a hemispherical or subglobose tube, and a small limb strait at the bottom, and with a bluntly 4-toothed, repand, or entire border. Petals 4, oval. Stamens 8, longer than the petals; filaments free; anthers incurved, fixed by the middle, acutely beaked at one end, and blunt at the other, and bearing 2 polliniferous cells each. Style 1, filiform, bearing a simple stigma. Berry nearly dry, globose, crowned by the limb of the calyx; when young 2-4-celled, cells 2-seeded; but when mature 1-celled, and 1-seeded. Nut brittle, easily separated from the calyx. Seed pendulous, exalbuminous. Cotyledons foliaceous, convolute. Radicle superior, acute.—Shrubs having the branches nodose, at the origin of the leaves. Leaves glabrous, rarely 3-nerved, usually feather-nerved. Flowers axillary, in fascicles, or in racemose heads, of a bluish-violet colour. Bracteoles small, opposite, sometimes connate under the flowers and at the bifurcations of the pedicels.

* Branches tetragonal.

1 M. trinerve (D. C. prod. 3. p. 5.) branches acutely tetragonal; leaves almost sessile; flowers in fascicles, nearly sessile, at the knots of the branches. ɣ. S. Native of the East Indies. Leaves bluntish, with revolute margins, 2 inches long and 1 broad.

Three-nerved-leaved Memecylon. Shrub 3 to 4 feet.

2 M. angulatum (Reichb. in Sieb. pl. exsic. maur. 2. no. 116.) branches acutely tetragonal; leaves on very short pedicels, oval, rather attenuated at both ends, bluntish, 1-nerved; flowers pedicellate, in fascicles at the knots of the branches. ɣ. S. Native of the Mauritius. Melaleuca ovatifolia, Poir. suppl. 3. p. 624. Petioles 1-2 lines long. Leaves 2 inches long and 10-12 lines broad. Pedicels usually bifid and 2-flowered.

Angular-branched Memecylon. Shrub 3 to 4 feet.

3 M. oloterum (D. C. prod. 2. p. 5.) branches 4-winged; the wings curved; leaves sessile, ovate-elliptical, somewhat emarginate at the apex, shining on both surfaces, scarcely 1-nerved. ɣ. S. Native of Madagascar. Leaves 5-6 lines long and 4 lines broad. Flowers solitary, pedicellate in the specimen examined but it is badly preserved.

All-winged-stemmed Memecylon. Shrub 2 feet.

4 M. subquadranulare (D. C. prod. 2. p. 6.) branches tetragonal at the apex; leaves sessile, ovate, bluntish, 1-nerved; flowers pedicellate, in fascicled umbels at the knots of the branches. ɣ. S. Native of the East Indies. Leaves 2 inches long and an inch broad. Pedicels 2-3 lines long. Border of calyx entire. Flower-bud tetragonal, acute.

Subangular-branched Memecylon. Shrub 3 to 4 feet.

** Branches terete.

5 M. cardifolium (Lin. spec. 407.) branches nearly terete; leaves oval, on short pedicels, bluish, 1-nerved; peduncles axillary, 3-times longer than the pediote, bearing a head of flowers. ɣ. S. Native of Ceylon. Burm. zeyl. t. 30. Lam. ill. t. 284. f. 1. Blum. bijdr. p. 1094. Fruit globose, rather ventricose at the base, crowned by the bluntly 4-toothed calyx.

6 M.整形obrum (D. C. prod. 2. p. 6.) branches nearly terete; leaves on short pedicels, oval, obtuse, sub-attenuated at the base, 7-nerved; peduncles axillary, many-flowered, hardly longer than the pedicles. ɣ. S. Native of the Mauritius. M. inornatum, Sieb. pl. exsic. maur. 2. p. 115. and perhaps of Willd. Leaves yellowish when dried, with rather revolute margins, 2 inches long and 1 broad. Fruit exactly globose, smaller than those of the preceding, with the limb of the calyx caducous. Flower-bud conical, acute. Border of calyx nearly entire.

Round-fruited Memecylon. Shrub 3 to 4 feet.

Loose-flowered Memecylon. Shrub 3 to 5 feet.

8 M. raniiflorum (Lam. dict. 4. p. 88.) branches nearly terete; leaves on short pedicels, elliptic, bluntish, 1-nerved; flowers in umbellate fascicles, borne in the axils and beneath the leaves; style twice the length of the stamens. ɣ. S. Native of the Mauritius and Ceylon. M. umbellatum, Blum. bijdr. p. 1094. ? Melaleuca bicolor, Poir. suppl. 3. p. 624. The figure in Burm. zeyl. t. 31. agrees well with this species, but the flowers are there represented as tetradinous, not octandrous.

Branch-flowered Memecylon. Shrub 4 to 5 feet.

9 M. exsulatum (Blum. bijdr. p. 1094.) branches? leaves on short pedicels, elliptic-oblong, bluntly acuminate, glabrous, and rather veiny, pale beneath; fascicles of flowers corymbose, axillary; fruit oval. ɣ. S. Native of Java, on Mount Salak.

Tail Memecylon. Tree 30 feet.

10 M. ovatum (Smith, in Rees' cyclo. vol. 23. no. 3.) branches nearly terete? leaves on long pedicels, ovate, bluntly acuminate; peduncles rising on the naked parts of the branches, aggregate, umbelliferous; base of calyx 8-nerved. ɣ. S. Native of the East Indies. Petioles half an inch long. Leaves 3 inches long.

Ovate-leaved Memecylon. Shrub 4 to 6 feet.

11 M. edule (Roxb. cor. 1. t. 88.) branches terete; leaves on short pedicels, broadly ovate, obtuse, 1-nerved; peduncles tetragonal, usually rising from the knots beneath the leaves, umbellately racemose, many-flowered; style about equal in length to the stamens. ɣ. S. Native of Coromandel, in every jungle. Fruit juicy, crowned by the 4-toothed limb of the calyx; when ripe they are eaten by the natives; they have much pulp of a bluish-black colour, and of an astringent quality.

Edible Memecylon. Cht. 1820. Tree 10 to 12 feet.

12 M. acuminate (Smith, in Rees' cyclo. no. 4.) branches terete? leaves on short pedicels, elliptic, acute; peduncles axillary, very short, umbelliferous; style about equal in length to the petals. ɣ. S. Native country unknown.

Acuminate-leaved Memecylon. Tree.

t. 15. Flowers purple. Fruit globose, ex Blum. Perhaps many species are confused under this name.

**Great Memecylon.** Tree 1 to 12 feet.

14 M. cordatum (Lam. dict. 4. p. 89. ill. t. 284. f. 2.) branches nearly terete; leaves sessile, coriaceous, and with a truncate, spreading, flabby-stemmed, petiole, oval, very blunt, sometimes retuse, attenuated at the base, coriaceous, veinless; umbels corymbiform, axillary; fruit globose. \( \text{S}. \) Native of the East Indies and the Mauritius.

**Var. a**, pedunculatum (D. C. prod. 2. p. 7.) peduncles nearly equal in length to the leaves; leaves smaller. \( \text{S}. \) Native of the East Indies.

**Var. \( \beta \), brépides (D. C. l. c.)** peduncles much shorter than the leaves; leaves larger. \( \text{S}. \) Native of the Mauritius.

**Cordate-leaved Memecylon.** Shrub 4 to 5 feet.

15 M. ferreum (Blum. bijdr. p. 1095.) branches terete? leaves petiolate, ovate, very blunt, sometimes retuse, attenuated at the base, coriaceous, veinless; umbels corymbiform, axillary; fruit globose. \( \text{S}. \) Native of Java, on the mountains.

**Iron Memecylon.** Shrub 4 to 5 feet.

16 M. cinnamomoides; leaves elliptic, obtusely acuminate, 3-nerved, glabrous, attenuated at the base; peduncles axillary, aggregate, longer than the petioles, umbellate, few-flowered. \( \text{S}. \) Native of Sierra Leone. (v. s. herb. Lamb.)

**Cinnamom-like Memecylon.** Shrub 5 to 6 feet.

17 M. Arzezii; leaves elliptic, attenuated at both ends, coriaceous, 1-nerved, ending in a long acumen at the apex; peduncles twin or tern, axillary; flowers umbellate. \( \text{S}. \) Native of Sierra Leone. (v. s. herb. Lamb.)

**Asphelina's-leaved Memecylon.** Shrub 5 to 6 feet.

18 M. Blackfoot; leaves large, sessile, very broad, coriaceous, strongly 3-nerved, the lateral veins running into a marginal nerve; corimbis compound, pedunculate, axillary. \( \text{S}. \) Native of Sierra Leone, in the woods in the low lands.

**Black-la velvet Memecylon.** Shrub 6 to 10 feet.

**Cult.** A mixture of sand, loam, and peat suits the species of Memecylon. Young cuttings, planted in a pot of sand, with a hand-glazed placed over them in heat root freely.

**Lin. syst. Octo-DCentria, Monogynia.** Calyx with the tube adhering to the ovary, and with a truncate, spreading, flabby-saucer-formed limb. Petals 4-5, convoluted, seated on the border of the calyx. Stamens 8-10, with inflexed filaments and curved oblong anthers. Style filiform, simple at the apex. Berry 8-celled; cells 1-seeded. Seed compressed.—Small smooth trees, with opposite, lanceolate, quite entire leaves; and axillary and terminal peduncles, bearing blue or violaceous flowers. This genus is probably not distinct from Memecylon.

1 S. scutella (Lour. l. c.) peduncles axillary, many-flowered; berries compressed. \( \text{S}. \) Native of Cochin-china. Flowers and fruit violaceous.

**Saucer-calx Memecylon.** Shrub 8 feet.

2 S. umbellata (Lour. l. c.) umbels terminal; berries roundish. \( \text{S}. \) Native of Cochin-china. Flowers white and party-coloured.

**Umbellata-flowered Memecylon.** Shrub 4 feet.

**Cult.** See Memecylon for culture and propagation.

**Lin. syst. Decandria, Monogynia.** Calyx furnished with 2 scales at the base; tube adhering to the ovary; limb urceolate, 5-cleft. Petals 5, broad at the base, inserted near the apex of the calyx, and alternating with its teeth, twisted in eversion. Stamens 10, rather unequal. Anthers oblong, opening by 2 pores at the apex. Ovary nearly globose. Style filiform. Stigma capitulate. Berry globose, crowned by the corollate toothed tube of the calyx, 1-4-celled, 1-4-seeded.—Glabrous shrubs with nodose branches, opposite, feather-nerved, acute, quite entire, coriaceous leaves, and axillary peduncles. This genus is allied to Melastomaceae, according to Richard, but according to R. Brown and E. Meyer it is intermediate between Myrtaceae and Melastomaceae; with the first it agrees in the elevated dots and feather nerves of the leaves, and with the last in the structure of the anthers.

1 M. MYRTILLOIDES (Poir. dict. sci. nat. 33. p. 163.) leaves almost sessile, ovate, attenuated, oblulate at the base; pedicels solitary, 1-flowered. \( \text{S}. \) Native of Hispaniola and Jamaica, in woods in the lowlands. Petaloma myrtilloides, Swartz, fl. ind. occ. 2. p. 833; t. 14.—Sloane, hist. 2. p. 78; t. 87. f. 3. Flowers white. Berry ovate, black, 1, rarely 2-seeded, and 1-celled, ex. Swartz. The bark is smooth and grey, with some very white spots, whence its name of silver-wood. The wood is hard, tough, heavy, and good for looms, handles, staves for oars, &c.

**Silver-wood.** Clt. 1823. Shrub 2 to 3 feet.

2 M. guanensis (Aubl. guian. 1. p. 453; t. 180.) leaves on short petioles, ovate, acuminate, feather-nerved; peduncles crowded in the sides of the calyx, 1 or few-flowered; style filiform. \( \text{S}. \) Native of Guiana, in woods at the river Sinimari, where it is called Mourichira. Lam. ill. t. 360. Petalóma Mouriri, Swartz, fl. ind. occid. 835. Flowers yellow. Berry globose, yellow, dotted with red, 1-celled, 4-seeded. ex Aubl. Wood hard and whitish.

**Guiana Silver-wood.** Clt. 1817. Shrub 3 to 4 feet.

3 M. cauiflora (D. C. prod. 2. p. 7.) leaves nearly sessile, ovate, much acuminate, somewhat coriaceous at the base; peduncles rising in umbellate fascicles from the old trunk. \( \text{S}. \) Native of Brazil, in woods. Petalóma cauiflora, Mart. mss. Trunk straight; branches horizontal. Petals white. Filaments of a rose-white colour. ex Mart. Young fruit 5-celled, or only 2-4-celled from abortion.

**Stem-flowered Silver-wood.** Tree 1 to 12 feet.

4 M. grandiflora (D. C. prod. 2. p. 8.) leaves on short petioles, ovate, acuminate, feather-nerved; peduncles short, few-flowered, crowded at the sides along the branches; style compressed. \( \text{S}. \) Native of Para, in Brazil. Petals oval, attenuated at the base, thick, rather coriaceous. Anthers large.

**Great-flowered Mouriria.** Shrub 3 to 4 feet.

† Species not sufficiently known.

5 M. mexicana (Moc et Sesse, fl. mex. icon. indic. ex D. C. prod. 3. p. 8.) \( \text{S}. \) Native of Mexico. Like M. Guianensis, but the petals are rose-coloured; anthers hardly acute at the base, and the berries are red and 4-celled.

**Mexican Silver-wood.** Shrub.

**Cult.** See Memecylon for culture and propagation.

Flowers hermaphrodite, rarely polygamous from abortion. Calyx with the tube adhering to the ovary (f. 88. a.); and with a 4-5-lobed (f. 88. e. e f. 89. a.) limb, which falls off as the flower decays. Petals sometimes wanting (f. 88. e.), but usually
4-5 (f. 89. b.), inserted near the top of the tube of the calyx, and alternating with its lobes (f. 89. b.). Stamens inserted in the tube of the calyx (f. 88. c. f. 89. a.), usually double the number of the lobes of the calyx (f. 89. c.), rarely equal or triple that number; filaments exerted, free, filiform or subulate; anthers 2-celled, bursting lengthwise. Ovary 1-celled, 2 (f. 88. a.)-5 (f. 89. c.)-ovulate; ovula pendulous from the apex of the ovary. Style 1, slender (f. 88. d. f. 89. d.). Stigma simple. Fruit drupaceous, baccate or nucamentaceous, 1-celled, indehiscent, 1-seeded from abortion, and usually furnished with longitudinal wings. Seed pendulous, filling the cavity of the pericarp, exalbaminous. Embryo straight, having the radicle directed to the hynum, with an inconsiderable plumule, and foliaceous cotyledons, which are sometimes flattish and reflexed by a middle plait, but usually convolute, that is, spirally folded round the axis, continuous with the radicle.—Trees or shrubs, for the most part natives within the tropics, with alternate or opposite, exstipulate, feather-nerved, entire leaves, and axillary or terminal spikes or racemes of flowers.

**Combrețeece** agrees with Myrțaceee, in the structure of the embryo; in this respect it also accords with Rhusophọrée; and with Alangiee, and Onagrariee, in the general structure of the flower. With Eleagneece and Santalacee, the apetalous genera agree in many important particulars. The properties are mostly astringent.

**Combrețum** and Quisqualiis are among the most splendid of the climbing plants of the tropics, adorning the trees from which they hang with garlands of white, crimson, and yellow flowers. The bark of Buċida Buceras is used with success in Guiana for taming leather. The juice of Terminälia vērni is employed by the Chinese as a varnish; it is, however, caustic, and its exhalation dangerous; benzoin is the produce of Terminälia Benzoin. The kernel of several species is eaten as a nut, and the expressed oil has the remarkable quality of not becoming rancid.

**Synopsis of the genera.**

**Tribe I.**

**Termináliael.** Flowers apetalous.

1 **Buċida.** Flowers hermaphrodite, apetalous. Calyx with an unreeoluted 5-toothed limb. Stamens 10. Drupe baccate, containing an angular putamen.

3 **Terminália.** Flowers usually polygnalous from abortion, apetalous. Calyx campanulate, 5-cleft (f. 88. a.) Stamens 10 (f. 88. c.). Drupe crowned by the calyx, usually dry and 1-seeded (f. 87. a. b.).

4 **Pentańtra.** All as in Terminália, but differs in the fruit being furnished with 5-7 vertical exserted wings.

5 **Gețonia.** Flowers hermaphrodite, apetalous. Calyx campanulate, 5-parted. Stamens 10. Fruit ovate, oblong, crowned by the calyx, pentagonal.

6 **Chuncm.** Flowers apetalous, some hermaphrodite, and some male. Calyx 5-cleft. Stamens 10. Fruit drupaceous, 5-angled; angles winged, two of the wings larger than the rest.

7 **Ramátél.** Flowers unknown. Fruit 3-angled; angles winged at the apex.

8 **Cosókrep.** Flowers hermaphrodite, apetalous. Calyx 5-cleft. Stamens 5-10. Fruit corky, scale-formed, closely imbricated into a head resembling a cone.

**Tribe II.**

**Combrețee.** Flowers with 4 to 5 petals.

9 **Lagunculária.** Flowers hermaphrodite. Calyx 5-cleft, permanent. Petals 5, minute. Stamens 10, inclosed. Fruit marginate, coriaceous, crowned by the calyx.

11 **Combrețum.** Flowers hermaphrodite. Calyx cylindrical (f. 89. a.) or campanulate, 4-5-toothed. Petals 4-5 (f. 89. b.). Stamens 8-10. Fruit narrow, oval, furnished with 4-5 vertical wings (f. 89. c.).

† **Genera not sufficiently known.**

15 **Ceratoståchys.** Flowers hermaphrodite. Calyx with an entire limb. Petals 8, small. Stamens 8-16, unequal. Drupe baccate, crowned by the limb of the calyx.

**Tribe I.**

**TERMINÁLIEL.** (plants agreeing with Terminália in having apetalous flowers). D. C. prod. 3. p. 9.—Myrabolâneæ, Juss. in ann. mus. 5. p. 222.—Termináliaeæ, Jann. exp. fam. 1. p. 178. t. 29.—Elegnória, gen. Juss. gen. p. 75. —Flowers apetalous, usually dioecious or polygnalous.

1. **BućiDA (from bocov, Louis, an ox; Dr. Browne had named this tree bucerasis, from bovus and exopos, from the shape of the process terminating the spike of flowers resembling a bull’s horn).** Lin. gen. 541. Lam. ill. t. 356. Gaertn. fruct. 3. p. 208. t. 217.—Buceras, P. Browne, jam. t. 23. f. 1.—Hudsonia, Robins, in Jam. hort. jum. 2. p. 310. but not of Lin.

**LIN. SYST.** Decândria, Monoginia. Flowers hermaphrodite. Limb of calyx urceolate-campanulate, 5-toothed, deciduous. Petals wanting. Stamens 10, inserted by 2 series, 5 at the base of the limb, and the 5 longest inserted between the incisures of the calyx. Anthers didymous. Style subulate, acute. Drupe baccate, containing an angular putamen. Ovula 5. Seed 1,
cylindrically oblong.—West India trees, with scattered leaves, crowded at the tops of the branches. Peduncles axillary. Flowers disposed in spikes or heads.

1 B. **bucida** (Linn. spec. 556.) leaves ovate-cuneiform, obtuse, glabrous; flowers disposed in cylindrical spikes, densely clothed with adpressed silky pubescence. ½ S. Native of the West Indies, in low swampy clayey lands near the coast. Flowers small, yellowish. Sloane, hist. 2. t. 189. f. 3. Browne, jam. t. 23. f. 1. Lam. ill. t. 356. The ends of the branches sometimes shoot out into a monstrous spongy excescence, like an ox’s horn, probably formed by insects; hence the specific name. Browne says this tree is remarkable for its slender crooked branches, and the tufted disposition of the leaves, that it grows to a considerable size, is reckoned an excellent timber tree, and that the bark is greatly esteemed by tanners. In Jamaica it is called Black **olive**, in Antigua **French oak**, and in the French Islands Grignon.

2 B. **augustifolia** (D. C. prod. 2. p. 10.) leaves cuneiform, obtuse, glabrous; flowers disposed in cylindrical spikes, clothed with rufous velvety down. ½ S. Native of Guiana. This species comes very near to **Bucida buicera**, but the leaves are not half so broad, and on shorter petioles, and the spikes are more numerous from the same knot, and the stamens are more exserted.

Narrow-leaved Olive-bark-tree. Tree 20 feet.

Capitate-flowered Olive-bark-tree. Tree 20 to 30 feet.

4 B. **megapotamica** (Spreng. syst. append. p. 177.) racemes subcorymbose; bracteas silky; calyxes wooley; leaves oblong-lanceolate, obtuse, rather mucronate. ½ S. Native of Brazil, at the Rio Grande.

 Cult. The species of **Bucida** grow best in a mixture of loam and peat, and cuttings of well-ripened wood strike freely, if planted in a pot of sand, with a hand-glass placed over them, in heat.

II. **AGATHISANTHES** (from *agnos*, agathis, a round head, and *anthes*, anthos, a flower; in reference to the flowers being disposed in pedunculate heads). Blum. bijdr. p. 645. D. C. prod. 3. p. 10.

Linn. syst. Dioecia, Decándria. Flowers dioecious, apetalous. Calyx of the male flowers 5-parted, with the lobes connivent iniricately. Stamens usually 10; filaments very short, inserted in a flat disk; anthers didymous. Calyx of the female flowers with a short 5-toothed limb. Style short, bifid, perforating the flat disk. Ovary 1-ovulate. Drupe baccate, umbilicate, containing a 1-seeded compressed nut. Embryo exalbuminous, inverted.—A tree 120 feet high, with crowded, oblong, quite entire, coriaceous leaves; and axillary and lateral, solitary or twin stalked heads of flowers. This genus is intermediate between **Bucida** and Ceratostachys.

1 A. **java** (Blum. l. c.). ½ S. Native of Java, in woods on the higher mountains on the west side of the island, where it is called by the natives *Hirang*.

Java Agathisanthes. Tree 120 feet.

 Cult. See **Bucida** for culture and propagation.

III. TERMINALIA (from *terminus*, end; so named from the leaves being in bunches at the ends of the branches, in

Linn. syst. Polygynium, Monoecia. Flowers usually polygamous from abortion. Limb of calyx campanulate (f. 88 c. c.), deciduous, 5-cleft; lobes acute. Petals wanting. Stamens 10, inserted by 2 series, longer than the calyx. Ovary biovulate (f. 88. a.). Style filiform, acutish (f. 88. d.). Drupe not crowned by the calyx, usually dry, indehiscent, 1-seeded. Seed amygdalaceous. Cotyledons spirally convolute (f. 88. b.).—Tropical trees and shrubs, with alternate leaves, usually crowded at the tops of the branches. Flowers disposed in spikes; spikes racemose or panicles; the flowers in the lower part of the spikes hempaphrodite, in the upper part male. This genus is divisible by the fruit, but that in most of the species being unknown, the greater part of them remain in uncertain divisions. Those species with a 4-cleft calyx and 8 stamens ought probably to be excluded from the genus.

Sect. I. **Catappa** (the Molucca name of **T. Catappa**). Guian. fruct. 2. p. 206. t. 127. and 3. p. 207. t. 217.—**Terminalia**, Lam. ill. t. 848. Drupe compressed, winged at the margins (f. 87. a.), or much attenuated, containing a woody putamen.

1 T. **Tanjoubo** (Smith, in Rees’ cyc. vol. 35. no. 11.) leaves elliptic, acuminate at both ends, quite entire, when young rather pubescent, when adult smooth; petals glandless. ½ S. Native of French Guiana. Lam. ill. 848. f. 3. R. Br. prod. nov. holl. 1. p. 521. Tanboioca Guianensis. Aubl. guian. 1. t. 178. Catappa Guianensis, Guern. fruct. 3. p. 207. t. 217. **Tanjoubo** is the Guiana name of the tree.

Tanboioca Terminalia. Tree 25 feet.

FIG. 87.

2 T. **augustifolia** (Jacq. hort. vind. 3. t. 100.) leaves linear-lanceolate, rather repand, attenuated at both ends, pubescent beneath and on the petals, or pilose; petiole furnished with 2 glands at the apex. ½ S. Native of the East Indies. Crémon Benzoé, Lin. mant. 297. T. Benzoé, Lin. fil. suppl. Lam. dict. 1. p. 349. Catappa Benzoé, Guern. fr. 2. p. 206. t. 127. T. Benzoé, Pers. Branches in whorles. This tree produces one kind of benzoin; it is procured by wounding the tree; it is composed of large white and light brown pieces, breaking very easily between the hands. When gently dried it forms a white powder, formerly in great request as a cosmetic. Its scent is one of the most agreeable. But the most striking ingredient of this resin is the benzoic acid.

Narrow-leaved Terminalia. Ct. 1692. Tree 20 to 40 feet.

3 T. **vernix** (Lam. dict. 1. p. 350.) leaves linear-lanceolate, tapering to both ends, glabrous as well as the branches and petioles. ½ S. Native of the Moluccas. *A'lor verniciis*, Rumph. amb. 2. p. 259. t. 86. Perhaps the petiole is furnished with 2 glands. The juice of the tree is employed in the countries of its natural growth as a varnish.

Varnish Terminalia. Tree 15 feet.

4 T. **Mauritiana** (Lam. dict. 1. p. 349. ill. t. 848. f. 3.) leaves oblong-lanceolate, attenuated at both ends, rather repand, glabrous; petiole furnished with 2 glands at the top. ½ S. Native of the Mauritian and Bourbon, where a resin is collected

Mauritian Terminals. Tree 40 to 50 feet. 5 T. Catappa (Linn. mant. 519.) leaves obovate, tapering to the base, pubescent beneath; glands small, situated at the base of the leaves on the under surface at the sides of the middle nerve. s. Native of the East Indies, and now cultivated in many of the West India islands. Jacq. icon. rar. 1. t. 197. Lam. ill. t. 818. f. 1. Adamârum, Rheed. mal. 4. t. 3. and 4. Fruit ovate-roundish, compressed. Leaves obtuse, and somewhat acuminate. Drupe about 3 inches long, egg-shaped, containing an oblong kernel, which has the taste of an almond, and may be used for the same purposes, but it does not contain so much oil. Within the tropics the trees are commonly planted near houses in avenues, and seeds are placed under them, for the enjoyment of the close extensive shade they afford. The timber is light and lasting, and is useful for many purposes. The bark and leaves yield a black pigment, with which the Indians dye their teeth, and Indian ink is made. Blume describes this T. Catappa (bijdr. p. 640.) as having the leaves cordate at the base, obesely crenuluated, glabrous, and rather pubescent on the mid-rib beneath.

Var. beta, subcordata (Willd. spec. 4. p. 968.) leaves obovate, rather cordate at the base, obtuse, pubescent beneath, or glabrous in the adult state; glands small, situated at the base of leaves beneath, at the sides of the middle nerve. s. Native of the West Indies, but only perhaps cultivated there. H. B. et Kunth, nov. gen. amer. 6. p. 113. T. internâdia, Bert. cx Spreng. syst. 2. p. 359. Hardly distinct from the species.

Catappa Terminalia. Clt. 1778. Tree 20 to 40 feet. 6 T. Mollucana (Lam. dict. 1. p. 349.) leaves obovate, obtuse at the base, and biglandular, quite entire, glabrous on both surfaces in the adult state, standing on short pedicels. s. Native of the Moluccas and East Indies. Catappa, Rumph. amb. 1. p. 174. t. 68. This species differs from T. Catappa in the flowers being usually double the size, in the disk being large and villous, and in the drupe being larger and hardly crested.

Molucca Terminal. Clt. 1804. Tree 30 to 40 feet. 7 T. Glabra (Forst. prod. p. 889. pl. escul. p. 58.) leaves obovate, cuneate at the base, quite entire, glabrous on both surfaces; pedicels longish, pubescent. s. Native of the Friendly and Society Islands. Spreng. antiqu. bot. t. 2. According to Forster, this species differs from T. Catappa in the leaves being glabrous beneath, and not above half the size, and in the nut being very much smaller, oval, less furrowed, never marginate, but acute, compressed, and membranous, and as if it was appendiculated at the apex. In the South Sea islands this tree is cultivated near the huts and in the burial-places. In the language of Otaheite it is named Aewira or e-Tara-iui and e-Tara-heimi, and is accounted sacred to their idols. The wood is used in building boats, and in making drums, benches, &c. The kernels are eaten and have the flavour of almonds.

Río Janeiro Terminalia. Tree 6 to 10 feet. 9 T. Føglia (Mart. fl. bras. 1. p. 42. t. 29.) leaves in fascicles, ovate, or oval-oblong, acutish, mucronate, glandless, clothed with silky villi on both surfaces; spikes naked at the base, axillary, crowded with flowers, shorter than the leaves; drupe large, furnished with 2 wings. s. Native of Brazil, in the province of Minas Geraes, where it is called Caxapora de Gento. Nectary fleshy, plicately 5-lobed at the base of the style.

Beach-leaved Terminalia. Tree 10 to 30 feet. 10 T. Lanceolata (Mart. l. c.) leaves in fascicles, ovate-lanceolate, acutish, mucronate, clothed with silky pubescence. s. Native of Brazil, in the province of Bahia. Said to be like the preceding, but the branches are slenderer, epidermis thinner, and the leaves are lanceolate, green, and tapering more to the base.

Lanceolate-leaved Terminalia. Shrub 8 to 10 feet. 11 T. Argentea (Mart. fl. bras. 1. p. 43.) leaves opposite, ovate, acuminate, pubescent above, and shining and silky beneath. s. Native of Brazil, in the province of Bahia, at Villa do Rio da Contas. A yellow resinous juice flows from this tree, which is used instead of gamboge by the inhabitants.

Silvery Terminalia. Tree. 12 T. Spreng. (St. Hil. fl. bras. 2. p. 243.) leaves oblong, acuminate, quite entire, glandless, clothed with silky down; flowers disposed in dense heads. s. Native of Brazil, in the provinces of Minas Geraes and Goyaz. Drupe winged.

Silky Terminalia. Tr. 20 ft. 13 T. Australis (St. Hil. fl. bras. 2. p. 240. t. 128.) leaves lanceolate, tapering into the petiole at the base, acute, quite entire, glandless, smoothish; flowers corymbose, on long peduncles. s. Native of Brazil, in the province of Minas Geraes. Flowers yellowish. Drupe ovate on each side. (f. 88.)

Southern Terminalia. Tree. 8 to 10 feet.

Sect. II. Myrobalânus (myrobalanus, a name under which Dioscorides speaks of an Egyptian tree, whose fruit yields a perfumed liquor, from μυρόν, myron, perfume, and βαλανος, balanos, a nut). D. C. prod. 3. p. 12.—Myrobalânus and Badânia, Gaertn. fruct. 2. p. 90. t. 97.—Myrobalânus, Lam. ill. t. 849. Drupe ovate or a little compressed, dry or baccate, containing a roundish, angularly-furrowed putamen.

14 T. Obovata (St. Hil. fl. bras. 2. p. 241.) leaves obovate-oblong, narrowed into the petiole at the base, mucronulate, quite entire, glandless, smoothish; flowers corymbose, on long peduncles. s. Native of Brazil, in the province of Minas Geraes, on the mountains called Serra Negra, where it is called Carascos. Drupe ovoid, attenuated at both ends.

Obovate-leaved Terminalia. Tree 20 feet. 15 T. Adaman'tum (St. Hil. fl. bras. 2. p. 241.) leaves oblong-oblong, narrowed at the base, rounded at the apex, and mucronulate, quite entire, glandless, pubescent; spikes naked at the base, but dense-flowered above the middle. s. Native of Brazil, in the province of Minas Geraes, in the Districto Diamantes. Adamant Terminalia. Tree.

16 T. Latifolia (Swartz. fl. ind. occ. 2. p. 747.) leaves alternate, obovate, tapering to the base, obtuse, and almost entire, glabrous on both surfaces, glandless. s. Native of Jamaica, in all the great inland woods. Racemes length of leaves. Drupe ovate, acuminate, boat-shaped, fleshy, coriaceous. Nerves of young leaves as well as the petioles covered with very short velvety down. Calyces pubescent.

Var. b. dichôlomâ (Meyer, esseq. 177.) flowers woolly. s.
Native of Guiana, in the island of Aroavibisch, in woods. Probably a distinct species.

*Broad-leaved Terminalia.* C.] 1800. Tree 30 to 40 feet. 17 T. BENGALAE (Roxb. hort. beng. p. 53.) leaves alternate, obturate, obtuse, quite entire, glabrous on both surfaces, glandless as well as the petioles. \( \gamma \), S. Native of Bengal. T. rotata, Roxb. in herb. Lamb. Perhaps T. myrobalana, Roth. is referable to this species. 1749.

*Bengal Terminalia.* Tree 100 feet. 18 T. BELRYCA (Roxb. cor. 2. p. 54. t. 198.) leaves alternate, elliptic, quite entire, acutish at both ends, glabrous, on long petioles; petiole furnished with 2 small, opposite, or subalterate glands at the apex. \( \gamma \), S. Native of the East Indies, on the mountains. Myrobalanum Belléricca, Bréyn. icon. 18. t. 49. Gertr. fruct. 2. p. 90. t. 97. Tâni, Rheed. mal. 4. t. 10. Drupe ovate, bluntly pentagonal, fleshy. Flowers seduce. A quantity of insipid gum like gum-arabic issues from this tree when wounded. The kernel of the nut is reported to intoxicaf if eaten in any great quantity.

*Bellicercia Terminalia.* C.] 1818. Tree 100 feet. 19 T. CHEBULA (Retz. obs. 5. p. 31. Roxb. cor. 2. p. 52. t. 197.) leaves nearly opposite, ovate, acutish, petiolate, glabrous above in the adult state, but when young they are clothed with silky villi on both surfaces; glands 2 at the top of the petiole, and many on the margin of the limb. \( \gamma \), S. Native of the East Indies, on the mountains. Myrobalanum Chêbula, Gertrn. fruct. 2. p. 90. t. 97. Drupa ovate, bluntly angular, the alternate angles the largest; flesh hard and brittle. Nut pentagonal. The outer coat of the fruit mixed with salt of steel makes a very durable ink. The galls, called cahayae by the Tamuls, are found on the leaves of this tree, and are probably produced by the punctures of insects on the tender leaves. With them and alum the best and most durable yellow is dyed, and in conjunction with ferruginous mud a black is procured from them.

*Chebula Terminalia.* C.] 1796. Tree 40 to 50 feet. 20 T. CIRPRHA (Roxb. hort. beng. p. 33.) leaves alternate, ovate, acuminate, quite entire, glabrous, petiolate; petiole furnished with 2 thick glands at the apex. \( \gamma \), S. Native of the East Indies. Myrobalanum cirrhâ, Gertrn. fruct. 2. p. 90. t. 97. Drupa ovate-oblong, tapering downwards, yellowish. Citrus-fruited Terminalia. C.] 1823. Tree 40 to 50 feet. 21 T. AUR'ITA (Hamilt. in herb. Lamb.) leaves alternate, elliptic, puberulous as well as the petioles, which are furnished with 2 or 3 opposite glands at the apex; fruit ovate. \( \gamma \), S. Native of the East Indies.

*Aruta Terminalia.* Tree. 22 T. NITIDA (Roxb. in herb. Lamb.) leaves alternate, elliptic, tapering to both ends, acuminate at the apex, glabrous; spikes axillary; calyx very woolly inside. \( \gamma \), S. Native of the East Indies.

*Nitid-leaved Terminalia.* Tree. 23 T. PROCERA (Roxb. cor. 3. t. 224.) leaves alternate, oblong, quite entire, obtuse, with an acumen, on short petioles, glabrous, but bearing hairs in the axils of the lateral nerves, and bearing 2 glands on the under surface at the base of the sides of the middle nerve. \( \gamma \), S. Native of Coromandel. Branches horizontal, whorled. Limb of calyx rotate. Drupa oblong, obscurely 6-angled.

27 T. PAMEA (D. C. prod. 3. p. 13.) leaves alternate, oblong, attenuated at the base, acutish at the apex, petiolate, glabrous; drupes oblong, bluntly trigonal, rather baccate. \( \gamma \), S. Native of French Guiana, in woods. Pamea Guianensis, Aubl. guian. 2. p. 946. t. 359. Leaves crowded at the tops of the branches. Flowers unknown. Pamea is the Guiana name of the tree.

Pamea Terminalia. Tree 40 feet.

* + Fruit of the following species unknown, or very doubtful.

* Flowers 4-cleft, octandrous.

28 T. ERYTHROPHYL'LA (Burch. cat. no. 1749. trav. 1. p. 400.) leaves alternate and opposite, quite entire, elliptic, acuminate, glabrous, rather eiliated, glandless; petioles very short, pubescent as well as the branches. \( \gamma \), G. Native of the Cape of Good Hope. Peduncles axillary, shorter than the leaves. Spikes ovate, capitulate. Flowers hermaphroditic. Perhaps a species of Combretum.

* Red-leaved Terminalia.* Tree 40 feet. 29 T. (? VLLOSA (Spreng. neu. entd. 2. p. 111.) leaves alternate, oblong, attenuated at both ends, denticulated, petiolate, glabrous above, villous beneath; panicles axillary, clothed with rusty villi. \( \gamma \), S. Native of Brazil. Cailx corolline, villous inside. Stamina 8, exerted. Perhaps a species of Combretum. Villosa Terminalia. Shrub.

30 T. DI'SCOLOR (Spreng. c.) leaves obovate-oblong, quite entire, glabrous, pubescent beneath; panicle terminal; branches angularly-compressed, glabrous. \( \gamma \), S. Native of Brazil. Calyx 5-lobed. Stamina said to be 8.

Discolour-leaved Terminalia. Tree.

* * Flowers 5-cleft, decandrous.

31 T. ARBU'SCULA (Swartz, fl. ind. occ. 750.) leaves scattered, ovate-lanceolate, entire, on short petiotes, pubescent when young, at length glabrous; spikes length of the leaves. \( \gamma \), S. Native of the north of Jamaica. Limb of calyx urceolate, 5-toothed, villous inside. Stamina 10, exerted. Fruit unknown.

* Shrubby Terminalia.* C.] 1822. Shrub 6 to 10 feet. 32 T. SER'CEA (Burch. cat. geogr. austr. no. 2309.) leaves alternate, crowded at the tops of the branches, oblong, mucronate, sessile, quite entire, clothed with silky adpressed villi on both surfaces; spikes shorter than the leaves, pedunculate, ovate, clothed with silky villi. \( \gamma \), S. Native of the Cape of Good Hope. Limb of calyx 5-cleft. Stamina inclosed in the specimen examined, but they were probably not mature.

* Silky Terminalia.* Shrub 6 to 8 feet.

33 T. ? MONO'PAT'ERA (Roth. nov. spec. 382.) leaves alternate, oblong-ovate, acutish, obtuse at the base, wrinkled above and pubescent, but tomentose beneath, and biglandular at the base; drupe ovate, tomentose, furnished with 1 or 3 wings. \( \gamma \), S.
Native of the East Indies. Perhaps a species of Pentapéra or Combretum. 

One-winged-fruiting Terminalia. Tree. 

34 T. PANICULATA (Roth. nov. spec. p. 383.) leaves petiole, oblong-oval, obtuse at both ends, rather pubescent, quite entire, biglandular beneath at the base; spikes densely panicled, tomentose.  ﷲ S. Native of the East Indies. Fruit unknown. 

Paniced Terminalia. Tree. 

**Species whose fruit and stamens remain undescribed.** 

35 T. CIJIATA (Spreng. syst. 2. p. 389.) leaves obovate-oblong, obtuse, attenuated at the base, ciliate, quite glabrous on both surfaces, glandless at the base; peduncles racemose, elongated, biglandular at the base.  ﷲ S. Native of the East Indies. 

Ciliated-leaved Terminalia. Tree. 

36 T. 2 FELITELATA (Roth. nov. spec. 381.) leaves opposite, oval, obtuse at both ends, quite entire, clothed with silky pili, dotted above, and reticulated with black beneath.  ﷲ S. Native of the East Indies. Petioles 3 lines long, clothed with rufous velvety down. Spikes compound. Stamens exserted. Fruit unknown. Perhaps a species of Pentapéra. 

Reticulated-leaved Terminalia. Shrub or tree. 

37 T. FULGATA (Roth. nov. spec. p. 381.) leaves alternate, elliptic, attenuated at both ends, glandless, quite entire, obtuse at the apex, pubescent, dotted above, on long petioles.  ﷲ S. Native of the East Indies. Spikes simple, a little longer than the petals. Stamens longer than the calyx. Fruit unknown. 

Dotted-leaved Terminalia. Shrub or tree. 

38 T. ELLIPTEA (Wild. spec. 4. p. 969) leaves oblong-elliptic, obtuse, quite entire, glabrous above, and rather pubescent beneath, biglandular at the base.  ﷲ S. Native of the East Indies. Glands of leaves cup-shaped, somewhat pedicellate. Spikes panicked, terminal. Stamens and fruit unknown. 

Elliptic-leaved Terminalia. Shrub or tree. 

39 T. TRIFOLIATA (Spreng. syst. 2. p. 358.) leaves ternate, lanceolate, bluntish, glabrous, of a different colour beneath; racemes panicked, smooth.  ﷲ S. Native of Brazil. The rest unknown. 

Trifoliate Terminalia. Shrub or tree. 

40 T. MACROSTEMON (Spreng. syst. 2. p. 14.) leaves oblong-lanceolate, acuminate, coriaceous, veiny, quite glabrous on both surfaces; branches of panicle verticillate, pubescent; stamens elongated.  ﷲ S. Native of Brazil. The rest unknown. 

Long-staminated Terminalia. Shrub or tree. 

41 T. LE'ERPA (Hoffmannsegg. ex Mart. fl. bras. 1. p. 43.) leaves opposite, ovate-oblong, acute, coriaceous, glabrous on both surfaces, and glandless at the base; spikes numerous, aggregate, pubescent.  ﷲ S. Native of Brazil in moist woods, in the province of Para. Fruit unknown. 

Shining-leaved Terminalia. Shrub or tree. 

42 T. F'tE_MA (Mart. ex Spreng. syst. 2. p. 358.) leaves in bundles, obovate, mucronate, coriaceous, with revolute margins, glabrous on both surfaces and reticulated; spikes terminal, aggregate, villous.  ﷲ S. Native of Brazil on high mountains, in the province of the Rio-Ne Gro. The rest unknown. 

Firm Terminalia. Tree. 

43 T. BRASILIE'NSIS (Spreng. syst. 2. p. 358.) leaves oblong, membranous, glandularly crenated, veiny, smoothish; flowers in fascicled racemes.  ﷲ S. Native of Brazil. The rest unknown. 

Brazil Terminalia. Shrub or tree. 

Cult. See Bucida for culture and propagation. p. 657. 

IV. PENTAPÉRA (from πέντε, pente, five, and πέταρον, a wing; in reference to the fruit being furnished with 5 wings). Roxb. hort. beng. p. 34. D. C. prod. 2. p. 14. 

Lin. syst. Polygânia, Moné'cia. All as in Terminalia, except the drupe, which is coriaceous and ovate, furnished with 5-6 regular vertical wings.—East Indian trees, with opposite or sub-opposite petiolate leaves, which are biglandular at the base. Spikes of flowers axillary and terminal, usually so close together as to form a brachiaceous panicle. Flowers 5-cleft, deciduous. Perhaps only a section of Terminalia, or perhaps number of the Indian species of Terminalia, whose fruit are unknown, are referrible to this genus.

1 P. TOMENTOSA (Roxb. l. c. D. C. diss. t. 1.) leaves nearly opposite, on short petioles, ovate, repandly crenated, obtuse at both ends, mucranate at the apex, somewhat dotted beneath, and velvety on the nerves, and bearing 2 thick cup-shaped glands at the base.  ﷲ S. Native of the East Indies, where it is called Usu or Usma. Terminalia alta, Roth. nov. spec. 378. Leaves 7-9 inches long, and 3 inches broad. Spikes cloathed with adpressed velvety down, forming a brachiaceous panicle. Flowers hairy. 

Panicled Pentapéra. Tree 40 ft. 

2 P. PANICULATA (Roxb. l. c.) leaves nearly opposite, petiolate, oval-oblong, acutish, obtuse at the base, quite entire, glabrous on both surfaces, coriaceous, bearing 2 thick eayhtiform glands at the base beneath.  ﷲ S. Native of Coromandel, where it is called Nimmerta and Pokaraikai. Leaves 5-6 inches long, and 2 inches broad. Spikes cloathed with adpressed velvety down, forming a brachiaceous panicle. Flowers hairy. 

Panicled Pentapéra. Tree 40 ft. 

3 P. ABU'NA (Roxb. l. c. D. C. diss. t. 2.) leaves nearly opposite, petiolate, oblong, acute, bluntish at the base, quite glabrous on both surfaces, entire, bearing 2 small glands at the origin of the pagina.  ﷲ S. Native of the East Indies, where it is called Urjoom, whence the trivial name. Leaves glaucencent, 3-5 inches long, and an inch broad. Spikes usually tern, panicked. Drupe furnished with 6-7 thick coriaceous wings. 

Urjoom Pentapéra. Tree 50 ft. 

4 P. OBOVATA (D. C. prod. 3. p. 14.) leaves opposite, on short petioles, obovate, very blunt at the apex or emarginate, and rather narrowed at the base, quite entire, glabrous on both surfaces, bearing 2 marginal conicve glands at the origin of the limb.  ﷲ S. Native of the East Indies, where it is called Merdehara. Terminalia alta, Leschen. herb. Leaves 3 inches long, and 1 broad, sometimes glandless. Spikes usually tern, panicked. Flowers in fascicles along the rachis. 

Obovate-leaved Pentapéra. Tree 40 feet. 

5 P. CUNIEATA (D. C. prod. 3. p. 14.) leaves opposite, peti- 

olate, oblong, cuneate-elliptic, acutish, quite entire, glabrous above, and clothed with rufous pubesence beneath, bearing 2 small glands at the base.  ﷲ S. Native of the East Indies. Terminalia cuneata, Roth. nov. spec. p. 379. Spikes constituting a terminal panicle. Flowers in fascicles along the rachis. Drupe ovate, 5-angled, 5-furrowed; angles winged. Leaves sometimes glandless. 

Cuneate-leaved Pentapéra. Tree 50 ft. 

6 P. CRENULATA (D. C. prod. 3. p. 15.) leaves nearly opposite, on short petioles, oblong-oval, acutish, but somewhat cor- 

date at the base, crenulated, dotted above, rufous beneath, and furnished with 2 glands at the base.  ﷲ S. Native of the East Indies. Terminalia crenulata, Roth. nov. spec. p. 380. Perhaps the same as P. crenulata, Roxb. hort. beng. p. 34. Spikes opposite, superior ones tern. Flowers pubescent, in fascicles. Fruit unknown. 

Crenulated-leaved Pentapéra. Tree 40 ft. 

7 P. MARADU ; leaves nearly opposite, long, oblong, glabrous above; fruit large, 5-winged.  ﷲ S. Native of the East Indies. Terminalia Maradu, Hamilt. ms. in herb. Lamb. 

Maradu Pentapéra. Tree 50 ft.
8. *Glabrus* (Roxb. hort. beng. p. 34.) leaves nearly opposite, oblong or obovate-oblong, obtuse, glabrous, furnished with 2 glands at the base on the middle nerve, discoulered beneath; panicellar terminal, composed of spikes.  

Glabrous Pentapetala. Tree 50 ft.

9. *P. alata* (Banks, herb.) leaves elliptic-obovate, obtuse, and mucronate, glabrous, furnished with 2 glands at the base of the limb; branches, racis, and calyces drooping; spikes on long peduncles, axillary or terminal, simple.  

Glan. Native of Tranquebar.

**Winged-fruited Pentapetala. Tree 40 ft.**

† *S. coriacea* (Roxb.) Native of Coromandel, where it is called *acenutti*. Perhaps the same as *Terminalia coriacea* of Rott.

Coriaceous-leaved Pentapetala. Tree 40 ft.

11. *S. melanthera* (Roxb.) Native of the East Indies.

Two-winged-fruited Pentapetala. Tree 40 ft.

**Cult.** See *Bacida* for culture and propagation, p. 657.

Linn. syst. Decaduaria, Monogynia. Limb of calyx permanent, campanulate, cleft almost to the base into 5 parts; lobes lanceolate, 3-nerved. Petals wanting. Stamens 10, exserted, disposed in 2 series, shorter than the calyceine lobes, 5 inserted at the recesses of the lobes, and the other 5 inserted in the bottom of the calyx. Anthers orbicular, didymous. Style filiform, obtuse, pubescent. Nut roundish, pentagonal, crowned by the calyx, 1-celled, 1-seeded.—Climbing shrubs, with opposite ovate acuminate leaves, on short pedicels, full of small resinous dots beneath. Racemes axillary, or constituting a terminal panicle.

1. G. floribunda (Roxb. cor. 1. t. 87.) leaves ovate, acute, pubescent above, and clothed with rustyomentum beneath; panicle terminal.  

G. crochatlycha (D. C. prod. 3. p. 15.) leaves ovate, acute, glabrous above except the nerve, pubescent beneath; racemes axillary, shorter than the leaves.  

COMBRETACEÆ. VIII. CONOCARPUS. IX. LAGUNCULARIA. X. GUIERA. XI. COMBRETUM.

Erect Conocarpus. Clt. 1752. Shrub 6 to 8 feet.

2 C. procumbens (Jaq. amer. 79 t. 51 f. 2.) stems much branched, procumbent; leaves obovate, glabrous; heads panicked. ½. S. Growing along with the last, and lying flat on the ground. C. erética var. B. procumbens, D. C. prod. 3. p. 16. Procumbent Conocarpus. Clt. 1730. Pl. prostrate.

3 C. acutifolia (Willd. in Roem. et Schultes. syst. 5. p. 574.) stems erect; leaves lanceolate, acute at both ends; heads of flowers solitary and axillary, or aggregate at the tops of the branches; branches pubescent. ½. S. Growing along with the two preceding species. Acute-leaved Conocarpus. Clt. 1820. Shrub 5 to 8 feet.

4 C. sericea (Forst. in herb. Lher.) leaves oblong, acuminate at both ends, clothed with silky villi on both surfaces even in the adult state; heads panicked. ½. S. Native of South America? C. erética var. sericea, D. C. prod. 3. p. 16. Silky Conocarpus. Shrub.

Sect. II. LEIOCARPUS (from leiosk, leios, smooth, and karpous, karpos, a fruit). Fruit loosely imbricated backwards, amply winged on the margins, and ending in a short acumen at the apex. Tube of calyx stretched out a little beyond the ovary. —African species.

6 C. leiodera (D. C. prod. 2. p. 16.) leaves oval, glandless, glabrous, hardly pubescent on the nerve beneath; heads axillary, pedunculate, solitary; fruit quite glabrous. ½. S. Native of Senegal and Gambia.

Smooth-fruited Conocarpus. Shrub 5 to 6 feet.

Sect. III. ANGOET'SSUS (from ana, ana, upwards, and geranos, geisson, a tile; in reference to the scale-like fruit being imbricated upwards in the heads). D. C. prod. 3. p. 16. Fruit imbricated upwards, drawn out into a long acumen at the apex. Tube of calyx drawn out beyond the ovary, and so slender as to give the limb the appearance of being pedicellate. —Indian species.

6 C. acuminita (Roxb. hort. beng. p. 34.) leaves glandless; heads axillary, pedunculate, solitary; fruit clothed with adpressed villi. ½. S. Native of the East Indies, where it is called panch-masun. Anderssonia acuminata, Roxb. herb. Leaves elliptic, acute, glabrous above, and clothed with adpressed down beneath. Heads globose, shorter than the leaves. Acuminated Conocarpus. Shrub.

† A species not sufficiently known.

Cult. See Bécida for culture and propagation, p. 657.

Tribe II.

COMBRETÆ (plants agreeing with Combretum in the flowers being furnished with petals). Flowers hermaphrodite, with 4-5 petals and 9-10 stamens.

X. GUIERA (Guier is the name of the tree in Senegal). Juss. gen. 320. Lam. illt. t. 360. D. C. prod. 3. p. 17.

Linn. syst. Decandria, Monogynia. Tube of calyx oblong, slender, somewhat cylindrical, with a tabular campanulate 5-toothed limb. Petals 5, oblong-linear, small. Stamens 10, exserted; anthers globose. Ovary oblong. Style 1, filiform. Capsule narrow, pentagonal, 1, 5-seeded. Seeds hanging by a thread, oblong. Cotyledons convolute?—A shrub, with opposite ovate entire leaves. Flowers crowded into spicate heads, sessile along the rachis, with large foliaceous bracteas at the base of the head of flowers, and other small ones at the base of the flowers.

Linn. syst. Octo-Decandria, Monogynia. Calyx with a 4-5-toothed (f. 89. a.) deciduous limb. Petals 4-5 (f. 89. b.), inserted at the top of the calyx. Stamens 8-10, exserted. Ovary 2-5- (f. 89. c.) -ovulate. Style filiform (f. 89. d.). Fruit 4-5-winged. Seed 1, pendulous. —Climbing or erect shrubs, rarely herbs, with entire, opposite or tern, rarely alternate leaves. Spikes solitary or twin, axillary, and terminal, opposite, or 3 or 4 in a whorl, usually disposed in a terminal panicle. Flowers bracteate, almost sessile, rarely pedicellate. Petals scarlet, red, white, rarely orange.

Sect. I. ECOMBRETUM (from ech, well or good, and combre- tum; this section contains what are considered the genuine species of the genus). Calyx 4-toothed. Corolla 4-petalled. Stamens 8. Fruit 4-5-winged. Cotyledons reflected by a plait in the middle?

2 C. oxyt'alam (G. Don, in Lam. trans. 15. p. 420.) climbing, glabrous; branches somewhat quadrangular; leaves ob-
long, membranous, attenuated at both ends, covered with resiny rusty dots beneath, as well as the calyces; petals scale-formed, obvate-lanceolate, acuminate; stamens very long. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Guayaquil. Very like the preceding, but differs in the membranous leaves tapering to both ends, and in the shape of the petals.

**Sharp-petalled** Combrex. Shrub cl.

3 C. FORSÅM (G. Don, in Lin. trans. 15. p. 420.) climbing; leaves oblong-elliptic, acuminate, beset with resinous rusty dots beneath, but when in a young state clothed with rusty down, as well as the calyces; flowers crowded; petals scale-formed, cinque-lanceolate, acuminate. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Brazil, near Rio Janeiro. Very like the two preceding species, but differs in the young leaves and calyx being clothed with rusty down.

**Beautiful Combrex.** Shrub cl.

4 C. MIKROPTÉLUM (D. C. prod. 3. p. 19. St. Hil. fl. bras. 2. p. 249.) leaves elliptic-oblong, acuminate, smoothish above, and lepidodotted beneath; spikes simple, dense-flowered, on short peduncles, about equal in length to the leaves; calyx rubiginose, with a tetragonal tube; petals obvate-lanceolate; stamens very long. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Brazil, in the provinces of Minas Geraes and Minas Novas. Petals yellow.

**Small-petalled** Combrex. Shrub cl.

5 C. ROTUNDIFÓLUM (Rich. act. soc. hist. nat. par. I. 701. p. 108.) climbing; leaves ovate-rounded, mucronate, glabrous; spikes opposite, bractless; flowers seen? calyx glabrous on the inside. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Cayenne. Leaves of the branches oval, of the branchlets roundish. Calyx lepidodotted on the outside. Stamens very long, purple? Fruit with ample membranous wings.

**Round-leaved** Combrex. Shrub cl.

6 C. MACROCAFÉLUM (Beauv. fl. d'Or. 2. p. 90. t. 118. f. 2.) fruit large, 4-winged; wings deep coricate at the apex. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of the west coast of Africa, at Benin.

**Large-fruited** Combrex. Shrub cl.

\( \text{§ 2. Calyx tubular. Flowers disposed in terminal fascicles or umbels.} \)

7 C. LECPEPHYLLUM (G. Don, in edinb. phil. journ. 1824. p. 344. and in Lin. trans. 15. p. 421.) erect, clothed with fulvous villi; leaves oblong, mucronate; racemes corymbose or umbel-like; floral leaves white, and constituting an involucre to the head of flowers, and with a linear white bractea to each flower; petals lanceolate, obtuse, 4 times longer than the calyx. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Sierra Leone, not far from Free-town, and of Senegal at St. Louis. C. trigonoides, Perr. in litt. ex D. C. prod. 3. p. 20. Flowers pedicellate, scarlet. Stamens scarlet, much longer than the petals, bearing black anthers.

**White-leaved Combrex.** Shrub cl. 4 to 6 feet.

8 C. LANGNEGÓNUM (G. Don, in Lin. trans. 15. p. 422.) erect; leaves orbicular, emarginate; flowers in fascicles; petals oval, crenulated, a little longer than the calyx. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Abyssinia. Shrub branched, woolly. Stamens long.

**Woolly Combrex.** Shrub cl. 4 to 6 feet.

9 C. FUCATUM (Blum. bijdr. p. 640.) climbing; leaves elliptic-oblong, acuminate, dotted on both surfaces; spikes capitulate, panicled, axillary, and terminal; calyx villous inside. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Java, on the mountains.

**Dotted-leaved** Combrex. Shrub cl.

\( \text{§ 3. Calyx tubular. Spikes axillary, never terminal.} \)

10 C. EXTÉNÆM (Roxb. hort. beng. p. 28. G. Don, in Lin. trans. 15. p. 422.) climbing, glabrous; leaves oblong or obovate, coriaceous; spikes slender, short, solitary, dense-flowered; petals ovate, acute, shorter than the calyx. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of the Moluccas. Flowers small, white. Stamens white, disposed in one series, much exserted. Stigma subcapitate.

**Extended Combrex.** Shrub cl.

11 C. HÉRBAEUM (G. Don, in edinb. phil. journ. 1824. p. 344. and Lin. trans. 15. p. 423.) herbaceous, humble; stems simple, pubescent; leaves alternate, lanceolate, mucronate, clothed with silky villi beneath, but glabrous above in the adult state; peduncles twin, few-flowered; petals ovate, acute, a little longer than the calyx. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Sierra Leone, common in the low lands. Root woody. Flowers small, white. Stamens not much exserted.

**Herbeaceous Combrex.** Fl. Feb. Pl. 1 foot.

12 C. DUARTEÁNÁM (St. Hil. fl. bras. 2. p. 248.) leaves elliptic, acuminate, lepidodotted on both surfaces; spikes shorter than the leaves; tube of calyx tetragonal; branches glabrous; petals lanceolate, very narrow at the base. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Brazil. Limb of calyx funnel-shaped.

**Duarte's Combrex.** Shrub cl.

\( \text{§ 4. Calyx turbinate-campanulate. Racemes axillary and terminal, panicled. Flowers pedicellate.} \)

13 C. PANÍCULÁN (Vent. choix. p. 58.) leaves oblong-obtuse; panicule terminal, branched, hairy; calyces pubescent; bracteas very short; flowers pedicellate. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Senegal and Sierra Leone. Flowers scarlet.

**Panicled-flowered** Combrex. Shrub cl.

14 C. ENÁM (G. Don, in edinb. phil. journ. 1824. p. 345.) erect, glabrous; branches spinose; leaves on long petioles, oval, membranous; flowers pedicellate; calyce teeth nearly obsolete; petals oval, obtuse; stamens not much exserted. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Sierra Leone, in the low lands. Flowers small, scarlet, collected into fascicles. Anthers black.

**Spinose Combrex.** Shrub cl. 6 to 8 feet.

15 C. SMEATHMAN'NÍ (G. Don, in Lin. trans. 15. p. 425.) climbing, hairy; leaves elliptic, acuminate, floral ones yellow; bracteas very large; racemes elongated; flowers pedicellate. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Sierra Leone. Flowers solitary, in the axils of large bracteas. Stamens exerted.

**Smeathman's Combrex.** Shrub cl.

\( \text{§ 5. Calyx turbinate-campanulate. Spikes axillary and terminal, usually disposed in the manner of a panicule.} \)

16 C. E'LEÁN (St. Hil. fl. bras. 2. p. 277. t. 120.) climbing; leaves elliptic, acute, acuminate, puberulous above, and clothed with yellowish tomentum beneath; spikes simple, on short peduncles; petals lanceolate, acute, hairy; calyx te tube cylindrical. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Brazil, in the province of Minas Geraes. Branches covered with yellowish tomentum. Petals yellow.

**Elegant Combrex.** Shrub cl.

17 C. FARÍNÁS (H. B. et Kunth, nov. gen. amer. 6. p. 110.) G. Don, in Lin. trans. 15. p. 425.) climbing, glabrous; leaves elliptic-oblong, obtuse, rather coriaceous, rounded at the base, mealy beneath; spikes usually twin, many-flowered; petals scale-formed; stamens very long. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native of Mexico, between the Acajaplo and Venta del Exido. Flowers subsecund, orange-coloured.

**Meaty Combrex.** Fl. April, July. Clt. 1825. Shrub cl.

18 C. FRANGULÉFÁLUM (H. B. et Kunth, nov. gen. amer. 6. p. 109.) climbing, glabrous; leaves elliptic, lepidodotted on both surfaces; spikes solitary, rarely twin; bracteas oblong, acute, villous; petals crenated, rather fan-shaped. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \) Native on the banks of the Orinoco, near Angustura, and Carichana. Stamens long.

**Faingula-leaved** Combrex. Shrub cl.

19 C. LA'XUM (Jacq. amer. p. 104. and piét. p. 53.) climbing, glabrous; leaves ovate; spikes erect, loose-flowered; calyx pubescent; petals roundish, shorter than the calyx. \( \text{b.} \) \( \text{c.} \) \( \text{S.} \)
Native of the West India Islands. Lam. ill. t. 282, f. 1. — Laxfl. itin. p. 358. Flowers small, white. Stamens long, inserted in the bottom of the calyx.

Loose-flowered Combretum. Shrub cl. 20 C. Mexiacum (Humb. et Bonpl. pl. aquin. 2. p. 156. t. 132.) humble, glabrous; young branches compressed; leaves elliptic, membranous, rather coriaceous at the base; spikes disposed in the manner of a panicle, clothed with rusty tomentum, short, many-flowered; petals somewhat reiniorm, shorter than the calyx. ʒ. S. Native of Mexico, near Acapulco, by the sea-side. Flowers sub-second, with the petals and stamens white and the anthers yellow. Stamens 3-times the length of the calyx.

Obtuse-leaved Combretum. Shrub. 22 C. fulchellolium (Mart. mss. G. Don, in Lin. trans. 15. p. 438.) climbing, puberulous; leaves elliptic, oblong, brownish beneath; spikes disposed in the manner of a panicle; calyxes and peduncles clothed with fuscous villi; petals rather reiniorm, reflexed. ʒ. S. Native of Brazil, at the Rio Negro. Flowers small, scarlet. Petals a little longer than the calyx, reflexed. Stamens 3-times the length of the calyx.

Neat Combretum. Shrub cl. 23 C. Bucor (St. Hil. fl. bras. 2. p. 247. t. 130.) climbing; leaves elliptic, bluntly acuminate, glabrous; calycine tube cylindrical; spikes disposed in the manner of a panicle, on short peduncles; petals roundish. ʒ. S. Native of Brazil, on the banks of the Rio St. Francisco, in the western part of the province of Minas Geraes, in the Cerrao or great desert, where it is called Bugi. Flowers polygamous; calyx downy; petals yellow.

Bugi Combretum. Shrub cl. 24 C. racemosum (Beauv. fl. d'ow. 2. p. 90. t. 118. f. 1.) climbing, glabrous; leaves obovate-oblong, acute, shining; panicle of many spikes; spikes elongated, tufted at the apex; petals lanceolate, obtuse. ʒ. S. Native of Benin, on the west coast of Africa. Flowers middle-sized, white, on short pedicels. Petals much longer than the calyx. Stamens very long.

White-leaved Combretum. Shrub cl. 26 C. Kanesum (Hamilt. mss. in D. Don, prod. fl. nep. p. 219.) humble, erect; leaves oblong or ovate, obtuse, glabrous; spikes simple and somewhat branched at the base; calyxes pubescent; petals ovate, obtuse. ʒ. S. Native of Nipam. Flowers small, white. Stamens very long.

Dwarf Combretum. Cl. 1825. Shrub ½ to 1 foot. 27 C. Roxburghii (G. Don, in Lin. trans. 15. p. 429.) climbing, glabrous; leaves ovate, obtuse; panicle composed of many loose-flowered spikes; raciss and calyxes pubescent. ʒ. S. Native of the East Indies. Leaves pubescent when young.

Roxburgh's Combretum. Shrub cl. 28 C. odoratum (Pav. mss. in herb. Lamb. G. Don, in Lin. trans. 15. p. 450.) climbing; branchlets puberulous; leaves oblong or obovate-oblong, rounded, and somewhat emarginate at the apex, coriaceous, glabrous; panicle composed of many spikes; spikes crowded with flowers; petals reiniorm. ʒ. S. Native of Guayaquil. Flowers red or scarlet. Stamens 3-times the length of the calyx.

Sweet-scented Combretum. Shrub cl. 29 C. glutinosum (Perr. in lit. D. C. prod. 3. p. 21.) unarmed, erect, arboreous, glabrous; leaves somewhat verticillate, ovate, petiolate, coriaceous, mucronate; racemes branched at the base or twin, elongated, bracteless. ʒ. S. Native of Sene- gal. Flowers yellow, on different branches from the leaf-bearing ones. Branches as well as the young leaves clammy.

Clammy Combretum. Shrub. 30 C. pyramidatum (Desv. in Hamilt. prod. fl. ind. occ. p. 35.) branches complanate, rather greyish; leaves obovate, somewhat emarginate, mucronate; capsule pyramidal, with acute angles, not winged. ʒ. S. Native of Guiana. The rest unknown.

Pyramidal-capsuled Combretum. Shrub. 31 C. roberdeum (Rich. in act. soc. hist. nat. par. 1791. p. 108.) climbing, glabrous; leaves oblong, coriaceous, rather coriaceous at the base, shining above; panicle terminal, composed of many spikes; branches, racis, and calyxes clothed with rusty down; stamens short; bracteae setaceous. ʒ. S. Native of Cayenne. Flowers small.

Downy Combretum. Shrub cl. 32 C. clamacum (D. C. prod. 3. p. 19.) climbing, glabrous; leaves elliptic, acuminate; spikes disposed in a terminal panicle; bracteae setaceous. ʒ. S. Native of French Guiana.

Glabrous Combretum. Shrub cl. 34 C. tomentosum (Roxb. in lit. 1791. p. 436. and in Lin. trans. 15. p. 430.) climbing, clothed with fuscous tomentum; leaves oval, mucronate, smoothish above in the adult state; spikes loose-flowered; petals oval, obtuse, a little shorter than the calyx; stamens short. ʒ. S. Native of Sierra Leone. Flowers small, white.

Tomentosum Combretum. Shrub cl. 34 C. macrostigma (G. Don, in edinb. phil. journ. 1824. p. 347.) erect; branches pubescent; leaves oblong, bluntly mucronate, glabrous in the adult state; spikes slender; petals linear-elliptic; the length of the calyx teeth; stamens not much exerted. ʒ. S. Native of Sierra Leone. C. parviflorum, Rchb. in Sieb. pl. excis. sénéc. no. 35. hort. bot. t. 62. Flowers small, red or scarlet, on short pedicels. Stamens very little longer than the petals.

Small-flowered Combretum. Shrub 3 to 6 feet. 35 C. mollis (R. Br. in append. to Salt. trav. G. Don, in Lin. trans. 15. p. 431.) climbing, villous; leaves oblong-lanceolate, acuminate, coriaceous at the base; spikes elongated; calycine teeth very short; petals small; stamens twice the length of the calyx. ʒ. S. Native of Abyssinia.

Soft Combretum. Shrub cl. 36 C. latifolium (G. Don, in Lin. trans. 15. p. 432.) climbing, glabrous; leaves ample, coriaceous, oblong, acuminate, sometimes rounded; spikes short, crowded with flowers; calyxes pubescent; petals obovate, obtuse; stamens twice the length of the calyx. ʒ. S. Native of the East Indies. C. macrophyllum, Roxb. hort. beng. p. 85? Flowers small, red.

Broad-leaved Combretum. Shrub cl. 37 C. chinense (Roxb. hort. beng. p. 28. G. Don, in Lin. trans. 15. p. 432.) climbing, and covered with rusty scales or dots; leaves elliptic, acute at both ends, green above; spikes loose-flowered; petals small; stamens but little exerted. ʒ. G. Native of China. Flowers middle-sized, scarlet?
COMBRETACEÆ. XI. Combretum.

Chinese Combretum. Shrub cl.

38 C. velutinum (D. C. prod. 3. p. 20.) leaves ovate, acuminate, clothed with soft villi on both surfaces as well as the branches and peduncles; spikes axillary, solitary, simple; pedicels very short. h. S. Native of Brazil. Terminália argentea, Mart. bras. p. 43.? Fruit large, 1-winged, pubescent; wings glabrous. Pedicels hardly 2 lines long.

Feluitey Combretum. Shrub cl.?

39 C. pedicella're (D. C. prod. 3. p. 20.) leaves oval-oblong, velvety, but especially beneath, as well as the branches, pedicels, and peduncles; racemes axillary, solitary, simple; pedicels about one half the length of the fruit. h. S. Native of Brazil. Very like the preceding species, but the pedicels and pedicels are half an inch long. Fruit ovate, acuminate, 4-winged, clothed with short, rufescent, lepidotilled down.

Pedieled Combreum. Shrub cl.?

40 C. altum (Perr. in litt. D. C. prod. 3. p. 20.) quite glabrous; leaves elliptic, attenuated at both ends, smooth, quite entire, on short pedicels; racemes at the base of the branches; fruit solitary, 4-winged, pruinose, or brownish purple between the wings, and lepidotilled. h. S. Native of Senegal, at the lake called Du Panier, 28 miles from St. Louis.

Taull Combretum. Shrub cl.

41 C. mucronatum (Thom. in herb. Vahl. ex herb. Puer. D. C. prod. 3. p. 20.) climbing? branchlets pubescent; leaves on short pedicels, elliptic, somewhat obovate, obtuse at the base, and acuminate mucronate at the apex, glabrous, but with the petiole and nerve rather pubescent; racemes pedunculate, elongated, bracteate. h. S. Native of Nipaul. Flowers small, glabrous on the outside and villous inside.

Wallich's Combretum. Shrub.

§ 1. Calyx tubular. Spikes axillary and terminal, usually disposed in the manner of a panicle.

43 C. comosum (G. Don, in edinb. phil. journ. 1824. p. 344. and in Lin. trans. 15. p. 433.) climbing; branches pubescent; leaves elliptic, acute, somewhat cordate at the base, pubescent when young, but glabrous in the adult state; panicle of many spikes; spikes bearing a tuft of flowers at the apex; bracteas lanceolate, acute; petals spatulate, obtuse; stamens long. h. S. Native of Sierra Leone; very common. Lindl. bot. reg. 1105. Flowers crimson or red.

Tyfated-flowered Combretum. Fl. Feb. Ju. Clt. 1822. Sh. cl. 44 C. intermedium (G. Don, l. c.) climbing; branches pubescent; leaves elliptic-obovate, mucronate, pubescent when young, but glabrous in the adult state; bracteas ovate, mucronate; petals spatulate, obtuse. h. S. Native of Sierra Leone. Very like C. comosum, but the flowers are larger and denser.

45 C. pilosum (Roxb. hort. beng. p. 28. G. Don, in Lin. trans. 15. p. 434.) climbing, pilose; leaves oblong-lanceolate, acuminate, auricled at the base; pedicel of many spikes; spikes short; calyces and pedicels beset with fuscous pili; petals oblong, oblong, ciliated. h. S. Native of the East Indies. Flowers crowded, white, about the size of those of C. comosum. Stamens twice the length of the petals.

Pilose Combretum. Shrub cl. 46 C. barratum (Newman, mas. G. Don, in Loud. hort. brit. p. 157.) hairy in every part; leaves obovate-oblong; panicle of many spikes; spikes long; petals obvate, bearded at the apex. h. S. Native of Maranham. Flowers white, rather large.

Bearded-petalled Combretum. Clt. 1820. Shrub cl. 47 C. ovalif. (R. Br. in append. to Salt. trav. in Abyss. G. Don, in Lin. trans. 15. p. 435.) erect; leaves obovate-oblong, obtuse, white beneath, when young pubescent, but glabrous in the adult state; branches and calyces pubescent; spikes axillary and terminal, short, loose-flowered; petals obovate-oblong, obtuse; stamens exserted. h. S. Native of Abyssinia. Flowers probably white.

Oval-leaved Combretum. Shrub erect?

48 C. alternifolium (Jacq. amer. p. 104.) climbing, glabrous; branches spinose; spikes recurved; leaves alternate, obovate, glabrous, shining above; panicle of many spikes; spikes short; flowers crowded; petals lanceolate, obtuse, twice the length of the calyx; stamens exserted. h. S. Native of South America. C. decándrum, Jacq. amer. ed. pict. p. 53. t. 260. f. 27. C. spinisómA, Humb. et Bonpl. pl. équinn. 2. p. 161. Poívrea alternifólia, D. C. prod. 3. p. 17. Flowers small, white, on short pedicels. The juice is very clammy, and is used as a substitute for glue.

Alternate-leaved Combretum. Shrub cl. 49 C. Pavónii (G. Don, in Lin. trans. 15. p. 436.) climbing; branches pilose; leaves oblong or oval, acuminate, mucronate, somewhat cordate at the base, clothed with rusty villi beneath; panicle of many spikes, elongated; petals lanceolate; stamens a little longer than the petals. h. S. Native of Guayaquil. C. decándrum, Ruiz, et Pav. mss. in herb. Lamb. Flowers scattered, middle-sized, probably scarlet.

Father's Combretum. Shrub cl. 50 C. expéptásum; shrub bushy; leaves oval, quite glabrous, attenuated at both ends; spikes opposite, slender, rather velvety; flowers distant, bracteate; calyces glabrous; petals oblong, hairy. h. S. Native of St. Domingo and Cuba, about the Havanannah. Poívrea expéptásum, D. C. prod. 3. p. 18. Woolly-petalled Combretum. Shrub.

§ 2. Calyx tubular. Panicle of several spikes. Flowers secund.

§ 5. Calyx turbinate-campanulate. Spikes numerous, terminal in a mimic of the panicle.

53. *C. decaedrum* (Roxb. cor. J. p. 43. t. 59.) climbing, clothed with fuscous down; leaves oblong, acuminate, floral ones yellowish; pedicels composed of numerous close-flowered spikes; petals ovate, mucronate; stamens short. **f.** S. Native of Sierra Leone, in the low lands. Hook. bot. mag. t. 2944. C. Alfezaniæm, G. Don, in *Lin. trans.* 15. p. 437. Flowers large, scarlet, scented. Anthers yellow. (f. 89.)

XII. CHRSOSTACHYS. XIII. CACOUCA.

4. *C. rotundifolium* (Roxb. l. c. p. 88.). **f.** S. Native of Bengal.

Cult. As few plants surpass the Combrëum in the elegance and brilliancy of their blossoms, so their species have become great favourites with collectors. A few, as the *C. purpureum*, *C. comosum*, and *C. grandiflorum*, are the greatest ornaments of our stoves; but some of the species, not yet introduced to our gardens, outvie them in beauty. All of them thrive well in a mixture of loam and peat, and young cuttings root readily if planted in a pot of sand; placed in a moist heat, with a hand-glass over them. The climbing species are well fitted for training up the rafters, or covering trellis-work in a stove.

XII. CHRSOSTACHYS (χρυσός, chrysos, gold, and σταχυς, stachys, a spike; in reference to the dense spikes of golden yellow flowers). Pohl. pl. bras. 2. p. 65.

LIN. SYST. *Decándria, Monogynia.* Calyx campanulate, obsoletely 5-toothed; teeth short, bluish. Petals 5, alternating with the teeth of the calyx, roundish and bluntly emarginate, unguiculate at the base. Stamens 10, very long, rather flexuous, inserted in the base of the calyx. Ovary ovate.—A climbing shrub, with opposite, coriaceous, entire leaves. Spikes dense, terminal, and axillary, panicle, opposite, bracteate. Flowers small, golden yellow.

1. *C. ovatáfolia* (Pohl. pl. bras. 2. p. 66. t. 143.) leaves ovate-elliptic, glabrous; ovaries and rachis of the spike clothed with yellow down. **f.** S. Native of Brazil, in the northern part of the province of Goyaz.

Ovate-leaved Chrsostachys. Shrub cl.

Cult. This is a fine stove climber. Its culture and propagation are the same as that for Combrëum, which see.

LIN. SYST. *Decándria* and *Dodecándria*, Monogynia. Limb of calyx tubularly campanulate, acutely 5-toothed, deciduous. Petals 5, alternating with the calyxite teeth, and larger than them. Stamens 10-14, inserted in the base of the limb of the calyx, filiform, long. Ovary according to Kuth, containing 3 pendulous ovaries. Style filiform, acute. Berry or drupe ovate, quadrangular, acute at both ends, not crowned by the calyx, pulpy inside, 1-2-seeded. Cotyledons thick and fleshy.—Climbing shrubs, with alternate and opposite leaves, sometimes the lower ones are verticillate; they are ovate, acuminate, standing on short pedicels. Flowers scarlet, alternate, bracteate at the base, disposed in long terminal spikes.

1. *C. coccinea* (Aubl. l. c.) fruit ovate, acute at both ends, somewhat pentagonal. **f.** S. Native of Gúiana, on the banks of the river Sinemari. Schoubschë'a coccinea, Willd. l. c. Flowers scarlet.

Scarlet-leaved Cacouca. Shrub cl.

China Cacouca. Shrub cl.

**Trifoliate Caecoscia.** Shrub cl.

*Cult.* See *Combrétum* for culture and propagation, p. 666.

**XIV. LUMNITZERA (in honour of Stephen Lumnitzer, author of Flora Poasaniana, 1 vol. 8to, Leipzig, 1791).** Willdl. nov. act. nat. cur. berl. 4. (1803) p. 156, but not of Jacquy. (1817). D. C. prod. 3. p. 22.

**Lin. syst. Decándria, Monogynia.** Bracteoles 2, very short, under each flower. Limb of calyx tubular, 5-toothed; teeth obtuse. Petals 5, inserted in the calyx and longer than it, reflexed. Stamens 10, 5 of which are shorter than the petals, and the longest 5 about the length of the petals. Ovary oblong, compressed. Style subulate. Drupe dry, 1-seeded.—A shrub, with alternate leaves, and intra-foliaceous racemes of flowers. The structure of the seed is hardly known, and therefore the genus may not be distinct from *Cacoecia*.

**Racecmose-flowered Lumnitzer.** Shrub cl.

*Cult.* See *Combrétum* for culture and propagation, p. 666.

**XV. QUISQUALIS (from quis, who, and quis, what kind; when the name was given to this genus it was uncertain to what class or order it belonged).** Rumph. amb. 5. p. 71. Lin. gen. no. 539. Lam. ill. t. 557. Blum. bijdr. p. 638. D. C. prod. 3. p. 22.

**Lin. syst. Decándria, Monogynia.** Tube of calyx slender, lengthened out much above the ovarium, deciduous, with a 5-clit border. Petals 5, oval-oblong, obtuse, longer than the calycine teeth. Stamens 10, exerted, inserted in the throat of the calyx, alternate ones shorter than the others. Ovarium ovate-globose, containing 4 ovula. Style filiform, obtuse, exerted. Drupe dry, 5-angled, 1-seeded. Cotyledons fleshy, large, plano-convex, ex Blume.—Climbing shrubs, with opposite, rarely alternate, ovate, quite entire leaves; and axillary and terminal spikes of changeable-coloured flowers, usually varying from white to red.

1 Q. *indica* (Lin. spec. 556.) pubescent; bracteas ovate-rhomboid, aristately acuminate, one under each flower; leaves ovate acuminate; petals oval, oblong, clothed with adpressed pubescence. " S. Native of Java. Amboyna. Lam. ill. t. 527. Sims. bot. mag. 2933. Ker. bot. reg. 499. Flowers beautiful, changeable in colour from orange to red, sweet-scented. 

**Indian Quisqualis.** Fl. May, Aug. Clt. 1815. Shrub cl.

2 Q. pubescens (Beauv. fl. d’ow. 1. p. 67.) pubescent; leaves cordate or oblong, acuminate, with a rounded base; bracteas ovate, acuminate. " S. Native of India. Flowers like those of *Q. indica*. 

**Pubescent Quisqualis.** Clt. 1815. Shrub cl.

3 Q. ebracteata (Beauv. fl. d’ow. 1. p. 57. t. 34.) smoothish; flowers bracteas; petals oblong, glabrous. " S. Native of India, in the kingdom of Waree. Leaves ovate-oblong, lower ones smaller and roundish. Flowers white. 

**Bracteless-flowered Quisqualis.** Shrub cl.

4 Q. glabra (Burm. fl. ind. 104. t. 28. f. 2.) leaves ovate, acute, and are as well as the minute bracteas quite glabrous. " S. Native of Java. Flowers in spikes; spikes all opposite. 

**Smooth Quisqualis.** Clt. 1815. Shrub cl.

5 Q. Loureiroi; leaves ovate, acute, glabrous; corymb terminal. " G. Native of Cochin-china. Q. *indica*, Loure. coch. p. 274. Racemes corymbose. Flowers from white to red. The seeds are astringent and anthelmintic. 

**Loureiro’s Quisqualis.** Shrub cl.

6 Q. villosa (Roxb. hort. beng. p. 90.) leaves oblong, somewhat coriaceous, villous as well as the linear-lanceolate bracteas; flowers pubescent. " S. Native of the East Indies.

**Villosa Quisqualis.** Shrub cl.

*Cult.* Some of the species of *Quisqualis* are equal in elegance to the species of *Combrétum* when in flower: their culture and propagation are the same, see p. 666.

† Genera belonging to *Combrétaceae*, but are not sufficiently known.

**XVI. CERASTOSTACHYS (from κερας, a horn, and σταχυς, a spike; in reference to the heads of flowers being intermixed with spongy processes).** Blum. bijdr. p. 644. D. C. prod. 3. p. 23.

**Lin. syst. Octo-Dodecandria, Monogynia.** Limb of calyx entire. Petals usually 3, small. Stamens 8-16, unequal. Ovary biovulate. Style short, crowned by a bidd stigma. Drupe baccate, crowned by the limb of the calyx, containing a 1-seeded compressed nut. Embryo exalbuminous? inverted.—A tall tree, with scattered, oblong, quite entire leaves; and axillary spikes of flowers. Flowers disposed in dense heads, intermixed with spongy, filiform processes. The place which this genus should occupy in the order is uncertain, from the embryo being unknown.

1 C. arboria (Blum. l. c.). " S. Native of Java, on Mount Salak.

**Tree Cerastostachys.** Tree 40 feet. 

*Cult.* See *Baccidae* for culture and propagation, p. 657.

**XVII. BRUGUIEREA (in honour of Bruguieres, the well-known French botanist).** Pet. Th. dict. se. nat. 5. p. 375. gen. nov. mad. no. 70. p. 21, but not of Lam. D. C. prod. 3. p. 23.

**Lin. syst. Decándria, Monogynia.** Tube of calyx furnished with 2 scales in the middle; limb 5-lobed, obtuse. Petals 5, oblong-lanceolate, spreading. Stamens 10, equal in length to the petals. Style acute. Ovary adnate to the calyx, containing 4 pendulous ovula. Fruit unknown.—A small tree, with alternate, oval, smooth, succulent leaves, tapering into the petiole. Racemes axillary. Flowers small, white. The genus, according to Petit Thours, is nearly allied to *Combrétum*.

1 B. Madagascarensis (D. C. prod. 3. p. 23.). " S. Native of Madagascar, in places inundated with salt water.—Kada-kandel, Rheed. mal. 6. t. 37.

**Madagascar Bruguiere.** Tree. 

*Cult.* See *Combrétum* for culture and propagation, p. 666.

**XVIII. BOBU’A (Bubu or Bombu) is the name of the tree in Ceylon).** D. C. prod. 3. p. 23.—Bombu, Adams. fam. pl. 2. p. 11.—Eugenioides, Lin. fl. zeyl. p. 192.

**Lin. syst. Icosándria, Monogynia.** Tube of calyx ovate, adnate to the ovary; limb 5-clit, with very short blunt lobes. Petals 5, alternate with the lobes of the calyx, and longer than them. Stamens 20-30, free, longer than the petals. Style filiform. Stigma subcapitate. Fruit (berry) foveate, indehiscent, few-seeded. Seed unknown.—A tree, with alternate, obovate-oblong, acute, glabrous, dotted, usually serrated leaves; and axillary, simple peduncles, bearing subsaccate distant flowers; pedicels very short, each propped by 2 or 3 bracteas just under the calyx. This is a very doubtful genus.

VOCHYSIEÆ.  

I. Callisthene.  

1. Callisthene.  

5. Qualea.  

Sect. II. Ovary adnate to the calyx.  
Calyx 4-parted.  

One of the lobes of the calyx furnished with a spur at the base. Petal 1. Fertile stamen 1, sterile 4.  

† Genera doubtful whether they belong to the present order.  

7. Lozania.  

8. Agardhiia.  
Calyx of 3 sepals. Petals 5, convolute. Stamen 1, bearing a large 2-celled anther. Style 1. Drupe oval, 3-celled, 3-valved.  

9. Schweiggeria.  
Calyx of 3 sepals. Petals 3, one of which is spurred. Stamen 1. Pistil none. Fruit unknown.  

§ 1. Ovary free from the calyx.  
Calyx 5-parted.  

1. Callisthene.  

Lin. syst. Mouândru, Monophyta.  
Calyx of 5 unequal parts (f. 90. d.), upper one large, and drawn out into a spur (f. 90. d.). Petal one (f. 90. a. b.), obcordate. Stamen 1 (f. 90. c.), alternatting with the petal, without any rudiments of sterile stamens. Anther 4-celled; cells separating by pairs. Ovary free, 3-celled; cells containing few ovula. Capsule 3-celled (f. 90. c.), 3-valved; valves without a dissepiment; cells 1-2-seeded. Seeds adnate to the angles of the central, thick, trigonal placenta. Resinous trees; with minute axillary buds, covered with white grains. Leaves and branches opposite and distich, coctaneous, stipulate, deciduous. Flowers axillary and lateral. Petals yellowish.  

1. Callisthene.  
Major (Mart. l. c. t. 75.)  
Glabrous; leaves elliptic or ovate-oblong, obtuse or acute; flowers solitary in the axils of the leaves, and therefore opposite. Seminaria. S. Native of Brazil, in hot sandy places. Petals yellow, lined with scarlet. (f. 90.)  

Larger Callisthene.  
Tree 10 to 12 feet.  

2. Callisthene Minor (Mart. l. c. t. 76.)  
Pubescent; leaves linear-oblong, obtuse, ending in a glandular mucrone; flowers solitary in the axils, and therefore opposite. Seminaria. S. Native of Brazil, in the high plains called Chepada de Parana. Petals cream-coloured.  

Smaller Callisthene.  
Tree 15 to 26 feet.  

3. Fasciculata (Mart. l. c. p. 126.)  
Leaves ovate-oblong, obtuse, rather emarginate, glabrous above, and villous beneath; flowers axillary, in fascicles. Seminaria. S. Native of Brazil, in the desert between Serra de St. Antonio, and the river St. Francisco, in the province of Minas Geraes. Petals cream-coloured.  

Fascicled-flowered Callisthene.  
Tree.  

Cult.  
See Vochysia for culture and propagation, p. 670.

Linn. syst. Monandria, Monogynia. Calyx of 5 unequal coriaceous parts; upper part large, and drawn out into a short horn. Petal one, deeply obovate. Fertile stamen one, alternate with the petal, usually without any rudiments of sterile ones. Anther 4-celled; cells in distinct pairs. Ovary free, with the cells containing few ovula. Capsule having the epicarp separable, 3-celled, 3-valved, opening at the disseminules; the valves are bent inwards so much as to form the disseminules to the capsule. Seeds 1-2 in each cell.—Trees, with opposite petiole coriaceous, reticulately-veined leaves. Leaf-buds covered with white grains, which remain afterwards permanent at the base of the branches. Flowers terminal, disposed in somewhat interrupted spikes. Petal pubescent.

1 A. dichotoma (Mart. l. c. t. 77.) leaves roundish and somewhat coriaceous at the base, narrow-oblong, and bluish, pubescent beneath. h. S. Native of Brazil, in the province of Minas Geraes. Petal sulphur-coloured, marked with a blue spot at the base.

Dichotomous Amphiluchia. Tree.

2 A. cordata (Mart. l. c. p. 129.) leaves deeply coriaceous at the base, rather ovate-lanceolate, acute, glabrous and glaucescent on both surfaces. h. S. Native of the south of Brazil. Quêleá cordâta, Spreng. syst. 2. p. 17. Flowers like the last.

Cordate-leaved Amphiluchia. Tree.

Cult. See Vochysia for culture and propagation, p. 670.

Linn. syst. Monandria, Monogynia. Calyx coloured, 5-parted (f. 91. a.), with 4 of the lobes small (f. 91. a.), and the fifth or superior one large, and drawn out into a spur at the base (f. 91. b.). Petals 3 (f. 91. c. d.), unequal, inserted in the calyx, the 2 lateral ones not half the size of the middle one (f. 91. d. e.). Stamens 3, opposite the petals, 2 lateral ones sterile and small; and the middle one larger and fertile, bearing a continuous immovable anther, which is cucullate at the apex. Stigma terminal, obtuse. Capsule trignon (f. 91. f.), 3-celled; the valves opening in the middle. Seeds furnished with a wing, exalbimunious, solitary in the cells. Cotyledons large. Radicle superior.—South American trees, with opposite or verticillate, ovate, entire, feather-nerved, bistipulate leaves, standing on short footstalks. Flowers of all yellow, disposed in terminal racemes; pedicles 1-2-4-flowered, bifractoclatacule at the base.

1 V. gianense (Lam. ill. no. 97. t. 11.) leaves opposite, obovate-oblong, ending in a short acumen each, glabrous on both surfaces; racemes simple, erect, terminal, dense-flowered; spur of flower spreading. h. S. Native of Guiana and Maranhão, in woods. Vochy GuianENSIS, Aubl. guian. 1. p. 18. t. 6. Cucullária excelsa, Willd. spec. 1. p. 17. but not of Vahl.

Guiana Vochysia. Tree 20 to 40 feet.

2 V. tomentosa (D. C. prod. 3. p. 28.) leaves opposite, oblong-oblong, ending each in a long taper-point, attenuated at the base, glabrous above, but clothed with rusty tomentum beneath; racemes terminal, loose, nodding. h. S. Native of Guiana, in woods. Cucullária excelsa, Vahl. enum. 1. p. 4. exclusive of the synonyms. Cucullária tomentosa, Meyer, essequ. p. 12.

Tomentose Vochysia. Tree 20 to 40 feet.

3 V. citrifolia (Poir. suppl. 5. p. 491.) leaves opposite, ovate, bluntly acuminate, glabrous; racemes terminal, panicled. h. S. Native of Brazil. Cucullária citrifolia, Rœm. et Schultes, mant. 1. p. 52.

Citrine-leaved Vochysia. Tree 20 to 30 feet.

4 V. emarginata (Poir. dict. 8. p. 682.) leaves 4 in a whorl, pediolar, obtuse, bluntly emarginate, attenuated at the base, rather coriaceous, glabrous on both surfaces; racemes numerous, ascending, elongated, terminal, erect; peduncles usually 3-flowered. h. S. Native of Brazil, about Rio Janeiro. Vochysia, Vand. fl. bras. in Rœm. script. 69. t. 6. f. 11. Cucullária emarginata, Vahl. enum. 1. p. 5.

Emarginate-leaved Vochysia. Tree 20 feet.

5 V. ternifolia (D. C. prod. 3. p. 27.) leaves 4 in a whorl, linear-oblong, acuminate, coriaceous, glabrous on both surfaces; racemes axillary, very simple. h. S. Native of Guiana, in humid woods. Cucullária ternifolia, Meyer, essequ. p. 12. There is a variety of this species mentioned by Meyer in nov. act. bonn. 12. p. 813, with 3 leaves in a whorl.

Four-leaved Vochysia. Tree 20 feet.

6 V. rotundifolia (Mart. bras. 1. p. 140. t. 83.) quite glabrous; leaves 3 or 4 in a whorl, almost sessile, coriaceous at the base, orbicular and emarginate, glaucescent, coriaceous, firm; racemem terminal, solitary; peduncles usually 2-flowered; ovaries glabrous. h. S. Native of Brazil, in the province of Minas Geraes, on mountains.

Round-leaved Vochysia. Tree 40 feet.

7 V. hieracea (Pohl. fl. bras. 2. p. 27. t. 118.) leaves obovate, mucronate, pilose, on short petioles, 5-6 in a whorl; racemes elongated; peduncles clothed with villous tomentum, usually 5-flowered. h. S. Native of Brazil, in the province of Goyaz.

Herbaceous Vochysia. Shrub 2 feet.

8 V. sericea (Pohl. fl. bras. 2. p. 28. t. 119.) leaves crowded, in cumulated whorles, usually 6 in each whorl, pediolar, oblong-oblong, emarginate at the apex; racemes clothed with silky tomentum; peduncles usually 3-flowered. h. S. Native of Brazil, in the province of Goyaz.

Silky Vochysia. Shrub 6 to 8 feet.

9 V. cinnamomea (Pohl. fl. bras. 2. p. 29. t. 120.) leaves cumulated in whorles, 6 or 8 in each whorl, nearly sessile, oblong, obtuse, emarginate, clothed with brown tomentum beneath; racemes very long, whorled; peduncles tomentose. h. S. Native of Brazil, in the province of Goyaz.

Cinnamum-like Vochysia. Shrub 6 to 8 feet.

10 V. elliptica (Mart. bras. 1. p. 141. t. 84.) leaves opposite, or 3 or 4 in a whorl, almost sessile, rounded and emarginate at both ends, glabrous, coriaceous, finely veined, glaucescent; racemes terminal, solitary; peduncles 2-flowered, and are, as well as the calyces, pubescent; ovaries villous. h. S. Native of Brazil, in the province of Minas Geraes, in the diamond district. (f. 91.)

Elliptic-leaved Vochysia. Tree 10 to 12 feet.

11 V. Vaccinum (Mart. bras. 2. p. 142. t. 85.) leaves 3 to 8 in a whorl, lanceolate-oblong, or obovate-oblong, attenuated at the base, obtuse or rounded at the apex, and emarginate, glabrous on both surfaces; veins of leaves rather remote, combined a considerable way from the margin; racemes terminal, solitary; ovaries glabrous. h. S. Native of the south of Brazil.

Var. a. fastigiata (D. C. prod. 3. p. 27.) leaves 3 or 4 in a whorl, approximate, lanceolate; racemes short, fastigiata, very simple, few-flowered; spur of flower bent downwards, and addressed to the calyx.

Var. b. macrostachya (D. C. l. c.) leaves 4 in a whorl, oblong or obovate-oblong; racemes terminal, solitary, compound, tapering much to the apex; spur of flowers bent.
**Vochysia**

**Var. λ, hexaphylla** (D. C. prod. 1. c.) leaves 4-6 in a whorl, linear-oblong, tapering much to the base; racemes terminal, very long, straight; spur straightish, spreading downwards.

**Var. χ, vulgāris** (D. C. l. c.) leaves 3-6 in a whorl, oblong-lanceolate, tapering to both ends, emarginate; racemes terminal, middle-sized, cylindrical, loose-flowered; spur of flower straightish, spreading downwards.

**Tonean’s Vochysia.** Tree 15 to 20 feet. 12 V. ruťa (Mart. bras. 1. p. 144. t. 88.) branches thickened, tomentose; leaves 4-6 in a whorl, petiolate, oblong, obtuse, clothed with rusty tomentum beneath, especially when young, reticulated with veins, coriaceous; racemes terminal, solitary, very long, loose-flowered; peduncles and calyces tomentose; ovaries very hairy. h. S. Native of Brazil, in the province of Minas Geraes.

**Rufous Vochysia.** Tree 20 feet. 13 V. dividegens (Pohl. pl. bras. 2. p. 19. t. 111.) leaves 3 in a whorl, diverging, petiolate, oblong-elliptic, hardly emarginate at the apex; racemes very long; peduncles 3-flowered, rather pilose. h. S. Native of Brazil, in the province of Goyaz.

**Diverging-leaved Vochysia.** Tree. 14 V. mirāntia (Pohl. pl. bras. 2. p. 20. t. 112.) leaves 3 in a whorl, petiolate, oblong, blunting at the apex and a little emarginate, rather attenuated at the base; racemes elongated; pedicels simple. h. S. Native of Brazil, in the province of Goyaz.

**Swelled-flowered Vochysia.** Tree 12 feet. 15 V. pułila (Pohl. pl. bras. 2. p. 21. t. 113.) leaves 3-4 in a whorl, on short petioles, oblong, narrow at the base, obtuse at the apex and mucronate, glaucous beneath; racemes very long; peduncles 2-flowered, rather pilose. h. S. Native of Brazil, in the province of Minas Geraes.

**Dwarf Vochysia.** Shrub 2 feet. 16 V. thyrsoidea (Pohl. pl. bras. 2. p. 24. t. 115.) leaves 4 in a whorl, on short petioles, oblong-elliptic, retuse, hardly attenuated at the base; racemes pyramidal; peduncles usually 4-flowered. h. S. Native of Brazil, in the province of Minas Geraes.

**Thyrso-like-flowered Vochysia.** Tree 20 to 30 feet. 17 V. alpestrātris (Mart. bras. 1. p. 145. t. 87.) leaves opposite, on short petioles, elliptic or oblong-elliptic, rounded, glabrous on both surfaces, finely veined; racemes terminal, solitary, long, cylindrical; ovaries glabrous. h. S. Native of Brazil, in the province of Minas Geraes, on the mountains.

**Alp Vochysia.** Tree 15 to 25 feet. 18 V. grac̄īs (Mart. bras. 1. p. 146. t. 88.) leaves 4 in a whorl, petiolate, ovate-oblong, rounded, or somewhat truncate, and rather emarginate at the apex, glabrous on both surfaces and finely veined, membranous; racemes terminal, long, cylindrical, aggregate; ovaries glabrous. h. S. Native of Brazil, in the province of Rio Negro, in woods.

**Great Vochysia.** Tree 80 to 100 feet. 19 V. Henkea (Mart. bras. 1. p. 147. t. 89.) leaves 4 in a whorl, on long footstalks, ovate-lanceolate, rather cupulidate, blunting and emarginate at the apex, glabrous on both surfaces and finely veined; racemes terminal, compound, aggregate, panicle; ovaries glabrous. h. S. Native of Peru.

**Henke’s Vochysia.** Tree 20 feet. 20 V. pyramidalis (Mart. bras. 1. p. 148. t. 90.) leaves opposite or 4 in a whorl, subcordate or rounded at the base, oblong-lanceolate, acuminate, costately veined beneath, and clothed with fine cincereous tomentum, as well as the branches, petioles, and peduncles; racemes terminal, solitary, pyramidal; ovaries glabrous. h. S. Native of Brazil, in the province of Minas Geraes.

**Pyramidal Vochysia.** Tree 20 to 30 feet.

21 V. florībūres (Mart. l. c. p. 149. t. 91.) leaves opposite or 3-4 in a whorl, oblong, cupulidate, costately veined beneath, and strigose and roughish at the veins; racemes terminal, aggregate; spur of calyx short, straight, and conical; ovary glabrous. h. S. Native of Brazil at Ega, in the province of Rio Negro. Allied to V. Guanénosis.

**Bundle-flowered Vochysia.** Tr. 30 to 40 feet. 22 V. pruinōsa (Pohl. pl. bras. 2. p. 22. t. 114.) leaves 4 in a whorl, cumulated, nearly sessile, oval-elliptic, rather cordate at the base, emarginate at the apex, pruinose; racemes elongated, tomentose; peduncles usually 3-flowered, tomentose. h. S. Native of Brazil, in the province of Goyaz.

**Florest Vochysia.** Shrub 6 to 12 feet. 23 V. czuna (Pohl. pl. bras. 2. p. 26. t. 117.) leaves usually 5 in a whorl, on short pediels, rather cuneated or obliquely oblong-ovate, obsolete at the apex; racemes pyramidal; peduncles usually 4-flowered. h. S. Native of Brazil, in the province of Minas Geraes.

**Cuneated-leaved Vochysia.** Tree 24 feet. 24 V. elongata (Pohl. pl. bras. 2. p. 25. t. 116.) leaves 3 or 4 in a whorl, on short pediels, oblong or oblong-elliptic, rounded and emarginate at the apex, attenuated at the base, reticulated; racemes elongated, straight; peduncles 2-5-6-flowered. h. S. Native of Brazil, in the province of Minas Geraes.

**Var. α, vitida** (Pohl. l. c.) leaves 4 in a whorl, elliptic, attenuated at the base; peduncles 5-6-flowered.

**Var. β, opia** (Pohl. l. c.) leaves 4 in a whorl, oblong, attenuated at the base; peduncles 2-flowered.

**Var. γ, terniula** (Pohl. l. c.) leaves 3 in a whorl.

**Elongated Vochysia.** Tree 24 feet. 25 V. ferrugiosea (Mart. bras. 1. p. 151. t. 22.) leaves opposite, ovate-oblong or oblong, acuminate, glabrous above, and costately veined beneath; the middle nerve and veins clothed with white tomentum, as well as the branches; racemes terminal, erect, straight; peduncles usually 4-flowered; spur of calyx hooked; ovaries glabrous. h. S. Native of Brazil, in the province of Rio Negro, in woods.

**Rustic Vochysia.** Tree 20 to 30 feet.

† A doubtful species.

**Race-mose-flowered Vochysia.** Tree.

**Cult.** A mixture of peat and loam will suit the species of this genus, and ripened cuttings will strike root if planted in a pot of sand, with a hand-glass placed over them.

**IV. SAVERTIA** (Auguste St. Hilare, does not say to whom he has dedicated this name, but it is evidently dedicated to some person of the name of Savert or Salverti). St. Hil. mem. mus. 6. p. 266. and 9. p. 340. Mart. bras. 1. p. 152. D. C. prod. 3. p. 28.

**Linc. syst. Monandria, Monogyne.** Calyx of 5 nearly equal
obtuse elliptic lobes, the upper one furnished with a spur at the base. Petals 5, the 2 superior ones very narrow. Stamens 3, inserted in the calyx, opposite the 3 lower petals, the lateral 2 sterile, the middle one only antheriferous. Style clavate. Stigma saucer-shaped, obtuse, lateral, situated beneath the apex of the style. Capsule 3-celled, 3-valved, trigonal; cells 1-seeded; valves opening in the middle. Seeds exalaminous, drawn out at one side into a woolly wing. Embryo with convolute cotyledons, and a superior radicle.—Trees, with oval, obtuse, exstipulate, feather-nerved leaves, which are crowded in whorls of 6 or 8. Flowers thyrsoid, sweet-scented, white, but at length becoming orange-coloured.

1 S. convallarioidæ (St. Hill. l. c.) leaves in whorles, oval, obtuse; flowers thyrsoid. P. S. Native of Brazil, in fields, in the province of Minas Geraes.

Lily of the valley-scented Salvertia. Tree 30 feet.

2 S. thyrœsflora (Pohl. pl. bras. 2. p. 16. t. 110.) leaves in whorles, obliquely oblong-oblong or oval, obtuse, mucronate; thyrses large, panicled; flowers small. P. S. Native of Brazil, in the province of Goyaz. Petals white, spotted with red.

Thrysæ-flowered Salvertia. Tree 20 feet.

Cult. See Vochysia for culture and propagation, p. 670.

Lin. syst. Monandra, Monogynia. Calyx 5-parted; lobes very unequal, rounded, the largest one petaloid, and furnished with a spur at the base. Petal 1, rarely 2, inserted in the bottom of the calyx, or perhaps inserted in the torus. Stamens 1, rarely 2, alternating with the petal; filament linear: anther oblong. Ovary free. Capsule woody, 3-celled, 3-valved; the valves opening in the middle. Seeds exalaminous, furnished with a wing. Embryo with large convolute cotyledons, and a superior radicle.—South American trees, with opposite branches, opposite coriaceous glabrous entire ovate feather-nerved leaves. Stipulas deciduous. Gynoecium of flowers terminal, trichotomous, panicked, furnished with 2 bracteas at each ramification. Flowers sweet-scented, rose-coloured or blue. The lateral veins of the leaves are the same as in Calophyllum, parallel, and approximate, running into a marginal nerve.

1 Q. rosea (Aubl. guian. l. p. 5. t. 1.) leaves elliptic, acuminate, glabrous on both surfaces; lateral veins approximate; petal entire; spur shorter than the calyx. P. S. Native of Guiana, in woods. Petal, as well as the large segment of the calyx, white on the outside, and rose-coloured on the inside.

Rose-coloured-flowered Qualea. Tree 60 feet.

2 Q. cerulea (Aubl. guian. l. p. 7. t. 2.) leaves oval, ending in a short taper-point each, glabrous on both surfaces; lateral veins approximate; petal emarginate; spur length of the calyx. P. S. Native of Guiana, in woods. Petal cinereous on the outside, and rather bluish on the inside.

Blue-petalled Qualea. Tree 60 to 80 feet.

3 Q. Gestàsia (St. Hill. mem. mus. 6. p. 254.) leaves lanceolate, acuminate, glabrous; petioles and pedicellus pubescent; calyx ciliated, the superior lobe emarginate; petal coriaceous. P. S. Native of Brazil in the mountains near Rio Janeiro. Petal sulphur-coloured, with the veins purplish at the base.

Gestas’s Qualea. Tree 100 feet.

4 Q. ecácràTa (Mart. bras. l. p. 130. t. 78.) leaves oblong, acuminate, glabrous above, but costately veined and clothed with fulvous pubescence beneath; racemes lateral, sub-corymbose, few-flowered; calyx without a spur. P. S. Native of Brazil, on mountains, in the province of Minas Geraes. Stamen 1 in the flowers, with 2 petals, and in the flowers, with 1 petal. Petal cream-coloured, veined.

Sparless Qualea. Tree 20 feet.

5 Q. grandiflora (Mart. bras. l. c. p. 133. t. 79.) leaves oblong, rather acuminate, glabrous above, tormentose and costately-veined beneath, but with the nerves and veins glabrous; flowers axillary or terminal, solitary or racemose; calyx clothed with silky pubescence on the outside, furnished with an elongated acutish spur. P. S. Native of Brazil, in the provinces of St. Paul and Minas Geraes. Petal 1, large, white, yellow at the base, orbicular, emarginate. Stamens 1.

Great-flowered Qualea. Tree 10 to 20 feet.

6 Q. multiflora (Mart. l. c. p. 134. t. 80.) leaves opposite or in a whorl, ovate or broad-lanceolate, or oblong, acuminate, glabrous on both surfaces, costately veined beneath; pediculæ pilose; racemes axillary or terminal; whorles of flowers distant; upper lobe of calyx truncate and emarginate; spur and ovaries very hairy. P. S. Native of Brazil, in the provinces of Minas Geraes and St. Paul. Petal 1, obcordate, cream-coloured. Stamens 1.

Var. b, pubescent (Mart. l. c.) leaves pubescent beneath. P. S. Growing along with the species.

Many-flowered Qualea. Tree 10 to 20 feet.

7 Q. parviflora (Mart. l. c. p. 135. t. 81.) plant clothed with powdery hoaryomentum; leaves opposite or alternate, oblong, bluntish, costately veined beneath; racemes axillary or terminal; calyx ciliate, with the spur spreading and obtuse. P. S. Native of the south of Brazil, in the Cerrao or Great Desert. Petal 1, obcordate, unguiculate, white, having the scent of violets.

Var. c, tomentosa (D. C. prod. l. p. 29.) leaves clothed with hoaryomentum on both surfaces, but in the adult state they are glabrous.

Var. ã, glabrata (D. C. l. c.) leaves smoothish on both surfaces. Var. ã, disco-color (D. C. l. c.) leaves glabrous above and canescent beneath.

Small-flowered Qualea. Tree 12 to 20 feet.

† Species not sufficiently known.

8 Q. Perrini (Spreng. syst. l. c. p. 17.) leaves oblong, subcordate, veiny; racemes hairy; petal entire; spur equal in length to the calyx. P. S. Native of Guiana.

Perrin’s Qualea. Tree.

9 Q. verticillata (Spreng. l. c.) leaves oblong, emarginate, attenuated at the base; corolla somewhat dipetalous, unequal. P. S. Native of Brazil.

Whorled Qualea. Tree.

Cult. For culture and propagation see Vochysia, p. 670.

§ 2. Ovary adnate to the calyx. Calyx 4-parted.

VI. ERISMA (from esema, erisma, stripe; so named from the anomalous form of the genus, which is at so much variance with others). Rudge, pl. guian. l. p. 7. t. 1. D. C. prod. 3. p. 29.—Debre’s, Rœm. et Schult. syst. 1. p. 4.—Ditmària, Spreng. syst. 1. p. 4.

Lin. syst. Monandra, Monogynia. Tube of calyx adnate to the ovary; limb 4-5-parted; the lobes unequal, the longest one parabolical, drawn out into a spur at the base, expanded into a large petaloid limb at the apex, which is bearded on the inside; it is convolute in assimilation, and incloses the genitils. Petal 1, opposite the petaloid limb of the calyx, inserted behind the filament. Stamens 1 fertile and 4 sterile; these last are very short. Anther oblong, narrow, sagittate, 3-celled, ex Martius. Ovary 1-celled, oblong, biovulate. Style filiform. Fruit unknown.—Trees, with opposite, oval, acuminate, coriaceous, glabrous, quite entire, feather-nerved leaves; lateral nerves confluent be-
fore the margin. Stipulas 2, small, at the base of each leaf. Panicle terminal, with opposite branches and branchlets, furnished with 2 unequal membranous deciduous bracteas to each ramification.

1 E. floribunda (Rudge, l.c.) leaves ovate, acute, with 16-18 lateral nerves on each side, having the upper surfaces hardly shining; branches of panicle clothed with rusty velvety down. S. Native of French Guiana. Tratt. obs. nat. 3, p. 71. t. 165. Debret floribunda, Roxm. et Schultes, syst. 1, p. 84. Ditonea floribunda, Spreng. syst. 1, p. 16. Petal violaceus.

*Bundle-flowered* Erisma. Tree 40 feet.

*Violaceous*-petalled Erisma. Tree 30 to 40 feet.

3 E. nitidum (D. C. prod. 3, p. 30.) leaves ovate, acute, with 7-9 lateral nerves on each side, shining on the upper surface; branches of panicle striated and glabrous. S. Native of Cayenne, on the mountains of Reura near Kow. Qualea lutea, Martin in Desf. herb. Petal yellow.

*Shining-leaved* Erisma. Tree 30 to 40 feet.

Cult. See *Vochysia* for culture and propagation, p. 670.

† The following genera are hardly known, and very doubtful whether they belong to the present order.

VII. LOZAN'IA (evidently a proper name, and perhaps the name of some botanist known to Mutis). Seb. Mut. in sem. nat. 1, grand. 1810, p. 20. D. C. prod. 3, p. 50.

Lx. syst. Monändria, Monogynia. Calyx with a somewhat ventricose tube, and a 4-parted limb; lobes ovate, acute, spreading, permanent. Petals wanting. Disk quadrangular, filling the bottom of the calyx. Stamens 1, small, inserted obliquely under the ovary, and tapering to the apex; anther ovate, didymous. Ovary ovate. Stigmas 3, small, subcapitate. Capsule ovate, trigonal, acuminated, 3-celled, 3-valved. Seeds 6, with usually 3 of them abortive, angular, inserted in the bottom of the capsule. — A tree, with alternate oblong serrated leaves, and spikes of flowers; peduncles axillary, crowded; pedicels furnished each with a linear bracteole at the base.

1 L. nemoralis (Seb. Mut. l.c.) S. Native of New Granada, in temperate parts. 

Lx. syst. Monändria, Monogynia. Calyx of 3 sepals. Petals 5, convolute. Stamens 1, bearing a large, 2-celled anther. Drupe oval, 3-celled, 3-valved. The rest unknown. Perhaps more nearly allied to *Terebinthiaceae*. It is a very doubtful genus.

1 A. cryptantha (Spreng. syst. 1, p. 17.) leaves ovate, acute, glabrous on both surfaces; raceme terminal. S. Native of Brazil.

*Hidden-flowered* Agardhia. Tree.

2 A. grandiflora (Spreng. l.c.) leaves cordate, oblong, coriaceous, with parallel veins, discoloured beneath and villously tomentose; racemes verticillate; flowers villous, as well as the pedicels and peduncles, which are glandular at the base. S. Native of Brazil.

Lx. syst. Monändria, Monogynia. Calyx of 3 corolline sepals. Petals 3, one of which is furnished with a spur, the other two erect and cartilaginous. Glands 5, ovate, surrounding the base of the stamens, which is columnar and triquetrous, and bearing an anther at the apex. Pistil none. Fruit unknown. — A little shrub, with the habit of *Bétrula fruticosa*, with scattered, sub-fascicled, ovovate, crenulately, glabrous leaves; and axillary bibracteate pedicles. Flowers small, like those of a violet. This genus is hardly known.

1 S. fruticosa (Spreng. l.c.) S. Native of Brazil. *Shrubby Schweiggeria*. Shrub.

Cult. See *Vochysia* for culture and propagation, p. 670.

Tube of calyx adhering to the ovary (f. 92, a, f.), except in the genus *Cassipoa*, which is free; limb 4-13-lobed (f. 92, c.); lobes valvate in restitution (but in *Olisbea* calyptraformis). Petals inserted in the calyx (f. 92, c.), and alternating with its lobes, therefore equal to them in number. Stamens inserted with the petals (f. 92, d.), equal to them in number, or double or triple that number; filaments free, subulate, erect; anthers ovate, inserted by the base, erect, but somewhat incurred in the genus *Olisbea*. Ovary adnate to the calyx (f. 92, a.), 2-celled; cells 2 or many-ovulate; ovula pendulous. Fruit indiseindest (f. 92, f.), 1-celled, 1-seeded, crowned by the calyx (f. 92, e.). Seed pendulous, exalbaminous. Embryo with a very long radicle and 2 flat cotyledons. — Tropical trees or shrubs, with opposite, simple, entire, or toothed leaves, having the lateral nerves feathered when present. Stipulas interpetiolar. Peduncles axillary.

From a consideration of the structure of *Carallia* and *Léguae*, Mr. Brown has been led to conclude, that we have a series of structures, connecting *Rhizophoraceae* on the one hand with certain genera of *Saliariaceae*, particularly with *Atherium*, though that genus wants its intermediate stipulas, and on the other with *Cunoniaceae*, especially with the simple-leaved species of *Ceratopetalum*. In the opposite leaves, interpetiolar stipulas, adnate ovarian, and polypetalous flowers, this order agrees with *Vochysieae* and *Cunoniaceae*; in the valvate calyx with *Lythriariae* and *Cunoniaceae*; and in the pendulous ovulas with *Combretiacea*. The genus *Olisbee* seems to come nearest to *Monecia*. The species of *Rhizophora* or *Mangrove* are remarkable in tropical countries for growing upon the shores of the sea and rivers, even as far as low water. The seeds have the singular property of germinating while inclosed within the capsule, and adhering to their parent, and pushing forth a long fusiform radicle, which lengthens till it reaches and fixes itself in the mud in which the parent grows, and forms a new individual. These young plants never separate from the parent until they are fairly fixed and rooted, as otherwise they would be washed away by the tide. Where *Mangroves* grow in abundance, the situation is always considered unhealthy, from their collecting a vast quantity of filth about their
Synopsis of the genera.

1. **OLISBEA.** Calyx undivided before the expansion of the flower, but afterwards separating transversely, in one piece. Petals 5. Stamens 10.

2. **RHIZOPHORA.** Limb of calyx 4-13-lobed. Petals equal in number to the lobes of the calyx. Stamens double the number of the petals. Anthers erect, ovoid, inserted by the base. Ovarium 2-celled, when young containing many pendulous ovula. Style 1, bifid at the apex. Fruit indescent, 1-seeded, crowned by the calyx. Seed small. Embryo inverted, germinating in the seed, with the radicle gradually lengthening out until it fixes itself in the mud.—Glabrous shrubs, growing in great abundance on the shores of the sea and rivers within the tropics, throwing out numerous roots from every branch. Leaves opposite, coriaceous, quite entire. Peduncles axillary.

*Flowers 4-petalled.* Mangles, Plm. gen. t. 15.

1 R. *Ma'ngle* (Lin. spec. 634.) leaves obovate-oblong, obtuse; peduncles 2-3-flowered, longer than the pedicels; fruit subulate-clavate. R. S. Native of Louisiana, Mexico, West Indies, Guiana, Brazil, and west coast of Africa, on the shores of the sea and rivers. J. Amer. p. 141. t. 89. ed. pict. t. 132. Catesb. care. 2. t. 63.—Plench. icon. t. 359. Flowers octandrous, pale yellow. P. Browne says the fruit germinates within the cup, and grows from the top downwards until it acquires a due degree of weight and perfection; then it falls off, and as the root is always the thickest, and hangs lowest, it drops in that direction, and is thus received in its natural position in the mud below, the leaves are immediately unfolded, and in a few minutes a perfect plant is seen, sometimes of 2 or 3 feet long, which soon begins to shoot its roots and push its growth like the parent plant. The lower branches frequently become the supporters of some species of oysters, which has given rise to the fabulous account of this shell-fish on trees as a fruit. The bark is most excellent for tanning leather. The decoction of it is a most powerful astringent. The wood is tough and durable.

**Mangle or Common Mangrove.** Citi. 1820. Tr. 12 to 15 ft. 2 R. *Candela*b (D. C. prod. 3. p. 32.) leaves oval, acute; peduncles 1-3-flowered, very short and thickish; fruit subulate-clavate. R. S. Native of Malabar and the Moluccas, on the shores of the sea and rivers. P. Kendall, Rhed. mal. 6. t. 34. Mangium canalicium, Rumph. amb. 3. t. 71 and t. 72. The flowers are at first white, but at length changing to reddish, according to Rhede. Stamens 9-12. Perhaps this species is not different from R. *Mangle*.

**Chandelier or Malabar Mangrove.** Tree 12 to 15 feet. 3 R. *Racemosa* (Meyer, prim. ess. 16.) leaves obovate-oblong or obvate; racemes axillary, dichotomously panicked. R. S. Native on the shores of Guiana, near the Essequibo. Pedals copper-coloured, pilose.

**Racemose-flowered Mangrove.** Tree 12 to 15 feet. 4 R. *Mucronata* (Lam. dict. 6. p. 169. ill. t. 396. f. 2.) leaves oval, abruptly acuminate; racemes nodding, dichotomous. R. S. Native of the Mauritius. Pedals oblong, obtuse? Stamens 8. Ovary 4-sided, ex Poir. Mucronate-leaved Mangrove. Tree 12 to 15 feet.

**Flowers of 5 petals.** Kandelia (from Tijerou-Candel, the Malabar name of R. Candel).

**Candel Mangrove.** Tree 10 to 15 feet.

6 R. *Timor'ensis* (D. C. prod. 3. p. 32.) leaves oval, obtuse, on long pedicels; peduncles length of pedicels, bearing 10-15 flowers in a head. R. S. Native of Timor. Leaves 2 to 2½ inches long. Petioles 6-12 lines long. Flowers crowded. Lobes of calyx 5, oblong, stiff. Pedals 5, biaistrate at the apex, when young convolute and clasping 2 stamens each.

4 R
Timor Mangrove. Tree 15 to 20 feet.

* Flowers of 8 petals.—Kasilia, (from Kanil-Kandel, the Malabar name of R. cylindrica).

7 R. cylindrica (Linn. spec. 634.) leaves oval, acuminated at both ends; peduncles axillary, 1-2-flowered; lobes of calyx at length reflexed. ½, S. Native of Malabar, in muddy places by the sea-side. Kanil-Kandel, Rheed. mal. 6. t. 89. Flowers white. Anthers red. Fruit cylindrical, from reddish to blue, 2-3 inches long, ex Rheed.

Cylindrical-fruited Mangrove. Tree 12 to 15 feet.

8 R. Caryophyllodes (Jack, mal. misc. 1. no. 2. p. 34.) leaves ovate-lanceolate, acute at both ends; peduncles axillary, 3-flowered, rarely dichotomously 5-flowered; lobes of calyx at length spreading. ½, S. Native of the Moluccas, Singapore, Pulo-penang. Radicle rather cylindrical, acutish.—Rumph. amb. 3. t. 78.

Close-like Mangrove. Tree 12 to 15 feet.

** Flowers of 10-13 petals.—Paletueviéra, Pet. Th.—Bruguiera, Lam. ill. t. 397. dict. 4. p. 696. but not of Pet. Th.

9 R. sexangulara (Lour. coch. 297.) leaves ovate-lanceolate; pedicels 1-flowered, sub-terminal; fruit prismatic, hexagonal, obuse. ½, G. Native of Cochini-china, on the banks of rivers. Bruguiera sexángula, Steud. Bruguiera sexangularis, Spreng. Flowers red, of 10 petals. Petals ciliated.

Hexagonal-fruited Mangrove. Tree 10 to 15 feet.

10 R. Gymnorhiza (Linn. spec. 634.) leaves ovate-oblong, acuminated at both ends, shining; pedicels 1-flowered, deflexed, about the length of the petioles; fruit terete, acute. ½, S. Native of the Moluccas, East Indies, and Cochini-china.—Rheed. mal. 6. t. 31. 32.—Rumph. amb. 3. t. 65. 70. 71. Bruguiera gymnorrhiza, Lam. ill. t. 397. Flowers reddish-yellow, of 10-13 petals. Roots naked above the earth. The bark is very astrignent, and is used in India for dyeing rufous or chestnut colour, which is easily changed into a fine permanent black.

Naked-rooted Mangrove. Tree 12 to 15 feet.

† Species not sufficiently known.

11 R. Conjugata (Linn. spec. 634.) leaves ovate-oblong, bluntish; flowers sessile; fruit cylindrically subulate. ½, S. Native of Ceylon.

Conjugate Mangrove. Tree.

12 R. Palux (D. C. prod. 3. p. 33.) leaves ovate-oblong, acuminated at both ends, alternate; calyx 5-lobed; fruit cylindrical, striated. ½, S. Native of the Moluccas, in marshes. —Rumph. amb. 3. t. 69.

Palum Mangrove. Tree.

13 R. Deándrea (Roxb. hort. beng. p. 36.) Native of the East Indies, where it is called Gurau. Not described.

Decandrous Mangrove. Tree.

14 R. Cereatophyllodes (Rech. nom.) Not described.

Buckhorn-leaved-like Mangrove. Shrub.

Cult. The species of mangrove are difficult, if not impossible, to cultivate in this country. They may be tried in a mixture of loam and sand, and kept moist with salted water.

III. CARALLIA (Carallia is the name of C. lóciada, in the language of the Telingas). Roxb. hort. beng. p. 87. and cor. 8. 1211. D. C. prod. 3. p. 35.

Lin. Syst. Dodécandria, Monogynía. Tube of calyx sub-globose (f. 92. a.). limb 6-7-lobed (f. 92. c.); lobes triangular. Petals 6-7 (f. 92. c.), orbicular. Stamens 12-14 (f. 92. d.), equal in length with the petals. Ovary globose (f. 92. a.), adnate to the calyx. Style length of stamens, crowned by a sub-unculate, 3-lobed stigma (f. 92. b.). Berry globose (f. 92. f.), 1-celled, crowned by the calyx (f. 92. e.). Seed 1, reniform, rarely 2.—Evergreen, glabrous, Indian trees, with opposite, serrated, stiffish leaves, which are shining on the upper surface. Peduncles axillary, trifid, many-flowered. The genus Baradéla of Pet. Th. see vol. 1. p. 808. now inserted in Rutácceae, is allied to this genus, according to R. Br. congo. p. 18.

1 C. lanceolatà (Roxb. hort. beng. p. 87.) leaves oblong-lanceolate, acute, serrated, 3-times longer than broad. ½, S. Native of Sumatra.

Lanceolate-leaved Carallia. Tree 20 feet.

2 C. lucida (Roxb. cor. 3. t. 211.) leaves oval, acuminated, serrated, twice the length of the breadth. ½, S. Native of the East Indies, on the lower Circars. Petals yellow, rather undulated. Fruit the size of a large pea.

3 C. integereflora (D. C. prod. 3. p. 33.) leaves oval, acuminated, quite entire, twice the length of the breadth. ½, S. Native of the East Indies. Perhaps only a variety of C. lucida.

Quite-entire-leaved Carallia. Tree 20 feet.

Cult. See Cassipourea for culture and propagation, p. 675.

§ 3. A genus with a free calyx, intermediate between Rhizophórea and Lythriarcia.

IV. CASSIPOUREA (Guiana name of C. Guianénseis.) Aubl. guian. 1. p. 529. t. 211. (1775.)—Tita, Scop. intr. p. 219. (1777.)—Legnottis, Swartz, prod. p. 84. (1878.) fl. ind. occ. p. 968. t. 17.—Richéria, Pet. Th. gen. nov. mad. no. 84. (1810.) but not of Lam. nor Browne.

Lin. Syst. Icosándria, Monogynía. Calyx campanulate, 5-lobed; lobes valvate in aestivation. Petals 3, inserted in the bottom of the calyx, attenuated at the base, fringed on the margins at the apex. Stamens 20-40, inserted in the bottom of the calyx and shorter than it, disposed in a single series. Ovary hemispherical. Style permanent, longer than the stamens. Stigma obtuse. Fruit 3-celled, 3-valved, girded by the calyx; cells 2-ovulate, but only 1-seeded from abortion. Seed hanging from the top of the cell, half arillate at the base. Albumen fleshy. Embryo inverted, with flat cotyledons and an oblong radicle.—Trees or shrubs, with opposite, ovate, acute, feather-nerved, short-stalked, entire, or toothed leaves. Stipulas lanceolate, between the leaves. Flowers axillary, crowded; pedicels 1-flowered, bracteate at the base.—This genus agrees with Rhizophórea in the stipulas, and especially with the genus Carallia. It agrees with Lythriarcia in the free calyx; but from both orders it differs in the albuminous seeds. Perhaps a proper order.

1 C. macrophylla (D. C. prod. 3. p. 34.) leaves ovate, obtuse at the base, on short petioles, acuminated at the apex, and with the margins bluntly repand; flowers sessile; petals pinnatifidly jagged. ½, S. Native of Brazil, in the province of Para. Legnottis macrophylla, Mart. herb. Leaves 6 inches long and 3 broad. Flowers larger than those of the following species, white.

Long-leaved Cassipourea. Tree or shrub.

2 C. Guianénseis (Aubl. guian. 1. p. 529. t. 211.) leaves ovate or oval, on short petioles, quite entire, acuminated at the apex; flowers almost sessile; petals pinnatifidly fringed. ½, S. Native of Guiana, in marshes, and of Brazil, in the
province of Para. Legnóis Cassipórea, Swartz, fl. ind. 970. Petals white.

Guiana Cassipórea. Shrub 6 to 7 feet.

3 C. Elًptica (Poir. suppl. 2, p. 191.) leaves elliptic, acuminate at both ends, quite entire, on short petioles; flowers distinctly pedicellate; petals rather palmately fringed. $\frac{3}{4}$. Native of Jamaica, on the higher mountains. Legnóis elliptica, Swartz, prod. 84, fl. ind. p. 969, t. 17. Petals white.

Elliptic-leaved Cassipórea. Tree 10 to 30 feet.

4 C. Madagascari€'ensis (D. C. prod. 3, p. 34.) leaves on short petioles, toothed; flowers pedicellate; pedicels rising from an urceolate bractea each; petals fringed at the apex. $\frac{1}{4}$. S. Native of Madagascar. Riché'ia, Petr. Th. nov. gen. mad. p. 25, no. 84.

Madagascar Cassipórea. Shrub 6 to 10 feet.

† A species not sufficiently known.

5 C. Conge'ensis (R. Br. congo, p. 58.). $\frac{1}{4}$. S. Native of the west coast of Africa, on the banks of the Congo. Petals less divided than the rest of the species.

Congo Cassipórea. Tree or shrub.

Cult. Loam and peat is a good soil for the species of Cassipórea, and cuttings root readily in sand, under a hand-glass, in heat.

Tube of calyx adnate to the ovary the whole length (f. 98. a.), or only adnating to it at the base (f. 94. a.), and drawn out beyond the ovary at the apex (f. 94. a.); limb 2-4-lobed, but usually 4-lobed (f. 93. a. f. 94. a. f. 96. a. f. 98. a.); lobes valvate in aestivation. Petals equal in number to the lobes of the calyx (f. 95. b. f. 96. b. f. 97. b. f. 98. d.), and alternating with them, for the most part regular, twisted in aestivation, inserted in the top of the tube of the calyx (f. 95. b. f. 96. b. f. 97. b. f. 98. d.), rarely wanting. Stamens sometimes equal in number to the petals (f. 93. d. f. 99. c.), but usually twice that number (f. 99. b.); filaments free, filiform; anthers oblong or ovate. Ovary many-celled, usually crowned by a cup-shaped gland. Style filiform. Stigma capitata (f. 95. c.) or lobed (f. 96. c. f. 97. a.). Fruit capsular (f. 96. d. f. 99. f.), baccate or drupaceous, 2 or 4-celled. Seeds many in each cell, rarely solitary, fixed to the central placenta. Albumen wanting, but the endopleura is sometimes tumid, and appearing like albumen. Embryo straight, with a long terete radicle and 2 short cotyledons.—Herbs or shrubs. Leaves simple, alternate or opposite, entire, toothed, or pinnatifid, feather-nerved. Flowers axillary, and disposed in terminal spikes or racemes.

This order is distinguished from Lythrae€'æ in the calyx being adnate to the ovary, and from Haloragieæ in the style being filiform, in the seeds being exalbuminous, and never pendulous in the cells. It is also distinguished from Myrtieææ in the leaves being destitute of pellucid dots, in the stamens being definite in number, not indefinite; and from Loé'eææ in the seeds being fixed to the central column, not parietal, as in that order. The order is generally known by its pollen cohering by a kind of filamentose substance, an inferior polyspermous ovary, a tetrasepalous tetrapetalous flower, with a definite number of stamens, and a single style; from this form, however, there are some anomalous variations, such as Circe'a and Lopézia, which are however easily reconciled to the usual structure of the order. Most of the genera are pre-eminently beautiful, as Epilobium, €'Enothéra, and Fuchsia, which are old favourites among gardeners.

The properties of Onagráia are but little known. The leaves of Jussie'a Peruviana are used as an emollient poultice, and the root of €'Enothéra biéénis as a sort of salad. The valves and dry capsule of €'Enothéra tetráperta contract when the atmosphere is dry, but when moist they expand.

Synopsis of the genera.

Tribe I.

Montinieæ. Fruit capsular. Seeds imbricate, erect, furnished with a membranous wing. Trees or shrubs, with alternate leaves.

2 Haü'yâ. Calyx adhering to the ovary at the base, and drawn out into a long tube at the apex, which is 4-lobed. Petals 4. Stamens 8. Capsule 4-valved.

Tribe II.

Fuchsieæ. Fruit baccate. Tube of calyx drawn out beyond the ovary (f. 94. a.). Trees or shrubs, with opposite leaves.

3 Gongyloca'rus. Calyx adhering to the ovary at the base, and drawn out into a long tube at the apex, which is 4-parted. Petals 4. Stamens 8. Fruit baccate, 2-celled, 2-seeded, indistinct.

4 Fuch'sia. Calyx 4-lobed (f. 94. a.). Petals 4. Stamens 8. Ovary 4-valved, 4-celled.

Tribe III.

Ona'oreæ. Fruit capsular, many-seeded (f. 95. d. f. 96. d.). Seeds not winged. Tube of calyx drawn out beyond the ovum (f. 96. a.). Stamens twice the number of the petals (f. 94. d. f. 95. b.).

7 €'Enothéra. Limb of calyx 4-parted (f. 96. a.). Petals 4 (f. 96. b.). Capsule oblong-linear (f. 96. d.), bluntly tetragonal or clavate, 4-celled. Seeds naked.

I. M. ACRIS (Lin. fil. suppl. 427.) H. G. Native of the Cape of Good Hope, on sandy hills.

Lin. syst. Octandria, Monogyynia. Calyx adhering to the ovary at the base, drawn out into a long cylindrical tube, which is cleft to the middle into 4 oblong-linear, acute, dependent lobes, which are coloured on the inside. Petals 4, ovate, inserted in the top of the calycine tube. Stamens 8, exserted; anthers oblong, oscillatory. Style 1, filiform, exserted. Stigma thick, capitate. Capsule 4-valved, 4-celled. Seeds numerous, expanded into an oblong wing at the apex.—A shrub, with alternate petiolate ovate leaves. Flowers large, from white to rose-coloured, sessile in the axis of the upper leaves.

Tribe I.

MONTINIEÆ (plants agreeing with Montinia in important characters). D. C. prod. 3. p. 35. Fruit capsular (f. 93. a.). Seeds imbricate, erect, furnished with a membranous wing.—Trees or shrubs, with alternate leaves. This tribe is formed from two genera that are not very well known.

Lin. syst. Dicécaria, Tetrádracia. Flowers dioecious from abortion. Tube of calyx adhering to the ovary (f. 93. a.); limb very short, 4-toothed (f. 93. a.). Petals 4 (f. 93. d.), roundish. Stamens 4 (f. 93. d.), alternating with the petals; in the female flowers barren. Anthers oblong, oscillatory. Ovary ovate; in the male flowers abortive. Style bifid (f. 93. b.). Capsule (f. 93. a.), 2-valved, 2-celled, crowned by the teeth of the calyx. Seeds 6-8 in each cell, fixed to the central placenta, which is somewhat tetragonal. Seeds girded by a wing. Albumen fleshy.—A smooth Cape shrub, with alternate leaves, and small white flowers. This genus differs from all the other genera in Onagraæ in the seeds being albuminous.

Tribe II.

FUCHSIEÆ (plants agreeing with Fuchsia in important characters). D. C. prod. 3. p. 36. Fruit baccate. Tube of calyx drawn out beyond the ovary (f. 94. a.).—Elegant South American shrubs, with opposite leaves.

III. GONGYLOCARPUS (from gongylos, gongulos, round, and karpos, karpos; in reference to the shape of the fruit). Schlecht. et Cham. in Linnaea. 5. p. 557.

Lin. syst. Octandria, Monogyynia. Calyx adhering to the ovary at the base, with the tube drawn out a long way beyond the ovary; limb 4-parted; throat crowned by a ring of glands below the stamens. Petals 4, entire. Stigma cipitate. Fruit baccate, 2-celled, 2-seeded; pistil fam'd. Woody.—An annual herb, with alternate, glabrous, ovate-lanceolate, acuminate leaves. Petals ovate-cuneate, caduceus, shorter than the calycine segments. Fruit turbinate, about the size of a grain of pepper. 1 G. RUBRAEFLORA (Schlecht. et Cham. l. c.) H. O. Native of Mexico, about Jalapa. Stems red, furnished with short axillary branches.

Red-stemmed Gongyllocarpus. Pl. 1½ foot. Cult. The seeds of this plant will require to be sown in a hot-bed in spring, and when the plants are about 2 or 3 inches high they may be planted out into the open border in a warm sheltered situation.

ONAGRARIE. IV. Fuchsia.

**Lin. syst. Octandra, Monogynia.** Tube of calyx adhering to the ovary at the base, and drawn out at the apex into a cylindrical 4-cleft tube (f. 94. a.), whose lobes soon fall off. Petals 4, alternating with the lobes of the calyx, and inserted in the upper part of the tube, very rarely wanting. Stamens 8. Ovary crowned by an urceolate gland. Style filiform, crowned by a capitulate stigma (f. 94. b.). Berry oblong or ovate-globose, 4-valved, 4-celled, many-seeded.—Shrubs, usually with opposite leaves, and axillary 1-flowered pedicels, which are sometimes disposed in racemes at the tops of the branches. Flowers usually drooping, red, rarely white, sometimes 5-cleft and decandrous.

**Sect. I. Quella** (an insignificant name given by Vanderli, Quellus is the name of a country-house of the queen of Portugal, situated about 2 leagues from Lisbon). Vand. in Rom. script. p. 101. t. 7. f. 10.—Dorvalia, Comm. miss.—Nahalis, Schnew. with a figure. Tube of calyx cylindrical or obconical, attenuated or constricted above the ovary. Ovula numerous, 2 series in each cell. Leaves opposite or verticillate, rarely subalternate.—South American shrubs.

§ 1. Breviflorae (from brevis, short, and flore, a flower; flowers short). D. C. prod. 3. p. 36. The free part of the tube of the calyx shorter than its lobes, or about equal in length to them. **Stamens inclosed.**

1 F. microphylla (H. B. et Kunth, nov. gen. amer. 6. p. 108. t. 354.) branches pubescent; leaves opposite, small, elliptic-oblong, acute, toothed, glabrous, but a little ciliated; pedicels axillary, shorter than the flowers; calyx funnel-shaped, with ovate acuminate lobes; petals retuse, toothed. G. G. Native of Mexico. Lindl. bot. reg. t. 1269. Sweet, fl. gard. new ser. t. 16. Calyx scarlet. Petals deep red. Stigma 4-lobed. (f. 94.)

**Small-leaved Fuchsia.** Fl. Ju. Sept. Cl. 1828. Sh. 4 to 6 ft.

3 F. kossea (Ruiz et Pav. fl. per. 3. p. 88. t. 322.) stem beset with prominent pulvinate tuberules; branches glabrous; leaves opposite, petiolet, oval, quite entire; pedicels axillary, subaggregate, shorter than the flowers; calyx funnel-shaped, with oblong, acute, reflexed lobes, twice the length of the petals, which are obsolete. G. G. Native of Chili. T. lycioides, Andr. bot. rep. t. 120. Sims, bot. mag. 1024. Calyx red. Petals purple. Stigma 4-lobed. **Rose-coloured-flowered Fuchsia.** Fl. April, Oct. Cl. 1796. Shrub 3 to 6 to 12 feet.

4 F. parviflora (Lindl. bot. reg. 1048.) branches smooth; leaves scattered and opposite, petiole, ovate-cordate or oval, quite entire, glaucous, glabrous; pedicels sub-aggregate; lobes of calyx reflexed; stigma thick, 4-lobed. G. G. Native of Mexico. F. ovata, Moc. et Sesse, fl. mex. icon. ined. but not of Ruiz et Pav. fl. per. The pedicels, according to the figure in the fl. mex., are pubescent, but according to the figure in the bot. reg., glabrous. Calyx red. Petals purple. Very like F. rosea

§ 2. Macrosteomoneae (from macro, makros, long, and stevma, stamen, a stamen; in reference to the stamens which are excised). D. C. prod. 3. p. 37. The free part of the tube of the calyx shorter than the lobes, or equal in length to them. **Stamens exerted.**

5 F. arborecens (Sims, bot. mag. 2620.) branches glabrous; leaves 3 in a whorl, ovate-oblong, acuminate at both ends, petiolate, quite entire; pedicel terminal, trichotomous, nearly naked; calyx funnel-shaped, with the lobes ovate, acute, and spreading reflexed; also the petals. G. G. Native of Mexico. Lindl. bot. reg. 493. *Fuchsia anemonea*, Hort. Flowers small, red, 5-6 lines long, disposed in terminal panicles. Stamens but little exerted. F. hamelioides, Moc. et Sesse, fl. mex. icon. ined. F. racemosa, Moc. et Sesse. Leaves broad.

**Arborecens Fuchsia.** Fl. Oct. Cl. 1824. Sh. 6 to 15 feet.

6 F. ovalis (Ruiz et Pav. fl. per. 3. p. 87. t. 324. f. a.) branches pubescent; leaves opposite or 3 in a whorl, petiolate, oval, a little denticulated, acute, pubescent on both surfaces; pedicels axillary, sub-aggregate on the branchlets, erect, much shorter than the flowers; lobes of calyx villous, oblong, acute, twice the length of the petals, which are ovate and acute. G. G. Native of Peru, in groves about Muna. Calyx and corolla scarlet. Stamens hardly exerted. **Oval-leaved Fuchsia.** Shrub 4 to 6 feet.

7 F. decussata (Ruiz et Pav. fl. per. 3. p. 88. t. 323. f. b.) branches pubescent; leaves opposite or 3 in a whorl, petiolate, lanceolate, pubescent on both surfaces; pedicels axillary, pendulous, longer than the calyx; lobes of calyx oblong, acute, longer than the petals, which are also oblong and acute. G. G. Native of Peru, in subhumid groves about Muna. Calyx rose-coloured. Petals scarlet. Stamens not much exerted. **Decussate-leaved Fuchsia.** Shrub 2 to 3 feet.

8 F. gracilis (Lindl. in bot. reg. t. 847.) branches finely pubescent; leaves opposite, glaucous, on long petioles, remotely denticulated; pedicels axillary, nodding, puberulous, length of the calyx; lobes of calyx oblong, acute, exceeding the petals, which are convolute and retuse; stigma undivided. G. G. Native of Mexico. F. decussata, Graham in edinb. phil. journ. 11. p. 401. Sims, bot. mag. 2507. but not of Ruiz et Pav. Calyx scarlet. Petals purple. Stigma fusiform. **Var. β, multiflora** (Lindl. bot. reg. 1025.) leaves smaller, glaucous, on short petioles; stigma conical. **Slender Fuchsia.** Fl. May, Oct. Cl. 1823. Sh. 6 to 10 ft.

9 F. macrostemma (Ruiz et Pav. fl. per. 3. p. 88. t. 324. f. 6.) branches glabrous; leaves 3 in a whorl, ovate, acute, denticulated, on short petioles; pedicels axillary, nodding, longer than the flowers; lobes of calyx oblong, acute, exceeding the petals, which are obovate and spreading; stigma 4-lobed. G. G. Native of Chili, in marshes. Lodg. bot. cab. 1062. Thifio, Feuill. obs. 3. p. 64. t. 47. This species differs from *F. cocinea* in the petals being blue and spreading, not convolute, in the stigma being 4-lobed, not undivided. Calyx scarlet. **Var. β, tenella** (D. C. prod. 3. p. 38.) flowers smaller; leaves opposite. G. G. *F. gracilis var. tenella*, Lindl. bot. reg. 1052. **Long-crowned Fuchsia.** Fl. July, Oct. Cl. 1823. Shrub 6 to 12 feet.

10 F. coctica (Lindl. bot. reg. 1062.) leaves 3 or 4 in a
whorl, ovate, flat, denticulated, glabrous; pedioles pubescent; flowers pendulous, solitary; petals about equal in length to the calyx; tube of corolla conical. \( \text{G.} \) Native of Chili. Calyx scarlet. Corolla purple. Stigma ovate.

11 F. coccinea (Ait. Hort. Kew. 2. p. 8.) branches glabrous; leaves opposite or 3 in a whorl, ovate, acute, denticulated, on short petioles; pedicels axillary, drooping, longer than the flowers; lobes of calyx oblong, acute, exceeding the petals, which are oblong and convolute. \( \text{G.} \) Native of Chili, in marshes, and as far south as the Straits of Magellan. Curr. bot. mag. 97. Duham. arbr. ed. nov. 1. t. 13. F. pendula, Salisbury. st. rar. t. 7. F. Magellanica, Lam. dict. Nahisia coccinea, Schneevogt, icon. no. 21. Skimmia coccinea, Maech. Quelusia, Van. l. c. Calyx scarlet. Petals violaceous.

**Scarlet Fuchsia.** Fl. May, Oct. Clt. 1788. Sh. 3 to 6 feet.

12 F. montana (St. Hil. fl. bras. 2. p. 275. t. 133.) branches sulcate and puberulous at the apex; leaves 3 in a whorl, oblong, acute, obliquely denticulated, glabrous, but when young puberulous; calyssine tube funnel-shaped, about equal in length to the lobes, which are lanceolate and acute; petals obovate, convolute; stigma 4-toothed; fruit oblong. \( \text{G.} \) Native of Brazil, in the province of Minas Geraes, on the mountain called Serra da Caraca. Calyx scarlet. Corolla violaceous.

**Mountain Fuchsia.** Shrub 1 to 2 feet.

13 F. pubescens (St. Hil. fl. bras. 2. p. 275. t. 134.) branches sulcate, puberulous; leaves 3-4 in a whorl, ovate-oblong, acute, denticulated, puberulous; tube of calyx funnel-shaped, about equal in length to the lobes, which are lanceolate and acute; petals obovate, convolute; fruit ovate-convolute. \( \text{G.} \) Native of Brazil, in the province of Minas Geraes, on the high mountain called Serra da Piedade, and in that part of the province of St. Paul called Campos Gerais. Calyx scarlet. Corolla violaceous.

**Pubescent Fuchsia.** Shrub 5 feet.

§ 5. *Longiflora* (from longus, long, and flos, a flower; in reference to the flowers, which are long). D. C. proc. 3. p. 38. *Free part of the tube of the calyx twice or thrice the length of its lobes. Stamens exerted.*

14 F. petiolaris (H. B. et Kunth, nov. gen. amer. 8. p. 104.) branches glabrous; leaves 3 in a whorl, or the upper ones are opposite, on long petioles, lanceolate-oblong, acute, remotely denticulated, glabrous; pedicels axillary, shorter than the flowers; lobes of calyx ovate-oblong, acuminate, longer than the petals, which are nearly of the same shape. \( \text{G.} \) Native of South America, at Santa Fe de Bogota. Calyx downy, an inch and a half long.

**Petiolar Fuchsia.** Shrub 4 to 6 feet.

15 F. quindiuensis (H. B. et Kunth, nov. gen. amer. l. c.) branches clothed with adpressed pili; leaves 3 in a whorl, small, approximate, oblong, acute, remotely denticulated, rather pilose above, and glabrous beneath; pedicels axillary, shorter than the flowers; lobes of calyx ovate, acuminate mucronate, a little longer than the petals, which are lanceolate and acute. \( \text{G.} \) Native of the Andes of Quindiu. Shrub probably procumbent. Pedicels and calyxes puberulous.

**Quindiu Fuchsia.** Shrub proc.?

16 F. venusta (H. B. et Kunth, l. c.) branches downy; leaves opposite and 3 in a whorl, elliptic, acute, entire, glabrous, and rather shining; pedicels axillary, a little shorter than the flowers, the upper ones disposed in a raceme; lobes of calyx ovate-lanceolate, acuminate, about equal in length to the petals, which are oblong-lanceolate, acute, with undulated margins.

\( \text{G.} \) Native of New Granada, near Guayaquil. Calyx purple, glabrous. Petals scarlet. Perhaps the same as *F. multiflora*, Lin. which is scarcely known.

**Beautiful Fuchsia.** Shrub 4 to 6 feet.

17 F. loxa (H. B. et Kunth, nov. gen. amer. l. c. t. 558.) branches hairy; leaves 3 in a whorl, oblong-lanceolate or lanceolate-oblong, acute, obliquely and remotely denticulated, glabrous, but hairy on the veins beneath; pedicels axillary, a little shorter than the flowers; lobes of calyx ovate-oblong, acute, a little shorter than the petals, which are ovate-roundish. \( \text{G.} \) Native of New Granada, near Loxa. Calyx purplish, glabrous. Petals scarlet.

**Loxa Fuchsia.** Shrub 4 to 6 feet.

18 F. ayavacensis (H. B. et Kunth, l. c.) branches hairy; leaves 3 in a whorl, oblong, acuminate, remotely denticulated, hairy on both surfaces; pedicels axillary, longer than the flowers; lobes of calyx ovate-lanceolate, ending in a narrow taper-point each, exceeding the petals, which are roundish-ovate. \( \text{G.} \) Native of Peru, near Ayavaca. Calyx smooth and purplish.

**Ayavaca Fuchsia.** Shrub 3 to 6 feet.

19 F. hirtella (H. B. et Kunth, l. c.) branches hairy; leaves 3-4 in a whorl, on short petioles, oblong-lanceolate, obliquely and remotely denticulated, hairy on both surfaces; flowers sub-racemose; lobes of calyx lanceolate, acuminate, a little longer than the petals, which are lanceolate-oblong and acute. \( \text{G.} \) Native of New Granada. Flowers nearly 2 inches long.

**Hairy Fuchsia.** Shrub 3 to 6 feet.

20 F. tríphylla (H. B. et Kunth, l. c.) branches downy; leaves 3 in a whorl, oblong, acute, quite entire, stiffish, smooth except the veins beneath, which are pubescent; pedicels axillary, shorter than the flowers, upper ones forming a raceme; lobes of calyx ovate-lanceolate, acuminate, a little longer than the lanceolate-oblong cupululate petals. \( \text{G.} \) Native of New Granada. F. tríphylla, Lin. spec. 159. ex Mutis, but exclusive of the synonyme.

**Three-leaved Fuchsia.** Shrub 3 to 6 feet.

21 F. integrifolia (St. Hil. fl. bras. 2. p. 273.) branches glabrous; leaves 3-4 in a whorl, oblong, acute, almost quite entire, glabrous; tube of calyx cylindrical, 3 times shorter than the lobes, which are lanceolate and acute; petals obovate, convolute; stigma 4-toothed; fruit elliptic. \( \text{G.} \) Native of Brazil, in the province of Minas Geraes, on the mountain called Serra da Caraca. This species differs from *F. macrostemma* in the leaves being entire, and in the tube of the calyx being short, compared with the lobes.

**Entire-leaved Fuchsia.** Shrub 3 to 4 feet.

22 F. affinis (St. Hil. fl. bras. 2. p. 274.) branches glabrous; leaves 3 in a whorl, oblong or ovate-oblong, acute, nearly quite entire, glabrous; calyssine tube funnel-shaped, twice the length of the lobes, which are lanceolate and acute; petals obovate, convolute; fruit ovate oblong; stigma 4-toothed. \( \text{G.} \) Native of Brazil, in the province of Rio Janeiro, on the mountains called Serra da Boa Vista and Serra da Estrada Nova, and in the southern part of the province of St. Paul in the District of Curitiba. Calyx scarlet. Corolla violaceous. Nearly allied to *F. integrifolia*, from which it differs in the calyx being more deeply cleft.

**Allied Fuchsia.** Shrub 6 feet.

23 F. raeamboza (Lam. dict. 2. p. 565. ill. t. 282. f. 1.) branches downy; leaves opposite or 3 in a whorl, on short petioles, oval, acute, denticulated, puberulous on both surfaces; pedicels axillary, about equal in length to the flowers, upper ones racemose; lobes of calyx lanceolate-oblong, acute; tube of calyx widened at the base. \( \text{S.} \) Native of St. Domingo.
Plum. ed. Burm. t. 133. f. 1. gen. p. 34. Flowers scarlet. Pedicels velvety. This species agrees with section second in the tube of the calyx being dilated at the base.

**Racemosse-flowered Fuchsia.** Shrub 4 to 6 feet.

24 F. fulgens (Moc. et Sesse, fl. mex. Icon. ined. D. C. prod. 3. p. 39.) branches glabrous; leaves opposite, petiolate, oblong-lanceolate, acuminate, denticulated, glabrous, whitish beneath; pedicels axillary, shorter than the flowers; upper ones racemosse; lobes of calyx oblong-lanceolate, acute, exceeding the petals, which are acutish. G. Native of Peru. Branches and pedicels red. Flowers reddish scarlet, 2 inches long. Racemes drooping at the apex.

**Fulgent Fuchsia.** Sh. 4 to 6 feet.

25 F. denticulata (Ruiz et Pav. fl. per. 3. p. 87. t. 325. f. b.) branches trifoliate; leaves 3 in a whorl, petiolate, oblong-lanceolate, acuminate at both ends, denticulated, having the middle nerve villous behind; pedicels axillary, rather shorter than the flowers; lobes of calyx lanceolate, acuminate, nearly twice the length of the obovate petals. G. Native of Peru, among rocks about Huassa-huassi and Cheuchin, where it is called mollo-canta, which signifies a beautiful plant. Flowers purple, nodding.

**Denticulated-leaved Fuchsia.** Sh. 6 to 12 feet.

26 F. corymbiflora (Ruiz et Pav. fl. per. 3. p. 87. t. 325. f. a) branches somewhat tetragonous; leaves opposite, petiolate, oblong-lanceolate, almost quite entire; pedicels 3, nearly terminal, nodding, shorter than the flowers; lobes of calyx lanceolate, acuminate, exceeding the petals, which are oblong-lanceolate. G. Native of Peru, about Chinchaco and Muna, in shady groves. Flowers scarlet, nearly 2 inches long. Berry ovate-oblong, reddish-purple.

**Corymb-flowered Fuchsia.** Sh. 6 ft.

27 F. serratifolia (Ruiz et Pav. fl. per. 3. p. 86. t. 323. f. a.) branches furrowed; leaves opposite or verticillate, petiolate, oblong, serrated, pubescent beneath; pedicels axillary, shorter than the flowers, drooping; lobes of calyx lanceolate, acuminate, exceeding the petals, which are ovate-oblong. G. Native of Peru, in humid, rather shaded places at Muna. Calyx red, rather villous, an inch and a half long, somewhat tumid at the base. Petals scarlet.

**Saw-leaved Fuchsia.** Sh. 6 to 8 ft.

28 F. simpleculalis (Ruiz et Pav. fl. per. 3. p. 89. t. 322. f. a) stem simple, quite smooth; leaves 4 in a whorl, lanceolate-linear, on short petioles; pedicels 4 together, very short, terminal, sub-corymbose; lobes of calyx lanceolate, exceeding the petals. G. Native of Peru, in woods at Muna. Sulfuraceous. Whorles remote. Involucrum 4-leaved, rather downy. Flowers pendulous, with a rose-coloured calyx, and scarlet petals.

**Simple-stemmed Fuchsia.** Sh. 1 to 2 feet.

29 F. ape'tala (Ruiz et Pav. fl. per. 3. p. 89. t. 322. f. b) stem villous, climbing, rooting; branches warty; leaves alternate, petiolate, ovate, acuminate, quite entire; petioles, branches, pedicels, and young leaves rather villous; pedicels sub-corymbose, shorter than the flowers; lobes of calyx ovate; petals wanting. G. Native of Peru, about Huassa-huassi and Muna, in groves. Calyx red, but the lobes are pale yellow. Flowers drooping, an inch and a half long. Berry oblong.

**Apetalous Fuchsia.** Sh. 1 to 2 ft.

30 F. exorticata (Linn. fil. suppl. 217.) branches smooth, at length excoriate; leaves alternate, petiolate, ovate-lanceolate, acuminate, denticulated, glabrous, whitish beneath; pedicels axillary, somewhat shorter than the flowers; lobes of calyx lanceolate, 3-nerved, longer than the tube and twice the length of the petals, which are ovate. G. Native of New Zealand. Lindl. bot. reg. 857. Link. et Otto, abb. t. 46. Skimmia exorticata, Forst. prod. p. 163. Calyx green and purple. Petals violaceous.

**Exorciated Fuchsia.** Fl. June, Oct. Clt. 1824. Sh. 2 to 3 ft. Cult. The elegance of the flowers and foliage of all the species of Fuchsia are well known to every lover of plants. They all thrive well in rich light soil, and young cuttings of them strike root readily in the same kind of soil, with a hand-glass over them; the glass to be taken off occasionally, to give the cuttings air, so as to keep them free from damp. Most of the species only require to be protected from frost, and many of them will survive the winter in the open air, with a very slight protection. Some of them, as F. gracilis, F. microphylla, F. thympillum, F. cónica, and F. cocinea have a fine effect all the summer, when planted in clumps on lawns, or in borders; in this situation the plants only require to be mulched at the root to preserve them through the winter, and in spring the ground is cleared, and the stems of the preceding year, which are generally dead, to young shoots to spring from the root.

**Tribe III.**

**ONAGRÆ (plants agreeing in important characters with Onagros or Onager, now Enothéra. D. C. prod. 3. p. 40. Fruit capsular (f. 95. d. f. 96. d.); cells many-seeded. Seeds not winged. Tube of calyx drawn out beyond the ovary (f. 96. a.). Stamens twice the number of the petals.—Herbs usually suffruticous at the base.**

V. **EPILÓBIUM (επι, upon, and λόβος, lobos, a pod; the flower is seated as if it were on the top of the pod).** Lin. gen. 471. Gaertn. fr. 1. p. 157. t. 31. f. 6. D. C. prod. 3. p. 40.—Chamaenerion, Tourn. inst. p. 392. t. 157. f. A, B, C. Lin. syst. Octandria, Monogynia. Calyx of 4 sepals; sepalas connected into a long tetragonal tube; the limb falling off when the flower begins to decay. Petals 4. Stamens 8; pollen not clamy. Capsule linear, bluntly tetragonal, 4-valved, 4-valved, many-seeded, inseparable from the calyx. Seeds pendulous, pappose.—Herbs, with opposite or alternate leaves. Flowers axillary, solitary, or disposed in terminal spikes, each flower furnished with a bractea. Corolla purple, rose-coloured, flesh-coloured, very rarely yellow.

**Sect. I. CHAMÆNE'RION (from χαμα, chamni, on the ground; and νερος, nerion, the Oleander; similar leaves but dwarfer habit).** Tauch. hort. canal. fasc. 1. D. C. prod. 3. p. 40. Flowers irregular. Petals entire. Genitals decline. Filaments dilated at the base. Leaves alternate.

1 E. angustifolium (Lin. spec. 493.) root creeping; stems erect, nearly simple; leaves nearly sessile, lanceolate, undulated, glabrous, with the veins pellucid; flowers disposed in spicate racemes, bracteate; style reflexed, pilose at the base, shorter than the stamens. G. Native of Europe and Siberia, in mountain woods and meadows. In Britain in moist shady places, particularly in the north of England and south of Scotland. Smith, engl. t. 1947. fl. dan. 289. E. Gesneri, Vill. dauph. 3. p. 507. E. intermédium, Wormsk. ex herb. Puerari. Chamaenerion spicatum, Gray, brit. 2. p. 559. Flowers crimson, inodorous; pollen blue. A very ornamental plant, but hardly fit to be introduced to a garden, on account of its increasing so rapidly by the roots, which it is almost impossible
again to eradicate. The young shoots are said to be eatable, although a decoction of the plant stipples. The pitch, when dried, is boiled, and becoming sweet, is, by a proper process, made into ale, and this into vinegar, by the Kamitschatdales; it is also added to the cow-parsnern to enrich the spirit that is prepared from that plant.

**Var. β, album:** flowers white. \( \mathcal{Y} \). \( \mathcal{H} \).

**Var. ** globosum (Ser. in D. C. prod. 3. p. 40.) leaves broader. \( \mathcal{H} \). \( \mathcal{H} \). angustifolium \( \beta \), Lin. spec. 494. E. spicatum \( \beta \), D. C. fl. fr. 4. p. 420. E. laetifolium, Schmidt. fl. bohmen. no. 379; but not of Lin.

**Narrow-leaved Willow-herb or French Willow.** Fl. Jul. Aug. in parts. \( \mathcal{Y} \). \( \mathcal{H} \). in meadows and moist places; United States, Canada, Newfoundland, north-west coast, &c. Root creeping. Flowers about half the size of those of *E. angustifolium*, but the habit is almost the same.

**Spicata Willow-herb.** Fl. July, Aug. Cirt. \( \mathcal{Y} \) 2 to 3 ft. \( \mathcal{H} \). 3 E. opacum (Lehm. ex Hook, fl. bor. amer. p. 203.) stem erect, pubescent; leaves nearly sessile, narrow, lanceolate, almost quite entire, opposite, veiny; flowers axillary, solitary, pedunculate; style reflexed, glabrous, shorter than the stamens. \( \mathcal{H} \). \( \mathcal{H} \). of North America, on the banks of the Columbia, particularly about Fort Vancouver. Flowers red; petals entire or erose. An intermediate plant between *E. angustifolium* and *E. laetifolium*.

**Opaque Willow-herb.** Pl. 1 to 2 feet. \( \mathcal{H} \). 4. *E. rosmarinifolium* (Henke, in Jacq. coll. 2. p. 50, but not of Pursh) downy; stem erect, branched towards the middle; leaves linear, oblongely denticulate, cuneiform, veiny; pedicels connected with the bractae, crowded near the tops of the branches. \( \mathcal{H} \). \( \mathcal{H} \). of Europe, in woods and on the banks of rivers. Rechb. icon. bot. 4. t. 341.—Moris. hist. sect. 3. t. 11. f. 2. Lob. icon. 313. f. 2. E. angustissimum, Curtt. bot. mag. t. 76. E. laetifolium, Lam. dict. 2. p. 374. Stem wood at the base. An elegant plant with red flowers.

**E. Dodonaei** (All. pedem. 1016. Vill. dauph. 3. p. 507.) stem almost glabrous, erect, branched at the apex; leaves linear, oblongely denticulate, glabrous; pedicels connected with the bractae, crowded near the tops of the branches. \( \mathcal{H} \). \( \mathcal{H} \). of Piedmont and Dauphiny. E. Halléri, Retz. *E. rosmarinifolium* \( \beta \), D. C. fl. fr. 4. p. 421. E. rosmarinifolium \( \beta \), alpinum, Ser. in D. C. prod. 3. p. 40.—Rechb. icon. bot. 4. t. 342. An elegant plant, much resembling the preceding, but smoother, smaller, and the flowers are large, and of a more deep rose colour.

**E. crocatum** (Lehm. in nov. act. bonn. 18.) stem suffrutescent; branches twiggv; leaves alternate, thickish, linear, having the margins denticulate with blunt glands; genitils deciduate. \( \mathcal{Y} \). \( \mathcal{H} \). of Native of Siberia. Leaves deep green. Petals crenulate, rose-coloured. Stigma 4-cleft.

**Thick-leaved Willow-herb.** Pl. 1 foot.

**E. laetifolium** (Lin. spec. 494.) stems erectish, firm, branched; leaves ovate-lanceolate, acuminate, almost quite entire, stiff, veiny, glaucous; flowers axillary, pedicellate, style nearly erect, glabrous, shorter than the stamens; bractae free from the pedicels. \( \mathcal{Y} \). \( \mathcal{H} \). of Native of Greenland, Siberia; North America, on the banks of rivers on the Rocky Mountains, between lat. 52° and 56°, to the shores and islands of the Arctic sea, Labrador, and Behring's Straits. Fl. dan. t. 565.

**Var. ** (Doug. miss.) plant smaller in every part. \( \mathcal{H} \). \( \mathcal{H} \). of North America.

**Broad-leaved Willow-herb.** Fl. Jul. Aug. Cirt. 1779. Pl. 2 ft. 8 E. huillei (Wild. herb. ex Stev. in litt. D. C. prod. 3. p. 40.) leaves lanceolate, quite entire, glabrous, veiny; branches opposite; corolla unequal. \( \mathcal{Y} \). \( \mathcal{H} \). of Native of Siberia. Perhaps a variety of *E. laetifolium*.

**E. alpinum** (Lin. spec. 495.) stems creeping at the base, bifidarily pubescent, few-flowered; leaves nearly sessile, elliptic-lanceolate, obtuse, mostly entire, glabrous; stigma undivided; capsules sessile, glabrous. \( \mathcal{Y} \). \( \mathcal{H} \). of Native of the Alps of Europe and the Pyrenees. In Scotland, by the sides of alpine rivulets, on Ben Lomond, about two-thirds of the way up, and on all the highland mountains; of North America, in the alpine rivulets of the Rocky Mountains. Smith, engl. bot. 2001. Lightfl. fl. scot. p. 199. t. 10. f. 1. Fl. dan. 322. E. angallidifolium. Lam. dict. 2. p. 376. Plant small. Flowers very small, bright red.

**Var. ** (Pers. ench. 2. p. 410.) stem rather pubescent at the base; leaves ovate-lanceolate, acutely serrated, wrinkled.

**Alpine Willow-herb.** Fl. June, July. Scotland. Fl. ½ foot.

**E. Hornemann's** (Rechb. icon. bot. 73. t. 180.) stems creeping at the base, angular, few-flowered, nodding at the apex; leaves oblong or lanceolate, denticulate; stigma clavate, undivided. \( \mathcal{H} \). \( \mathcal{H} \). of Native of Finland, in alpine rivulets; and north-west coast of America. E. nütans, Horn. fl. dan. 1837. but not of Schmidt. E. alpinum \( \beta \), nütans Horn, fl. bor. amer. p. 205. Flowers bright red. Very like *E. alpinum*.

**E. origanifolium** (Lam. dict. 2. p. 376. Rechb. icon. bot. 2. t. 180.) stems creeping at the base, smoothish, nodding at the apex, bluntly quadrangular; leaves ovate, acutely denticulate, glabrous, on short petioles; stigma undivided, clavate; capsule pedicellate, glabrous. \( \mathcal{Y} \). \( \mathcal{H} \). of Native of the Alps of Europe and the Pyrenees, in rivulets and fountains; on many of the highland mountains of Scotland, in alpine rivulets, common; in rivulets on the sides of the Cheviot hills, as mentioned by Ray; in North America, in alpine woods, sides of rivulets, and shady elevated spots on the Rocky Mountains, and of the island of Unalaska. E. alsinifolium, Vill. dauph. 3. p. 511. Smith, engl. bot. t. 2000. Flowers small, rose-coloured. A much more robust plant than *E. alpinum*.

**E. glanduliferum** (Lehm. pug. 2. p. 14. Hook, fl. bor. amer. p. 206.) stem simple, creeping at the base, angular, glabrous; leaves sessile, ovate-lanceolate, rather decurrent, acute, glandularly denticulate; flowers erect; stigma clavate; capsule sessile, with the angles slightly pubescent. \( \mathcal{Y} \). \( \mathcal{H} \). of Native of North America, at Cumberland House Fort, on the Saskatchewan. Petals white. An intermediate plant between *E. origanifolium* and *E. tetragonon*.

**Glandular Willow-herb.** Pl. 1 foot.

V. Epilobium.

681

21 E. brevifolium (D. Don, prod. fl. nep. p. 232.) leaves ovate, acute, serrated, pubescent on both surfaces, and lined on the upper surface; flowers axillary, on short pedicels; lobes of calyx linear-lanceolate, shorter than the corolla. 2. H. Native of Upper Nebraska. Stem branched. Flowers small, lilac.

Short-leaved Willow-herb. Pl. 1 foot.

22 E. nutans (Schmidt, fl. bohem. no. 380. Schultz, Östr. fl. 1. p. 595.) stems terete, branched, many-flowered; leaves opposite, almost sessile, ovate-lanceolate, obtuse, quite entire; petals obcordate; stigma quadrid. 2. H. Native of Bohemia, in bog at Isra. Rchb. icon. bot. 2. p. 87. t. 197. E. hypericifolium, Tauch, hort. canal. fasc. 1. no. 7. This plant comes very near to E. montanum, from which it differs in the leaves being remote and quite entire, in the flowers being smaller and changeable in colour, at first white but afterwards changing to a flesh colour.

Nodding-flowered Willow-herb. Pl. 1 foot.

23 E. aethus (Bieb. fl. taur. 1. p. 295.) leaves opposite and alternate, ovate, glandularly toothed; calyx obtuse-angled; stigma undivided. 2. H. Native of Caucasus. This species differs from E. montanum in the undivided stigma, in the stem being angled, from the margins of the petioles being decurrent, in the leaves being firmer, and in the flowers being nearly twice the size. Perhaps only a variety of E. original folium.

lar. β, hímide (Bieb. I. c.) leaves toothed all round.

Aglid Willow-herb. Pl. 1/2 to 1 foot.

24 E. coloratum (Muhl. in Willd. enum. 411.) stems terete, pubescent; leaves lanceolate, serrated, stalked, opposite, superior ones alternate, glabrous. 2. H. Native of Pennsylvania. This plant differs from E. roseum in the stems being branched at the apex, in the leaves being nearly sessile and narrower, and in the flowers being smaller, ex Link. enum. I. p. 379.

25 E. Dain't neum (Fisch. in Horn. hort. inain. suppl. 44. and Link. enum. I. p. 379.) stem erect, very simple; leaves usually toothed, pubescent, opposite and alternate, nearly sessile; petals obcordate; fruit pilose. 2. H. Native of Dahuria. Flowers very minute. Calyx reddish.

26 E. germac'seens (Meyer, verz. pfl. p. 193.) smoothish; stem rather angular, branched; leaves stalked, opposite, or alternate, ovate-oblong, re pandently denticulated, bearing bulbs in their axils; petals rather longer than the calyx; stigma clavate. 2. H. Native of Caucasus, on the margins of rivulets, near Kaischaur, at the height of 2400 feet above the level of the sea. This is a singular species, from its bearing bulbs in the axils of the leaves.

Budding Willow-herb. Pl. 1 foot.

27 E. dé' neum (Rafin. prec. dec. 42. and in Desv. journ. bot. 1814. 2. p. 271.) plant pubescent; leaves scattered, approximate, sessile, linear-lanceolate, bluntish, nervet; flowers panicked, pedunculate; bracteas oblong. —Native of North America.

Dense-flowered Willow-herb. Pl. 1 foot.

28 E. denticulatum (Rziz. et Pav. fl. per. 2. p. 78. t. 314.) stems stellatactus; leaves somewhat lanceolate, denticulated; lower ones opposite; petals equal, bifid. 2. G. Native of Peru and Chili. E. juneum, Forst. ex Spreggz. syst. 2. p. 233. Petals rose-coloured.

Denticulated-leaved Willow-herb. Pl. 1/2 to 1 foot.

VOL. II.

V. Epilobium.
Slender-leaved Willow-herb. Pl. 1 foot.
30. E. divaricataem (Rafin. prec. dec. p. 42. and in Desv. journ. bot. 1814. 2. p. 271,) stem branched, glabrous; branches spreading; leaves opposite, petiolate; petals lanceolate, acute, glabrous, unequally denticulated. \( Y. \) H. Native of North America.

Divaricate-branched Willow-herb. Pl. 1 to 2 feet?
31. E. hirsutum (Lin. spec. 494.) roots creeping; stems branched, hairy; lower leaves opposite, upper ones alternate, ovate-lanceolate, hairy, toothed, half stem-clasping; stigma deeply 4-cleft; the segments deflexed. \( Y. \) H. Native of Europe and Siberia, in wet places. In Britain, in watery places, ditches, and margins of rivers, among reeds, coarse grasses, and willows. Smith, engl. bot. 838. Curt. lond. 2. t. 21. Fl. dan. t. 326. E. ramíssurn, Huds. p. 162. E. amplexicále, Lam. dict. 2. p. 374. E. grandifílorum, All. pedem. no. 1018. Flowers in a leafy, corymbose cluster, large, of a delicate, pale pink, with cloven, regular petals. The whole herb is downy, soft, and clammy, exhaling a peculiar, acidulous scent, justly compared to the flavour of boiled codlings and cream. The plant varies with white flowers and variegated leaves.

Var. \( \beta \), intermédiaem (Ser. in D. C. prod. 3. p. 42,) stem, branches, and leaves clothed with hoary villi; fruit covered with very long pil. \( Y. \) H. Native about Paris, and of Siberia. E. intermédiaem, Mer. fl. par. 147. but not of Wormsk. E. hirsutum Sibericum. Deless. herb.

Hairy Willow-herb or Codlings and cream. Fl. July. Brit. Pl. 3 to 5 feet.
32. E. villósum (Thumbl. prod. 75.) leaves alternate, lanceolate, serrated, hairy. \( Y. \) G. Native of the Cape of Good Hope. This species hardly differs from E. hirsutum, unless in the lobes of the stigma being thicker and more convolute. Flowers red.

Villous Willow-herb. Pl. 2 to 3 feet.
33. E. tomentósum (Vent. hort. cels. t. 90.) plant clothed with hoary tomentum; stems much branched; leaves half stem-clasping, lanceolate, bluntish, serrated; stigmas quadrifid, with the lobes horizontal. \( Y. \) H. Native of the Levant, between Julphala and Hispahan, on the borders of rivulets. Perhaps only a variety of E. hirsutum. Flowers red.

34. E. cylindriaem (D. Don, prod. fl. nep. p. 222.,) leaves lanceolate-linear, serrulatum, stalked, lower ones opposite, upper ones alternate; stems terete, pubescent. \( Y. \) H. Native of Nipaul. Flowers small, red. Habit of E. palistaem.

Cylindricaem-stemmed Willow-herb. Pl. \( \frac{1}{2} \) foot.
35. E. palístreem (Lin. spec. 495.) stems terete, branched, pubescent; leaves sessile, linear-lanceolate, slightly toothed, glabrous, lower ones opposite, upper ones alternate; stigma linear, obtuse, unidivided. \( Y. \) H. Native of Europe, Siberia, and Labrador; in boggy turfy ground, near ditches and rivulets. Smith, engl. bot. t. 546. Fl. dan. 1574. Flowers pale purple, in leafy clusters. Herb extremely variable in luxuriance.

Var. \( \beta \), verticillátum (Ram. ex D. C. fl. fl. p. 442.,) leaves \( \delta \) in a whorl. \( \frac{1}{2}. \) Y. H. Native of the Pyrenées.

Var. \( \gamma \), albiflorum (Hook. fl. bor. amer. p. 207,) stem terete, simple, smooth; leaves sessile, linear, somewhat denticulate; flowers drooping; capsules pedicellate, elongated, canescence; stigma unidivided. \( Y. \) H. Native throughout Canada, and as far north as lat. 64\°, and among the prairies of the Rocky Mountains. E. palístreem, var. albiscém, Wahl. fl. succ. 1. p. 234. Richards. in Frankl. journ. ed. 2. append. p. 12. E. lineáreem, Mühl. Flowers white. Perhaps the same as E. Dahárucium of Fischer.

Marsh Willow-herb. Fl. June, July. Brit. Pl. \( \frac{1}{2} \) to 1\ 1/2 feet.
36. R. rivuláre (Wahl. fl. ups. p. 126.) puberulous; leaves sessile, long-lanceolate, denticulated, lower ones opposite, upper ones alternate; petals oval, emarginate; stigma 4-lobed. \( Y. \) H. Native of Sweden, on the banks of rivulets and fountains. Rebb. icon. bot. 2. p. 61. t. 170. Flowers red. Habit of E. palistaem.

37. E. parviflorum (Schreb. lips. 146.) stem nearly simple, woolly, terete; leaves sessile, lanceolate, minutely toothed, soft, and downy on both surfaces; flowers in leafy clusters; root fibrous; stigma 4-cleft, spreading. \( Y. \) H. Native of Britain; frequent in watery places and about the banks of rivers. Smith, engl. bot. t. 755. E. pubescém, Wildl. succ. 2. p. 315. E. hirsutum, Huds. 161. Lin. spec. p. 494. var. \( \beta \). E. villósum, Curt. fl. lond. 2. t. 22.—Fl. dan. 347. Flowers not a quarter the size of those of E. hirsutum.

38. E. simplex (Tratt. arch. 1. p. 57., with a figure,) stems simple, striated, pubescent; leaves decussate, linear-lanceolate, quite entire, sessile, pubescent; petals emarginate; stigma quadrifid. \( Y. \) H. Native on Mount Scheiblingstein. According to Trattneck, this plant differs from E. Èreiflorum, in the leaves being quite entire, sessile, and linear, and in the flowers being smaller.

39. E. rotundiflorum (Forst. prod. no. 161.) leaves opposite, roundish, denticulated. \( Y. ? \) H. Native of New Zealand.

Round-leaved Willow-herb. Pl. ?
40. E. squamátum (Nutt. gen. amer. 1. p. 250.,) pubescent; roots scaly, bulbous; stems cylindrical, branched; cauline leaves opposite, rameal ones alternate, all linear, and quite entire, with revolute margins; flowers pedicellate; petals bifid; stigma clavate, unidivided. \( Y. \) H. Native of North America, about Philadelphia. E. rosmariniflorum, Pursh. fl. amer. sept. 1. p. 259. Petals white. E. lineáreem, Bigel. in litt. Perhaps the same as E. palistaem, var. albiscém. The scaly bulbous roots are by no means peculiar to this species.

41. E. tenélíum (Rafin. prec. dec. p. 41. and in Desv. journ. bot. 1814. p. 271.) stem filiform, simple, pubescent above; leaves opposite, sessile, linear, elongated, usually entire, full of pellucid lines, glabrous except the margins, which are finely ciliated; flowers erect; stigma unidivided; capsule pedicellate, slender, canescence. \( Y. \) H. Native of North America.

Sleender Willow-herb. Pl. 1 foot.

Var. \( \beta \), obscurum (Pers. ench. 2. p. 410.) leaves opposite and alternate, lanceolate, glabrous, and serrated, decurrent at the base; stigma clavate. \( Y. \) H. Chamaénerion obscurum, Schreb. E. obscurum, Schmidt, fl. bohem. cent. 4. p. 81. Rebb. icon. bot. 2. p. 89. t. 199.

Var. \( \gamma \), virgénum (Wahl. fl. succ. 1. p. 233.) narrower and rather pubescent; leaves less decurrent. \( Y. \) H. Native of Sweden and Siberia.

43. E. faécidium (Brot. fl. lus. 2. p. 18.) stem weak, tetrá-
gional below, filose, creeping at the base; leaves lanceolate, denticulated, glabrous, almost sessile, lower ones opposite. 4. H. Native of Portugal, about Coimbra and elsewhere in Beira. Flowers red. This plant is usually taken for a variety of *E. tetragona*, but is a perfectly distinct species.

*Pluteus-Bompland* (H. B. et Kunth, nov. gen. amer. 6. p. 95.) plant rather woody; stem simple or branched, usually erect; leaves opposite, lanceolate, sessile, a little toothed; flowers axillary, solitary, almost sessile; stigma capitate? 2. F. Native of South America, on the Andes, about Popayan, in humid places, at the height of 5000 feet above the level of the sea. Petals nearly orbicular, rose-coloured, twice the length of the calyx. Capsule 2 to 3 inches long.  

*Epiptilum* (Pursh, fl. sept. 1. p. 259.) stem tetragonal, rather pilose; leaves opposite, serrulato-pedunculate, peduncle axillary, alternate, elongated; lobes of calyx narrow, length of petals; style exserted; stigma thick, 4-lobed. 2. H. Native of the north-west coast of America, and in the grassy valleys of Unalaska. Flowers yellow, as large as those of the *French-willow*.

*Epiptilum*, yellow-flowered. 1 foot.  

**Cult.** All the species of the *Willow-herb* are of the easiest culture and propagation; they will grow in any common garden soil, and are easily increased by dividing at the roots or by seeds. Those species belonging to the first section of the genus being the most showy, are the most worthy of cultivation, as border flowers.

### VI. GAURA (from γαuroς, gauros, superb; in reference to the elegance of the flowers of some of the species.)

**Lin. syst. Octandria, Monogynia.** Calyx of 3-4 sepals; sepals connected into a long tube; limb 3-4-parted, deciduous. Petals 3-4. Stamens 6-8. Stigma 3-4-lobed. Fruit 1-celled, closely adhering to the calyx, 3-4-sided, 1-4-seeded. Seeds naked. Flowers terminal, spiral, sessile, bracteate, white, red, rarely yellow, all becoming reddish as they fade.

1 G. *bicu'avis* (Lin. spec. 493.) stem herbaceous; leaves lanceolate-oblong, acute, denticulate; flowers irregular; petals obovate, ascending, spreading, naked; genitals deflexed; style longer than the stamens; fruit obovate, tetraquetrous, sessile, pilose, acute, bluish, marked with thick depressed nerves, and with transverse wrinkles below. 2. H. Native of Virginia and Pennsylvania, and about Montreal. Curt. bot. mag. 389. Limb of calyx length of tube. Sepals purple at the apex. Petals at first white, then reddish. Floriferous branches subcapitate, at length becoming a somewhat whorled spike.

**Narrow-leaved Gaura.** Pl. 2 to 3 feet.  

3 G. *sinuata* (Nutt. in litt. ex D. C. prod. 3. p. 44.) branches and leaves rather pilose; pilus adpressed; leaves numerous, linear, sinuated; flowers disposed in long spikes; fruit distant, clavate, tetragonal at the apex, attenuated at the base, and terete, on short pedicels; the angles thinnish. 2. H. Native of North America, in the territory of the Arkansa and Red rivers. A very distinct species.

**Sinuated-leaved Gaura.** Pl. 2 to 3 feet.  

4 G. *epi'bioldes* (H. B. et Kunth, nov. gen. amer. 6. p. 93.) herbaceous; branches and leaves pubescent, approximate; leaves linear, quite entire, or remotely toothed; petals ovo-rotate, obtuse; stamens straight; fruit pubescent, oblong-linear, tetragonal, 4-ribbed; ribs thick, alternating with the angles. 2. H. Native of Mexico, near Acotapan, at the height of 3120 feet above the level of the sea. This species hardly differs from *G. angustifolia*, unless in the stem being more branched, in the leaves being flat, not curled on the margins, and in the flowers being much larger. The habitat approaches that of *E. rosmarinifolium* in habit and colour of flowers.

**Willow-herb-like Gaura.** Pl. 2 to 3 feet.  

5 G. *tribe'tala* (Cav. icon. 4. p. 66. t. 398. f. 1. good.) herbaceous; branches pilose; leaves lanceolate-linear, a little toothed, puberulous; flowers hexandrous; sepals 8, deflexed; petals 3, rose-coloured, obovate-oblong, unilaterial, ascending; fruit ovate, triquetrous, acute, with transverse plicate stripes, and turgid angles. 2. H. Native of Mexico. H. B. et Kunth, nov. gen. amer. 6. p. 94. G. hexandra Ortega. Flowers white, but at length becoming red.

6 G. *tribe'tala* (Susse, ex Lagas. gen. et spec. p. 14.) leaves linear-lanceolate, repandly toothed; petals 4, ovate, ascending. 2. H. Native of New Spain.

**Sweet-scented Gaura.** Pl. 2 to 3 feet.  

7 G. *bracte'ata* (Ser. miss. in D. C. prod. 3. p. 45.) leaves linear-lanceolate, deeply and irregularly serrate; bracteae linear, entire, acute; flowers pedicellate; petals obovate, spreading, length of the limb of the calyx. 2. F. Native of Mexico, in the garden of St. Angeli. G. sinuata and G. spieta, Moc. et Sesse, fl. mex. icon. ined. t. 375. Flower-bud obtuse. Style clavate at the apex. Stamens 8.

**Bracteate-flowered Gaura.** Pl. 2 to 3 feet.  

8 G. *lino'tolia* (Nutt. in James' exped. rock. mount. 2. p. 335.) stems much branched; leaves linear, acute, entire, glabrrous; flowers racemose, dense, numerous; bracteae linear-subulate, puberulous; tube of calyx long, pilose; the lobes oblong-linear; petals 4, obovate-oblong; fruit very minute, ovate, triquetrous, pilose. 2. H. Native of North America, about the Arkansas. Flowers ovoid. Calyx of a brownish-purple colour. Petals white.

**Flax-leaved Gaura.** Pl. 1 to 2 feet.  

9 G. *parvi'flora* (Doug. et Lehm. pug. 2. p. 15. and Hook. fl. bor. amer. p. 208.) stems herbaceous, erect, pilose; leaves oblong, acuminate, remotely denticulated, and ciliated on the margins, rather velvety when young; spikes elongated; flowers minute, crowded; fruit distant, tetragonal, smoothish, tapering to both ends. 2. H. Native of the north-west coast of America, on the sandy banks of the WallaWallah river.

**Small-flowered Gaura.** Pl. 1 to 1½ foot.  

10 G. *coce'nea* (Fras. cat. 1815. Pursh, fl. amer. sept. 2. p. 733.) stems herbaceous, decumbent; leaves linear-lanceolate, repandly denticulated, but when young quite entire, canescent; spikes loose; flowers alternate; bracteae linear, permanent; fruit elliptic, terete at the base, but tetragonal at the apex, canescent. 2. F. Native of North America, at Fort Mandan, also on the plains of the Saskatchewan and Red rivers. Petals scarlet.  

Margravine Gaura. Pl. ascending.

12 G. *ga'bra* (Lemh. pug. 2. p. 16. Hook, fl. bor. amer. p. 209.) stems ascending, suffruticose at the base, quite glabrous; leaves narrow-lanceolate, undulated, glabrous; spikes elongated; flowers alternate; ovaries linear, tetragonal, glabrous. 2. H. Native of North America, about Carlton House, on the Saskatchewan. Petals spatulate, red.

Glabrous Gaura. Pl. ascending.

13 G. *mollis* (H. B. et Kunth, nov. gen. amer. 6. p. 93.) plant suffruticose? branches clothed with silky hairs; leaves lanceolate-oblong, remotely denticulated, pubescent; petals ovate, obtuse, cruciately opposite, pale yellow; stamens straight; fruit oblong, arcurately incurred, nearly as in *Erothéra*. 2. H. Native of Mexico. Perhaps a species of *Erothéra*.

Soft Gaura. Pl. 1 foot?

14 G. *mutabilis* (Cav. icon. rar. 3. p. 30. t. 258.) leaves ovate, sessile, remotely toothed; petals broadly ovate, acute, cruciately disposed, spreading; styles and stamens straight; stem shrubby. 2. H. Native of New Spain. *Erothéra* anômala, Curt. bot. mag. t. 388. Petals yellow, but becoming red as they fade.

15 G. *Erothéraflora* (Zuecagni, obs. bot. tent. 2. no. 65.) leaves ovate-lanceolate, running down to the petiole at the base, remotely toothed, villous; flowers sessile. 2. H. Native country unknown. Habit of *Erothéra* longiflora. Flowers at first yellow, but becoming red as they fade. Fruit elliptic, quadrangular. Perhaps a variety of *G. mutabilis*.

† Species not sufficiently known.

China Gaura. Pl. 1 foot.

17 G. *suffrutescens* (Moc. et Sesse, fl. mex. icon. ined. t. 374.) stems shrubby at the base; leaves oblong-linear, undulated, glaucescence; young branches drooping; flowers loose, spreading; bracteas lanceolate, acute; limb of calyx deflexed; petals somewhat secund, spatulate, on long claws; stamens 8, and are as well as the style ascending; fruit unknown. 2? G. Native of Mexico. Flowers large, red. Stigma capitate.

*Suffruticose* Gaura. Shrub.

18 G. *epilobium* (Moc. et Sesse, fl. mex. icon. ined. t. 375.) stem glabrous; leaves oval-oblong, denticulately sinuated; racemes few-flowered; flowers nearly sessile; petals almost orbicular, incumbent, hardly undulate; fruit unknown. 2? F. Native of Mexico. Flowers red. Stamens shorter than the petals.

*Epilobium*-like Gaura. Pl. 1 to 2 feet.

Cult. The most part of the species of *Gaura* are little better than biennials, although some are marked perennial. A light soil suits them best, and they are only to be propagated by seeds, which should be sown early in spring in the open ground. Those species natives of Mexico will require a little protection in winter the first year from seed.

VII. *Erothéra* (from *ovis*, *oinos*, wine, and *thaera*, a catching; the roots of *G. biennis* were formerly eaten after meals, as incentives to wine-drinking, as olives are). Lin. gen. 469. D. C. prod. 3. p. 45.

Lin. syst. *Oenothera*, Monogynia. Calyx of 4 sepals (f. 95. a. f. 96. a.); sepalas connected into a long, tetragonal, or 8-ribbed tube; segments of the limb deciduous, as well as the free part of the tube. Petals 4 (f. 93. b. f. 96. b.). Stamens 8, erect, or declinate; pollen triangular, clamy. Stigma 4-cleft or capitulate. Capsule 4-valved, 4-valved, cylindrical or prismatic, elevator, or tetragonal, inseparable from the base of the calyx. Seeds fixed to the central placenta, naked. Flowers opening at sun-set and closing at sun-rise.

SECT. I. *Spierrostigma* (from *spia*, *spiaira*, a sphere, and *stigma*, a stigma; in reference to the form of the stigma, which is globose). Ser. in D. C. prod. 3. p. 46. Stigma globose (f. 95. c.). Fruit oblong, cylindrical or tetragonal; valves linear. Anthers short, retuse at the apex.

3 G. *cheiranthifolia* (Horn. ex Spreng. syst. 2. p. 223.) stems branched; branches ascending, hairy; leaves sessile, spatulate, obtuse, quite entire, villous, cadescent; flowers sessile; capsule subulate, curved, angular, acute, hairy. 2? F. Native of Chili. Lindl. bot. reg. 1040. Flowers middle-sized, pale yellow. (f. 95.)

4 G. *alta* (Rafin. fl. lud. p. 95.) branches winged; leaves sessile, oval-lanceolate, entire, glabrous; flowers sessile; petals unguiculately; stigma globos; capsule 4-winged.—Native of Louisiana.

Winged-stemmed *Evening Primrose*. Pl.

5 G. *quadripav'léra* (Dougl. in bot. reg. 1119.) stems declinate, branched, weak, puberulous; leaves linear-lanceolate, somewhat denticulated, puberulous; petals with crenulated margins; capsule tetragonal, attenuated at the apex, villous. 2? H. Native of the north-west coast of America, on the banks of streams, as well as in the open elevated country west of the Rocky Mountains. Petals lilac, each marked with a more intense spot. Stigma globular, entire.

6 G. *Boothii* (Dougl. mas. ex Hook. fl. bor. amer. p. 213.) stems branched; leaves ovate, toothed, glabrous above, hairy beneath, lower ones stalked; flowers secund, in spikes; petals small, obovate, entire, equal in length to the stamens; style exserted; capsule cylindric, furrowed, twisted, pubescent. 2? H. Native of North America, on low exposed gravelly hills, near the branches of Lewis's and Clarke's rivers, in lat. 46°. N. Flowers white, sweet-scented. Stigma capitate.
ONAGRARIE. VII. CESTHERA. 685

Booth's Evening Primrose. Pl. ½ foot.

7 E. PYGMEÆ (Doug. mss. ex Hook. fl. bor. am. 218.) stem ascending, branched; lower leaves stalked, rhomboid, superior ones sessile, lanceolate, all toothed and pubescent; capsule somewhat second, cylindrical, attenuated at the apex, torulose. O. ? H. Native of North-west America, in barren sands near the Uballa river. Habit of the preceding species.

Pygmy Evening Primrose. Pl. ½ to ⅓ foot.

8 E. SPIRA'lis (Hook. fl. bor. am. p. 213.) stem nearly simple, decumbent, hoary; leaves lanceolate, obtuse, quite entire, hoary, and beset with striose pilis, attenuated at the base; spikes leafy; petals twice the length of the stamens; capsule acutely tetragonal, acuminate, hoary, somewhat spirally twisted. O. ? H. Native of the north-west coast of America. Allied to E. Boothii, but larger in all parts, and very easily distinguished by its entire hoary leaves and capsules.

Spirlt-capsulated Evening Primrose. Pl. ½ foot.

9 E. VIRIDE'SCENS (Hook. fl. bor. am. p. 214.) plant densely clothed with hoaryomentum; stem erect, simple; leaves ovate, acute, sessile, coarsely toothed; spikes leafy; petals deep green in the dried state, twice the length of the stamens; capsule acutely tetragonal, rather hairy, twisted. O. ? H. Native of the north-west coast of America.

Greenish-petalled Evening Primrose. Pl. ¼ foot.

10 E. CONTOR'TA (Doug. mss. ex Hook. fl. bor. am. p. 214.) stem weak, branched, glabrous; leaves linear, quite entire, glabrous; flowers small; capsule cylindrical, twisted, curved, elongated, torulose. O. ? H. Native of North America, in sandy barren soil on the interior banks of the Columbia river. Although the specimens examined by Dr. Hooker of this, as well as those of E. pygmeæ, are too imperfect to determine exactly the form of the stigmas, he thinks it not improbable from the habit of these plants that they should be ranged in the present section.

Twisted-podded Evening Primrose. Pl. ½ to ⅓ foot.

Flowers yellow.

11 E. BIE'XNIS (Lin. spec. 492.) stem erect, branched; radical leaves oblong-lanceolate, cauleine ones ovate-lanceolate, toothed, pubescent; petals hardly obcordate, exceeding the stamens; lobes of stigma linear and thickish; capsule nearly cylindrical, thickest at the base; valves either entire or bifid, opening at the apex. O. ? H. Native of North America, in Virginia, Canada, and on the north-west coast, from whence it has migrated to Europe in the year 1614, and now found apparently wild in England; particularly between the first and second ranges of sand-hills on the coast of Lancashire, a few miles north of Liverpool, in the greatest abundance. It covers several acres of ground near Woodbridge, Suffolk. This plant is common in gardens, and often escapes from thence into rich waste ground. But on the dreary sand of our Lancashire coast it is truly wild, being planted there by the hand of nature, though perhaps transported by natural means from the other side of the Atlantic. Pl. dan. 446. Smith, engl. bot. 1534. Flowers large, pale yellow, delicately fragrant. Roots edible.

13 E. ELA'TA (H. B. et Kunth, nov. gen. amer. 6. p. 90.) leaves lanceolate, acute, clothed with silky canescence pubescence, obliquely and remotely denticulated; petals roundish-obovate, retuse, pale yellow; stamens declare, about the length of the petals; capsules sessile, cylindrical, slightly angular, clothed with silky villi. O. ? H. Native of Mexico. Flowers pale yellow.

14 E. PUBE'SCENS (Wild. herb. ex Spreng. syst. 2. p. 229.) stem simple, erect; leaves oblong-lanceolate, obsolescently toothed, pubescent; capsule curved, cylindrical, clothed with silky villi. O. ? H. Native of South America. Flowers pale yellow.

Pubescent Evening Primrose. Pl. 2 to 3 feet.

15 E. GRANDIFLORA (Neill. hort. nov. gen. 1. p. 2. (1798.) ed. 2. vol. 2. p. 341. but not of Ruiz et Pav.) pubescent; stem simple; leaves lanceolate, remotely toothed; genitils deflexed; petals large, obcordate; capsule sessile, cylindrical, and slightly angular. O. ? H. Native of North America. Flowers large, pale yellow, solitary and sessile in the axils of the leaves.

16 E. SWAVE'GLENs (Desf. tabl. ed. 1804. p. 109. et Pers. ench. 1. p. 403.) stems, calyxes, and capsules villosa; leaves ovate-lanceolate, obsolescently toothed; petals large, emarginate; capsule elongated, about equal in thickness from base to apex. O. ? H. Native of North America. This plant is cultivated for the scent and size of the flowers, which are yellow.

17 E. SIMSIS'ANA (Ser. in D. C. prod. 3. p. 47.) stem straight, hispid, furrowed; leaves lanceolate, repandly toothed; tube of calyx 3 times the length of the ovarium; sepals very narrow, length of the petals; petals obverse, rather truncate, denticulated at the apex; stamens arched, shorter than the corolla; lobes of stigma linear, thickish; capsule sessile, cylindrical, slightly angular, with the valves reflexed at the apex. O. ? H. Native of Mexico. Flores corymbosa, Sims, bot. mag. t. 1794. but not of Lam. Flowers yellow.

18 E. LAMARK'IANA (Ser. in D. C. prod. 3. p. 47.) stem branched; leaves quite entire; petals large, yellow; capsules glabrous, cylindrically tetragonal, short. O. ? H. Native of North America. E. grandiflora, Lam. dict. 4. p. 554. but not of Ait. Flowers yellow.

Lamark's Evening Primrose. Pl. 2 to 3 feet.

19 E. SALICIFLORA (Desf. ed. 1815. p. 271.) stem tall, simple, angular; leaves oblong-lanceolate, acute, nearly entire, rather pilose, thickish; genitils about equal in length to the corolla; lobes of stigma oblong-linear, large, thickish; capsule oblong, tetragonal; valves linear, with red nerves. O. ? H. Native country unknown. Flowers yellow.

20 E. PARTIFLORA (Lin. spec. 492.) stem even, reddish, rather villous; leaves ovate-lanceolate, denticulated; stamens erect, longer than the petals; capsule ovate-cylindrical. O. ? H.
Native of North America. Mill. fig. 189. f. 1. Flowers small, yellow. Capsule sessile, 8-angled at the apex.

21 **O. cruciata** (Nutt. mss.) stem reddish, rather hairy: leaves lanceolate, acuminate, denticulated, glabrous, but the upper ones are rather downy; flowers sessile; petals linear, rather shorter than the anthers; calycine segments reflexed, linear, mucronate, longer than the petals, but about equal in length to the stamens; lobes of stigma thick, conving, or spreading a little; capsule cylindrical, hairy. \(\alpha\). H. Native of North America. Flowers small, yellow.

22 **O. gaeroides** (Horn. hort. hafn. 1 p. 362.) stem erect, pubescent, red, branched at the apex; leaves ovate-lanceolate, toothed, nearly sessile, spotted with red at the apex; capsules elongated, length of the bracts. \(\alpha\). H. Native of North America, near Baltimore. Flowers small, yellow.

23 **O. medica** (Link, enum. 1. p. 377.) stem erect, pubescent; leaves lanceolate-linear, acute, toothed, clothed with soft pubescence; tube of calyx long, pubescent; petals emarginate. \(\alpha\). H. Native of North America. Flowers yellow.

24 **O. corymbosa** (Lam. dict. 4. p. 554. but not of Sims.) stems twisted, furrowed; leaves numerous, lanceolate, glabrous, a little toothed, green; flowers sub-corymbose, terminal, pedunculate; tube of calyx short, length of the ovary, with the segments ovate and concave, unguiculate on the back; capsule ovate-oblong, villous. \(\alpha\). H. Native of North America. Cultivated in gardens. \(\varepsilon\). Spectabilis, Horn. ex Spreng. syst. 2. p. 227.

25 **O. alleghans** (Lam. dict. 4. p. 552. ill. t. 270. f. 2.) plant clothed with glaucous pubescence; leaves lanceolate, toothed, white; petals obovate, toothed at the apex; filaments and anthers red; capsule pubescent, cylindrical, rather gibbous at the base, 8-homed at the apex. \(\varepsilon\). G. Native of Peru. Flowers yellow.

**Whitened Evening Primrose.** Fl. 1 foot.

26 **O. nocturna** (Jacq. coll. 3. p. 205. icon. rar. 3. t. 455.) stems branched, terete, pubescent; leaves lanceolate, remotely toothed, flat, glabrous; petals obovate, obtuse; fruit ovate-oblong, somewhat revolute at the apex. \(\alpha\). H. Native of the Cape of Good Hope. Leaves almost like those of *Chenopodium ambrosioides*. Petals at first yellow, but at length changing to red.

27 **O. longiflora** (Jacq. hort. t. 172. Willd. spec. 2. p. 307.) stems simple, pilose; leaves lanceolate, denticulated, hairy; petals obcordate; tube of calyx very long; segments of the stigma very long and linear; genitils shorter than the petals; capsule long, thickened at the base, and narrow at the apex, somewhat tetragonal, hairy. \(\alpha\). H. Native of Buenos Ayres and Brazil. Curt. bot. mag. 365. Flowers large, pale yellow. Leaves like those of *Picris echinoides*.

28 **O. villidosa** (Thumb. prod. p. 75.) stems rather angular, very villous; leaves lanceolate, toothed, undulated, very villous; capsules nearly terete. \(\alpha\). H. Native of the Cape of Good Hope. According to Spänel this species is allied to *O. mollissima* and *O. odorata*. Flowers yellow.

29 **O. mollissima** (Lin. spec. 492.) stem branched; leaves lanceolate, a little undulate, remotely toothed, clothed with soft down; petals obovate, entire, shorter than the calyx; genitils hardly the length of the petals; lobes of stigma filiform; capsule cylindrical, striated, very long, downy, somewhat tetragonal, a little thickened at the apex. \(\varepsilon\). H. Native of Buenos Ayres, Monte Video, and Chili, in fields. Schkuhr, handb. 1. t. 105. Ce. nocturna, Willd. herb. ex Spreng.—Dill. hort. clt. 286. Flowers at first yellow, but afterwards changing to a reddish colour as they fade.

30 **O. affinis** (St. Hil. fl. bras. 2. p. 269.) stem branched, suffrutescent at the base, tomentose; leaves lanceolate, acute, sublaterally denticulated, puberulous; petals quite entire, longer than the calyx; genitils shorter than the petals; lobes of stigma linear; capsule cylindrical, somewhat tetragonal, a little thickened above the middle, tomentose. \(\varepsilon\). G. Native of Brazil, in the province of Rio Grande de St. Pedro do Sul, on the margins of woods near the town of Rio Pardo. Flowers yellow. Nearly allied to *O. mollissima*.

**Aluled Evening Primrose.** Pl. 1 to 1 1/2 foot.

31 **O. catharinae** (St. Hil. fl. bras. 2. p. 270.) stems trailing or ascending, simple or branched, puberulous; leaves lanceolate, acute, sublaterally denticulated, puberulous; petals exceeding the calyx, emarginate at the apex; genitils shorter than the petals; lobes of the calyx linear; capsule cylindrical, somewhat tetragonal, a little thickened above the middle, pubescent. \(\varepsilon\). G. Native of Brazil, in the island of St. Catharine, at the entrance to Rio Janeiro. Flowers yellow. Very nearly allied to *O. mollissima*, from which it may be distinguished by the greater size of the flowers, by the petals being emarginate at the apex, by the stigmas being short in proportion to the length of the style, and by the leaves being less velvety.

**St. Catharine Evening Primrose.** Pl. ascending.

32 **O. odorata** (Jacq. coll. 3. p. 107.) pubescent; stems branched, suffrutescent at the base; leaves lanceolate, a little toothed, undulate, curled; genitils length of the corolla; sepals unguiculate on the back; petals deeply obcordate; stigmas downy; capsule elongated, cylindrical, villous. \(\alpha\). H. Native of Patagonia. Jacq. icon. rar. t. 456. \(\varepsilon\). undulata, Ait. hort. kew. ed. 2. vol. 2. p. 342. Onagra undulata, Møench. Leaves stiffish. Flowers at first yellow, but afterwards becoming reddish as they fade, about the size of those of *O. longiflora*. Plant rather clammy.

**Var. a, glaucescens** (Ser. mss. in D. C. prod. 3. p. 48.) leaves glaucous; peduncles and calyxes purplish; genitils erect.—Jacq. icon. rar. 3. t. 456.

**Var. b, viridescens** (Ser. mss. in D. C. prod. 3. p. 48.) leaves green; nerves of leaves, calyx, and germs usually red; genitils indurate. Ker. bot. reg. t. 147. Sims. bot. mag. 2403. Hook. cxot. fl. t. 183.

**Sweet-scented Evening Primrose.** Fl. April, May. Clt. 1790. Pl. 1 to 2 feet.

33 **O. striata** (Lede. in Link, enum. 1. p. 377.) stem muriated, greenish; lower leaves linear, very long, denticulated, canailes one lanceolate. \(\varepsilon\). H. Native country unknown. Flowers yellow. Capsule cylindrical, but at length becoming elavate, having the nerves thick and coloured. Seeds irregularly oval-oblong, bay-coloured, striated longitudinally.

34 **O. sinuata** (Michx. fl. bor. amer. 1. p. 224.) plant decumbent, clothed with soft pubescence; leaves lanceolate, remotely toothed or cut; flowers small; sepals unguiculate towards the apex; capsules cylindrically tetragonal, somewhat incurved, pilose, length of the bracts. \(\varepsilon\). H. Native of Virginia.
Murr. nov. comm. gaet. 5. p. 44. t. 9. ex Willd. spec. 2. p. 309.

Pl. 1 foot.

35 G. erosà (Lem. in sem. hort. hamb. 1821, and in nov. act. bonn. 14. p. 513.) stem terete, pilose, fistular; leaves lanceolate, pubescent, veinly, rossely toothed at the base, somewhat sinuate, toothed to about the middle, but quite entire at the apex; flowers small; capsule cylindrical, 4-furrowed, thickened a little in the middle. ♀. H. Native of the Cape of Good Hope. Petals obcordate, finely crumpled. Lobes of stigma cylindrical, thick, obtuse.

36 G. viscosa (Raffn. fl. Ind. p. 96.) stem branched, decumbent, terete, villous, and clammy; leaves sessile, lanceolate, nervled, sinuate toothed; flowers axillary, sessile; petals obcordate; stigma 4-lobed; capsule cylindrical, channelled. ♀. H. Native of Louisiana. Flowers yellow.

Clammy Evening Primrose. Pl. dec.

37 G. indicà (St. Hill. fl. bras. 2. p. 268.) stems many from the same root, nearly simple, pubescent; leaves lanceolate, acute, obtusely and sinuate denticulared, pubescent; petals shorter than the calyx, emarginate; genials equal in length to the petals; lobes of stigma linear, papillose; capsule cylindrical, pubescent. ♂. H. Native of Brazil, not far from the town of Rio Grande de St. Pedro do Sul. Flowers small, yellow.

Indecorosus Evening Primrose. Fl. May. Pl. ½ ft.

38 G. prostrà (Ruiz et Pav. fl. per. p. 79. t. 315.) leaves somewhat lanceolate, acute, sinuate toothed; sepals longer than the corolla; petals obcordate; capsule linear, bluntly tetragonal, crowned, curved. ♂. H. Native of Peru, in cornfields.—Pluk. alm. t. 203. f. 3. Flowers at first yellow, but afterwards changing to purplish as they fade.

Prostrate Evening Primrose. Pl. prostrate.

40 G. serìclata (Nutt. gen. amer. 1. p. 246. journ. acad. philad. 1823. p. 120.) stem branched, and is, as well as the under side of leaves and capsules, rather pubescent; leaves oblong-linear, irregularly serrated, ending in a hard acute point; flowers remote, sessile; calyx angular; capsule prismatic; petals entire; stamens and style very short. ♀. H. Native of North America, on the mountains about the rivers Platte and Missouri. Lindl. in Hook. exot. fl. 140. Sweet, fl. gard. t. 133. Flowers small; deep yellow. Corolla salver-shaped. Stigma capitulate, slightly 4-lobed.

41 G. leucòcàrpà (Comien, mas. in Hook. fl. bor. amer. p. 210.) stem branched; leaves stiff, serrated, spathulate-lanceolate, upper ones lanceolate, when young rather silky; petals emarginate, crenulated at the apex; tube of calyx shorter than the petals and segments; segments of stigma linear-oblong; anthers adnate; capsule cylindrical, clothed with hoary silky down. ♀. H. Native of North America, on the dry banks of the Saskatchewan, and common upon limestone rocks on the Red and Assinaboine rivers. Flowers yellow. Plant with the habit of a species of Helianthemum.

White-fruited Evening Primrose. Pl. ½ ft.

** Flowers white.

42 G. cespitòsa (Sims. bot. mag. t. 1593.) plant almost stemless; leaves lanceolate, deeply toothed; tube of calyx very long; petals deeply obcordate; genials shorter than the corolla; segments of stigma thickish, elongated; capsules sessile, somewhat obconically-oblong, with the margins of the valves crestedly muricated. ♀. H. Native of North America, on hills about the Missouri. Nutt. gen. 1. p. 346. G. scapigera, Pursh. fl. bor. amer. 1. p. 263. ex Link, enum. 1. p. 577. Flowers large, white, but afterwards changing to purplish as they fade.

43 G. aleicàulis (Fras. cat. 1813. Nutt. gen. amer. 1. p. 245.) stem erect, branched at the apex, white, quite glabrous; leaves linear-lanceolate, almost quite entire, pubescent beneath; petals roundish, entire, about equal in length to the stamens; capsule cylindrically prismatic, truncate. ♀. H. Native of North America, on the banks of the Saskatchewan and Missouri. Flowers white, large.

White-stemmed Evening Primrose. Pl. 2 to 3 feet.

44 G. pallida (Lindl. bot. reg. 1142.) roots creeping; stems ascending, branched, glabrous; leaves linear-lanceolate, acuminate, quite entire or toothed, glabrous; petals retuse, crumpled, exceeding the stamens; capsule cylindrical, twisted. ♀. H. Native of North America, common over all the dry sandy soil to the west of the Rocky Mountains. Petals white, yellow at the base, becoming reddish as they fade.

*** Flowers red or purple. Anthers inumte.

45 G. humifùsa (Nutt. gen. amer. 1. p. 245.) plant prostrate; stems branched, villous; leaves linear-lanceolate, somewhat denticulated, or entire and setaceous; tube of calyx rather longer than the ovary; petals obcordate; capsule prismatic. ♂. H. Native of Florida, on the sea shore. Flowers purple.

46 G. tenérea (Cav. icon. 4. p. 68. t. 396. f. 2.) stem branched, erect; leaves linear-spataulate; petals obovate, rather retuse, violaceous; style longer than the stamens, which are erect, but much shorter than the petals; segments of stigma narrow, short; capsule sulcate, cylindrical, curved, tomentose, longer than the bractees. ♂. H. Native of Chili, about Coquimbo and elsewhere. Ruiz et Pav. fl. per. 3. t. 316. Sims, bot. mag. t. 2424. Plant rather glaucous. Flowers purple; petals crenulated at the apex. Lobes of stigma as well as anthers dark purple.

47 G. tenèfiolà (Cav. icon. 4. p. 67. t. 397.) stem branched; branches ascending; leaves lanceolate; petals obovate, somewhat truncate, crenated at the apex; style longer than the stamens, which are erect, but shorter than the petals; lobes of stigma narrow, short; capsule cylindrical; ♂. H. Native of Chili, about Coquimbo, where it is commonly called serenoa. Sweet, fl. gard. new. ser. t. 19. Ruiz et Pav. fl. per. 81. t. 317. Flowers purple. Very like G. tenella.

48 G. amèca (Lemh. in nov. act. bonn. 14. p. 811. t. 45. and in ind. sem. hort. hamb. 1821.) pubescent; stem terete; leaves lanceolate, bluntish, slightly toothed, glaucescent; petals 3 times longer than the calyx, oblative, slightly emarginate, undulate, crenated; capsule cylindrically tetragonal; lobes of stigma semi-cylindrical. ♂. H. Native of North America. CE. roseo-4lba, Bernh. in sched. hort. elf. 1824. Sweet, fl. gard. 268. Petals whitish, but rose-coloured at the base, and below that marked by a triangular, purple, striated blotch.
ONAGRARIÆ.

Please Evening Primrose. Fl. June July. C1t. 1825. Pl. 1 ft. 49. E. ViMNEA (Dougl. in bot. mag. 1. 2875.) stem erect, branched, glaucous, glabrous; leaves lanceolate, nearly quite entire, glaucous, and glabrous; tubec of calyx about equal in length to the segments; petals entire, denticulated, twice the length of the segments; stigmas purple; capsule cylindrical, attenuated at the apex, furrowed, pubescent. (H. Native of North California, near the river Aquilar, in dry prairies in lat. 45° north. Lindl. bot. reg. 1290. Flowers lilac.

Twiggy Evening Primrose. Fl. June, Sept. C1t. 1826. Pl. 2 to 3 ft. 50. E. LINDEL'IY (Dougl. in bot. mag. 288.) stem ascending, diffuse, branched; leaves linear-lanceolate, quite entire, glabrous; tube of calyx 3 times shorter than the segments; petals entire, denticulated, twice the length of the segments; stigmas yellow; capsule cylindrical, elongated, tapering to both ends, puberulous. (H. Native of the north-west coast of America, about Fort Vancouver, and at the Mulnomak river. Petals lilac, each marked with a purple spot; claws yellow.

Lindley’s Evening Primrose. Fl. June, Nov. C1t. 1826. Pl. 1 to 2 feet. 51. E. DECMEN'S (Dougl. in bot. mag. 2889.) stem ascending, diffuse, branched; leaves glaucous, quite entire, pubescent, lower ones broadly ovate, upper ones ovate-lanceolate; petals enarginate, crenulated; stigmas purple, with reflexed segments; capsule bluntly tetragonal, tapering from the base, villous. (H. Native of California, in dry mountain valleys. Lindl. bot. reg. 1291. Petals lilac, obcordate. From all its nearest allies this plant differs in the form of the stigmas.

Decumbent Evening Primrose. Fl. June, Nov. C1t. 1827. Pl. 1 to 2 ft. long, ascending. 52. E. PURPU'REA (Curt. bot. mag. 552.) plant glaucous; leaves lanceolate, attenuated at both ends, bluntish; tube of calyx short; petals obovate, crenulated; genitils exerted, much shorter than the corolla; lobes of stigma thick, short, dark purple; anthers yellow; capsule ovate, trigonous, sessile, angular, pilose; seeds irregularly angular, and covered with dots when examined by a lens. (H. Native of the north-west coast of America. E. humilis, Dom. Hort. cantab. p. 41. Flowers purple.

Purple Evening Primrose. Fl. May, Aug. C1t. 1794. Pl. 1 ft. 53. E. ROMANZOVI (Ledeb. in Horn. hort. hafn. suppl. 183.) glaucous; stem erect; leaves lanceolate-oblong, mucronate, tapering into the petiole; tube of calyx very short; limb one-half shorter than the corolla; petals broad-obovate, crenulated; stamens much shorter than the corolla; lobes of stigma thick, short, dark purple; anthers green; stigmas nearly sessile, inclosed, dark purple; capsule oblong-cylindrical, somewhat tetragonal, pilose; seeds hoary, and rather scaly when examined by a lens. (H. Native of North America, on the western coast. D. Don in Kew. bot. reg. t. 662. Flowers violaceous.

Flowers white.

54. E. ACALUS (Cav. icon. 4. p. 68. t. 399.) leaves rosulate, pinnatifid; the terminal lobe large and denticulated; tube and flowers large; calyce segments free, reflexed; petals obvate, rather retuse, entire; anthers and stigmas narrow, shorter than the corolla; capsule obvate, tetragonal, a little winged, sessile.

G. F. Native of Chili. Ker. bot. reg. 768. Petals large, white, but becoming red as they fade.

VII. EsoTHER'IUM.

Stemless Evening Primrose. Fl. May, Sep. C1t. 1821. Pl. 1/4 ft. 55. E. TARAXACHFÓLIA (Hort. and Sweet, fl. gard. t. 294.) stem branched, elongated, procumbent; leaves pubescent, alternate, interruptedly pinnatifid, sinuate-toothed, but the apex entire; tube of flower very long; petals large, obovate, entire, 5-nerved; anthers and stigmas shorter than the corolla; capsules sessile, obovate, pubescent, tetragonal; angles winged. 2. H. Native of Chili, about Conception. E. grandiflora, Ruiz et Pav. fl. per. 2. t. 318. f. 6. E. acanthis, b major, Ser. in D. C. prod. 3. p. 49. Flowers large, white, but becoming reddish as they fade.

Dandelion-leaved Evening Primrose. Fl. May, Aug. C1t. 1825. Pl. 1/2 foot. 56. E. ANISOLÓRA (Sweet, fl. gard. new. ser. 105.) stem suffruticosum, tall, straight, branched, downy; radical leaves elliptic, entire, or few-toothed; middle ones elliptic, sharply toothed, with the segments at the base variable, linear, acute, and divaricating; upper ones unequal, pinnatifid, with the segments divaricate, with the terminal lobes large; tube of flower very long; ovary tetragonal; petals large, imbricate, with crenulated margins. 2. H. Native of Chile, what as they fade. Lindl. bot. reg. t. 1497. Leaves downy. Lobes of stigma linear.

Unequal-leaved Evening Primrose. Fl. May, Oct. C1t. 1828. Pl. 3 feet. 57. E. Pur'kissii; pubescent; stem decumbent, white; radical leaves nearly entire; cauline ones pinnatifid, with linear acute divericate segments; nerves of leaves white like the stem; flowers few, disposed in a kind of spike; petals obcordate, white, large, longer than the stamens; style filiform; ovaries sessile, prismatic, furrowed. (H. Native of North America, on the plains of the Missouri. E. albicaulis, Pursh, Fl. amar. sept. 2. p. 753. but not of Nutt. E. pinnatifidus, Nutt. gen. amer. 1. p. 245. but not of Kunth. Flowers large, white.

Pursh’s Evening Primrose. Fl. May, Aug. C1t. 1811. Pl. dec. 58. E. SPECIOSA (Nutt. in mem. acad. soc. hist. nat. phil. 1821. p. 119.) plant puberulous; stem suffruticosum; leaves oblong-lanceolate, attenuated at both ends, serrated, and somewhat pinnatifid, nervet, pubescent beneath; flowers subraceaceous; raceme naked, at first drooping; petals obcordate, equal in length to the stamens; capsule obovate, angular. 2. H. Native of North America, on the banks of the Red river. Hook. exoth. fl. t. 80. Sweet, fl. gard. 253. Flowers large, white, but becoming reddish as they fade.

Shenk Evening Primrose. Fl. Mar. Sept. C1t. 1821. Pl. 2 to 3 ft. 59. E. TETTRA'PTERA (Cav. icon. 3. p. 40. t. 279.) stem branched, pilose; leaves lanceolate, pinnatifid, or toothed, somewhat ciliated, hardly petiolate; tube of calyx almost wanting; petals obcordate, entire; genitils shorter than the corolla; anthers and stigmas narrow and long; capsule obovate, 4-winged, ribbed, pilose, tapering into a pedicle at the base; seeds ovate, smooth, pale. 2. H. Native of New Spain, Sims. bot. mag. 468. Petals white, but becoming red as they fade.

Four-winged-capsuled Evening Primrose. Fl. June, Sept. C1t. 1796. Pl. 1 foot. 60. E. LATI'FLÓRA (Moc. et Sesse, fl. mex. icon. ined. t. 376.) root fusiform; stem terete, hairy, branched at the apex; leaves lanceolate-linear, acute, deeply toothed, alternate, opposite, or in whorles; flowers on short pedicels. 2. H. Native of Mexico. Flowers large, white, but becoming reddish as they fade. Fruit unknown.

Broad-flowered Evening Primrose. Pl. 1 foot.

Flowers red or purple.

61. E. VIGOA'TA (Ruiz, et Pav. fl. per. 29. t. 315.) stem prostrate or erect, branched; leaves lirate and lanceolate, toothed;
flowers disposed in a kind of raceme; petals obovate, hardly longer than the limb of the calyx; capsule claveate, 10-angled, the alternate angles broad. 2. H. Native of Peru, in fields, and among rubbish. Flowers purple. There is a variety of this with nearly entire leaves.

Subulate-leaved Evening Primrose. Pl. 1 2 3 feet.

63 CE. rosea (Ait. hort. kew. ed. 1. vol. 2. p. 3. ed. 2. vol. 2. p. 343.) shrubby; stem branched; branches twiggy; leaves elliptic, attenuated at both ends, toothed, lower ones lyrate; tube of calyx short; petals obovate-roundish; glands shorter than the corolla; capsule claveate, 8-angled. 2. F. Native of Mexico. Curt. bot. mag. 347. CE. purpurasc. Lam. dict. 4. p. 564. CE. rubra, Cav. hron. 4. p. 68. t. 400. Flowers red, about the size of those of Epilobium angustissimum.

61 CE. tubiflora (Moc. et Sesse, fl. mex. icon. ed. 1. t. 377.) root rather fuscous; stems depressed; leaves linear-oblong, acute, somewhat dentillicate; tube of calyx very long; petals obcordate; stamens longer than the stigmas; fruit unknown. 2. F. Native of Mexico. Flowers rose-coloured. This is a very distinct species, but from the fruit being unknown it is doubtful whether it belongs to the present section.

Tube-flowered Evening Primrose. Pl. 1 2 foot.

** Flowers yellow.

65 CE. triandra (Nutt. in journ. acad. philad. 1821. p. 118.) stemless; leaves interruptedly pinnatifid, toothed, glabrous; petals obovate, slightly 3-lobed at the apex, the middle lobe mucronate; capsules almost 4-winged, large, sessile at the root. 2. H. Native of North America, in arid fields on the banks of the Red River, and of Louisiana. Sims, bot. mag. 2566. CE. rhizocarpa, Spreng. syst. 2. p. 230. Flowers radical, pale yellow, sweet-scented in the evening. Tube of calyx very long.

66 CE. pinnafloria (H. B. et Kunth, nov. gen. amer. 6. p. 91.) stem erect, branched at the base; leaves pinnatifid, pubescent; capsule 8-angled, somewhat 4-winged, on short pedicels. 2. F. Native of Mexico, about Actopan. Flowers yellow, about the size of those of Epilobium hirsutum, axillary at the tops of the stem and branches.

Pinnatifid-leaved Evening Primrose. Pl. 1 foot.

67 CE. macracantha (Pursh. fl. amer. sept. 2. p. 734.) stem simple, prostrate, downy; leaves lanceolate, quite entire, or glandularly dentillicate, with the margins and nerves covered with white silky down; petals broad, obcordate; stamens arched, shorter than the corolla; lobes of stigma cylindrical, blunt; capsule large, sessile, oblong, 4-winged. 2. H. Native of North America, on the banks of the Mississippi, near St. Louis. Sweet, fl. gard. t. 5. Stem purplish. Corolla large, yellow. Calyx spotted as in CE. macrocarpa. Leaves sometimes glandularly dentillicate.

70 CE. hybrids (Michx. fl. bor. amer. 1. p. 225.) stem erect, villous; leaves pubescent on both surfaces, lanceolate, remotely toothed; flowers on short pedicels; bracteas wanting or subulate; capsules ovate, tetragonal, disposed in something like spikes. 2. H. Native of Upper Carolina. Flowers yellow. There is a variety of this plant with glabrous leaves.

Hybrid Evening Primrose. Fl. Ju. Oct. Clt. 1813. Pl. 1 foot. 71 CE. fruticosa (Lin. spec. 492.) stems erect, brownish, glabrous, or pilose; leaves ovate-lanceolate, denticulated, pilose, or glabrous; racemes spicate, leafy, naked at the base; petals broadly obcordate, erose, twice the length of the stamens; capsule claveate, pilose, 8-angled, one of the angles winged. 2. H. Native of Virginia and Canada. Curt. bot. mag. t. 332. CE. canadensis, Goldie, in edin. phil. journ. 1821. p. 7. Flowers large, deep yellow. Stem branched at the apex.

72 CE. serotina (Hort. ex Sweet, fl. gard. 184.) stems ascending, branched, pubescent; leaves lanceolate, acute, denticulated, glabrous, attenuated at the base; petals wrinkled or plaited; capsule pedicellate, 4-winged, oblong, pubescent; segments of stigma blunt, spreading. 2. H. Native of North America. Flowers yellow. Habit procumbent and branching.

73 CE. ambigua (Spreng. syst. 2. p. 229.) stems simple, pilose; leaves ovate-lanceolate, acute, denticulated, dotted; calyxine segments short; capsule sessile, clavate, 4-winged. 2. H. Native of Pennsylvania. CE. fruticosa, Curt. nov. gen. amer. 1. p. 247. Flowers yellow.

74 CE. Fraseri (Pursh, fl. amer. sept. 2. p. 734.) smoothish; stems simple at the base; leaves ovate, glandularly dentilicate; tube of calyx longer than the ovariun; petals obcordate, broad, crenately undulated; capsule obvolute, thick, tetragonal. 2. H. Native of South Carolina. Sims, bot. mag. 1674. Flowers yellow.

Fraser’s Evening Primrose. Fl. Ju. Oct. Clt. 1811. Pl. 1 foot. 75 CE. Tarqua (H. B. et Kunth, nov. gen. amer. 6. p. 91.) procumbent; leaves lanceolate-oblong, acute, narrowed at the base, nearly quite entire, puberulous; petals ovate-roundish, retuse? glands shorter than the corolla; capsules very nearly sessile, 4-winged, bluntly truncate at the apex. 2. H. Native of South America, near the town of Quito, in the valley of Tarquor, at the height of 4000 feet above the level of the sea. Flowers yellow. Like CE. pumila, but differs in the leaves being broader and puberulous, and in the calyxes, capsules, and ovaries being clothed with silky down.

Tarqua Evening Primrose. Pl. procumbent.

76 CE. pumila (Lin. spec. 493.) stems usually simple, ascending, rather pilose; leaves lanceolate, quite entire, obtuse, a little ciliated; flowers subsipicate, on short pedicels; petals obcordate, rather longer than the genitals; capsule claveate, 8

4 T
angled, 4 of the angles winged. America, in most parts. Curt. bot. mag. t. 335. Mill. ill. 188. Flowers yellow, about the size of those of *Poteritilla eurina*. Leaves small. (f. 97.)

**Dwarf Evening Primrose.** Fl. May, Sept. Clt. 1757. Pl. 1/3 ft. 77 *O. nana* (Nutt. gen. amer. 1. p. 247.)stem erect, nearly glabrous; leaves lanceolate, denticulated, glabrous; flowers subsipicate, on short pedicels; petals emarginate, a little longer than the genitae; capsules 8-furrowed, the 4 alternate ribs more prominent than the rest. z. H. Native of North America, in North Carolina, near Wilmington; and on the plains of the Saskatchewan. Flowers small, yellow.

**River-bank Evening Primrose.** Pl. 1 to 1 1/2 ft. 78 *O. cristata* (Michx. fl. bor. amer. 1. p. 225.) stems weak, minutely pubescent; leaves lanceolate, blusht, entire; flowers small; tube of calyx not half so long as the segments; capsule sessile, clavate, 8-angled, the 4 alternate angles more prominent than the others. z. H. Native of North America, from Quebec to Hudson's Bay. Flowers yellow, the size of those of *Epilobium palustre*. Dr. Hooker considers this identical with *O. pumila*, see fl. bor. amer. p. 212.

**Small Evening Primrose.** Fl. May, Sept. Clt. 1817. Pl. 1/2 ft. 80 *O. multicaulis* (Ruiz, et Pav. fl. per. 3. p. 80. t. 317. f. 6.) stems tufted, depressed; radical leaves lanceolate-oblong, denticulated, caudine ones ovate; flowers sessile, secund; petals hardly exceeding the calyx in length; capsules second, clavate, 8-angled, the 4 alternate angles more prominent than the others; seeds obovate, angular, fuscensce. z. H. Native of Peru, on the Andes, in the provinces of Tarma and Canta. Flowers yellow.

**Many-stemmed Evening Primrose.** Pl. depressed. 81 *O. lintfolia* (Nutt. in journ. acad. philad. 1821. p. 120.) stem straight; leaves linear, very narrow, obtuse, entire; flowers spicate; calyxes hispid, obovate-oblong; angles blusht; petals obcordate, 1-nerved; nerve thick, coloured. z. H. Native of North America, on rocks along the Akanza river. Flowers 2 lines broad, yellow.

**Flax-leaved Evening Primrose.** Fl. June, Aug. Pl. 1/2 to 2/3 ft. 82 *O. linea* (Michx. fl. bor. amer. 1. p. 225.) plant slender, pubescent; leaves linear, entire; capsules on longish stipes, roundish-tetragonal, villous. z. H. Native of Upper Carolina. This species is hardly known. Flowers yellow.

**Linear-leaved Evening Primrose.** Fl. June, July. Clt. 1822. Pl. 1/2 to 1 foot. 83 *O. elongifolia* (H. B. et Kunth. nov. gen. amer. 6. p. 92.) stem branched; leaves oblong or ovate-oblong, acute, narrow at the base, remotely and obsolescent denticulated, puberulous; capsules pedicellate, clavate, 4-winged. z. F. E. Native of New Granada. Flowers orange-coloured.

**Willow-herb-leaved Evening Primrose.** Pl. 1 foot.

VIII. **GAYOPHYTUM.** IX. **ClARKIA.**

85. *O. adscens* (Willd. herb. ex Spreng. syst. 2. p. 230.) stems weak, ascending, branched; leaves lanceolate, toothed, pubescent; capsule sessile, clavate, curved. z. H. Native of South America.

**Ascending Evening Primrose.** Pl. ascending.

† *Species not sufficiently known.*

86. *O. inca* (Nutt. gen. amer. 1. p. 247.) stem humble, slender, erect; leaves clothed with hoary tomentum, quite entire, elliptic-ovate, acute; racemes few-flowered, naked; capsules almost sessile, oblong, 4-angled. z. H. Native of Maryland. Flowers golden yellow.

**Hoary Evening Primrose.** Pl. 3 foot.

87. *O. australis* (Sal. prod. p. 278.) leaves linear-lanceolate, denticulated, unduluted, minutely pubescent; capsule sessile, cylindrica, obsolescently 8-angled.—Native about Port Desire.

**Southern Evening Primrose.** Pl. 1 foot.

Cult. All the species of *Eunothia* are handsome border flowers, and deserve to be cultivated. They will grow in any common garden soil. The perennial kinds are easily increased by seeds, by dividing the plants at the root, and some of them by cuttings. The seeds of annual and biennial kinds only require to be sown where the plants are intended to remain.

**VIII. GAYOPHYTUM** (a name peculiarly composed from M. Gay, the discoverer of the plant, and *ephyon, phyton*, a plant; signifying Gay's plant). *Adr. Juss. in ann. sc. nat. 25. p. 18.*

**LIN. SYST. OCA'rAalia, Mavonpyina.** Calyx 4-parted. Petals 4. Stamens 8, the 4 opposite the petals small and barren. Style short. Stigma capitate, obscurely 2-lobed from a transverse furrow. Ovarium oblong-elliptic, compressed, 2-celled. Capsule linear, 4-valved, 2-celled; lateral valves revolute; cells many-seeded. Seeds fixed to the longitudinal placenta, 1 row in each cell, ascending, naked.—A small, glabrous herb. Leaves linear-falcate, lower ones nearly opposite, upper ones alternate. Flowers solitary, axillary, shorter than the leaves, yellowish. Pollen trigonal.

**Humble Gayophytum.** Pl. 1 to 3 inches.

Cult. The seeds of this plant only require to be sown in the open border, in a warm sheltered situation.

**LIN. SYST. OC'rAria, MAOnopyina.** Calyx tubular, 4-cleft, nearly as in *Oeunothia*.

Petals 4, unguiculate, cruciate, 3-lobed (f. 97. b.), convolute in aestivation. Stamens 8, the 4 alternate ones sterile. Stigma 4-lobed (f. 97. a.); lobes petaloid. Capsule cylindrical, furrowed, 4-celled, 4-valved. Seeds ascending, naked.—Smooth, annual herbs, with alternate, lanceolate, or linear, entire leaves; and axillary, sessile, solitary, showy flowers.

1 C. *ful'cille* (Pursh, l. c.) petels deeply 3-lobed; leaves linear. z. H. Native of North-west America, on the banks of the Kooskoosky and Clarke's rivers, and from the great falls of the Columbia to the Rocky Mountains. Hook. bot. mag.
Flowers large, of a beautiful rose-purple colour, rarely white.

*Var. β*; petals less deeply lobed, but more denticulated. Hook. bot. mag. t. 2918.

2 C. rhomboidea (Doug. & Hook. fl. bor. Amer. p. 214.) petals entire, rhomboid; leaves lanceolate. O. H. Native along with the preceding species. Flowers of a beautiful rose-purple colour.

Cult. The C. pulchella is one of the most showy border annuals ever introduced to the gardens, and is on that account to be seen in every flower-garden and nursery, although but a few years since its first introduction. Both species will grow in any common garden soil, in which the seeds may be sown.

**Tribe IV.**

**Jussieae** (plants agreeing in character with the genus Jusaiea). D. C. prod. 3. p. 52. Fruit capsular; cells many-seeded. Tube of calyx permanent, not drawn out beyond the ovary, but dividing immediately into segments (f. 98 a.).—Usually herbs, rarely shrubs.

**Lin. syst. Octo-Deccandria, Monogynia.** Tube of calyx prismatic or cylindrical, adhering in its whole length to the ovarium; limb 4 (f. 98 a.)—5 to 6-parted; the lobes acute and permanent, valvate in evaporation. Petals spreading, equal in number to the lobes of the calyx (f. 98 d.). Stamens double the number of the petals, deciduous like them. Ovary sometimes flattish at the apex, sometimes elevated into a furrowed cone (f. 98 b.). Style filiform, short, crowned by a capitate 4-6-furrowed stigma. Capsule 4-6-seeded, oblong, usually ribbed and opening between the ribs, always crowned by the calyx. Seeds numerous, naked.

—Herbs, rarely shrubs, natives of marshes. Leaves alternate, for the most part quite entire. Flowers axillary, solitary, sessile, or on very short pedicels, usually bilobate at the base, generally yellow, rarely white.

*Flowers with 5 petals and 10 anthers, very rarely with 6 petals and 12 anthers.*

1 J. peruviana (Lin. spec. 555.) stem suffruticose, erect; leaves oblong, attenuated at both ends, pubescent beneath; pedicel bearing 2 foliaceous bracteoles at the apex, twice the length of the tube of the calyx, which is pentagonal and tubinate; calyceous lobes 5, lanceolate, one half shorter than the petals, which are roundly obovate. O. B. S. Native of Peru, near rivulets about Lima. Feuill. obs. 2. p. 716. t. 9. Flowers large, yellow. An emollient poultice is formed of the leaves of this plant in Peru.

**Peruvian Jussiea.** Shrub 1 to 2 feet.

2 J. variaflora (Meier. prim. essq. 174.) stem shrubby, ascending, glabrous; leaves lanceolate, acuminate at both ends, crenate-serrate, glabrous; flowers on short pedicels, bilobate at the base; tube of calyx angular; calyceous lobes 5-6, lanceolate, shorter than the petals, which are ovate. O. B. S. Native of Guiana, about Essequibo, in marshes. Flowers yellow. This species is said to be nearly related to J. Peruviacea, but the leaves are narrower and the flowers are on shorter pedicels.

**Variable Jussiea.** Fl. Aug. Sept. Ct. 1826. Pl. 1 to 2 ft. 3 J. doceandria (D. C. prod. 3. p. 53.) herbaceous, erect, glabrous; leaves oval, acute at both ends; on short petioles; flowers sessile; tube of calyx elongated, cylindrical; calyceous lobes 5-6, linear-oblong, amethystine; petals ovate, emarginate, equal in length to the calyceous lobes. O. B. S. Native about Demerara. Stem terete, below; branches compressed, angular. Flowers yellow.

**Dodecantrandra Jussiea.** Pl. 1 foot.

4 J. leptocaera (Nutt. gen. amer. 1. p. 279.) herbaceous, erect, smoothish; stem and calyx partly hairy; leaves lanceolate, smoothish, attenuated at both ends; flowers sessile, 5-6-petalled; tube of calyx very slender, cylindrical; petals hardly longer than the calyceous lobes. O. B. H. Native of North America, on the banks of the Mississippi and Missouri; very plentiful. Stem usually simple, irregularly angled. Petals yellow.

**Sleender-fruited Jussiea.** Fl. Jul. Sept. Ct. 1817. Pl. 1 ft. 5 J. pilosa (H. B. et Kunth, nov. gen. amer. 6. p. 101. t. 532. a and b.) herbaceous, erect, hispid; leaves oblong-lanceolate, narrowed at the base, hairy on both surfaces; flowers on very short pedicels, bractless; tube of calyx cylindrical, elongate; calyceous lobes 5-6, rarely 4, oblong-lanceolate, acuminate; petals roundly obovate, shorter than the calyceous lobes. O. B. S. Native of Guiana, about Demerara. Flowers yellow. Nearly allied to J. pilosa.

**Pilose Jussiea.** Pl. 1 foot.

6 J. affinis (D. C. prod. 3. p. 53.) herbaceous, erect, pilose; leaves oblong-lanceolate, acuminate at both ends, smoothish, ciliated on the nerve and margins; flowers on very short pedicels, bractless; calyx pilose, with a cylindrical elongated tube, and 5 linear-lanceolate acuminate lobes; petals oblong-ovate, equal in length to the calyceous lobes. O. B. S. Native of Guiana, about Demerara. Flowers yellow. Nearly allied to J. pilosa.

**Allied Jussiea.** Pl. 1 foot.

7 J. grandiflora (Michx. fl. bor. amer. 1. p. 267.) plant floating; stems herbaceous, villous; leaves pubescent, oblong-lanceolate, lower ones rather spatulate, the rest tapering to both ends; pedicels bractless, and are as well the calyces villous; flowers drooping before expansion; calyceous lobes 5-6, acute; petals obvate, emarginate, twice the length of the calyceous segments. O. W. H. Native of the Cisplatine, and Lower Carolina, in ponds. Sims, bot. mag. 2132. Flowers large, yellow.

8 J. montevideensis (Spreng. syst. 2. p. 232.) stem ascending, smooth at the base, but hairy above; lower leaves spatulate, glabrous, upper ones lanceolate, acute, quite entire, and hairy; calyx with a narrow tube and 5 lanceolate acute lobes; petals 5, obvate, emarginate. O. W. S. Native of Brazil, in marshes and rivulets in the province of Cisplatine, near the town of Monte-Videó. J. grandiflora, St. Hilt. fl. bras. 2. p. 265. Pedicels bilobate. Flowers yellow.

Var. β; flowers 5-times smaller than those of the species; leaves smoothish above, but with a few scattered hairs beneath. St. Hilt. l. c.

**Monte-Videó Jussiea.** Pl. floating.

9 J. diffusa (Forsk. descr. p. 210.) stems creeping; leaves lanceolate; flowers sessile, 5-petalled, decandrous. O. W. S. Native of Egypt, in the Delta at the Nile, on the edges of fields. This plant is hardly known, but evidently distinct from J. erécta, 4 × 2
as may be seen from the short description of Forskål, and is admitted by Delile, in his fl. Ægypt. ill. p. 14 without any description.

Diffuse Jussiaea. Pl. diffuse.

10 J. polygoïdes (H. B. et Kunth, nov. gen. amer. 6. p. 97.) plant shrubby, creeping, glabrous; leaves oblong-spatulate, obtuse, thickish; flowers on short pedicels, bractless; tube of calyx slender, somewhat pentagonal; calycine lobes 5, lanceolate.

12 B. S. Native of New Granada, near Ibague, in humid valleys. Petals not known.

Pepthus-like Jussiaea. Pl. creeping.

11 J. Patiblique (H. B. et Kunth, l. c.) herbaceous, creeping, glabrous, leaves oblong, or obovate-oblong, acutish, cuneated at the base; flowers pedicellate, bibracteolate; tube of calyx slender and angular; calycine lobes 5, lanceolate, acuminate; petals roundish-ovate, twice the length of the calycine lobes.

2 B. S. Native on the shores of the Pacific, near Patiblica. Flowers yellow. Capsule linear.

Patiblica Jussiaea. Pl. creeping.

12 J. Polygoïdes (H. B. et Kunth, nov. gen. amer. 6. p. 97.) herbaceous, creeping, glabrous; leaves lanceolate-oblong, acutish, narrowly narrowed at the base; flowers pedicellate, tube of calyx slender, furnished with 2 bracteoles in the middle; calycine lobes oblong-lanceolate, acute.

2 W. H. Native of New Granada, in marshes and bogs; and of Mexico, near Hacienda la Laguna, in running waters. Flowers yellow. Capsule linear.

Polygonoïle-like Jussiaea. Pl. creeping.

13 J. Fluviatilis (Blume, bijdr. p. 1132.) stems herbaceous, terete, glabrous, floating; leaves obovate-oblong, rounded, sometimes retuse; pedicels bibracteolate; calycine lobes lanceolate, acuminate, pubescent; tube of calyx and capsule cylindrical.

2 W. S. Native of Java, in mountain rivulets. Allied to J. repens.

River Jussiaea. Pl. floating.

14 J. repens (Lin. munit. p. 381.) plant herbaceous, creeping, glabrous; leaves obovate-oblong, retuse, petiolate; flowers on longish pedicels, somewhat bicollars at the base; calyx villosus, with a short terete tube, which is attenuated at the base, and 5 lanceolate acute lobes; petals obovate, twice the length of the calycine segments.

2 W. S. Native of the East Indies, floating in water; in Java, Malabar, Timor, &c. Lin. fl. zeyl. 169. Willd. spec. 2. p. 574. exclusive of Swartz’s and Brown’s synonyms.—Rheed. mal. 2. t. 51. Cubospermae palistaire, Lour. coch. p. 275. J. adscéndens, Lin. munit. 69. Does not differ from this unless in the pedicels being a little shorter, as will be seen by comparing the descriptions in Rees’ eyel. by Smith. Capsule terete, an inch long. Flowers white, yellow at the base.

15 J. Swartziana (D. C. prod. 3. p. 54.) plant herbaceous, creeping, smooth in every part; leaves oblong, obtuse, petiolate; flowers pedicellate, furnished with 2 little scales at the base; tube of calyx terete, attenuated at the base; calycine lobes 5, lanceolate, acute, about equal in length to the petals, which are ovate.

2 B. S. Native of the West Indies and Brazil, in marshes, bogs, and water. J. repens, Swartz, obs. p. 172. Oldenlændia, P. Browne, jam. 208. no. 3. Petals yellow. Very like J. repens; but differs in the leaves being oblong, not obovate, in the calyx being glabrous, not villous, and in the petals being smaller.

Swartz’s Jussiaea. Pl. fl. and cr.

16 J. Uruguaynsis (St. Hil. fl. bras. 2. p. 264.) suffruti-
cose, hairy; leaves linear-lanceolate, acute, mucronulate, quite entire, hairy; the mucrone glandular at the apex; calyx hairy; tube of calyx linear; calycine lobes 5, lanceolate, acute; capsule cylindrical, 5-ribbed; seeds subtriangular.

2 B. S. Native of Brazil, in the province of Cisplatine, in the mud cast out by the river Uruguay, in that part of the province called Salto. Petals yellow, obovate, emarginate.

Uruguay Jussiaea. Pl. 13 foot.

21 J. Camuleola (D. C. prot. 3. p. 54.) plant herbaceous, creeping; stem puberulous, much branched; branches lanceolate, leafy; leaves linear-oblong, obtuse, glabrous; flowers on short pedicels, somewhat bicollars at the base; tube of calyx cylindrical, glabrous; calycine lobes 5, lanceolate, acute, about equal in length to the petals.

2 B. S. Native of Cuba. Flowers of a shining yellow. Capsules twice the length of the leaves, terete, tapering to the base.

Branched Jussiaea. Pl. cr.

18 J. fluitans; leaves roundish-spataulate; peduncles axillary, very long, solitary, 1-flowered; flowers deciduous. 2 W. S. Native of Maranhão, floating in rivulets. Flowers yellow.

Floating Jussiaea. Pl. fl.

** Flowers with a 4-leaflet (f. 98 a.) calyx, 4 petals (f. 98 b.), and 8 stamens.

19 J. incisa (Lin. fil. suppl. p. 577.) erect, glabrous, rooting at the base; leaves petiolate, obovate, obtuse; peduncles 1-flowered, a little longer than the petioles; calycine lobes ovate, smaller than the petals. 2 B. S. Native of Surinam, in marshes. J. erécta, Lin. aman. 8. p. 256; but not of his spec. Lam. dict. 3. p. 390. Petals yellow. Perhaps only an octandrous variety of J. repens or J. Swartziana.

Inclinate-stemmed Jussiaea. Pl. 1 ft.

20 J. natans (Humb. et Bonpl. pl. eqin. 1. p. 16. t. 3.) herbaceous, glabrous, floating, supported in the water by a bladder and large white spongy roots, which issue from the ramifications; leaves petiolate, nearly orbicular, quite entire or toothed; flowers pedunculate; lobes of calyx 4-5 acute, shorter than the petals, which are ovate.

nutant Jussiaea. Pl. fl.

21 J. sedoïdes (Humb. et Bonpl. pl. eqin. 1. p. 13. t. 3.) herbaceous, floating, rooting; leaves on long petioles, disposed in stellate tufts, ovate-rhomboid, obtuse, dentately crenated, clothed with adpressed beneath; flowers pedicellate, almost bractless; lobes of calyx ovate-oblong, acute; petals roundish-obovate, longer than the lobes of the calyx.

Stonecrop-like Jussiaea. Pl. floating.

22 J. subacaulis (Pursh, fl. amer. sept. 1. p. 304.) herbaceous, creeping, glabrous; leaves linear-lanceolate, repandly toothed; flowers pedicellate; petals obovate; alternate filaments very short. 2 B. F. Native of North America, on the banks of the Missouri. Flowers small, yellow, ocatndrous, solitary in the axils of the leaves.

Steamless Jussiaea. Pl. creeping.

23 J. acumhata (Swartz, fl. ind. occ. p. 745.) plants herbaceous, ascending, erectish, nearly simple, glabrous; leaves on short petioles, broad-lanceolate, acuminated at both ends; flowers on short pedicels, bractless; lobes of calyx ovate-lanceolate; petals acute, spreading. 2 B. H. Native of the south of Jamaica, in low places, and in the island of Arawaisch, ex Meyer, prim. essq. 173. Flowers small, yellow, ocatndrous, solitary in the axils of the leaves. Capsule elongated, tetragonal.

Acumhinated-leaved Jussiaea. Pl. ascending.

24 J. Lintella (Vahl. ecol. 2. p. 32.) herbaceous, erect,
glabrous; branches spreading, compressed, angular; leaves almost sessile, linear-lanceolate, acuminate at both ends; flowers almost sessile; lobes of calyx lanceolate, attenuated. O. B. S. Native of South America. Flowers yellow. Specimens gathered at Demerara, in marshes, agree with the description of Vahl, except in the leaves being more lanceolate, in the capsule being 5-10 lines long, not an inch, and in the petals being ob-ovate-oblong, length of the calyx. The specimens we have collected ourselves in Trinidad, Jamaica, Grand Cayman, and about the Havannah, as also in Brazil, agree perfectly with the plant described by Vahl.

**Faux-leaved Jussiaea.** Fl. July, Aug. Clt. 1824. Pl. 1 ft. 25 J. erecta (Linn. spec. 556. exclusive of syn. of Rumph. and f. zeyl.) herbaceous, erect, glabrous, branched; stems nearly terete; branches rather angular; leaves on short petioles, lanceolate, acuminate at both ends; flowers sessile, bracteoles; lobes of calyx acuminate, about equal in length to the petals, which are obovate; capsule cylindrically constricted, under the limb of the calyx. *O. B. S. Native of South America, and all the West India islands, common. Gaertn. fruct. 159. t. 31. Smith in Rees' cyc. no. 8. exclusive of the synonyme of Rheede. Perhaps two plants are confused under the name of J. erecta. Perhaps J. ramosa of Jacq. in Rchb. hort. bot. 1. t. 75, is distinct from this.

**Var. a. Schinifolia (D. C. prod. 3. p. 55.) leaves broad-lanceolate, much longer than the capsules.—Native about Demerara.—Seb. thes. 1. t. 26. f. 3.**

**Var. β, Plumerifolia (D. C. l. c.) leaves narrow-lanceolate, twice the length of the capsules. Native of the West Indies. J. sessiliflora, Moc. et Sesse. fl. mex. icon. ined. is probably referable to this plant. J. Onagra, Mill. det. no. 4. J. erecta, Swartz, obs. 173. Lam. ill. t. 250. f. 2.—Plum. ed. Brum. t. 175. f. 2.**

**Erect Jussiaea.** Fl. July, Sept. Clt. 1739. Pl. 2 to 3 ft. 26 J. Blumeana (D. C. prod. 3. p. 55.) stem suffruticosus, erect, striated, puberulous; leaves linear-lanceolate, rather puberulous; flowers almost sessile; calyces lobes oblong-lancolate, ciliata; capsule cuneate-oblong, puberulous, about equal in length to the leaves. *O. B. S. Native of Java. J. angustifolia, Blum. bijdr. p. 1132. but not of Lam. Flowers yellow. Said to be nearly allied to J. erecta. There is also a variety of this plant with narrow leaves, which are crowded at the tops of the branches.

**Blume's Jussiaea.** Pl. 1 to 2 ft. 27 J. altissima (Perr. in litt. ex D. C. prod. 3. p. 55.) herbaceous, erect, glabrous, branched; stem angular under the branches; leaves sessile, linear-lanceolate, tapering to both ends; flowers almost sessile, bracteoles; lobes of calyx acuminate, 3-nerved, exceeding the petals. *O. B. S. Native of Senegal. Capsule tetragonal, 7-9 lines long.

**Tallest Jussiaea.** Pl. 3 to 4 ft. 28 J. Tenutifolia (Nutt. in Sillim. journ. amer. 1822. p. 294.) leaves sessile, linear, glabrous, remote, few; flowers sessile, octandrous; capsule 4-angled. *O. B. F. Native of Eastern Florida.

**Fine-leaved Jussiaea.** Pl. 1 ft. 29 J. Linearis (Willd. spec. 2. p. 575.) stem erect, branched, smoothish; leaves linear, sessile, and are, as well as the branches, rather hispid; flowers sessile; lobes of calyx linear, auritish; tube cylindrical, slender and elongated. *O. B. S. Native of Guinea. Flowers small. Stem hard, woody, slender. Hairs on leaves short, scattered. Capsule puberulous when examined under a lens, 8-9 lines long, one-half shorter than the leaves.

**Linear-leaved Jussiaea.** Pl. 1 ft. 30 J. Hyssopifolia; herbaceous, erect; stems and branches angular, glabrous; leaves narrow-lanceolate, almost entire, mem-
75. B. S. Native of Brazil, in the province of Minas Novas, in humid valleys near Pindade, and in the province of Minas Geraes in meadows, near Palmita. Petals yellow.

Palmita Jussieua. Fl. June. Sh. 3 to 5 ft.

59 J. lancaelata (St. Hil. fl. bras. 2. p. 254.) shrubby, much branched; branches hairy, angularly furrowed at the apex; leaves lanceolate, acute, quite entire, glabrous above, puberulous beneath; flowers pedicellate; calyx hairy, with an obconical tube and lanceolate acute lobes; petals obvate, slightly emarginate. 75. B. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, in sand on the banks of the river Jiquitinonha. Petals yellow.

Lanceolate-leaved Jussieua. Sh. 1 ft.

40 J. cararosa (St. Hil. fl. bras. 2. p. 258.) shrubby; branches furrowed at the apex, beset with brownish pili; leaves oblong, ending in a short acumen, quite entire, hairy; flowers pedicellate; calyx hairy, with an obconical 4-ribbed tube, and lanceolate acute segments; petals obvate, slightly emarginate, exceeding the calyx; capsule obconical, obliquely tetragonal; seeds elliptic, 1-celled. 75. B. S. Native of Brazil, near Salto Grande, not far from the town of St. Paul. Petals yellow.

Caparosa Jussieua. Sh.

41 J. elegans (St. Hil. fl. bras. 2. p. 257.) shrubby; branches pubescent and furrowed at the apex; leaves lanceolate, acuminate, obliquely sinuate, hispid; flowers pedicellate; calyx pubescent, with an obconical 8-ribbed tube, and lanceolate acute lobes; petals obvate, exceeding the calyx. 75. B. S. Native of Brazil, in the province of Rio Janeiro, at the river Parahyba, near the village of Uba. Flowers yellow.

42 J. laruttetana (St. Hil. fl. bras. 2. p. 256.) shrubby; branches angular, reddish, smooth; leaves oblong-lanceolate, acute or rounded at the apex and ending in a short point, tapering to the base, obliquely toothed, smooth; calyx pubescent, with an obconical quadrangular 4-ribbed tube, and lanceolate acute ciliate lobes; petals obvate, exceeding the calyx; capsule obconical, 8-ribbed; seeds elliptic, 1-celled. 75. B. S. Native of Brazil, in the province of Minas Geraes, near Padre-Bento, where it was collected by one Laroutte.

Laroutte's Jussieua. Sh. 1 to 2 ft.

43 J. decurrens (D. C. prod. 3. p. 56.) herbaceous, erect, branched, glabrous; stems winged from the leaves running down them; leaves lanceolate; flowers rather pedicellate; pedicel furnished with 2 glands in the middle; lobes of calyx 3-5-nerved, acute; petals obvate, longer than the calyx; capsule turbinate, winged at the angles. 75. W. F. Native of Georgia and Carolina, and probably of Virginia, in watery shady places. J. erecta, Abbot. insect. georg. t. 10. ex Pursh, fl. amer. sept. 1. p. 394, but not of Lin. Ludwigia Jussiaeoides, Michx. fl. bor. amer. 1. p. 89. but not of Lam. Ludwigia decreeanea, Walt. ed. 80. Ell. sketch. 1. p. 217. Flowers yellow. There are varieties of this species with ovate and linear-lanceolate leaves, and sessile and pedicellate flowers.

Decurrent-leaved Jussieua. Pl. 1 ft.

44 J. palustris (Meyer, prim. essq. 173.) stem erect, suffrutescent, winged; upper leaves lanceolate, lower ones rather spatulate, glabrous; pedicels short; lobes of calyx lanceolate, veined, about equal in length to the petals, which are oval; tube of calyx bluntly tetragonal. 75. B. S. Native of marshes about Essequibo. Flowers yellow.

Marsh Jussieua. Pl. 1 ft.

45 J. anastomosans (D. C. prod. 3. p. 56.) arboreous; branches deflexed, red, smooth, angular to the apex; leaves lanceolate, acute, quite entire, shining, smooth; lateral nerves running into a parallel marginal one; flowers pedicellate; calyx smooth, with an obconical quadrangular tube, and lanceolate acute lobes, furnished with 2 bracteas at the base; petals obvate, rounded, about equal in length to the calyce lobes. 75. S. Native of Brazil, in the province of Minas Geraes, on the mountain called Serra de Nasu Sura Mui dos Uomens. Stem as thick as a man's arm. St. Hil. fl. bras. 2. p. 255. Flowers yellow.

Anastomosing Jussieua. Sh. 10 to 12 ft.

46 J. nervosa (Poir. suppl. 3. p. 199.) branches angular, and as, and as the nerves of the leaves, beset with short velvety down; leaves sessile, lanceolate, acute, glabrous, with the nerves rather prominent beneath; pedicels 1-flowered, longer than the ovary, furnished with 2 scales at the apex; lobes of calyx 5-nerved, acuminate, about equal in length to the tube, which is rather turbinate and angular. 75. B. S. Native of Cayenne. Top of ovary protruding into an 8-flowered truncate cone.

Nerved-calyx Jussieua. Sh. 2 ft.

47 J. ligustriifolia (H. B. et Kunth. nov. gen. amer. 6. p. 100.) herbaceous, erect, smooth; leaves on short petioles, oblong, acute; pedicels 1-flowered, bisectolate at the apex; lobes of calyx ovate, acute, 5-nerved; tube quadrangular, attenuated at the base; petals roundish, longer than the calyx. 2. 75. B. S. Native of Mexico. Plum. ed. Burm. t. 175. f. 1. ex Kunth. Flowers yellow.

Priet-leaved Jussieua. Pl. 1 to 2 ft.

48 J. Maypurensis (H. B. et Kunth. nov. gen. amer. 6. p. 101. t. 531.) stem shrubby, glabrous; leaves on short petioles, oblong-lanceolate, acute, stiffish, puberulous on the nerves and veins beneath; pedicels 1-flowered, bisectolate at the apex; lobes of calyx ovate, acute, somewhat 5-nerved, about equal in length to the petals, which are ovate; tube tetragonal, obconical. 75. B. S. Native in humid places, on the banks of the Orinoco near Maypures. Petals yellow. Anthers twisted. Bracteoles linear.

Maypure Jussieua. Pl. 1 to 2 ft.

49 J. ovalifolia (Sim. bot. mag. t. 2530.) plant erect, branched, clothed with villous pubescence; branches tetragonal, a little winged; leaves nearly sessile, elliptic, acuminate, nerved; flowers sessile; lobes of calyx ovate, acuminate, 3-nerved, about equal in length to the petals, which are orbicular; tube elongated, tetragonal. 75. B. S. Native of Madagascar. Flowers yellow. Genitals very short.

50 J. Bermanni (D. C. prod. 3. p. 57.) stem erect, nearly terete; when young rather villous, but at length glabrous; leaves lanceolate, acuminated at both ends; flowers on short pedicels, bisectolate; lobes of calyx ovate, acute, 3-nerved; tube and

Burmanni's Jussiaea. Pl. 1 ft.

51 J. villosa. (Lam. dict. 3. p. 391.) stem suffruticose, villose; leaves almost sessile, lanceolate, rather villous on both surfaces; flowers sessile; calyx villous; lobes lanceolate; tube cylindrical. Æ. B. S. Native of the East Indies and the Island of Timor. J. exaltata, Roxb. hort. beng. 33. Hamilt. in trans. linn. 14. p. 303. Andr. bot. rep. 621.—Rheed, mal. 2. t. 50. but the capsule is dilated at the apex in the figure of Rheed, not cylindrical. The nerves of the capsule are 8, filiform and permanent, as well as in the two following species.

Villosa Jussiaea. Pl. 1 1/2 ft.

52 J. octonevria (Lam. dict. 3. p. 382.) herbaceous, erect, glabrous; leaves narrow-lanceolate, acuminate; flowers sessile; lobes of calyx lanceolate, acute; tube cylindrical, 8-nerved, striated, shorter than the floral leaves; petals obovate, emarginate, exceeding the calycine lobes. Æ. B. S. Native of the West Indies, in humid or watery places. Ênothera octovialis, Jacq. amer. 102. t. 70. exclusive of the synonym of Plum. Lam. ill. t. 280. F.l. Flowers yellow.

Eight-nerved-calyx Jussiaea. Pl. 2 to 3 ft.

53 J. octofolia (D. C. prodr. 3. p. 57.) herbaceous, erect, downy; leaves lanceolate, acuminate; flowers on short pedicels, furnished with 2 bracteoles at the top of the pedicel, or on the tube; lobes of calyx ovate-lanceolate, 5-nerved; tube cylindrically obconical, 8-nerved, attenuated at the base.—Native of the West Indies and Mexico, in watery places. Plum. ed. Burm. t. 175. f. 1. J. octovalvis, Swartz, obs. 142. The 8 nerves of the capsule are permanent and filiform. This species differs from the preceding in being downy, not glabrous, in the capsule being attenuated at the base, not cylindrical, in the flowers being pedicellate, not sessile, and furnished with two bracteas, not naked. Petals obovate, longer than the calyx.

Eight-threaded-calyx Jussiaea. Pl. 1 1/2 ft.

54 J. scabrea (Wildk. enum. 1. p. 449.) stem suffruticose at the base, hairy; branches angular at the apex; leaves oblong, acute, quite entire, hairy; flowers almost sessile; calyx hairy, with a linear tetragonal tube, and lanceolate acute lobes; petals obovate, 3 times the length of the calyx; capsule linear, 3-ribbed; seeds roundish, 2-celled. Æ. B. S. Native of Brazil, in the province of Rio Janeiro, at the river Paraíba near Uba. J. ilicifolia, Lam. dict. 3. p. 331, but not of Vahl.—J. Mearcgválii, D. C. prodr. 3. p. 58.—Cambarába, Maregr. bras. p. 30, with a figure.

55 J. nitrata (Vahl. eclog. 2. p. 31.) shrubby, erect, hairy; leaves on very short petiolas, lanceolate, attenuated, hairy beneath; pedicels bracteal, shorter than the ovarium; lobes of calyx ovate, acute, 5-7-nerved at the base; tube obconical, 4-nerved; petals obovate, longer than the calyx. Æ. B. S. Native of South America. Ênothera hiâra, Lin. spec. 491.—Plum. ed. Burm. t. 174. f. 2. Flowers yellow.

56 J. macrantha (H. B. et Kunth, nov. ger. amer. 6. p. 102. t. 133.) suffruticose, erect; and branches villous; leaves oblong, acuminate, narrowed at the base, clothed with adpressed hairs on both surfaces; pedicels length of the ovarium, bibracteolate at the apex; lobes of calyx ovate, acute, 5-7-nerved; tube cylindrically oblong, attenuated at the base, obconical; petals obovate, longer than the calyx. Æ. B. S. Native of New Granada, in humid places near Guatua. This species differs from the preceding in the pedicels being furnished with two caducous foliaceous linear bracteas, but perhaps only a variety.

Long-fruitied Jussiaea. Shrub 1 to 2 feet.

57 J. parviflora (St. Hil. fl. bras. 2. p. 263.) suffruticose; branches downy, and rather angular at the apex; leaves linear-lanceolate, acute, quite entire, rather scabrous; flowers almost sessile; calyx puberulous, with a narrow tetragonal tube, and lanceolate acute lobes; petals obovate, equal in length to the lobes of the calyx, pale yellow; capsule linear, 8-ribbed; seeds roundish, bicolinar. Æ. B. S. Native of Brazil, in that part of the province of Minas Geraes called Minas Novas, in sand on the banks of the river Jiquitianinha, also in marshes. Petals pale yellow.

Small-flowered Jussiaea. Sh. 2 ft.

58 J. sericea (St. Hil. fl. bras. 2. p. 500.) suffruticose, branched; branches angular at the apex, and densely clothed with yellowish pili; leaves lanceolate, acute, quite entire, clothed with silky tomentum on both surfaces; flowers pedicellate; calyx clothed with yellow pili, with an obconical 4-ribbed tube, and lanceolate acute lobes; petals obcordate. Æ. B. S. Native of Brazil, in the province of Minas Geraes. Petals yellow.

Silky Jussiaea. Sh. 1 to 2 ft.

59 J. tomentosa (St. Hil. fl. bras. 2. p. 254.) shrubby, a little branched; branches angular at the apex, and densely clothed with brownish tomentum; leaves obvolute or elliptic, mucronulate, dentately serrated, pilose above, but densely clothed with grey tomentum beneath; flowers pedicellate; calyx hairy, with an obconically obsolete 5-ribbed tube, and lanceolate acute segments; petals obovate, slightly emarginate; capsule obconical; seeds elliptic, 1-celled. Æ. B. S. Native of Brazil, in the province of Minas Geraes, near the town of Paracatu. Flowers yellow, crowded at the tops of the branches. In the character the calyx is said to be 4-cleft, but in the description 5-cleft; the last is most probably correct, as the stamens are said to be 10; if such be the case the plant should have been ranged in the first section.

Tomentose Jussiaea. Sh. 3 ft.

60 J. mollis (H. B. et Kunth, nov. gener. amer. 6. p. 102.) herbaceous; erect; branches villous; leaves ovate, acute at the base and apex, hairy on both surfaces, soft beneath; pedicels villous; calyx villous; leaves ovate, acute; tube ovate. Æ. B. S. Native of Guiana, in humid places. Petals and stamens unknown.

Soft Jussiaea. Pl. 1 ft.

61 J. velutina; herbaceous, erect, branched, downy; leaves elliptic-lanceolate, attenuated at both ends; flowers on short pedicels, almost sessile. Æ. B. S. Native of Guiana, in the Island of St. Thomas, in marshes and on rivers' banks. Flowers yellow, middle-sized.

Velvet Jussiaea. Pl. 1 1/2 ft.

62 J. fruticosâ (D. C. prodr. 3. p. 57.) stem suffrugi, much branched; leaves lanceolate, quite entire, alternate, hairy; flowers pedicellate. Æ. B. S. Native of Cochlin-china, in cultivated fields. Ênothera fruticosa, Lour. coch. p. 226. Flowers yellow. Calyx columnar, crowned by the calyx. Seed naked. This plant is referred by Springle to J. suffruticosa of Lin. but that species is hardly known.

Shrubby Jussiaea. Sh. 6 ft.

63 J. supruscâ (Lin. spec. 555.) erect; villous; flowers pedicellate, ocatandrous. Æ. B. S. Native of the East Indies. The synonyms attached to this species by Linnaeus are perfectly erroneous.

* Species hardly known.
ONAGRARIÆ. X. Jusslea.

leaves lanceolate; flowers large, sessile, yellow, decandrous. B. S. Native about Campeachy.

Jussiaeia. Sh. 3 ft.

66 J. purpureascens (Lin. spec. 555.) erect, villous; flowers sessile, decandrous, petalless.—Native of South America.

Published Jussiaea. Pl. 2 ft.

66 J. tenella (Burm. fl. ind. p. 106 t. 55 f. 5.) glabrous; leaves opposite, linear-lanceolate; flowers pedicellate, decandrous, petalless.—Native of Java.

Weed Jussiaea. Pl. 1 ft.

Cult. All the species of this genus are either water or bog plants, and therefore require to be kept moist. The species, natives of bogs, may be grown in pots, under which may be placed pans of water. The floating aquatic kinds should be grown in tubs, filled with water, with a layer of mould in the bottom, in which the plants may root. All the species, natives of warm climates, require a great degree of heat to bring them to flower. The J. grandiflora is the only hardy aquatic kind; it grows best when planted in a shallow pond or rivulet.

XI. PRIEU'REA (this genus is dedicated to M. Le Prieur, the discoverer of the plant at Senegal). D. C. prod. 3. p. 58.

Cult. For culture and propagation see Jussiea a.

Lin. syst. Tetrandria, Monogynia. Tube of calyx cylin- drical, adhering to the ovary; limb 4-parted, the lobes almost permanent. Petals 4, alternating with the lobes of the calyx. Stamens 4, opposite the lobes of the calyx. Apex of ovary or base of style pyramidal, tetragonal, 4-furrowed, glabrous in the furrows, and villous on the angles; the stamens lying in the furrows. Style filiform, pyramidal from the apex. Stigma capitate, 4-furrowed, or 4-lobed. Capsule turbinate, or very much elongated, 4-celled, 4-valved, crowned by a cone-formed pyramid. Seeds numerous.—Branched Indian herbs. Leaves alternate, linear, on very short petioles, quite entire. Flowers axillary, almost sessile, yellow, furnished with two bracteoles at the base of the calyx. This genus is intermediate between Jussiea and Isnärdia; from the former, it is distinguished in the stamens being equal in number to the petals, not double that number; from the latter, in the capsule being elongated and ending in a cone-formed pyramid at the base of the style. The genus Ludwigia of Linnaeus is the same as Isnärdia.

1 L. jussieoides (Lam. dict. 3. p. 588, but not of Michx.) erect, glabrous; leaves lanceolate-linear, acuminate at both ends; flowers pedicellate, almost bractless; capsule elongated, nearly terete.—Native of the Mauritius and the East Indies. Stems terete, branched. Branches and leaves puberulous, when examined under a lens. Flower-bud ovate, acuminate. Capsule an inch long, but hardly a line in breadth. Perhaps the same as L. alterniflora of Burm. exclusive of the synonyms. Jussiaea-like Ludwigia. Pl. 1 foot.

2 L. fruticosa (Blume, bijdr. p. 1133.) stem erect, glabrous, shrubby, pentagonal; leaves lanceolate, bluntly acuminate, with finely ciliate margins; flowers on stalk or crowded, axillary, sessile; capsule linear, tetragonal. B. S. Native of Java, near rivers and rivulets. There is a variety with narrow leaves. Allied to L. Jussieoides.

Shrubby Ludwigia. Shrub 1 foot?

3 L. leucorrhiza (Blume, l.c.) stem erect, glabrous, herba- ceous, pentagonal; leaves alternate, linear-lanceolate, bluntish, with the margins finely ciliate; flowers at first capitulate, but at length axillary, solitary, and sessile; capsule elongated, ciliate, tetragonal.—Native of Java, about Buitenzorg at the river Tjelmon. Root white, fusiform. Allied to L. fruticosa.

White-rooted Ludwigia. Pl. ½ foot.

4 L. lathyroides (Blum. bijdr. 1134.) stems erect, glabrous, pentagonal; leaves linear, bluntish; flowers pedicellate, furnished with 2 bracteas at the top of the pedicels; capsule tetragonal, rather turbinate, short.—Native of the East Indies. Branches angular. Leaves oblong-linear, acute at the base. Bracteas one half shorter than its capsule. Pyramid of ovary depressed at the base of the style. Stigma large, 4-lobed.

Lythrum-like Ludwigia. Pl. ½ foot.

5 L. erigetsa (Lin. mant. p. 40.) stem erect, smooth; leaves alternate, lanceolate; pedicels usually tern, 1-flowered; capsule subcylindrical, 4-angled; petals small. O. W. H. Native of the East Indies. L. triflora, Lam. dict. 3. p. 613. L. alternifolia, Burm. fl. ind. p. 36. exclusive of the synonyms. There are two plants in Burmann’s herbarium under this name, one referable to L. Jussieoides and the other L. erigetsa.

Erigated Ludwigia. Pl. 1 foot.

7 L. diffusa (Hamilt. in Lin. trans. 14. p. 301.) diffuse, glabrous; leaves lanceolate; flowers almost sessile; capsule prismatic, tetragonal; angles blunt; peduncles one half shorter than the leaves. O. W. H. Native of the East Indies, in water. Scheel. mal. 2. t. 49. Jussiea caryophylla var. a. Lam. dict. 3. p. 331.

Diffuse Ludwigia. Pl. diffuse.

8 L. prostrata (Roxb. fl. ind. 1. p. 440.) lower branches prostrate and rooting; flowers sessile, solitary, or numerous in the axils of the leaves; capsules filiform; seeds disposed in one series in each cell. O. H. Native of Pegu.

† Species hardly known.

9 L. Jussieoides (Lin. spec. ed. 2. p. 173.) flowers pedicellate; capsule cylindrical; stems diffuse; leaves lanceolate. Y. W. S. Native of the East Indies, and Ceylon. Ludwigia, Lin. fl. zeyl. no. 66. Ludw. oppositifolia, Lin. syst. veg. p. 135. This species is hardly known, as Linnaeus, in his spec. pl. says the leaves are opposite, and in his fl. zeyl. alternate, and cites the figure in Scheel. mal. 2. t. 49. for his plant, and at the same time excludes it from his mant.

Perennial Ludwigia. Pl. prostrate.

10 L. triflora (Burm. fl. ind. p. 37.) erect, herbaceous,
ONAGRARIE.

LIN. SYST. TETRÁDRIA, Monogyniá. Tube of calyx ovate or subcylindrical (f. 99. a. d.), short, adhering to the ovarium; limb 4-parted, permanent (f. 99. b.). Petals sometimes 4, alternating with the lobes of the calyx, sometimes only rudiments of petals, and sometimes wanting altogether. Stamens 4 (f. 99. c.) in front of the calycine lobes. Style filiform from the base, deciduous; stigma capitate. Capsule obovate or nearly cylindrical (f. 69. f.), tetragonal, 4-valved, 4-celled, many-seeded, opening at the cells.—Aquatic or marsh herbs. Leaves entire, alternate, or opposite. Flowers axillary, sessile.

SECT. I. LUDWIGIA (see Ludwigia for derivation). D. C. prod. 3. p. 60.—Ludwigia, Lin. Petals 4, sometimes larger than the calycine lobes, or equal in length to them, and sometimes smaller.

* Leaves alternate.

Var. b. salicifolia (D. C. l. c.) flowers on very short pedicels. 2. B. H. Native of Carolina. Ludwigia salicifolia, Poir. suppl. 3. p. 512. Lateral nerves of leaves confluent near the margins, giving the leaves the appearance of being 3-nerved.

Var. c. unifóra (D. C. l. c.) stem simple; flower terminal. —Native of New Jersey. Ludwigia unifóra, Rafin. in Desv. journ. bot. 1. p. 224.

Linear-leaved Isnardia. Pl. 2 to 5 feet.

Var. ß, pern mobs (D. C. prod. 3. p. 60.) leaves obtuse; flowers on short pedicels. 2. B. H. Ludwigia pern mobs, Bart. fl. 52.

Soft Isnardia. Pl. 2 feet.

Soft Isnardia. Pl. 1 to 2 feet.

6. I. CAPITÁTA (D. C. prod. 3. p. 60.) stem erect, twiggy, glabrous, but the stolons are creeping and pubescent; leaves alternate, linear-lanceolate, glabrous, acute at the apex and rounded at the base; heads spicate, terminal; petals shorter than the calyx; capsule nearly globose; calycine lobes short.

Capitáte-flowered Isnardia. Pl. 1 1 to 1 foot.

** Leaves opposite.

8. I. REPÉNS (D. C. l. c.) stems creeping, glabrous; leaves opposite, obovate; pedicels axillary, shorter than the leaves; petals ovoate, much smaller than the calyx; capsule oblong, tetragonal. 2. B. S. Native of Jamaica, among stones on the banks of rivers. Habit of I. palátris. Ludwigia répons, Swartz, fl. ind. occ. 1. p. 273. Icon. t. 8. Creeping Isnardia. Pl. creeping.

* Leaves opposite.

9. I. PALÜSTRIS (Lin. spec. 175.) stems procumbent, rooting, glabrous; leaves opposite, ovate, acute; flowers axillary, soli-

10 I. ALATâ (D. C. prod. 3. p. 61.) stems diffuse, branched, glabrous, distinctly angular and winged; leaves lanceolate-cuneate, decurrent, glabrous; flowers sessile, axillary, apetalous; capsule cubical, a little winged. 2. B. H. Native of North America, in Sullivan Island. Ludwigia alata, Ell. sketch. 1. p. 212.

Winged-stemmed Isnardia. Pl. diffuse.

12 L. Spâherocárpa (D. C. prod. 3. p. 61.) stem erect, branched, glabrous, hardly angular; leaves alternate, linear-lanceolate, acute at both ends, when young rather downy; flowers axillary, sessile, apetalous; capsule globose, small, pubescent. G. B. H. Native of South Carolina, about Orangeburgh. Ludwigia spheroârpa, Ell. sketch. 1. p. 213.

Round-flowered Isnardia. Pl. ½ foot.

Lanceolate-leaved Isnardia. Pl. 1 foot.

† Species hardly known.

15 L. Ramôsa (D. C. prod. 3. p. 61.) stems procumbent, rooting, branched, glabrous; leaves opposite, linear-lanceolate; flowers nearly sessile, axillary. G. B. H. Native country unknown. Ludwigia ramosissima, Roth. cat. 3. p. 24.? but not of Wilt. Petals white, ex Wild. one half shorter than the calyx, ex Roth. Capsule elliptic, ex Wild. tetragonal, ex Roth. Stipulas joined to the leaves, ex Roth. Perhaps the plant of Wild. is the same as that of Roth. Bracted Isnardia. Pl. creeping.

16 L. Auraântâca (D. C. l. c.) stem erect, branched; leaves sessile, ovate-lanceolate, alternate, acute, glabrous; flowers axillary; petals length of calyx.—Native of Newcastle, Delaware, Chester, and Pennsylvania, in North America. Ludwigia aurântâca, Rafn. in Desv. journ. 1. p. 224. Flowers orange-coloured. The rest unknown.

Orange-coloured-flowered Isnardia. Pl. 1 to 2 feet.

Cult. None of the species are worth cultivating, except in botanical gardens. Their culture and propagation is the same as that for Ludwigia, see p. 697.

Tribe V.

CIRCEâEAE (plants agreeing with Circe'â in important characters). D. C. prod. 3. p. 61. Tube of calyx not drawn out beyond the ovary, but dividing immediately (f. 100. a.), deciduous. Fruit capitate, ovate-globose (f. 100. e). Stamens 5, one of which is usually converted into a petal (f. 100. b.).—Herbs or subshrubs. Leaves opposite, petiolate, cordate, or ovate. Flowers racemose.

Lin. Syst. Monândria, Monogynânia. Limb of calyx 4-parted (f. 100. g.), deciduous. Petals 4, irregular (f. 100. h.). Stamens 5, only 1 of which bears an anther (f. 100. c.), the other opposite, sterile, petal-formed (f. 100. d.), usually of a different colour from the true petals. Stigma capitâte (f. 100. d.). Capsule naked, subglobose (f. 100. e.), 4-celled, divided into 4 valves at the apex of the cells; valves adnate to the central placenta by the dissepiments. Seeds small, numerous.—Erect herbs or subshrubs. Leaves toothed, alternate, rarely opposite. Racemes terminating the stem and branches. Flowers small, pedicellate, purple, or red.

2 L. Cordêãta (Horn. hort. hafn. add. p. 949.) plant glabrous; branches sulcate angular; leaves alternate, roundish-ovate, cordate, rather ciliated. G. H. Native of Mexico ?

4 L. Minûma (Lag. ex Schrank,
Native Britain.

Small Lopezia. Pl. \( \frac{1}{2} \) foot.

5 L. oppositifolia (Lag. nov. gen. et spec. p. 1.) plant glabrous; leaves ovate, dentately serrated, for the most part opposite, but the upper ones are alternate; racemes short. \( \odot \). H. Native of New Spain. Schrank, nov. act. bonn. 9. p. 91. L. annua, Hort.

Opposite-leaved Lopezia. Pl. 1 foot.

6 L. integrifolia (D. C. prod. 3. p. 62.) plant glabrous; leaves alternate, ovate-lanceolate, acuminate at both ends, quite entire; racemes leafy, terminating the branches. \( \odot \). H. Native of Mexico. Stem angular. Petioles of lower leaves more than an inch long. Sterile stamen white. Leaves quite entire or hardly serrated, never serrated.

Entire-leaved Lopezia. Pl. 1 to \( \frac{1}{2} \) foot.

Vermilion-flowered Lopezia. Shrubb 1 to 2 feet.

8 L. miniat'a (Jacq. coll. 5. p. 5. t. 15. f. 4.) stem suffrutescant, hairy, terete; leaves ovate-lanceolate, hairy, suberased; racemes terminating the branches. \( \odot \). H. Native of Mexico. Sterile stems the same colour as the petals.

9 L. pubescens (H. B. et Kunth, nov. gen. amer. 6. p. 92.) stem branched, glabrous, terete, as well as the downy branches; leaves oval-oblong, acute, pubescent. \( \odot \). H. Native of Mexico?

Pubescent Lopezia. Pl. 1 foot.

10 L. fu'illa (Bonpl. nav. p. 57.) stem simple, hairy, terete; leaves on short petioles, ovate, acute, toothed, upper ones lanceolate, pilose on both surfaces; racemes terminal; flowers on long pedicels. \( \odot \). H. Native of Mexico, on hills between Guanaxuato and Santa Rosa. Bracteas shorter than the pedicels. Calyx glabrous.

Dwarf Lopezia. Fl. July, Sept. Cit. 1824. Pl. \( \frac{1}{2} \) foot.

 Cult. All the species are elegant border annuals, when in flower, and most of them will live through many winters, and become suffrutescant, if sheltered from the frost. They are of easy culture, the seeds only requiring to be sown in the border early in spring, or sown on a hot-bed to forward the plants, which may afterwards be planted out in the open border. A light soil and warm situation suit them best.

XV. CIRCEA (Circe, in mythology, the famous enchantress; in reference to the fruit, which lays hold of the clothes of passengers, from being covered with hooked prickles, as Circe is fabled to have done by her enchantments). Tourn. inst. t. 155. Lin. gen. no. 24. Lam. ill. t. 16. Gärtn. fruct. 1. p. 114. t. 24. D. C. prod. 3. p. 63.

Lin. syst. Diandria, Monogynia. Calyx deciduous, tubular, with a 2-parted limb. Petals 2, alternating with the lobes of the calyx. Stamens 2, alternating with the petals, inserted into the calyx. Disk large, cup-shaped, filling up the whole of the tube of the calyx, and projecting beyond it. Ovarium 2-celled, with an erect ovulum in each cell. Style simple, arising out of the disk. Stigma emarginate. Capsule 2-celled, 2-valved, 2-seeded. Seeds solitary, erect, without albumen. Embryo erect, with a short inferior radicle.—Herbaceous plants. Roots creeping. Leaves opposite, stalked, toothed. Flowers in terminal and lateral racemes, covered with uncinate hairs. This genus differs from the rest of Onagraceae, in its large fleshy disk, in its solitary, erect ovula, and in the binary division of the flower; it is connected with this order through Lopezia, with which it cannot, however, be absolutely associated, and bears about the same relation to Onagraceae, as is borne by Habrégaeas.

1 C. lutetiana (Lin. spec. 12.) stem erect, pubescent; leaves ovate, acuminate, toothed, opaque and downy, longer than the petioles. \( \odot \). H. Native of Europe, in moist shady places; plentiful in some parts of Britain. Fl. dan. t. 210. Schkuh. handb. t. 2. Smith, engl. bot. t. 1026. C. vulgárís, Moench. C. pubéscens, Pohl. C. ovalifólia, Gray. The roots are creeping; and have been considered deterasive. Flowers pale red. Anthers and style white. Stigma red.

Var. \( \beta \), Canadensis (Lin. l. c.) stem glabrous. \( \odot \). H. Native of North America, particularly in Canada, about Lake Huron and Montreal, as well as in the United States. C. Canadensis, Mühl. cat. p. 2. C. Lutetiana, Bigel. fl. bost. p. 8.

Parisian or Common Enchantress Nightshade. Fl. June, Jul. Britain. Pl. 1 to \( \frac{1}{2} \) foot.

2 C. alpína (Lin. spec. 12.) stems ascending, smoothish; leaves cordate, toothed, shining, length of petioles, membranous. \( \odot \). H. Native of Europe, in moist, shady, stony places; plentiful in some parts of the north of England and Scotland, and almost throughout all North America. Smith, engl. bot. t. 1037. Lam. ill. t. 16. f. 2. C. cordifólia, Stok. mat. med. 26. Flowers pale red. Fruit less hispil than those of the preceding species. Plant 4 or 6 inches high.

Var. \( \beta \), intermédia (Ehrh. beitr. 4. p. 42.) stem erect, simple, smoothish; leaves repandly denticulated, acuminated. \( \odot \). H. Native of Europe, in mountainous and shady places. Stout, fl. germ. with a figure. This plant grows to the height of C. Lutetiana but it differs from it in the leaves being cordate, as in C. alpína.

Alpine Enchantress Nightshade. Fl. July, Aug. Britain. Pl. \( \frac{1}{2} \) to 1 foot.

Cult. The species of Circea will grow under any circumstances, and are easily increased by the running roots, which render them a great pest in gardens, unless confined by some means.

† Genera belonging to Onagraceae, but are not sufficiently known.

XVI. PLEUROSTEMON (from πλεύρων, pleuron, a side, and στέμων, stemon, a stamen; in reference to the stamens being all at one side of the flower). Rafin. adn. 1820. D. C. prod. 3. p. 64.—Pleurándra, Rafin. fl. lud. 1817. p. 95. but not of Labill.

Lin. syst. Octandria, Monogynía. Tube of calyx drawn out beyond the ovarium, bigid at the apex. Petals 4, spatulate, all on one side. Stamens 8, and are as well as the style at that side of the flower opposite the petals. Stigma 4-lobed. Capsule oval, 4-celled, many-seeded. Seeds unknown. This genus appears to come very near Génétia, from the calycine tube being drawn out beyond the ovarium.

White-flowered Pleurostemon. Pl. 7 feet.

Cult. The seeds of this plant may be sown in the open border.
XVII. ONAGRARIÆ. XVIII. ONSUSUS. HYDROCARYÆS. I. TRAPA. HALORAGEÆ.

ONAGRARIÆ (meaning unknown to us, but appears to be derived from ovo, oeg, an ass; and ovra, orua, a tail; but the application is not evident). Rafin. l. d. p. 96. D. C. prod. 3. p. 64.—Chamissoëa, Link. in tab. der gewasch. 1818. p. 186. but not of Humb. and Kunth.

LIN. Syst. Octandria, Monogynia. Tube of calyx adhering to the ovary; limb 2-parted; lobes reflexed, deciduous, ex Rafin. Petals 4, inserted at the base of the limb of the calyx. Stamens 8, Stigma quadrifid. Capsule 4-celled, 4-valved. This genus is hardly known. It is probably not distinct from *Oenothera*.

1 O. acuminata (Rafin. l. c.) petals obcordiate. Q. H. Native of Louisiana. *Oenothera*, no. 3. Robin. louis. p. 490. Stem thick, 7 feet high, hairy. Leaves crowded, sessile, lanceolate, acuminate, somewhat bluntly and remotely toothed.

*Acuminated-leaved* Onosurus. Pl. 7 feet.

_Cult._ The seeds of this plant should be sown in the open border.

Calyx superior, 4-parted (f. 101. c.), with the tube adhering to the ovary. Petals 4 (f. 101. b.), arising from the throat of the calyx. Stamens 4, alternating with the petals. Ovary (f. 101. a.) 2-celled. Ovulas solitary, pendulous. Style filiform, thickened at the base. Stigma capitate. Fruit hard, indehiscent, 1-celled, 1-seeded, crowned by the indurated segments of the calyx. Seed large, solitary, pendulous, exalbuminous. Cotyledons 2, very unequal.—Floating herbs. Lower leaves opposite, upper ones alternate; those under water cut into capillary segments; petioles turgid in the middle (f. 101. c.). Flowers small, axillary.

This order is closely allied to Onagrarieae, from which it is distinguished by its solitary pendulous ovules; more closely allied to Halorageae, from which it is distinguished only by the very large seeds, unequal cotyledons, developed calyx, and want of albumen. Seeds of all eatable.

I. TRAPA (abridged from calcitrapa, the Latin name of an instrument called caltrops, furnished with four spines, formerly used in war to impede the progress of cavalry; in reference to the fruit of some of the species being furnished with 4 spines). Linna. gen. no. 157. Lam. ill. t. 73. Gaertn. fruct. 1. p. 127. t. 26. D. C. prod. 3. p. 62.—Tribuloides, Tourn. inst. t. 431.

LIN. Syst. Tetrádria, Monogyria. Being no other genus, the character is therefore the same as that of the order. The lower leaves of all the species are capitellate multifid, as in *Myriophyllum*, the upper or floating ones are delioid and toothed, and disposed in a rosulate manner.

* Fruit furnished with 4 horns. *

1 T. natans (Lin. spec. 175. exclusive of the synonyme of Rheede,) horns of fruit disposed in a cross-like manner, acute, and furnished with a small retrograde beard at the apex, 2 upper ones spreading horizontally, 2 lower ones somewhat ascending. Q. W. H. Native of the temperate parts of Europe and Siberia, in stagnant and slow running water. Schkuhr, handb. t. 25. Mirb. ann. mus. 16. p. 447. t. 19. D. C. org. veg. t. 55. Ker. bot. reg. 88.—Cam. epit. 715. with a figure. Flowers white, the claws of the petals short and purplish. The nuts are esteemed farinaceous, nourishing, and pectoral. The calyx with its spines or indurated lobes being removed, there is a white sweet kernel within, somewhat like a chestnut in taste; they are sold in the markets at Venice under the name of Jesuits' nuts. At Verceil they are called gelarin, and are much eaten there by the common people and children. Pliny says that the Thracians made them into bread. According to Thunberg the roots of this or some other species are commonly boiled in broth in Japan, though the taste is by no means pleasant.

_Four-spined_ Water-caltrops. Fl. June, Aug. Clt. 1823. Pl. fl. **Fruit furnished with 2 horns only.**

3 T. hispinosa (Robx. cor. t. 234. fl. ind. 1. p. 449.) horns of fruit opposite, stiff, acute, spinose, and bearded; floating leaves rather quadrade, serrulate toothed, tomentose beneath. Q. W. S. Native of the East Indies, floating in water.—Rheed. mal. 11. t. 64. 33. Shringata, Jones in asiat. res. 2. p. 350. and 4. p. 253. Petioles furnished with a large bladder in the middle. Petals white. Nectary cupulate, curved. The nuts are sold in the markets in many parts of the East Indies, the kernels being much esteemed by the Hindoos.

Two-spined-fruited Water-caltrops. Fl. June, Aug. Clt. 1822. Pl. fl. 4 T. nucifera (Lin. fil. suppl. 128.) horns of fruit opposite, thick, very blunt, somewhat recurved at the apex; floating leaves quadrade, entire, or a little toothed. Q. W. G. Native of China, about Canton, floating in water; it is also cultivated by the Chinese for the sake of its fruit. Gaertn. fruct. 2. t. 89. 4. Chinensis, Lour. coch. p. 86. Braam. icon. chin. 1821. t. 52. Burm. in Pl. chin. fasi. 3. p. 56. t. 67. the lower figure. Flowers white.

Two-horned-fruited Water-caltrops. Fl. June, Aug. Clt. 1790. Pl. fl. 5 T. cochinchinensis (Lour. coch. p. 86.) horns of fruit thick, obtuse, opposite, somewhat recurved at the apex; leaves oblong, cut at the apex, tomentose beneath. Q. W. H. Native of Cochinchina, floating in stagnant water. Flowers white, on long peduncles. The seeds are eatable, and taste like chestnuts.

Cochin-china Water-caltrops. Fl. June, Aug. Pl. fl. "Cult._ The seeds of the species of *Trapa* require to be sown or thrown into a cistern, or pond, or large pan of water, with rich loamy soil in the bottom. They all grow best in a strong heat. *T. natans* grows well in a pond in the open air.

Tube of calyx adhering the whole length of the ovary (f.
102. c. a.); limb minute, 4-parted (f. 102. c.), or almost wanting (f. 103. a.). Petals minute, inserted in the summit of the calyx, opposite the calyceal lobes, and equal in number to them, or wanting. Stamens inserted with the petals, equal in number to them or occasionally fewer. Ovarium adhering to the calyx, with 1 or more cells (f. 102. d.). Style none. Stigmas equal in number to the cells of the ovarium, papilose or penicilliform, sessile. Fruit dry, indehiscent, membranous (f. 103. c.), or bony (f. 102. d.), with 1 or more cells. Seeds solitary in the cells, pendulous; albumen fleshly. Embryo straight in the axis, with a superior, terete, elongated radicle, and 2 short minute cotyledons.—Herbaceous or suffruticose plants, the greater part of which are inhabitants of water and moist places. Leaves alternate, opposite, or in whorls. Flowers axillary, sessile, or disposed in terminal spikes, occasionally monoeccious or dioecious. The plants contained in this order are not known to possess any medical properties.

**Synopsis of the genera.**

**Tribe I.**

*Cercodia*æ. Limb of calyx evidently parted (f. 102. c.). Stamens equal, or double the number of the calyceal lobes (f. 103. a.). Petals and cells of fruit equal in number to the lobes of the calyx.

2. *Gonio carpus.* Limb of calyx 4-parted (f. 102. c.). Petals 4 (f. 102. a.). Stamens 8 (f. 102. b.). Fruit 8-angled, 4-celled, 4-seeded (f. 102. d.).

**Tribe II.**

*Callitrichæae.* Limb of calyx not conspicuous (f. 103. a.). Petals wanting. Stamens 1, rarely 2. Fruit 4-celled, 4-seeded (f. 103. c.).

7. *Callitriche.* Flowers polygamous, hermaphroditic, or dioecious, or often monoeccious. Bracteas 2, petaloid, at the base of the flowers.

**Tribe III.**

8. *Hippurus.* Character the same as that of the tribe.

**Tribe I.**

*Cercodiaæ* (plant agreeing with *Cercopia* in important characters). Juss. dict. sci. nat. (1817.) 7. p. 441. D. C. prod. 3. p. 65. Hygrobiæ, Rich. anal. fru. p. 34. Limb of calyx evidently parted (f. 102. c.). Stamens equal in number to the calyceal lobes, or double that number (f. 102. b.). Petals and cells of fruit usually equal in number to the calyceal lobes (f. 102. d.).

Speedwell-leaved *Serpicula*. Pl. creeping.

3 S. uricicervium (Burch. cat. geogr. no. 404. trav. 1. p. 37.) leaves opposite, linear, quite entire, glabrous. J. G. Native of the Cape of Good Hope. Plant weak, much smaller and slenderer than the first.

Reddish *Serpicula*. Pl. creeping.

† A very doubtful species.

4 S. thymifolia (Burm. cap. p. 26.)—Native of the Cape of Good Hope. Stem much branched. Leaves alternate, deflexed, ovate, acute, 1-nerved. Flowers rising from the axis of the upper leaves, rather pedicellate, nearly terminal, 5-parted. Perhaps a species of *Ionidium*.

Thyme-leaved *Serpicula*. Pl. Cult. Any common soil will suit the species of *Serpicula*, and they are easily increased by separating the creeping shoots.

**II. GONIOCA'RPUS (from *gynaia*, *gynaia*, an angle, and *karpos*, karpou, a fruit; in reference to the angular fruit). Koen. ann. bot. 1. p. 546. D. C. prod. 3. p. 66.—Gonocarpus, Thumbl. fl. jap. 5. but not of Hamilt.—Gonatocarpus, Willd. spec. 1. p. 690.

Linn. syst. Octandria, Monogynia. Tube of calyx adhering to the ovarium, which is ovate (f. 102. c.); limb 4-parted (f. 102. c.). Petals 4 (f. 102. a.), alternating with the calyceal lobes. Stamens 8 (f. 102. b.). Stigmas 4. Fruit nucumentaceous (f. 102. d.), indehiscent, 8-angled, 8-nerved, 4-celled, 4-seeded. Seeds pendulous.—Herbs. Leaves opposite, toothed. Flowers sessile in the axis of the upper leaves.

**Sect. I. Aporotonus (from α, priv. and ποικίλος, ποικίλος, a foot, and γυνή, γυνα, a female; in reference to the stigmas being sessile, without any foot or style). D. C. prod. 3. p. 66. Stigmas sessile on the top of the ovarium, wart-formed. J. G. Micranthus (Thumbl. jap. 69. t. 15.) leaves ovate, serrate-toothed, smooth; spikes elongated, branched; flowers on short pedicels, pendulous. O. H. Native of Japan. Pe-
HALORAGIS. II. GONIOCARPUS. III. HALORAGIS. IV. CERCODIA. V. PROSERPINACA.

Small-flowered Goniocarpus. Pl. decumbent.

2 G. sca'der (Koen. ann. bot. 1. p. 547. t. 12. f. 6.) leaves lanceolate, deeply serrated, scabrous; spikes compound; branches nearly opposite. H. Native of China, about Macao, where it is cultivated. Ludwigia octandra, Banks, herb.  Scientific Name.

Scabrous Goniocarpus. Pl. decumbent.

3 G. microcap'rus (Thibaud, herb. ex D. C. prod. 3. p. 66.) leaves ovate, acute, serrated, glabrous on both surfaces, as well as the branches and petioles; panicle loose; flowers on short pedicels, spreading. H. Native of New Holland. Habit of G. mierânthus, but differs in the leaves being quite glabrous.

Small-flowered Goniocarpus. Pl. proc.

Sect. II. Pteréd'ygnus (from πτερόν, pteron, a wing, and γυγή, gyne, a female; in reference to the stigmas being plumed at the apex). D. C. prod. 3. p. 66. Styles 4, ending each in a plumose pencil-formed stigma.

4 G. tetrágy'nums (Labill. nov. holl. t. 53.) leaves ovate, serrated, acute, rather scabrous, pilose when young, as well as the petioles and branches; spikes elongated; flowers sessile, erect. H. Native of Van Dieman's Land (f. 102.).

Four-styled Goniocarpus. Pl. ¼ foot.

5 G. tené'llus (D. C. prod. 3. p. 66.) leaves oblong-lanceolate, acute, scabrous, pilose when young, as well as the petioles; stem beset with adpressed bristles; spikes elongated; flowers sessile, erect, upper ones male, the rest female. H. Native of New Holland. Very like G. tetragynus, but the stems are much more slender, the leaves much narrower, and the flowers are monocious from abortion.

Weak Goniocarpus. Pl. ¼ foot.

6 G. teucri'oide's (D. C. prod. 3. p. 66.) leaves ovate, serrated, acute, scabrous, pilose from the hispid spreading hairs; flowers in the axils of the upper leaves on short petioles, constituting a leafy loose raceme. Native of New Holland. Sieb. pl. ex sic. no. 544. Stems tetragonal, much branched; branches opposite. Leaves and habit those of a species of Teucrium. Native of New Zealand, the apex's racemose, terrestrial or cushion-shaped. Different than any of those other species. Petals pilose on the back. Stamens 8. Stigmas 4, short, a little bearded. Fruit blunted tetragonal, rather globose.

Teucrium-like Goniocarpus. Pl. decumbent.  Cult. The seeds of the species of Goniocarpus should be sown in the open border, in a warm sheltered situation.

III. HALORAGIS (from Ἀλόγος, hals halos, the sea, and ράξ ραγις, raz ragis, the berry of a bunch of grapes; because it grows on the sea coast, and the fruit resemble grapes in being round). Forst. gen. t. 31. D. C. prod. 3. p. 66.—Halorâgis spec. Lher. Labill.

Lin. syst. Octándria, Di-Tetragynia. Tube of calyx adnate to the ovary; limb 4-parted. Petals 4, alternating with the lobes of the calyx. Stamens 8. Stigmas 2-4, short, sessile, papillose. Fruit lacunaceous, dehiscent, globose, smooth, 2-4-celled, 2-4-seeded.—Smooth Australian shrubs. Leaves quite entire. Flowers axillary. Goniocarpus and Cercodina are probably only sections of Halorâgis.

1 H. prostrâ'ta (Forst. l. c. et prod. no. 179.) stems prostrate; leaves opposite, oblunet, undulated; flowers solitary in the axils of the leaves; stigmas and seeds 4. G. Native of Botany Bay, New Holland, and the island of Pines. Lher. stipr. nov. 1. p. 82. Willd. spec. 2. p. 474.

Prostrate Halorâgis. Fl. May, Sept. C. 1820. Sh. prosp. 2 H. d'éynna (Labill. nov. holl. 1. p. 100. t. 129.) stem erect; leaves alternate, linear; flowers fasciculate in the axils of the leaves; stigmas and seeds 2. G. Native of New Holland, in Van Leewin's Land. Fruit sometimes 1-seeded from abortion.

Digynous Halorâgis. Sh. 2 ft.

† A species not sufficiently known.

3 H. Cape'nis (Nois. et Cels. ex Colla, Hort. Ripul. p. 68.) stem erect; leaves alternate, petiolate, elliptic, dotted beneath. G. Native of the Cape of Good Hope, ex Hort. Flowers unknown.

Cape Halorâgis. Sh. 2 to 3 ft.  Cult. The species of this genus thrive well in any light rich soil, and young cuttings root freely if planted under a hand-glass.

IV. CERCO'DIA (from ερχος, keros, a tail, and ειδος, eidos, like; in reference to the long narrow petals). Murr. comm. genêt. 3. p. 1780. t. 3. t. 1. D. C. prod. 3. p. 67.—Cercodêa, Lam. ill. t. 319.—Halorâgis spec. Lher. Jacq.  Lin. syst. Octándria, Tetragynia. Tube of calyx adnate to the ovary, which is 4-sided; limb 4-parted. Petals 4. Stamens 8. Stigmas 4, sessile. Fruit nuncumaceous, dehiscent, 4-celled, 4-seeded, 4-sided; angles winged.—Smooth Australian shrubs. Leaves opposite, toothed. Flowers in fascicles or racemes. Petals 3 times the length of the lobes of the calyx. This genus is intermediate between Halorâgis and Proserpinaca.

1 C. e'recta (Murr. l. c.) leaves petiolate, ovate-lanceolate, coarsely toothed; flowers sessile, aggregate in the axils of the upper leaves. G. Native of New Zealand. Tetragyrânia iâfélânia, Lin. fil. suppl. 257. Halorâgis alâvta, Jaq. icon. rar. 1. t. 60. exclusive of the country. Halorâgis Tetragyrânia, Lher. stipr. nov. 1. p. 82. Halorâgis Cercodêa, Alt. hort. l. 2. p. 37.

1 P. fal'vustris (Lin. in act. ups. 1741. p. 81.) leaves linear-lanceolate, lower ones usually pinnatifid; angles of nut acute.

2. W. H. Native of North America, from Canada to Carolina.

2 P. pectinata (Lam. ill. I. p. 214. t. 50. f. 1.) leaves all pinnatifidly pectinated; angles of nut blunt. 2. W. H. Native of South Carolina, Georgia, New Jersey, and Pennsylvania. Ell. sketch. 1. p. 182. Torrey, fl. unit. st. 1. p. 162. P. palustris b, Michx. I. c. Only a variety of the preceding according to Michx, but according to Lamarck, Elliott, and Torrey it is a proper species.

Cult. These plants should either be grown in large pans of water, with an inch or two of mould in the bottom for the roots to run in, or in pots set in pans of water, or they may be grown in ponds. They require some care and shelter to preserve them through the winter in Britain.

VI. MYRIOPHYLLUM (from μυρος, myrios, a myriad, and φύλλον, phyllon, a leaf; in reference to the numerous divisions of the leaves). Vaill. act. acad. par. 179. t. 2. Lin. gen. no. 1066. Gaertn. fr. 1. t. 68. Lam. ill. t. 775. D. C. prod. 3. p. 68.—Pentapterophyllum, Dill. nov. gen. 7.—Pentâpterus, Hall. helv. 1. p. 454.

Linn. syst. Monœca, Tetrândria, and Octândria, Tetrâgyenia. Flowers monoeous, rarely hermaphrodite. Male. Calyx 4-parted. Petals 4, caducous, ovate, alternating with the calyceous lobes. Stamens 4-6 or 8. Female. Calyx adhering to the ovary; limb 4-lobed. Petals none. Fruit separable into 4 hard, 1-seeded, indentshinse nuts. Albumen almost absent.—Floating aquatic herbs, rising above the water to flower. Leaves finely cut, opposite or verticillate. Flowers small, disposed in axillary whorls; or in whorled spikes, in consequence of the upper leaves being almost abortive; upper ones male, lower ones female.

Sect. I. Pentâpterus (from πεντε, five, and πτερον, pteron, a wing; application not evident). D. C. prod. 3. p. 68. Flowers usually monoeous. Anthers oblong. Leaves opposite or often in whorls.

* Male flowers octandrous.

1 M. spicatum (Lin. spec. 1409.) leaves finely cut into capillary segments, disposed in whorls; flowers in whorled interrupted, almost leafless; floral leaves shorter than the flowers, lower ones a little serrated, the rest quite entire. 2. W. H. Native of Europe and North America, in ditches, lakes, and pools, never in flowing water; plentiful in Britain. Fl. dan. 681. Smith, engl. bot. t. 83. Schkuhr, handb. t. 296. Petals reddish.

2 M. pectinatum (D. C. fl. fr. suppl. 529.) leaves finely cut into capillary segments, disposed in whorls; flowers in whorled, interrupted, almost leafless spikes; floral leaves a little longer than the flowers, all pectinately serrated. 2. W. H. Native about Montpellier, in still water, and Denmark, and probably through the whole of Europe. Habit of the preceding species, but differing in the floral leaves. It appears to be intermediate between M. spicatum and M. verticillatum.

Pectinate-leaved Water-milfoil. Pl. fl.

3 M. alternifolium (D. C. fl. fr. suppl. p. 529.) leaves finely cut, disposed in whorls; flowers in nearly leafless spikes, alternate, lower ones in fascicles, the rest solitary; lower floral leaves pinnatifid, exceeding the flowers, upper ones entire, short. 2.

W. H. Native of the west of France, in still water about Nantes, and in Vascony. M. alternifolium, Steud. nom.

Alternate-leaved Water-milfoil. Pl. fl.

4 M. verticillatum (Lin. spec. 1140.) leaves finely cut into capillary opposite segments; flowers in axillary whorls; floral leaves all pinnatifid, much longer than the flowers, and hardly distinguishable from the other leaves. 2. W. H. Native of Europe and North America, in pools, lakes, and ditches, but never in running water. Smith, engl. bot. 218.—Cf. Cl. hist. 2. p. 252. Var. b, Limûrum (Heck. in litt.) leaves of linear, acute, and regular. 2. H. Native of Europe, in almost dry places.

5 M. Quitte's (H. B. et Kunt. nov. gen. amer. 6. p. 89.) leaves finely cut into filiform lobes, about 15 lobes on each side. 2. W. S. Native of the Andes about Quito, in the river Guancabamba.

Quito Water-milfoil. Pl. fl.

6 M. indicus (Wild. spec. 4. p. 407.) leaves in whorls, lower ones finely cut into capillary segments, upper ones lanceolate, cuticular, rather cut at the apex; flowers axillary, verticillate. 2. W. S. Native of Ceylon and Coromandel. The flowers are said to be hermaphrodite.

Indian Water-milfoil. Pl. fl.

7 M. elatinoïdes (Gaud. fl. mal. p. 17. ann. sc. nat. 5. p. 105.) leaves 4 in a whorl, lower ones cut into capillary segments, upper ones pinnatifid, toothed or entire, oblong-lanceolate; flowers dioecious, female ones axillary. 2. W. F. Native of the Maçlove and Falkland Islands. Male flowers unknown.

Elatine-like Water-milfoil. Pl. fl.

8 M. ternatum (Gaud. I. c.) leaves 3 in a whorl, lower ones cut into capillary lobes, upper ones oblong, quite entire; flowers axillary, upper ones male, octandrous, lower ones female. 2. W. F. Native of the Falkland Islands.

Ternate-leaved Water-milfoil. Pl. fl.
